1. *Platanthera chorisiana* (Cham.) Reichenb. f. *Habenaria chorisiana* Cham.; *Pseudodiphyllyum chorisianum* (Cham.) Nevski; *Platanthera matsudae* Makino; *Platanthera ditmariana* Komar.—TAKANE-TOMBO. Small green herb with slender, slightly thickened roots; stems 8–15 cm. long (to 40 cm. long in var. *elata* Finet); leaves 2, approximate, on the lower part of stems, elliptic to broadly so, or nearly orbicular, 2–6 cm. long, 2–5 cm. wide, rounded to mucronate at apex, abruptly narrowed at base; scalelike leaves few, linear-lanceolate; racemes 2–10 cm. long, many to rather few-flowered; bracts as long as to slightly longer than the flowers, rarely shorter, linear, broadened at base; flowers minute, green; sepals nearly equal, oblong to elliptic, rounded at apex, 1-nerved, about 2 mm. long, the lateral sepals spreading, slightly oblique; petals ovate to broadly so, slightly shorter than the sepals; lip ovate-orbicular, obtuse, as long as the sepals, somewhat thickened; spur 1–1.3 mm. long, slightly incurved and thickened above, obtuse.—July–Sept. High mountains; Hokkaido, Honshu (centr. and n. distr.); rare.—Along Bering Sea, Kamchatka, Kuriles, and Sakhalin.

2. *Platanthera breviculcarata* Hayata. *P. yakumontana* Masam.—NITAKA-CHIDORI, TSUKUSHI-CHIDORI. Small herb with somewhat thickened, elongate roots; stems 10–15 cm. long; leaves 1–2, nearly radical, oblong to elliptic, 2.5–4 cm. long, 1.5–2 cm. wide, rounded at apex, abruptly narrowed at base; scalelike leaves 1–3, rather large, broadly lanceolate, acute, ascending; racemes 2–5 cm. long, 5- to 20-flowered; bracts lanceolate, acute, 4–7 mm. long; flowers greenish white; sepals white, nearly equal, 1-nerved, narrowly oblong, the dorsal sepal about 3 mm. long, the lateral sepals about 4 mm. long, obtuse, spreading; petals rather thick, broadly semi-ovate, about 3 mm. long, subobtusely, erect, forming a hood with the dorsal sepal; lip oblong-ligulate, somewhat carinate, obtuse, 3.5–4 mm. long; spur 2–3 mm. long, slightly curved, thickened at tip, obtuse.—July. High mountains; Kyushu (Mount Kirishima and high mountains of Yakushima); rare.—Formosa.

3. *Platanthera metabifolia* F. Maekawa. *P. chlorantha* sensu auct. Japon., non Cust.; *P. bifolia* sensu auct. Japon., non L. C. Rich.—EZO-CHIDORI, FUTABA-TSURE-SAGI. Roots

somewhat fusiform-thickened; stems 20–50 cm. long; leaves 2, radical, oblong to elliptic, 8–15 cm. long, 3–5 cm. wide, obtuse, narrowed to base; racemes 8–16 cm. long, rather densely flowered, the bracts lanceolate; flowers white; dorsal sepal ovate to ovate-elliptic, 5.5–6 mm. long, the lateral sepals about 8 mm. long, broadly lanceolate, obtuse, spreading; petals broadly lanceolate, erect, rather thick, obtuse, slightly shorter than the sepals, forming a hood with the dorsal sepal; lip broadly linear, 1–1.3 cm. long, subcarinate, obtuse; spur 2–2.7 cm. long, gradually narrowed toward the obtuse apex.—July–Aug. Hokkaido.—Kuriles and Sakhalin.

4. *Platanthera okuboi* Makino. HACHIJO-TSURE-SAGI. Roots fusiform; stems 20–45 cm. long; leaves 1–2, nearly radical, oblong to narrowly so, 10–20 cm. long, 3–6 cm. wide, obtuse, narrowed at base; scalelike leaves rather large, erect, broadly lanceolate, 2–6 cm. long; racemes rather densely many-flowered, 5–10 cm. long; bracts broadly lanceolate, 15–25 mm. long; flowers white to slightly green; dorsal sepal broadly ovate, obtuse, 5-nerved, 6–8 mm. long, the lateral sepals broadly lanceolate, 8–10 mm. long, obtuse, 3- to 5-nerved; petals erect, shorter than the dorsal sepal, slightly thickened, oblique, narrowly ovate, 3-nerved, about 6 mm. long; lip broadly linear, 10–13 mm. long, obtuse; spur 2.5–3 cm. long.—May–June. Honshu (Izu Is.).

5. *Platanthera florenti* Fr. & Sav. *P. listeroides* Takeda.—JIMBAI-SO. Roots elongate; stems 20–40 cm. long, rather slender; leaves 2, radical, oblong to elliptic, 5–12 cm. long, 3–5 cm. wide, obtuse to abruptly acute, lustrous, abruptly narrowed to base, somewhat spreading, the upper leaves small, several, ascending, loose, broadly lanceolate, 5–10 mm. long, acute; racemes rather loosely 5- to 10-flowered; bracts spreading; flowers pale green; dorsal sepal ovate to ovate-elliptic, 3-nerved, obtuse, 5–6.5 mm. long, the lateral sepals falcate, lanceolate, 3-nerved, obtuse, 7–8 mm. long, reflexed; petals deltoid-ovate, about 7 mm. long, slightly shorter than the median sepal, oblique, abruptly narrowed at tip, only slightly thickened at apex, 2-nerved; lip broadly linear, obtuse, 7–10 mm. long; spur 1.5–2 cm. long, incurved, gradually narrowed toward the apex; rostellum broad.—Aug.–Sept. Woods in mountains; Honshu, Shikoku, Kyushu; rather rare.

6. *Platanthera ophrydioides* F. Schmidt. *P. amabilis* Koidz.; *P. reinii* Fr. & Sav.; *P. platycorys* Schltr.; *P. ophrydioides* var. *platycorys* (Schltr.) F. Maekawa—KISO-CHIDORI. Roots somewhat thickened; stems 15–30 cm. long, rather slender; larger leaves solitary on lower part of stem, spreading, elliptic to oblong, 3–6 cm. long, 2–4 cm. wide, obtuse to rounded or abruptly acute at apex, rounded to subcordate and slightly clasping at base, the upper leaves 1–2, small, lanceolate; racemes 3–8 cm. long, 5- to 15-flowered; bracts 5–15 mm. long; flowers pale green; dorsal sepal narrowly triangular-ovate, 3-nerved, 5–6 mm. long, slightly mucronate, the lateral sepals reflexed, lanceolate to linear-lanceolate, 6–7 mm. long; petals erect, the lower half triangular-ovate, membranous, abruptly narrowed and elongate at tip, with the upper half broadly linear, only slightly thickened near apex; lip broadly linear, 6–8 mm. long, subobtusate; spur 6–10 mm. long, narrowed toward the rather acute apex, incurved.—Aug. Coniferous woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Sakhalin and s. Kuriles.—*Forma australis* (Ohwi) Makino. *P. ophrydioides* var. *australis* Ohwi—NAGABA-KISO-CHIDORI. Southern phase with linear-oblong or oblanceolate leaves.—Honshu (Kii Prov. and westw.), Shikoku, Kyushu.

Var. *takedae* (Makino) Ohwi. *P. takedae* Makino; *P. ophrydioides* subsp. *takedae* (Makino) So—MIYAMA-CHIDORI, NIKKŌ-CHIDORI. Flowers slightly smaller than in the typical phase, the spur conical, barely 1 mm. long.—Coniferous woods in mountains; Hokkaido, Honshu (centr. distr. and northw.); rather rare.

Var. *uzenensis* Ohwi. GASSAN-CHIDORI. Flowers smaller, the dorsal sepal ovate-rounded, 2–2.5 mm. long, the lateral sepals 3–3.5 mm. long; petals obliquely ovate, with a thickened shorter upper half; lip 3–4 mm. long; spur narrowly oblong, 2–2.5 mm. long.—Honshu (Japan Sea side of centr. and n. distr.).

7. *Platanthera mandarinorum* Reichenb. f. var. *macrocentron* (Fr. & Sav.) Ohwi. *P. oreades* var. *macrocentron* Fr. & Sav.—HASHI-NAGA-YAMA-SAGI-SŌ. Roots somewhat thickened; stems 30–40 cm. long, 1-leaved below the middle; principal leaves lanceolate to oblong, sometimes linear-oblong, 6–12 cm. long, 1–3.5 cm. wide, ascending, obtuse, acute or rounded, rounded to abruptly narrowed at base, the upper reduced leaves 2–5, 1–2 cm. long, erect, lanceolate to narrowly so; racemes 5–12 cm. long; bracts lanceolate, 5–20 mm. long; flowers pale green; dorsal sepal broadly ovate to cordate-rounded, 3-nerved, 5–7 mm. long, the lateral sepals linear-lanceolate, 8–12 mm. long, gradually falcate, 3-nerved; petals obliquely ovate, obtuse, suddenly narrowed above the middle, the upper portion thickened; lip broadly linear, obtuse, 12–15 mm. long; spur rather obtuse, 2–3 cm. long; rostellum broad.—Mountains and hills; Honshu, Shikoku, Kyushu; highly variable.—China.

Var. *maximowicziana* (Schltr.) Ohwi. *P. minor* sensu auct. Japon., non Reichenb. f.; *P. maximowicziana* Schltr.—TAKANE-SAGI-SŌ. Stems 10–20 cm. long; leaves broadly lanceolate to narrowly oblong, obliquely spreading, the upper reduced leaves 1 or 2 or none; flowers smaller than in the typical phase, the spur shorter.—July–Aug. High mountains; Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles.

Var. *brachycentron* (Fr. & Sav.) Koidz. *P. oreades* var. *brachycentron* Fr. & Sav.—YAMA-SAGI-SŌ. Stems 20–40 cm. long; leaves linear-oblong to oblong, the upper leaves 2 or

3, small, erect; flowers smaller than in the typical phase; dorsal sepal 4–5 mm. long, the lateral sepals 6–8 mm. long; petals somewhat elongate; lip 10–15 mm. long; spur 12–20 mm. long.—May–July. Grassy places in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Sakhalin, Korea, and China.

Var. *hachijoensis* (Honda) Ohwi. *P. hachijoensis* Honda—HACHIJO-CHIDORI. Stems rather thick, 20–30 cm. long; leaves slightly clasping at base, the upper leaves reduced, the bracts larger than in the typical phase.—May–June. Honshu (Izu Isl.).

8. *Platanthera minor* (Miq.) Reichenb. f. *P. japonica* var. *minor* Miq.; *P. interrupta* Maxim.—ŌBA-NO-TOMBO-SŌ. Whole plant blackened when dry; roots fusiform; stems 30–60 cm. long; larger leaves 1 or 2, alternate, the lowest oblong or narrowly oblong, 7–12 cm. long, 2.5–3.5 cm. wide, subobtusate, narrowed to base, the upper gradually smaller, narrower, acute to acuminate, the scalelike leaves several, acuminate, lanceolate; racemes 10–25 cm. long, loosely 10- to 25-flowered; bracts broadly lanceolate, as long as the ovary, the margins usually papillose; flowers greenish white; dorsal sepal broadly ovate, obtuse, 3- to 5-nerved, 4–5 mm. long, the lateral markedly spreading, narrowly oblong, 3- to 5-nerved, 6–7 mm. long; petals erect, semi-ovate, obtuse, 3- to 4-nerved, slightly shorter than the dorsal sepal; lip broadly linear, obtuse, 5–7 mm. long; spur 12–15 mm. long, linear, pendulous, obtuse.—June–July. Low mountains; Honshu, Shikoku, Kyushu; rather common.

9. *Platanthera tipuloides* Lindl. *Habenaria keiskei* Miq.; *P. keiskei* (Miq.) Fr. & Sav.; *P. sororia* Schltr.; *P. tipuloides* var. *sororia* (Schltr.) So—HOSABA-NO-KISO-CHIDORI. Roots elongate, thickened near base; stems slender, 20–30 cm. long, 1-leaved below the middle; leaves narrowly oblong to linear-oblong, ascending, 3–7 cm. long, 1–2 cm. wide, obtuse, sessile and abruptly contracted at base, the upper leaves 1–3, small; racemes 4–6 cm. long, rather densely many-flowered; bracts smooth on margin, nearly as long as the ovary; flowers small, yellowish green; dorsal sepal ovate to narrowly so, 2–3 mm. long, the lateral sepals reflexed, narrowly elliptic, 3.5–4.5 mm. long, obtuse; petals semi-ovate, thickened, obtuse, as long as the dorsal sepal; lip 5–6 mm. long, broadly linear; spur pendulous to gently incurved, slender, slightly thickened toward the obtuse apex, 12–17 mm. long; anther-locules parallel, approximate.—July–Aug. Coniferous woods or grassy places in mountains; Hokkaido, Honshu, Shikoku (Mount Tsurugi); rather common northward.—c. Siberia, Kamchatka, Kuriles, and Sakhalin.

Var. *nipponica* (Makino) Ohwi. *P. nipponica* Makino; *P. matsumurana* Schltr.—KŌBA-NO-TOMBO-SŌ. Plant 20–40 cm. high; leaves broadly linear, rather erect; spikes loosely few-flowered; spur ascending.—June–Aug. Bogs in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.

Var. *linearifolia* Ohwi. NAGABA-TOMBO-SŌ. Leaves linear, to 15 cm. long, 5–6 mm. wide; flowers few, loosely arranged.—Aug.–Sept. Kyushu (Yakushima).

10. *Platanthera sachalinensis* F. Schmidt. ŌYAMA-SAGI-SŌ. Roots more or less thickened; stems 40–60 cm. long, rather stout; larger leaves 1–3, alternate, the lowest ascending, obovate-oblong, 10–20 cm. long, 4–7 cm. wide, obtuse, narrowed below into a sheath, the upper leaves gradually smaller, acute to acuminate, the upper 2 or 3 scalelike; racemes 10–30 cm. long, densely many-flowered; bracts usually slightly longer than the flowers, ascending; flowers greenish, small;

dorsal sepal narrowly ovate, 3–3.5 mm. long, the lateral sepals obliquely ovate, 4–5.5 mm. long, obtuse, reflexed; petals semi-ovate, thickened, about 3 mm. long, slightly shorter than the dorsal sepal; lip broadly linear, 5–7 mm. long; spur slender, 15–20 mm. long.—Grassy places in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin and s. Kuriles.

Var. *hondoensis* Ohwi. *OBANA-Ô-YAMA-SAGI-SÔ*. Racemes more loosely flowered; flowers 10–25, the dorsal sepal about 5 mm. long, the lateral sepals about 7 mm. long; spur 2.2–2.5 cm. long.—Honshu (Mount Mitsumine in Musashi, and Mount Fuji in Suruga).

11. *Platanthera japonica* (Thunb.) Lindl. *Orchis japonica* Thunb.; *P. manubriata* Kraenzl.—*TSURE-SAGI-SÔ*. Roots horizontal, slightly thickened; stems 40–60 cm. long, stout, 5- to 8-leaved; lower 3–5 leaves narrowly oblong, 12–20 cm. long, 4–7 cm. wide, acute to obtuse or acuminate, short-sheathed at base, the upper leaves 2–4, becoming bractlike, broadly linear, racemes 10–20 cm. long, densely many-flowered; bracts usually slightly longer than the flowers, acuminate; flowers white; dorsal sepal elliptic, 7–8 mm. long, rather obtuse, navicular, keeled, the lateral sepals obliquely ovate, obtuse, about 8 mm. long; petals subdeltoid, obtuse, erect, somewhat thickened, slightly shorter than the sepals; lip broadly linear, 13–15 mm. long; spur pendulous, linear, 3–4 cm. long.—May–June. Hokkaido, Honshu, Shikoku, Kyushu; rather rare.—China.

12. *Platanthera hologlottis* Maxim. *Habenaria neuropetala* Miq.; *P. neuropetala* (Miq.) Fr. & Sav.; *Limnorchis hologlottis* (Maxim.) Nevski.—*MIZU-CHIDORI*. Roots horizontally spreading, thickened; stems stout, 50–80 cm. long;

leaves 12–16, alternate, the upper ones gradually reduced, the lower 4–6 larger, linear-lanceolate to broadly linear, 10–20 cm. long, 1–2 cm. wide, acute to acuminate; racemes 10–20 cm. long, densely many-flowered; bracts linear-lanceolate, long-acuminate; flowers white, fragrant; dorsal sepal elliptic, flat, 5- to 7-nerved, very obtuse, 4–5 mm. long, the lateral sepals pendulous, falcate, narrowly oblong, 6–7 mm. long, obtuse; petals narrowly ovate, obtuse, thickened, about 7-nerved, slightly shorter than the dorsal sepal; lip ligulate, narrowly oblong, carnos, rounded at apex; spur longer than the sepals, 1–1.2 cm. long, linear, slender.—June–July. Wet places and bogs; Hokkaido, Honshu, Shikoku; locally abundant.—s. Kuriles, Korea, Manchuria, and e. Siberia.

13. *Platanthera hyperborea* (L.) Lindl. *Orchis hyperborea* L.; *P. convallariaefolia* Lindl.; *P. makinoi* Yabe; *P. hyperborea* var. *makinoi* (Yabe) Takeda.—*SHIROUMA-CHIDORI*, *YÛBARI-CHIDORI*. Stems about 30 cm. long, rather thick; leaves several, alternate, narrowly oblong, sheathed at base, the lower 7 cm. long, 2 cm. wide, the upper gradually reduced, obtuse to acute; racemes about 7 cm. long, densely several to many-flowered; bracts nearly as long as the flowers or longer, ovate-lanceolate; flowers yellowish green; dorsal sepal broadly ovate, obtuse, 4–5 mm. long, the lateral sepals oblique, narrowly ovate, obtuse, about 5 mm. long, 6-nerved; petals obliquely ovate or narrowly deltoid, acute; lip oblong-ovate, obtuse, about 5 mm. long; spur about as long as the sepals.—Grassy places in alpine regions; Hokkaido (Mount Yubari), Honshu (Mount Shirouma in Shinano); very rare.—Kuriles, Kamchatka, N. America, and Iceland.

5. COELOGLOSSUM Hartm. AO-CHIDORI ZOKU

Terrestrial herbs with alternate leaves; inflorescence spicate, the flowers small, greenish, the bracts green; sepals connivent in upper part and forming a hood with the petals; lip cuculate, 3-lobed, the terminal lobe minute; spur very short; anther-locules distinct; pollinia oblong, partly hidden by a small bursicule; caudicles rather elongate; glands small, scarcely broader than the caudicle; rostellum bifid, very low; stigma depressed.—Few species, in the temperate regions of the N. Hemisphere.

1. *Coeloglossum viride* (L.) Hartm. var. *bracteatum* (Willd.) Richt. *Orchis bracteata* Willd.; *C. bracteatum* (Willd.) Parl.; *Habenaria viridis* var. *bracteata* (Willd.) A. Gray; *Platanthera viridis* var. *bracteata* (Willd.) Reichenb. f.; *P. bracteata* (Willd.) Torr.—*AO-CHIDORI*. Roots thickened, conical, more or less lobed; stems erect, 15–30 cm. long, 2- or 3-leaved on lower half; leaves narrowly obovate-oblong or oblong, 4–8 cm. long, 1.5–3.5 cm. wide, rounded to acute at apex, sheathing at base; spikes 4–12 cm. long, rather dense, many-flowered; bracts usually longer than the flower, narrowly

lanceolate, 1–4 cm. long; flowers greenish brown, small; sepals narrowly ovate, 5–7 mm. long, obtuse, 5- to 7-nerved, ascending; petals linear-lanceolate, 1-nerved, shorter than the sepals; lip pendulous, oblanceolate, rather thick, longer than the sepals, shallowly 3-lobed, the lateral lobes about 2 mm. long, erect, broadly lanceolate, obtuse, the terminal lobe subrounded, about 0.5 mm. long; spur narrowly ovoid, about 3 mm. long.—May–July. High mountains; Hokkaido, Honshu (centr. and n. distr.); rather rare.—Korea, China, e. Siberia, Europe, and N. America.

6. TULOTIS Raf. TOMBO-SÔ ZOKU

Terrestrial herbs with slender slightly thickened roots; leaves 1–3, alternate; inflorescence spicate, with small, green bracts; flowers small, green or yellowish green; sepals and petals nearly equal, narrow; lip 3-lobed, the lateral lobes nearly basal, small, the median lobe elongate, with a callosity at the base; anther-locules parallel or divergent, the pollinia granular, with a caudicle at the elongated base.—About 8 species, in e. Asia, and N. America.

- 1A. Spur linear, 5–7 mm. long; lip obtuse. 1. *T. ussuriensis*
1B. Spur oblong, about 1 mm. long; lip subacute. 2. *T. inumae*

1. *Tulotis ussuriensis* (Regel) Hara. *Perularia ussuriensis* (Regel) Schltr.; *Platanthera ussuriensis* (Regel) Maxim.; *Platanthera tipuloides* var. *ussuriensis* Regel; *Platanthera herbiola* var. *japonica* Finet; *Perularia fuscescens* sensu auct. Japon.,

non Lindl.—*TOMBO-SÔ*. Roots elongate, slightly thickened; stems 20–50 cm. long, slender, 2-leaved on the lower part, with scalelike leaves toward the top; larger leaves subapproximate, oblong to broadly oblanceolate, 8–13 cm. long,

1-5 cm. wide, rounded to acute, narrowed to the base; spikes nearly 15 cm. long, the bracts narrowly lanceolate, long-acuminate, nearly as long as the flowers; flowers greenish, rather numerous, the dorsal sepal ovate, 3-nerved, obtuse, 2-3.5 mm. long, the lateral sepals spreading, narrowly oblong, obtuse, 3-4 mm. long; petals narrowly ovate, obtuse, thickened; lip 3-4 mm. long, obtuse, 3-lobed, the lateral lobes deltoid, small, the terminal lobe rather thick, linear-oblong, obtuse, slightly reflexed at tip; spur linear, 5-7 mm. long.—July-Aug. Grassy places and woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, and USSR.

2. *Tulotis iinumae* (Makino) Hara. *Perularia iinumae* (Makino) Ohwi; *Habenaria iinumae* Makino; *Platanthera iinumae* Makino; *Gymnadenia iinumae* (Makino) Miyabe &

Kudo.—IINUMA-MUKAGO. Roots slender, slightly thickened; stems slender, 25-35 cm. long, 2-leaved near the middle, with several reduced leaves above; larger leaves subapproximate, oblong, 8-15 cm. long, 2-4 cm. wide, rounded to abruptly acuminate at apex, sheathed at base; spikes 5-10 cm. long, many-flowered, the bracts linear-lanceolate, spreading above; flowers small, greenish; sepals nearly erect, 1-nerved, obtuse, ovate, about 2 mm. long; petals slightly shorter than the sepals; lip slightly longer than the sepals, ovate, subacute, thick, ascending, spreading toward tip, with an ascending acute minute lobe on each side above the base; spur oblong, 1-1.5 mm. long.—July-Aug. Grassy places and thickets in mountains; Hokkaido (Oshima Prov.), Honshu, Shikoku, Kyushu.

7. HERMINIUM L. MUKAGO-SÔ ZOKU

Small terrestrial herbs with tuberous roots; leaves few, sheathing at base; spikes terminal; flowers small, greenish; sepals equal, free; petals equal, or smaller than the sepals; lip spreading or pendulous, adnate to the column at base, 3-lobed, the terminal lobe smaller; spur absent; column very short, rostellum short; anther-locules parallel; glands naked.—More than a dozen species in Europe and Asia.

- 1A. Leaves 3-5, linear to broadly so; lip much longer than the sepals, 3-lobed from the middle, the lateral lobes linear, nearly entire, the terminal lobe much shorter than the lateral lobes. 1. *H. longicirure*
 1B. Leaves 2, ovate to broadly lanceolate; lip 3-lobed from the base, slightly longer than the sepals, the lateral lobes ascending, slightly smaller than the terminal lobe, both lanceolate. 2. *H. monorchis*

1. *Herminium longicirure* (Wright) Wang & Tang. *Aceras longicirure* Wright; *H. angustifolium* var. *longicirure* (Wright) Makino—MUKAGO-SÔ. Slender herb with ovoid roots; stems rather slender, 20-40 cm. long, loosely 3- to 5-leaved; leaves linear to broadly so, 8-15 cm. long, 4-8 mm. wide, acuminate; spikes 5-15 (-20) cm. long, the bracts ovate-triangular, 1-nerved, long-acuminate, shorter or slightly longer than the flowers; flowers green, not fully open; sepals oblong, very obtuse, 1-nerved, 2-2.5 mm. long, equal; petals slightly shorter than the sepals, linear-lanceolate; lip 5-8 mm. long, linear, pendulous, slightly broadened at base, 3-lobed from the middle, the lateral lobes linear, obtuse, ascending, the terminal lobe very short; spur absent; column very short.—June-Aug. Grassy places in lowlands; Hokkaido (Oshima Prov.), Honshu, Shikoku, Kyushu; rather rare.—Ryukyus, Formosa, China, Manchuria, and Korea.

2. *Herminium monorchis* (L.) R. Br. *Ophrys monorchis* L.—KUSHIRO-CHIDORI. Small herb with thickened roots; stems 10-35 cm. long, slender; leaves 2, radical, ovate or broadly lanceolate, 4-10 cm. long, 1-2 cm. wide, acute to acuminate, the cauline usually 1, near middle of stem, small; spikes densely flowered, elongate, to 20 cm. long in fruit; bracts green, as long as the ovary, lanceolate, caudate-acuminate; flowers somewhat secund, green; sepals ascending, 1-nerved, the dorsal ovate, about 2 mm. long, obtuse, the lateral sepals slightly narrower and longer; petals oblong, 3-4 mm. long, obtuse; lip 4-5 mm. long, ascending, somewhat broadened at base, inflated, 3-lobed from the base, the lateral lobes short, ascending, the terminal lobe linear, obtuse; ovary 3-4 mm. long.—June-July. Hokkaido (Kushiro); very rare.—Korea, China, n. India, Siberia, and Europe.

8. AMITOSTIGMA Schltr. HINA-RAN ZOKU

Terrestrial herbs, with tuberous roots; stems slender, 5-20 cm. long, 1- to 4-leaved; leaves narrow, sometimes nearly radical; flowers in spikes, rose-purple or pale rose, the bracts green, lanceolate, often shorter than the ovary; sepals free, oblong or ovate, 1- to 3-nerved; petals similar to the sepals, often forming a hood with the dorsal sepal; lip rather large, 3-lobed, the terminal lobe larger, often shallowly bifid, spur relatively short; column very short, adnate to the base of lip; staminodes developed, the anther-locules parallel, approximate, not elongate at base; rostellum small; stigma transversely divided into 2 lobes; ovary often short-stalked.—About 20 species, in e. Asia and India.

- 1A. Flowers relatively small; lip about 3.5 mm. long; perianth-segments 1-nerved, about 2.2 mm. long; leaves solitary, broadly lanceolate, subacute. 1. *A. gracile*
 1B. Flowers relatively large; lip 7-13 mm. long; perianth-segments 3-6 mm. long.
 2A. Leaves solitary (rarely 2 in No. 2).
 3A. Leaves linear to broadly so; plant of bogs; flowers white to pale rose; lobes of lip lanceolate. 2. *A. kinoshitae*
 3B. Leaves narrowly oblong to lanceolate; plant of shaded rocky cliffs; flowers rose-purple; lobes of lip ovate. 3. *A. keiskei*
 2B. Leaves 2-4; flowers rose-purple; lobes of lip broadly cuneate to nearly rounded; plants of shaded rocks.
 4A. Leaves approximate at base of stem, the lower 2 oblong to broadly oblanceolate; bracts nearly hyaline; lip with a rather deeply bifid terminal lobe. 4. *A. lepidum*
 4B. Leaves alternate, cauline, linear to broadly so; bracts green; lip with entire terminal lobe. 5. *A. kurokianum*

1. *Amitostigma gracile* (Bl.) Schltr. *Mitostigma gracile* Bl.; *Gymnadenia gracilis* (Bl.) Miq.; *G. tryphiaeformis* Reichenb. f.; *Orchis gracilis* (Bl.) Soô—HINA-RAN. Roots somewhat tuberous-thickened; stems 5–15 cm. rarely to 20 cm. long, slender, 1-leaved near base; leaves broadly lanceolate to linear-oblong, ascending, 4–8 cm. long, 1–2 cm. wide, subacute, rounded at base, the scalelike leaves usually 1, on upper part of stem, small; spikes few- to rather many-flowered, second, 1–4 cm. long; bracts small, ovate to narrowly so, acuminate, 3–5 mm. long, 1-nerved; flowers rose-purple; sepals 2.2–2.5 mm. long, 1-nerved, obtuse, elliptic, the lateral sepals obliquely ovate, ascending; petals oblique, broadly ovate, about 2.2 mm. long, obtuse, 1-nerved, as long as the sepals; lip suberect, about 3.5 mm. long, 3-lobed to below the middle, the lateral lobes narrow, short, the terminal longest, spatulate-cuneate, rounded at apex, 3-nerved at base; spur cylindric, 1–1.5 mm. long; capsules short-pedicelled, 5–6 mm. long.—June–July. Honshu (w. distr.), Shikoku, Kyushu.—Korea.

2. *Amitostigma kinoshitae* (Makino) Schltr. *Gymnadenia kinoshitae* Makino; *G. gracilis* var. *kinoshitae* (Makino) Finet; *G. keiskei* var. *kinoshitae* (Makino) Makino; *Orchis kinoshitae* (Makino) Soô; *A. hisamatsui* Miyabe & Tatew.—KOANI-CHIDORI. Roots narrowly oblong; stems slender, erect, 12–20 (rarely to 25) cm. long, 1- or 2-leaved below the middle; leaves linear to broadly so, 4–8 cm. long, 4–8 mm. wide, subacute; spikes 2- to 5-flowered, second; bracts broadly lanceolate, 3–8 mm. long, subacute; flowers white to pale rose; sepals 3.5–4.5 mm. long, obtuse, 3-nerved, the dorsal sepal elliptic, the lateral sepals obliquely ovate; petals about as long as the sepals, obliquely ovate, 2-nerved; lip 8–10 mm. long, 3-lobed, cuneate, the lateral lobes ascending, lanceolate, the terminal lobe slightly longer, spatulate-cuneate, shallowly bifid; spur 1–1.5 mm. long, obtuse; capsules short-pedicelled.—June–Aug. Bogs, rarely wet rocks along streams in mountains; Hokkaido, Honshu (Kantô Distr. and northw.).—S. Kuriles.

3. *Amitostigma keiskei* (Maxim.) Schltr. *Gymnadenia keiskei* Maxim.; *Orchis keiskei* (Maxim.) Soô—IWA-CHIDORI. Roots somewhat fusiform; stems 8–15 cm. long, slender, erect, 1-leaved below the middle; leaves lanceolate to narrowly ob-

long, 3–5 cm. long, 8–15 mm. wide, ascending, obtuse; spikes rather densely few-flowered, second; bracts narrowly lanceolate to broadly linear, 4–10 mm. long, obtuse; flowers rose-purple, rarely white; sepals obtuse, 1- to 3-nerved, 3.5–4.5 mm. long, the dorsal sepal elliptic, the lateral sepals obliquely oblong; petals obliquely ovate, obtuse, 2-nerved, as long as the sepals; lip ascending, about 10 mm. long, rather deeply 3-lobed, the lateral lobes ascending, ovate, the terminal lobe somewhat longer, slightly broader, bifid; spur 2–2.5 mm. long, obtuse.—May–June. Shaded rocky cliffs in mountains; Honshu (centr. distr.).

4. *Amitostigma lepidum* (Reichenb. f.) Schltr. *Gymnadenia lepidum* (Reichenb. f.) Soô—OKINAWA-CHIDORI. Roots mostly oblong; stems 8–15 cm. long; leaves 3, sometimes 2, nearly radical and approximate, spreading, oblong to broadly oblanceolate, 4–8 cm. long, 1.5–2.5 cm. wide, obtuse, mucronate, the upper leaves narrower and shorter; flowers few; bracts nearly hyaline, broadly lanceolate, acuminate, 1-ribbed, 5–10 mm. long; sepals oblong, 1- or sometimes 2-nerved, 4.5–6 mm. long, obtuse; petals oblique, broadly ovate, obtuse, 2-nerved, about 3 mm. long; lip 8–10 mm. long, rather deeply 3-lobed, the lateral lobes ascending, the terminal lobe larger, broadly cuneate, deeply bifid; spur 4–5 mm. long, obtuse.—Mar.–Apr. Kyushu (s. distr.).—Ryukyus.

5. *Amitostigma kurokaminum* (Ohwi & Hatus.) Ohwi. *Orchis kurokaminiana* Ohwi & Hatus.—KURO-KAMIRAN. Roots somewhat ellipsoidal; stems erect, 5–15 cm. long, slender, 2-leaved; leaves alternate, cauline, linear to broadly so, 5–10 cm. long, 5–8 mm. wide, arcuate-recurved at the acuminate tip; spikes 2–3 cm. long, rather densely 2- to 10-flowered, second; bracts green, linear, 5–10 mm. long, acuminate, broadened at base; flowers rose-purple; sepals oblong, obtuse, 1- or sometimes 3-nerved, the lateral sepals spreading, 6–6.5 mm. long; petals obliquely ovate, about 5 mm. long; lip 8–10 mm. long, 3-lobed, the lateral lobes ascending, the terminal lobe larger, entire, elliptic, 4–5 mm. long; spur short-cylindric, about 3 mm. long; capsules short-pedicelled.—June–July. Rocks in mountains; Kyushu (Mount Kurokami).

9. GYMNADENIA R. Br. TEGATA-CHIDORI ZOKU

Terrestrial herbs often with thickened, sometimes lobed roots; stems leafy; leaves linear to oblong; spikes terminal, mostly many-flowered, often second, sometimes twisted, the bracts small; flowers relatively small, rose-purple to pale rose; dorsal sepal often forming a hood with the petals, the lateral sepals ascending to spreading; lip 3-lobed; anther-locules parallel, with a narrowly grooved rostellum between the locules; glands slender, naked, distinct; stigma not distinct.—About 10 species, mostly in boreal regions.

1A. Stems 20–60 cm. long; leaves 3–7, cauline, 7–20 cm. long; lateral lobes of lip spreading.

2A. Spur 15–20 mm. long, about 1.5 times as long as the ovary, 3 to 4 times longer than the perianth; roots digitately thickened; leaves broadly linear, flat. 1. *G. conopsea*

2B. Spur 2–5 mm. long, much shorter than the ovary, and somewhat shorter than the perianth; roots not as above; leaves elliptic to narrowly oblong, slightly plicate. 2. *G. camtschatica*

1B. Stems 10–20 cm. long, slender; leaves usually 2, radical, 3–6 cm. long; petals forming a hood with the dorsal sepal. 3. *G. cucullata*

1. *Gymnadenia conopsea* (L.) R. Br. *Orchis conopsea* L.; *G. conopsea* var. *ussuriensis* Regel; *G. ibukiensis* Makino—TEGATA-CHIDORI. Roots digitate, thickened; stems 30–60 cm. long, rather stout; leaves 3–7, disposed mostly on lower half of stems, alternate, broadly linear, sometimes lanceolate or linear, 10–20 cm. long, 1–2.5 cm. wide, obtuse, becoming acute or acuminate toward the top and smaller, linear-lanceolate,

long-acuminate; spikes rather densely many-flowered, 7–15 cm. long; bracts broadly lanceolate, long-acuminate; flowers rose-purple; sepals ovate, obtuse, spreading, 4–5 mm. long, 2- or 3-nerved; petals oblique, broadly ovate, obtuse, shorter than the sepals; lip 6–8 mm. long, with 3 equally rounded lobes; spur linear, 15–20 mm. long.—July–Aug. Grassy places in high mountains; Hokkaido, Honshu (centr. distr.

and northw.); rather common.—Korea, Sakhalin, Kuriles, China, Siberia, and Europe.

2. *Gymnadenia camtschatica* (Cham.) Miyabe & Kudo. *Orchis camtschatica* Cham.; *Neolindleya camtschatica* Nevski; *Platanthera decipiens* Lindl.; *G. vidalii* Fr. & Sav.—NOBINE-CHIDORI. Roots slightly thickened, slenderly cylindric; stems 20–60 cm. long, 4- to 7-leaved; leaves alternate, elliptic to narrowly oblong, 7–15 cm. long, 2–6 cm. wide, rounded at apex, slightly plicate, the upper 1 or 2 leaves small, broadly lanceolate, acuminate; spikes mostly many-flowered, 5–15 cm. long; bracts lanceolate, green, usually conspicuously longer than the flowers; flowers pale rose; sepals 3-nerved, narrowly ovate, rather obtuse, ascending, about 5 mm. long; petals obliquely ovate, shorter than the sepals; lip broadly cuneate-ovate, slightly longer than the sepals, 3-lobed at apex, the lateral lobes narrowly ovate, obtuse, the terminal lobe rather short; spur prominently curved, 2–5 mm. long, narrowed toward the obtuse apex.—May–June. Woods in mountains; Hokkaido,

Honshu (centr. distr. and northw.), Shikoku.—Kamchatka and Sakhalin.

3. *Gymnadenia cucullata* (L.) L. C. Rich. *Orchis cucullata* L.; *Neottianthe cucullata* (L.) Schltr.—MIYAMA-MOJIZURI. Roots globose; stems slender, 10–20 cm. long, with few scalelike linear leaves; radical leaves usually 2, spreading, oblong to broadly lanceolate, 3–6 cm. long, 1–2.5 cm. wide, acute to acuminate; spikes secund, more or less many-flowered; bracts linear, slightly longer or shorter than the ovary; flowers pale rose; sepals and petals alike, narrowly lanceolate, 1-nerved, 6–8 mm. long, gradually narrowed to an acute apex, nearly erect, slightly connivent above; petals forming a hood with the dorsal sepal; lip narrowly ovate, erect, 7–8 mm. long, 3-lobed, the lobes nearly erect, parallel, linear, the terminal lobe slightly broader; spur curved inward, longer than the perianth.—July–Aug. Woods in high mountains; Hokkaido, Honshu (centr. distr. and northw.).—Cooler regions of Eurasia.

10. HABENARIA Willd. MIZU-TOMBO ZOKU

Terrestrial herbs sometimes with tuberous roots; inflorescence spicate; leaves linear to oblong; flowers green to white; sepals alike or the dorsal broader; petals simple or bifid, sometimes fimbriate; lip slightly adnate to base of the column, usually 3-lobed, spurred; column short; anther-locules parallel or divergent at base, sometimes tubular at base; glands naked; staminodes rarely present; stigma 2-lobed; rostellum usually small, 2-armed, erect, between the anther-locules.—About 700 species, widely distributed in temperate and tropical regions.

- 1A. Arms of rostellum very short; anther-locules erect, closely parallel; flowers greenish.
 - 2A. Spikes 4–5 cm. long; sepals 3-nerved; spur short-cylindric, about 6 mm. long; leaves radical. 1. *H. iyoensis*
 - 2B. Spikes 7–25 cm. long; sepals 1-nerved; spur ovoid to clavate, 1.5–4 mm. long.
 - 3A. Larger leaves mostly basal; spur ovoid, about 1.5 mm. long; plant brown when dry. 2. *H. formosana*
 - 3B. Larger leaves on lower half of the stems; spur clavate, 3–4 mm. long; plant blackened when dry. 3. *H. flagellifera*
- 1B. Arms of rostellum relatively long; anther-locules ascending, usually divergent; flowers white to pale green.
 - 4A. Lateral lobes of lip filiform to linear, entire or obsoletely toothed; flowers white to pale green.
 - 5A. Lateral sepals subreniform, strongly reflexed; lateral lobes of lip obliquely spreading; flower-buds somewhat strongly 4-angled in lateral view; flowers greenish, with a spur rather abruptly inflated at the apex. 4. *H. sagittifera*
 - 5B. Lateral sepals obliquely ovate, spreading to slightly deflexed; lateral lobes of lip horizontally spreading, straight or scarcely recurved; flower buds obliquely 3-angled in lateral view; flowers white, with the spur gradually inflated.
 - 6A. Flowers relatively large; lateral sepals 7–8 mm. long; lip about 15 mm. long; spur 3–4 cm. long. 5. *H. linearifolia*
 - 6B. Flowers relatively small; lateral sepals about 5 mm. long; lip about 10 mm. long; spur rather short, 4–15 mm. long. 6. *H. yezoensis*
 - 4B. Lateral lobes of lip flabellate or cuneate, with lacinate upper margins; flowers white.
 - 7A. Leaves broadly linear or narrowly lanceolate, 3–6 mm. wide; flowers 1–3, rarely 4; petals obliquely ovate, few-nerved, longer than the sepals, obsoletely toothed or shallowly lacinate on lower margin; lateral lobes of lip deeply lacinate. ... 7. *H. radiata*
 - 7B. Leaves broadly lanceolate to narrowly ovate-oblong, 2–4 cm. wide; flowers rather densely arranged and numerous; petals lanceolate, 1- to 2-nerved, shorter than the sepals, entire; lateral lobes of lip shallowly lacinate. 8. *H. miersiana*

1. *Habenaria iyoensis* Ohwi. *Peristylus iyoensis* Ohwi—IYO-TOMBO. Glabrous, erect perennial about 20 cm. high, with ovoid tuberous roots; leaves radical, several, broadly oblanceolate, 3–6 cm. long, 1–1.5 cm. wide; scape or stem erect, with few, appressed, scalelike leaves; spikes 4–5 cm. long, 7- to 12-flowered; bracts lanceolate, acuminate, 5–15 mm. long; sepals 3-nerved, about 3 mm. long, the dorsal sepal broadly ovate, erect, obtuse, the lateral sepals obliquely ovate, reflexed; lip 3-lobed nearly to the base, about 3.5 mm. long, the lateral lobes spreading, filiform, flexuous, about 4 mm. long, the terminal lobe 2.5 mm. long, broadly linear; spur nearly straight, short-cylindric, about 6 mm. long, obtuse; ovary about 1 cm. long.—Oct. Honshu (s. Kantō Distr.), Shikoku, Kyushu; very rare.

2. *Habenaria formosana* Schltr. *H. tentaculata* var. *acutifolia* Hayata—TAKASAGO-SAGI-SŌ. Rhizomes slender, short, loosely sheathed; stems erect, 30–50 cm. long; leaves 2–4, nearly radical, rosulate, narrowly oblong to broadly lanceo-

late, 7–20 cm. long, 1.5–4 cm. wide, ascending, abruptly acute, the upper leaves 6–8, appressed to the stem, broadly linear; spikes 7–25 cm. long, mostly rather many-flowered; bracts lanceolate, long-acuminate, 1–1.5 cm. long, 3-nerved, appressed to the ovary; flowers sessile; sepals narrowly ovate, 1-nerved, obtuse, about 3.5 mm. long; petals slightly shorter than the sepals, 1-nerved, ovate; lip 3-lobed from the oblong-cuneate, rather carnos base, the lateral lobes filiform-linear, ascending, spreading, flagelliform, the median lobe about 2 mm. long, obtuse, the spur ovoid, apiculate, about 1.5 mm. long; column very short.—Kyushu (Yakushima); very rare.—Ryukyus and Formosa.

3. *Habenaria flagellifera* Makino. *Coeloglossum flagelliferum* Maxim. ex Makino; *Peristylus flagelliferus* (Makino) Ohwi; *P. hiugensis* Ohwi; *P. satsumanus* Ohwi—MUKAGO-TOMBO. Glabrous, erect perennial, blackened when dry, with ovoid tuberous roots; stems 20–50 cm. long; principal leaves 3–5, on lower part of stem, alternate, broadly lanceolate,

5–10 cm. long, 1.5–2.5 cm. wide, short-acuminate, the reduced upper leaves few, appressed to the stem; spike 10–20 cm. long, rather many-flowered; bracts broadly lanceolate, 5–10 mm. long; flowers green; dorsal sepal narrowly ovate, rather obtuse, the lateral sepals obliquely oblong, obtuse, reflexed at anthesis; petals narrowly ovate, nearly as long as the lateral sepals, erect; lip 3-lobed nearly to the base, about 2 mm. long, the lateral lobes 6–7 mm. long, the terminal lobe short, obtuse, lanceolate; spur clavate, 3–4 mm. long; ovary 5–7 mm. long.—Sept.–Oct. Grassy places in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

4. *Habenaria sagittifera* Reichenb. f. *H. oldhamii* Kraenzl.; *H. tosaensis* Makino; *H. sagittifera* var. *reichenbachiana* Takeda—MIZU-TOMBO. Slender perennial with tuberous roots; stems erect, 40–70 cm. long, with few leaves on the lower part; leaves linear, 5–15 cm. rarely to 20 cm. long, 3–6 mm. wide, gradually narrowed at tip, sheathing at base, the upper scalelike leaves few, erect, linear, broadened at base; spike rather densely flowered, the bracts narrowly ovate, 8–15 mm. long, abruptly narrowed at tip; flowers rather numerous, greenish, 8–10 mm. across; sepals unequal, the dorsal rounded-cordate, 3–4 mm. long, 5-nerved, the lateral sepals prominently oblique, subreniform, 6–7 mm. long and as wide, strongly reflexed; petals subdeltoid, much dilated on lower margins, as long as the dorsal sepal, the anterior margin appressed to the column; lip about 2 cm. long, 3-lobed, the lobes linear, the lateral lobes obliquely spreading, about 10 mm. long, sometimes obsoletely toothed, the terminal lobe about 15 mm. long, entire; spur about 15 mm. long, slender, with an abruptly inflated apex, nearly as long as to slightly shorter than the ovary.—July–Sept. Bogs and wet grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.

5. *Habenaria linearifolia* Maxim. *H. sagittifera* var. *linearifolia* (Maxim.) Takeda—SAWA-TOMBO. Erect perennial with tuberous roots; stems 40–70 cm. long, few-leaved on lower part; leaves linear, 10–20 cm. long, 3–6 mm. wide, gradually narrowed to the tip, slightly plicate or flat, 1-costate on back, sheathing at base, the upper reduced leaves few, appressed, linear, broadened at base; spikes 7–15 cm. long, many-flowered; bracts 1–1.5 cm. long; flowers white, 1–1.5 cm. across; dorsal sepal erect, ovate, 6–7 mm. long, 5-nerved, the lateral sepals spreading, obliquely ovate, about 7 mm. long; petals erect, subdeltoid, about 6 mm. long, with dilated lower margins; lip about 15 mm. long, about 2 mm. wide, 3-lobed to below the middle, the lobes linear, the lateral lobes horizontally spreading, sometimes declined at tip, usually toothed on one side near the apex; spur 3–4 cm. long, gradually inflated toward apex; ovary 2–2.5 cm. long.—Aug. Bogs and wet grassy places; Hokkaido, Honshu (n. distr.).—Korea, Manchuria, Ussuri, and Amur.

6. *Habenaria yezoensis* Hara. *H. linearifolia* var. *brachycentra* Hara—HIME-MIZU-TOMBO. Slender, erect herb with tuberous roots; stems 25–50 cm. long, 6- to 7-leaved on lower part; leaves 6–11 cm. long, 4–6 mm. wide, acute, 3-nerved, sheathing at base, the upper reduced leaves lanceolate; spikes loosely 2- to 8-flowered, to 10 cm. long; bracts lanceolate,

broadened at base; flowers white, suboblong (in bud) in lateral view; dorsal sepal erect, broadly ovate, about 4 mm. long and as wide, 3-nerved, the lateral sepals spreading, greenish, obliquely ovate, about 5 mm. long; petals erect, white, obliquely ovate-triangular, about 4 mm. long; lip greenish, about 10 mm. long, the lateral lobes spreading, gently recurved, minutely toothed near apex, about 6 mm. long, the terminal lobe about as long; spur greenish, about 4 mm. long, curved forward, inflated toward apex; ovary about 1.5 cm. long.—Aug. Bogs; Hokkaido.

Var. *longicalcarata* Miyabe & Tatew. *H. osensis* Makino—OZE-NO-SAWA-TOMBO. Spur about 15 mm. long, gradually inflated upward.—July–Aug. Bogs; Honshu (Oze in Kotsuke); rare.—s. Kuriles.

7. *Habenaria radiata* (Thunb.) Spreng. *Orchis radiata* Thunb.; *Platanthera radiata* (Thunb.) Lindl.; *Pecteilis radiata* (Thunb.) Raf.; *Hemihabenaria radiata* (Thunb.) Finet—SAGI-SŌ. Slender, erect perennial with nearly spherical, tuberous roots; stems 20–40 cm. long, with 3–5 leaves on lower part and few scalelike leaves above; leaves ascending, broadly linear to narrowly lanceolate, 5–10 cm. long, 3–6 mm. wide, acuminate, sheathing at base, the upper scalelike leaves appressed to the stem, distant, linear, gradually acuminate; bracts green, 7–12 mm. long; flowers 1–3, rarely 4, about 3 cm. across, white; sepals 5- to 7-nerved, narrowly ovate, obtuse, green, 8–10 mm. long, the lateral ones spreading, oblique; petals white, obliquely ovate, few-nerved, erect, forming a hood with the dorsal sepal, 10–12 mm. long, subacute, toothed or shallowly lacinate on the outer margin; lip white, short-cuneate, 3-lobed, about 15 mm. long, the lateral lobes obliquely flabellate, deeply lacinate on outer margin, the terminal lobe linear, rather obtuse, entire, about 1 cm. long, 2 mm. wide, 3-nerved; spur 3–4 cm. long, narrowly cylindric, gradually thickened toward the apex; ovary about 1.5 cm. long.—Aug. Wet grassy places in lowlands; Honshu, Shikoku, Kyushu.

8. *Habenaria miersiana* Champ. *H. geniculata* sensu auct. Japon., non D. Don; *H. sieboldiana* Miq.—DAI-SAGI-SŌ. Terrestrial, erect perennial with broadly ovoid, tuberous roots; stems 30–60 cm. long; leaves 4–5, broadly lanceolate to narrowly ovate-oblong, 8–15 cm. long, 2–4 cm. wide, acute, short-sheathing at base, with narrow translucent margins, the upper leaves scalelike, appressed to the stem, narrowly lanceolate, 3–5 cm. long, with a filiform point; inflorescence rather densely flowered; bracts broadly linear; flowers white, 2–2.5 cm. across; sepals narrowly ovate, 10–13 mm. long, acute, the lateral sepals oblique and slightly deflexed; petals lanceolate, 8–10 mm. long, acuminate, entire, 1- to 2-nerved, forming a hood with the dorsal sepal; lip 15–18 mm. long, 3-lobed, the lateral lobes spreading, broadly cuneate, shallowly lacinate, the terminal lobe linear, 1-nerved, 5–8 mm. long; spur about 3 cm. long, gradually thickened toward the obtuse apex; ovary about 2 cm. long.—Aug.–Oct. Thickets; Honshu (Awa Prov.), Shikoku, Kyushu; rare.—Ryukyus, Formosa, and s. China.

11. ANDROCORYS Schltr. MISUZU-RAN ZOKU

Small terrestrial plants with a single, erect, narrow, radical leaf, the scape naked; spikes loose; flowers small, few; dorsal sepal erect, concave, ovate, adnate to the base of petals, the lateral sepals reflexed, oblong; petals spreading, concave, oblique, ovate-rounded, forming a hood with the dorsal sepal; lip small, entire, ligulate, narrowed toward the obtuse apex, adnate to base of

the lateral sepals, spurless; anthers large, the locules small, lateral, incurved, the connective large; rostellum deltoid, erect, with spreading lateral lobes; stigmas 2, papillose, stalked, the caudicles attached to the rostellum; ovary sessile, slightly twisted.—Two species, one in w. China and one in Japan.

1. *Androcorys japonensis* F. Maekawa. MISUZU-RAN. Roots tuberous, small; leaf membranous, solitary, basal, erect, oblanceolate-oblong, 15–22 mm. long, 5–7 mm. wide, obtuse, long-attenuate at base; scapes 7.5–9 cm. long, erect, covered at base with leaf-sheaths, the bracts minute; flowers 2–3, 2–2.5 mm. across; dorsal sepal elliptic, obtuse, about 1 mm. long, the lateral sepals slightly reflexed, falcate, oblong, obtuse, irregu-

larly denticulate, about 1.5 mm. long; petals oblique, ovate-rounded, 0.8 mm. long, incurved at tip, narrowed to the base, with minute irregular teeth on margins, forming an open hood with the dorsal sepal; lip ligulate, not spurred, lanceolate, 1.5 mm. long, obtuse, broader at base; column about 1 mm. long.—Aug. High mountains; Honshu (Yatsugatake); very rare.

12. MICROTIS R. Br. NIRABA-RAN ZOKU

Small terrestrial plants with tuberous roots; stems low, 1-leaved; leaf elongate, linear, terete, sheathing the lower part of the stem; inflorescence densely spicate, minutely bracteate; flowers minute; dorsal sepal erect, broad, incurved, the lateral sepals lanceolate or oblong, free, spreading or reflexed; petals similar to the lateral sepals or smaller; lip attached to the base of the column, sessile, spreading, oblong, entire or bifid, often with callosities at base; spur absent; column very short, with 2 auricles at apex; stigma short, obtuse, attached at base of rostellum; anther erect; pollinia granular.—About 10 species, chiefly in Australia, a few in e. Asia and Malaysia.

1. *Microtis formosana* Schltr. *M. parviflora* sensu auct. Japon., non R. Br.—NIRABA-RAN. Tubers globose, 5–8 mm. across; stems 10–30 cm. long, 1-leaved near the middle, enveloped by a sheath on lower half, with few leafless membranous sheaths at the base, naked on upper half; leaves nearly radical, terete, 2–2.5 mm. across, longer than or as long as the stem, gradually narrowed to the tip, obtuse, long-sheathing at base; spikes 2–8 cm. long, rather densely flowered; bracts membranous, narrowly ovate-deltoid, 2–4 mm. long, nearly nerveless, mostly acuminate, mucronate; flowers green, about 2.5 mm. across; dorsal sepal elliptic, about 2 mm. long, erect,

concave, slightly incurved at tip, obtuse, the lateral sepals gently reflexed, narrowly oblong, obtuse, slightly shorter than the dorsal; petals narrowly oblong, obtuse, about 2/3 as long as the dorsal sepal; lip spreading, somewhat fleshy, quadrangular-oblong, nearly as long as the dorsal sepal, truncate at apex, slightly broadened at base, with 2 obscure callosities at the base; spur absent; ovary short-pedicelled, capsules 3–4 mm. long.—Apr.–May. Grassy places in lowlands; Honshu (Izu Isl., Kazusa, Kii, and Suwo Prov.), Shikoku, Kyushu; rare.—China, Ryukyus, and Formosa.

13. LISTERA R. Br. FUTABA-RAN ZOKU

Terrestrial, slender, rhizomatous perennials; stems erect, simple, with a few scales or scalelike leaves at base, the principal leaves 2, opposite, near middle of the stem, sessile, spreading, not sheathing, ovate-rounded; inflorescence racemose, the flowers small, usually pedicelled, yellowish green, the bracts small; sepals equal, free, reflexed to spreading; petals resembling the sepals; lip longer than the sepals, attached to base of column, spreading, often pendulous at tip, entire or bifid, usually auriculate near base; column very short, without a foot, wingless; rostellum terminal, sometimes reclined; stigma broad; anther-locules contiguous, the pollinia often bifid in each locule, granular; capsules pedicelled, obovoid or globose, erect or spreading.—About 30 species, in Europe, Siberia, n. India, e. Asia, and N. America.

- 1A. Leaves slightly above the base of the stem, elliptic to broadly ovate; scalelike leaves on the scape 4–10, with a filiform slightly reflexed apex; lip without auricles. 1. *L. makinoana*
- 1B. Leaves nearly at the middle of the stem; scalelike leaves 0–2.
 - 2A. Lip 5–8.5 mm. long, with obtuse lobes, with or without auricles.
 - 3A. Lip auriculate near base, glabrous; perianth segments reflexed.
 - 4A. Lobes of lip linear-oblong, the auricles loosely embracing the column; leaves deltoid or deltoid-cordate. 2. *L. japonica*
 - 4B. Lobes of lip ovate, the auricles ascending, not embracing the column. 3. *L. nipponica*
 - 3B. Lip without auricles, ciliolate, the lobes ovate; perianth segments spreading. 4. *L. yatabei*
 - 2B. Lip 2.5–3.5 mm. long, with linear lobes, the auricles spreading outward; scapes naked. 5. *L. cordata*

1. *Listera makinoana* Ohwi. *L. savatieri* sensu auct. Japon., non Maxim. ex Komar.; *L. patenifolia* Nevski—AO-FUTABA-RAN. Rhizomes slender, creeping, with filiform roots; stems 10–25 cm. long, slender, 2-leaved near the base, glabrous below the leaves, glandular-puberulous on upper portion above the leaves; leaves 2, spreading, elliptic-ovate to ovate-rounded, sometimes deltoid-ovate, 12–40 mm. long, 10–30 mm. wide, obtuse to subacute, broadly truncate to shallowly cordate at base, 3-nerved; scalelike leaves 4–10, loosely alternate, ascending, narrowly linear, 2–5 mm. long, with a filiform slightly reflexed apex; flowers 5–20, greenish, loosely arranged,

the bracts spreading, small; sepals oblong-lanceolate, rather obtuse, 2–2.7 mm. long; petals linear, obtuse; lip 2–2.5 times as long as the sepals, narrowly obovate-cuneate, not auricled, the lobes ovate, rounded at apex.—Aug. Woods in mountains; Honshu, Shikoku, Kyushu.

2. *Listera japonica* Bl. *L. shikokiana* Makino—HIME-FUTABA-RAN, MURASAKI-FUTABA-RAN. Rhizomes slender, creeping; stems erect, 5–18 cm. long, slender, usually 2-leaved above the middle, the lower portion glabrous, the upper portion loosely glandular-puberulous; leaves 2, deltoid to deltoid-cordate, 1–2 cm. long, 0.7–2 cm. wide, sessile, acute or mucro-

nate, broadly truncate to shallowly cordate at base; scalelike leaves absent; flowers 2-5, very loose, purplish green, with reflexed perianth-segments 2.3-3 mm. long; sepals obtuse, narrowly ovate, the lateral ones narrowly oblong; petals linear-oblong, obtuse, the lip 2.5-3 times as long as the sepals, 5.5-8.5 mm. long, cuneate, bilobed, with rather acute auricles embracing the column near the base, the lobes linear-oblong, 3-5 mm. long; capsules 3 mm. long, long-pedicelled.—Apr.-May. Woods in mountains; Honshu, Shikoku, Kyushu; rather rare.—Ryukyus.

3. *Listera nipponica* Makino. *L. savatieri* Maxim. ex Komar., pro parte; *L. brevidens* Nevski.—MIYAMA-FUTABARAN. Rhizomes slender, short; stems 10-20 cm. long, erect, 2-leaved near the middle, the upper part with short, spreading, glandular-pubescent, the lower part glabrous; leaves reniform to cordate, 15-25 mm. long, 10-30 mm. wide, abruptly mucronate, truncate-cordate to truncate-rounded at base, the scalelike leaf broadly lanceolate or wanting, racemes 3- to 10-flowered, loose, the bracts ascending, broadly lanceolate, 1-2 mm. long; flowers brownish green; perianth-lobes reflexed; sepals 3-4 mm. long, strongly reflexed from the base, narrowly lanceolate, obtuse; petals as long as the sepals, narrowly oblong; lip twice as long as the sepals, broadly cuneate-obovate, bifid, auriculate near the base, the lobes ovate; capsules ellipsoidal, 3-4 mm. long, the pedicels slightly longer.—July-Aug. Coniferous woods; Hokkaido, Honshu (centr. and n. distr.), Kyushu (Mount Sobosan); rare.—Ussuri.

4. *Listera yatabei* Makino. *L. major* Nakai; *L. savatieri* Maxim. var. *major* (Nakai) Beauverd; *L. convallarioides* subsp. *yatabei* (Makino) Beauverd.—TAKANE-FUTABARAN. Rhizomes slender; stems 15-20 cm. long, slender, 2-leaved near

the middle, the lower part glabrous, the upper part glandular-pubescent; leaves reniform to cordate, 15-30 mm. long, 20-30 mm. wide, obtuse or sometimes acute, 3-nerved, the scalelike leaves 2, narrowly linear, acuminate, 1-3 mm. long; racemes loosely 5- to 10-flowered; flowers greenish brown, the bracts ascending, lanceolate to elliptic, 1-2 mm. long; perianth segments spreading; sepals narrowly oblong, about 2 mm. long, obtuse; petals linear; lip 6-8 mm. long, narrowly cuneate, ciliolate, the lobes ovate, nearly erect, obtuse; ovary about 3 mm. long, slightly shorter than the pedicels.—Aug. Coniferous woods; Hokkaido, Honshu (centr. distr.); rare.—s. Kuriles, Sakhalin, Korea, Ussuri, and e. Siberia.

5. *Listera cordata* (L.) R. Br. *Ophrys cordata* L.—FUTABARAN, KO-FUTABARAN. Rhizomes short, slender; stems 10-20 cm. long, slender, 2-leaved near the middle, the lower portion glabrous, the upper part glandular-puberulent; leaves deltoid-reniform or deltoid-cordate, 8-20 mm. long, 1-2.5 cm. wide, obtuse, mucronate, slightly cordate to truncate at base; scalelike leaves absent; racemes loosely 4-10 flowered; flowers greenish yellow or purplish; bracts spreading, deltoid-ovate, rather acute, about 1 mm. long; sepals spreading, narrowly oblong, obtuse, 1.5-2 mm. long, the petals narrowly ovate, nearly as long as the sepals; lip spreading, cuneate, 2.5-3.5 mm. long, deeply bifid, toothed at the base, the lobes linear; ovary pedicelled; capsules ellipsoidal, 3-4 mm. long, slightly shorter than the pedicels.—July-Aug. Woods in high mountains; Hokkaido, Honshu (centr. and n. distr.), Shikoku; rather rare.—Europe, Siberia, and N. America. The Japanese phase has relatively smaller flowers and broader leaves than the plant in Europe and is sometimes called var. *japonica* Hara.

14. NEOTTIA L. SAKANE-RAN ZOKU

Saprophytic rhizomatous herbs without chlorophyll; stems simple, erect; leaves scalelike, sheathing, scattered on the stems; inflorescence racemose, the flowers small, short-pedicelled, the bracts small; sepals nearly alike, free, concave, spreading; petals similar to the sepals but narrower; lip spreading from the base of the column, longer than the sepals, flat or concave, entire or bifid; column rather long, wingless, nearly terete, without a foot; rostellum incurved; stigma broad; anther erect or incurved, the locules contiguous; pollinia granular; capsules ovoid or ellipsoidal, erostate.—About 10 species in Eurasia, especially in India and e. Asia.

1A. Stems stout, 25-45 cm. long; upper part of plant inclusive of inflorescence and ovaries brownish crisped-pubescent; flowers 6-7 mm. across; perianth-segments very obtuse; lip deeply bifid, 10-12 mm. long, 2.5-3 times as long as the sepal.

1B. Stems slender, 10-25 cm. long; plant glabrous; flowers 3-4 mm. across; perianth-segments gradually acuminate; lip entire, 2-3 mm. long, nearly as long as the sepals. 1. *N. nidus-avis* var. *manshurica*
 2. *N. asiatica*

I. *Neottia nidus-avis* (L.) L. C. Rich. var. *manshurica* Komar. *N. nidus-avis* sensu auct. Orient. Asiat., non L. C. Rich.; *N. papilligera* Schltr.—SAKANE-RAN. Rhizomes thick, short; stems stout, fleshy, 25-45 cm. long, brownish crisped-pubescent above, erect, simple; leaves scalelike, tubular, membranous, alternate, loose, glabrous, 1.5-4 cm. long; racemes 10-15 cm. long, loosely or somewhat densely flowered, erect, with short, crisped, brown, glandular hairs above; bracts deltoid-lanceolate to deltoid-ovate, membranous, 1-ribbed, gradually narrowed to the tip, 4-7 mm. long; flowers yellow, 6-7 mm. across, with a glandular-pubescent pedicel; sepals and petals obovate, 1-nerved, 5-6 mm. long, very obtuse, concave; lip 10-12 mm. long, deeply bifid, the limb oblong, papillose inside, often pubescent without, the lobes ascending, narrowly oblong, falcate, obtuse or rounded, some-

times truncate at apex; column about 3.5 mm. long.—May-June. Woods in mountains; Hokkaido, Honshu (centr. distr.); very rare.—Sakhalin, s. Kuriles, Manchuria, and e. Siberia. The typical phase occurs in Europe and Siberia.

2. *Neottia asiatica* Ohwi. *N. micrantha* Lindl., non La Llave & Lex.; *N. subsessilis* Ohwi.—HIME-MUYO-RAN. Rhizomes short; stems 10-25 cm. long, rather slender, glabrous, 3- to 4-scaled; scalelike leaves loose, sheathing, tubular, membranous, 2-3 cm. long, very obtuse, few-nerved; racemes 5-10 cm. long, loosely-flowered, glabrous, the bracts membranous, ovate, rather acute, 1-1.5 mm. long, spreading; flowers 3-4 mm. across; sepals and petals ovate-lanceolate, gradually acuminate, 1-nerved, spreading, recurved at tip, about 3 mm. long; petals slightly shorter than the sepals; lip nearly as long as the sepals, deltoid-ovate, 2-3 mm. long, very acute,

spreading, 3-nerved, entire, with slightly involute margins at tip; ovary glabrous, short-pedicelled; capsules about 3 mm. long.—June–Aug. Coniferous woods; Hokkaido, Honshu

(centr. and n. distr.); very rare.—Sakhalin, Ussuri, Kamchatka, and Korea.

15. APHYLLORCHIS Bl.

TANEGASHIMA-MUYÖ-RAN ZOKU

Saprophytic herb with fleshy roots; stems simple, with loose alternate scales; inflorescence loosely racemose, the flowers rather small, sessile or pedicelled, the bracts small; sepals nearly equal, free, erect at first, later spreading; petals as long as the sepals but narrower; lip sessile, somewhat spreading, short-clawed, with 2 broad auricles, the limb entire or 3-lobed; column rather long, nearly terete; stigma ovate, depressed, under the short rostellum; anther short-stalked, ovate, the locules contiguous; pollinia granular.—About 15 species, in India, Malaysia, and E. Asia.

1. *Aphyllorchis tanegashimensis* Hayata. TANEGASHIMA-MUYÖ-RAN. Stems 40–60 cm. long, erect; scalelike leaves loose, broadly ovate, 1–1.5 cm. long, 8–10 mm. wide, slightly clasping, very obtuse, membranous, appressed, the upper scales narrowly ovate, obtuse, 2 cm. long; racemes rather densely many-flowered, 15–20 cm. long, the bracts lanceolate, acute with an obtuse tip, membranous, 8–15 mm. long, 1.5–3 mm. wide; flowers ascending at first, later spreading or slightly deflexed, pedicelled; sepals oblong-lanceolate, obtuse, 3-nerved, ascending, 1–1.2 cm. long; petals nearly as long as the sepals

but slightly narrower, 1-nerved; lip nearly as long as the sepals, erect, auriculate, slightly recurved at tip, the claw about 2 mm. long, the limb ovate, obsoletely 3-lobed, the lateral lobes small, obscure, the terminal deltoid, obtuse, the auricles broader than long, obliquely deltoid, acute, about 3 mm. long; column slightly shorter than the sepals; capsules deflexed, 3–3.5 cm. long, 7–10 mm. wide, straight, linear, terete, with the base of the column persistent at the apex.—Sept. In broad-leaved evergreen forests; Kyushu (s. distr. and Tanegashima).—Ryukyus.

16. CEPHALANTHERA L. C. Rich.

KIN-RAN ZOKU

Terrestrial, usually leafy, erect herb with short rhizomes and elongate roots; leaves cauline, usually plicate, lanceolate to oblong or elliptic, with prominent nerves; flowers rather small, in spikes, erect, white or yellow, the bracts largest in lower part of spike, leaflike; sepals free, not fully open, nearly alike; petals slightly smaller than the sepals, often broader; lip with a chin at base, erect, distinctly jointed between the upper and lower portions, inflated at base, the lateral lobes erect, embracing the column, the terminal lobe larger; column rather long, not winged; rostellum scarcely surpassing the broad stigma; anther broadly ovate, the locules contiguous; pollinia bifid in each locule, granular; capsules erect.—More than a dozen species, in the temperate regions of the N. Hemisphere.

1A. Flowers yellow; sepals narrowly ovate-oblong, obtuse, 14–17 mm. long; bracts deltoid, about 2 mm. long; lip 5- to 7-striate. 1. *C. falcata*
1B. Flowers white; sepals broadly lanceolate, gradually narrowed to the tip, 8–12 mm. long; lip 3-striate.

2A. Stems and leaves glabrous; leaves narrowly oblong, 3–8.5 cm. long, rarely much-reduced; bracts narrowly deltoid, 1–3 mm. long, the lower 1–2 sometimes rather large, commonly not surpassing the flower; lip with a somewhat acute basal chin. ... 2. *C. erecta*
2B. Stems, leaves, and ovaries with short, papillose hairs; leaves lanceolate to linear-lanceolate, 7–15 cm. long, acuminate; bracts linear, the lower 1–2 elongate, commonly longer than the spike; lip with a short, obtuse basal chin. 3. *C. longibracteata*

1. *Cephalanthera falcata* (Thunb.) Bl. *Serapias falcata* Thunb.; *Epipactis falcata* (Thunb.) Sw.; *C. japonica* A. Gray; *C. platycheila* Reichenb. f.—KIN-RAN. Smooth, terrestrial herb; stems 40–80 cm. long, 6- to 8-leaved, covered at base by a few membranous sheaths; leaves broadly lanceolate, 8–15 cm. long, 2–4 cm. wide, gradually acute, prominently nerved, narrowed to the base; spikes 3- to 12-flowered, glabrous, smooth, the bracts membranous, deltoid, about 2 mm. long; flowers yellow, rather large, half-open; sepals ovate-oblong, 14–17 mm. long, obtuse, narrowed to the base, the dorsal sepal narrower, concave on back; lip shortly dilated, 3-lobed, longitudinally 5- to 7-striate on the inside, included within the sepals, recurved at tip; column 8–10 mm. long.—Apr.–June. Thickets and thin woods in low mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.—Korea and China.

2. *Cephalanthera erecta* (Thunb.) Bl. *Serapias erecta* Thunb.; *Epipactis erecta* (Thunb.) Wettst.; ? *C. elegans* Schltr.—GIN-RAN. Slender, glabrous perennial; stems 20–40 cm. long, 3- to 6-leaved, with few sheaths at base; leaves narrowly oblong, 3–8.5 cm. long, 1–2.5 cm. wide, short-acuminate, narrowed to the sheathing base, prominently several-nerved; spikes nearly smooth, 4–8 cm. long, several- to about 10-flowered; bracts narrowly deltoid to broadly lanceolate, 1–3

mm. long, the lower 1 or 2 often somewhat larger, or rarely to 4 cm. long; flowers white; sepals lanceolate, gradually narrowed at tip, obtuse, 7–9 mm. long; petals broadly lanceolate, obtuse; lip about 2/3 as long as the perianth, with a distinct acute chin at base, the terminal lobe transversely elliptic, short-acute; column as long as the lip; ovary slightly shorter than the perianth.—May. Thickets, thin forests, and grassy slopes in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *subaphylla* (Miyabe & Kudo) Ohwi. *C. subaphylla* Miyabe & Kudo.—YŪSHUN-RAN. Green leaves smaller, the bracts well developed.—Hokkaido, Honshu, Kyushu.

Var. *shizuoi* (F. Maekawa) Ohwi. *C. shizuoi* F. Maekawa.—KUGENUMA-RAN. Chin long, obtuse.—Near seashores; Honshu (Kugenuma in Sagami).

3. *Cephalanthera longibracteata* Bl. *Epipactis longibracteata* (Bl.) Wettst.—SASABA-GIN-RAN. Slender, erect perennial; stems 30–50 cm. long, rather firm, white-scarious on the angles, alternately 6- to 8-leaved and with a few leafless sheaths at the base; leaves oblong-lanceolate to linear-lanceolate, 7–15 cm. long, 1.5–3 cm. wide, sometimes long-acuminate, shortly sheathed at base, scarious on margins and on nerves beneath, prominently nerved; spikes loosely several-flowered; bracts linear to broadly so, 4–7 mm. long, the lower 1 or 2

elongate, leaflike, as long as the spike, 5–10 mm. wide; flowers white; sepals erect, about 12 mm. long, lanceolate, acute with an obtuse tip; petals short and broad; lip 2/3 as long as the sepals, the basal chin obtuse, short, not prominent, the termi-

nal lobe cordate, abruptly acute; ovary as long as the perianth. —May–June. Thickets and grassy places in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common. — Korea.

17. EPIPACTIS R. Br. KAKI-RAN ZOKU

Terrestrial erect herbs with creeping rhizomes; stems leafy; leaves ovate to lanceolate, plicate; flowers in racemes, short-pedicelled, nodding, greenish or yellowish, sometimes purplish, the bracts herbaceous, narrow, often longer than the flowers; sepals free, somewhat spreading, equal; petals similar to the sepals; lip sessile at the base of the column, broad, with a dilated limb, the lateral lobes erect, the terminal lobe spreading, jointed at the base with the lower portion, often undulate on the margins; column short; stigma transverse under the broad prominent rostellum; pollinia bilobed in each locule, granular; capsules spreading or pendulous. —About 25 species in temperate regions of Europe, Asia, and N. America.

- 1A. Lower portion of lip obcordate, the upper portion broadly ovate, obtuse; plant nearly glabrous throughout; bracts scarcely longer than the flowers; perianth segments 12–15 mm. long; petals obtuse. 1. *E. thunbergii*
 1B. Lower portion of lip semicircular, truncate, the upper portion deltoid, acute; stems, leaves, and axis of inflorescence prominently scabrous; bracts usually longer than the flowers; perianth segments 9–12 mm. long; petals acute. 2. *E. papillosa*

1. *Epipactis thunbergii* A. Gray. *Serapias longifolia* sensu Thunb., non L.; *E. longifolia* Bl. sensu auct. Japon., excl. syn.; *E. gigantea* sensu auct. Japon., non Dougl.; *E. gigantea* var. *manshurica* Maxim. ex Komar. —KAKI-RAN, SUZU-RAN. Rhizomes slender; stems 30–70 cm. long, smooth, 6- to 12-leaved, purplish below and covered with few leafless sheaths at base; leaves narrowly ovate to broadly lanceolate, 7–12 cm. long, rounded and short-sheathed at base, gradually acuminate, glabrous except for a few mammillae on the nerves above; bracts scarcely longer than the flowers; petals ovate, obtuse, nearly as long as the sepals, rounded on lower margin; lip as long as the petals, the lower portion obcordate, the upper portion broadly ovate, with 2 elevated lines near the base, obtuse; column about 6 mm. long; ovary pedicelled, spreading to pendulous; capsules about 2 cm. long, narrowly oblong. —June–Aug. Bogs and moist places; Hokkaido, Honshu, Shikoku, Kyushu; rather common. —Korea, Ussuri, and Manchuria.

2. *Epipactis papillosa* Fr. & Sav. *E. latifolia* var. *papillosa* (Fr. & Sav.) Maxim. ex Komar. —EZO-SUZU-RAN, AO-

SUZU-RAN. Rhizomes short; stems 30–70 cm. long, prominently pilose with brown, crisped, hairlike protuberances, with few leafless sheaths at base; leaves 5–7, elliptic-ovate to broadly lanceolate, 7–12 cm. long, 2–4 cm. wide, prominently short-acuminate, the upper blades long-acuminate, with whitish hairlike protuberances on nerves and on margin, the lower blades short-sheathed at base; racemes 10–20 cm. long, many-flowered; bracts usually longer than the flowers; flowers spreading or nodding, greenish; sepals ascending with recurved tips, narrowly ovate, acute, 9–12 mm. long; petals rather short, ovate, as long as the sepals, acute; lip pale green, as long as the petals, the lower portion semicircular or depressed-obovate, truncate, brown within, the upper portion deltoid, acute; column as long as the lower lobe of the lip; ovary pedicelled; capsules about 1 cm. long, ellipsoidal. —Aug. Mountains; Hokkaido, Honshu, Kyushu; rare.

Var. *sayekiana* (Makino) T. Koyama & Asai. *Epipactis sayekiana* Makino —HAMA-KAKI-RAN. Flowers pale green and purple spotted. —Near seashores; Honshu (Sagami and Kazusa Prov.).

18. POGONIA Juss. TOKI-SO ZOKU

Small, terrestrial herbs with slender, elongate roots; stems slender with a single, narrow, flat leaf at the middle and a bract at apex; basal bracts narrower and smaller, green; flowers solitary, rather large, with a green bract at base; sepals and petals nearly alike, free, suberect; lip erect from base of the column, free, not spurred, undivided or 3-lobed, or often with 2–4 elevated lines and sometimes fleshy-hairy toward tip inside; column elongate, not winged, slightly broadened; rostellum short; stigma flat, placed under the rostellum; anther mobile, the locules parallel; pollinia one in each locule, granular, without a caudicle. —Few species, in e. Asia and N. America.

- 1A. Flowers half open, rose-purple, 2–2.5 (rarely 1.5) cm. long; sepals oblong-oblancoate, 3–5 mm. wide, obtuse; lip slightly longer than the perianth segments, the lateral lobes deltoid, the terminal one distinctly recurved; bogs. 1. *P. japonica*
 1B. Flowers scarcely open, pale rose-purple, 1–1.5 cm. long; sepals linear-oblancoate, 1.5–3 mm. wide, narrowed at tip and obtuse; lip as long as the petals, the lateral lobes small, the terminal one slightly recurved; grassy slopes. 2. *P. minor*

1. *Pogonia japonica* Reichenb. f. *P. similis* Bl.; *P. ophioglossoides* sensu auct. Japon., non Nutt. —TOKI-SO. Rhizomes short, slender; stems 20–40 cm. long, with a few bladeless sheaths at base; leaf suberect, lanceolate or linear-oblong, 4–10 cm. long, 7–12 mm. wide, obtuse, decurrent and forming two narrow wings on stem; flowers 2–2.5 cm. long, solitary, terminal, rose-purple; bract leaflike, 2–4 cm. long, 3–6 mm. wide, usually longer than ovary; sepals 3–5 mm. wide, obtuse, the dorsal broadly oblong-oblancoate, the lateral narrower, as long as the dorsal; petals narrowly oblong, very obtuse, slightly

shorter than the sepals, minutely and irregularly toothed on upper margin; lip slightly longer than the perianth segments, 3-lobed, the terminal lobe obovate, distinctly recurved, with fleshy hairs within and on margin, the lateral lobes deltoid; ovary about 1.5 cm. long. —May–July. Bogs; Hokkaido, Honshu, Shikoku, Kyushu. —Korea and China.

2. *Pogonia minor* (Makino) Makino. *P. japonica* var. *minor* Makino —YAMA-TOKI-SO. Very similar to the preceding but smaller, 15–25 cm. high; leaves usually oblancoate to broadly so, sometimes narrowly oblong, 3–7 cm. long, 4–12

mm. wide; flowers pale rose-purple, 1.5–3 mm. wide, narrowed to an obtuse tip; dorsal sepal narrowly oblanceolate, the lateral ones linear-oblanceolate; lip as long as the petals, nearly

erect, with smaller lateral lobes, the terminal lobe slightly recurved; ovary 1–1.5 cm. long.—June–July. Grassy slopes in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rare.

19. GALEOLA Lour. TSUCHI-AKEBI ZOKU

Saprophytic, leafless herbs without chlorophyll; rhizomes often greatly elongate; stems erect or scandent, elongate, branched; inflorescence racemose, the flowers rather large, the bracts usually small; sepals equal, concave, spreading; petals similar to the sepals; lip sessile, broad, inflated on back, loosely enveloping the column, as long as the sepals, the lateral lobes absent or broad, glabrous or pilose inside; column rather long, sometimes narrowly winged, without a foot; stigma under the rostellum transversely broadened; anther reclined, the locules separated; pollinia bilobed in each locule, granular (sometimes slightly waxy); fruit relatively large, fleshy, indehiscent or occasionally dehiscent; seeds often winged.—More than a dozen species, in e. Asia, Malaysia, India, and e. Australia.

- 1A. Plant glabrous, scandent, to 20 m. long or sometimes more, much branched; flowers about 12 mm. long; perianth-segments linear-oblong; lip navicular. 1. *G. altissima*
 1B. Plant brown-pubescent, erect, 50–100 cm. high, branched above; flowers about 2.5 cm. long; perianth-segments narrowly oblong; lip obovate. 2. *G. septentrionalis*

1. *Galeola altissima* Reichenb. f. TSURU-TSUCHI-AKEBI, TAKA-TSURU-RAN. Roots firm, elongate; plant glabrous, scandent, to 20 m. long; stems rather slender, firm, much-branched, lustrous, flexuous, reddish brown, with slightly thickened nodes, glabrous; racemes densely flowered; flowers about 12 mm. long, glabrous; perianth-segments linear-oblong; sepals obtuse, 5-nerved, petals narrower than the sepals, 3-nerved, rounded at apex; lip navicular, erose and undulate on upper margins, with a broad fleshy puberulent disc reaching to the middle and a bilobed woolly mass above it; column rather long; capsules linear, acuminate.—Kyushu (Tanegashima); very rare.—Ryukyus, Formosa, India, and Malaysia.

2. *Galeola septentrionalis* Reichenb. f. TSUCHI-AKEBI. Rhizomes elongate, thickened; plant brown-pubescent, 50–100

cm. high; stems fleshy, firm, erect, loosely scaly, branched above; scales deltoid- to deltoid-lanceolate, acute to acuminate, slightly fleshy and firm, striate, concave, 1–1.5 cm. long; branches ascending, 5–10 cm. long, interspersed with small scales; racemes densely flowered; bracts 3–5 mm. long; flowers about 2.5 cm. across, yellowish brown; sepals narrowly oblong, obtuse, ascending, fleshy, densely brown-puberulent outside; petals glabrous; lip erect, fleshy, obovate, rounded to obtuse, with elevated cristate lines within, finely toothed on margin, slightly shorter than the sepals; column rather long, slightly incurved; ovary brown-puberulent; fruit pendulous, narrowly cylindric-oblong, 6–8 cm. long, fleshy, red when mature; seeds winged.—June–Aug. Hokkaido, Honshu, Shikoku, Kyushu; rare.

20. LECANORCHIS Bl. MUYO-RAN ZOKU

Leafless, unbranched saprophytic herbs without chlorophyll, blackening when dried; rhizomes creeping, with short-sheathing loosely imbricate scales; stem erect, simple, slender, short-scaled; leaves relatively small; racemes loosely flowered, the bracts scalelike; flowers somewhat tubular, not fully open, white to pale purple; perianth with 3 small appressed calyculae at the base; sepals and petals narrow, alike, free; lip adnate to the column, narrow, erect, broadened at tip and loosely involute, often hairy on the inner surface, sometimes 3-lobed; column elongate, subterete, clavate, thickened at tip; rostellum short, with the rounded, prominent stigma under it; anther on margin of clinandrium, erect or divergent, the locules distinct; pollinia granular.—Few species, in e. Asia, Malaysia.

- 1A. Lip 3-lobed, the terminal lobe villous inside; flowers loosely arranged.

2A. Flowers white, 1.5–2 cm. long; lip adnate high on the column, the terminal lobe wholly villous inside inclusive of the margin, the lateral lobes small, semi-orbicular, inserted at base on each side of the terminal lobe or at the top of the limb. 1. *L. japonica*
 2B. Flowers pale yellow, about 1 cm. long; lip adnate to the lower half of column, the limb broad, the terminal lobe with a large villous area inside, the lateral lobes glabrous, smaller, only slightly lower than the terminal and long-decurrent on the limb.

2. *L. kiusiana*
 1B. Lip entire, sparingly pubescent inside toward tip, cucullate at apex; flowers pale purple, rather densely arranged. 3. *L. nigricans*

1. *Lecanorchis japonica* Bl. MUYO-RAN. Rhizomes somewhat thickened, firm, elongate, rather densely scaly; stems erect, 30–40 cm. long, brownish black when dried, with a few loose scales; scalelike leaves rather membranous, 5–8 mm. long, short-sheathing, obliquely truncate, obtuse or subacute, the upper sometimes not sheathing at base; flowers several, 1.5–2 cm. long, not opening widely, white, the bracts deltoid-ovate, subacute, 2–4 mm. long, the caliculus about 1 mm. long, slightly connate at base, deltoid; sepals and petals oblanceolate, obtuse; lip with an oblanceolate limb, adnate high on the column, 3-lobed, the lateral lobes suborbicular, at base of the terminal lobe, the terminal lobe orbicular, villous

inside.—July–Aug. Woods in mountains; Honshu, Shikoku, Kyushu; rare.

2. *Lecanorchis kiusiana* Tuyama. USUKI-MUYO-RAN. Saprophytic erect perennial, about 10 cm. high; stems turning black when dried, with a few remote scales; flowers few, loosely arranged, about 1 cm. long, pale yellow, not fully opening; sepals and petals oblanceolate; lip adnate to the lower half of the column, the free portion involute, dilated, 3-lobed, the terminal lobe semirounded, undulate-lobulate, loosely papillose on margin, with a large villous area inside, the lateral lobes smaller, glabrous.—May. Kyushu; rare.

3. *Lecanorchis nigricans* Honda. *L. purpurea* Masam., nom. seminudum—KURO-MUYO-RAN. Similar to the preceding; stems more slender, firm, 20–40 cm. long; flowers few, pale purple, rather densely arranged; bracts 2–3 mm. long, deltoid, spreading; lip entire, adnate to the column on the

lower half, the free portion obovate, mitre-shaped, obtuse, cucullate at apex, sparsely pubescent inside near tip.—July–Aug. Woods in mountains; Honshu (s. Kinki Distr.), Kyushu; rare.

21. BLETILLA Reichenb. f. SHI-RAN ZOKU

Terrestrial herbs with pseudobulbs; leaves thin, few from the nodes of the bulbs, jointed at base, plicate, elliptic-lanceolate to oblong; inflorescence spicate, the bracts caducous; flowers rose-purple, rarely white, relatively large; sepals and petals alike, free, ascending; lip 3-lobed, with elevated cristate lines on the inner surface, the lobes loosely embracing the column, the terminal lobe slightly recurved; column with a narrow wing on each side; pollinia 4 in each locule, the caudicle short.—Few species, in e. Asia.

1. *Bletilla striata* (Thunb.) Reichenb. f. *Limodorum striatum* Thunb.; *Epidendrum tuberosum* Lour.; *Cymbidium hyacinthinum* J. E. Smith; *Bletia hyacinthina* (J. E. Smith) R. Br.—SHIRAN. Pseudobulbs ovoid-globose, about 4 cm. long; stems 30–70 cm. long, slender, covered at base with several leaf-sheaths, and with 1 or 2 bladeless sheaths near the middle; leaves elliptic-lanceolate to oblong, 20–30 cm. long, 2–5 cm. wide, acuminate, glabrous, gradually narrowed to the sheathing base; inflorescence spicate, loosely 3- to 7-flowered; bracts green, oblong-lanceolate, 2–3 cm. long, 6–8 mm. wide, acute, several-nerved, the margins scariosus; flowers rose-purple;

sepals and petals alike, 2.5–3 cm. long, 6–8 mm. wide, sub-acute, several-nerved, ascending; lip as long as the perianth, cuneate-obovate, with loosely involute margins, 3-lobed, the terminal lobe suborbicular, undulate on margin, with 5 elevated lines inside; column about 2 cm. long.—May. Grassy slopes in foothills; Honshu (Kantō Distr. westw.), Shikoku, Kyushu; rare; frequently cultivated in gardens.—Ryukyus and China.—Forma *gebina* (Lindl.) Ohwi. *Bletia gebina* Lindl.; *Bletilla striata* var. *gebina* (Lindl.) Reichenb. f.—SHIROBANA-SHI-RAN. Flowers white.

22. NERVILIA Gaudich. MUKAGO-SAISHIN ZOKU

Terrestrial herbs with bulblike rhizomes; leaves solitary, radical, developing after anthesis, rounded-flabellate to cordate, plicate, petiolate, parallel-nerved; scapes with a few membranous bladeless sheaths near the base; inflorescence racemose, 1- to many-flowered; perianth-segments narrow, nearly alike, subparallel; lip sessile or clawed at base of the column, narrow, entire or 2- to 3-fid; spur scarcely developed; column elongate, clavate; stigma oblong or broader; rostellum short; anther substipitate; pollinia 1 or 2 in each cell; capsules erect or pendulous.—About 60 species, in Africa, India, Malaysia, e. Asia, and n. Australia.

1. *Nervilia nipponica* Makino. *N. punctata* Makino, excl. syn.—MUKAGO-SAISHIN. Leaves solitary, long-petioled, cordate-rounded, subacute, 7- to 9-nerved, 3.5–4.5 cm. wide; scapes about 10 cm. long, slender, pale purple, loosely sheathed, 1-flowered, the sheaths (reduced leaves) tubular, obliquely truncate; flowers solitary, terminal, at first ascending, nodding later, about 10 mm. long, purplish; bract thinly membranous, oblanceolate, about 5 mm. long; perianth-segments narrowly

oblanceolate, subobtusely, thinly membranous, nearly erect; petals slightly shorter than the sepals; lip narrow, as long as the petals, 3-lobed, the lateral lobes elliptic, rugulose, white, purple-spotted inside, the median lobe very small, obtuse, white; ovary obovoid, prominently pedicelled.—June. Honshu (Izu Is., Musashi and Izumi Prov.), Kyushu (Tanegashima); very rare.

23. EPIPOGIUM Sw. TORAKICHI-RAN ZOKU

Saprophytic herbs without chlorophyll; rhizomes coralloid or tuberous; stems loosely scaly; flowers racemose, short-pedicelled, spreading to pendulous; bracts membranous, usually shorter than the flowers; sepals equal, free, narrow, ascending or reflexed; petals similar to the sepals; lip sessile, ovate, inflated below forming a saccate spur, the lateral lobes absent or small, the terminal spreading, with 2–4 series of papillae within; column short, broadened at tip; rostellum broad and short; stigma prominent, broad, separated from the rostellum; pollinia 1 in each locule, granular, often with filiform caudicles attached to the glands; capsules ovoid, pendulous.—About 7 species, in Europe, w. Africa, Asia, Malaysia, and ne. Australia.

1A. Rhizomes coralloid, much branched and thickened; lip on upper side of flower auriculate. 1. *E. aphyllum*

1B. Rhizomes tuberous, not branched; lip entire.

2A. Sepals and petals narrowly ovate; spur as long as the lip; racemes 1- to 7-flowered. 2. *E. japonicum*

2B. Sepals narrowly lanceolate; petals oblong-lanceolate; spur much shorter than the lip; racemes 8- to 27-flowered. 3. *E. rolfei*

1. *Epipogium aphyllum* (F. W. Schmidt) Sw. *Satyrium epipogium* L.; *Orchis aphylla* F. W. Schmidt; *E. gmelinii* L. C. Rich.; *E. epipogium* (L.) Karst.—TORAKICHI-RAN. Glabrous, saprophytic, pale brown herb with short, thickened, much-branched coralloid rhizomes; stems 7–20 cm. long, fleshy, loosely sheathed, slightly thickened at base, the sheaths short, thinly membranous, nerveless, obliquely truncate, 5–10 mm. long; racemes loosely 2- to 8-flowered, the bracts nar-

rowly ovate, thinly membranous, erect, nearly nerveless, acuminate, 6–10 mm. long; flowers brownish, about 18 mm. across, pedicelled; sepals narrowly lanceolate, acute, reflexed, 12–14 mm. long, 1-nerved; petals slightly shorter than the sepals, lanceolate, acute; lip nearly as long as the petals, spreading, rose-colored and purple-spotted within, with 4–6 cristate, papillose lines in the center, the lateral lobes (auricles) small, ovate, the terminal lobe large, slightly concave, obtuse, with

undulate margins at tip; spur oblong, rounded at apex, slightly shorter than the lip, 6–8 mm. long, 3–4 mm. wide; ovary pedicelled, nearly globose.—Aug.–Oct. Coniferous woods; Hokkaido, Honshu; very rare.—Europe, Caucasus, Himalayas, Siberia, Korea, Sakhalin, Ussuri, and Kamchatka.

2. *Epipogium japonicum* Makino. *Galera japonica* (Makino) Makino—AOKI-RAN. Rhizomes tuberous, 10–18 mm. long, transversely lined, ovoid; stems erect, fleshy, yellowish, with 2 to 5 loose, thinly membranous, appressed sheaths; racemes erect, loosely 1- to 7-flowered, the bracts ovate, thinly membranous, longer than the pedicels; flowers about 2 cm. long, pendulous; sepals and petals ascending, narrowly ovate, acute, pale yellow with purple spots; lip inferior, somewhat spreading, deltoid, entire, strongly concave, papillate within, whitish with purple spots; spur thick, oblong, obtuse, nearly as long as the lip; column rather short, broadened at tip; ovary globose.—Sept.–Oct. Woods in mountains; Honshu; very rare.

3. *Epipogium rolfei* (Hayata) Schltr. *Galera rolfei* Hayata; *E. makinoanum* Schltr.; *E. nutans* sensu auct. Japon., non Reichenb. f.—TASHIRO-RAN. Rhizomes tuberous, ellipsoidal, 3–4 cm. long; stems erect, 25–55 cm. long, the sheaths 5–6, loose, membranous; racemes erect, 6–25 cm. long, 8- to 27-flowered, the bracts membranous, reflexed, broadly lanceolate, gradually narrowed to tip, nerveless, 8–12 mm. long; flowers pedicelled, pendulous, about 12 mm. across; sepals narrowly lanceolate, 8–10 mm. long, acuminate, 3-nerved, thin, nearly erect; petals oblong-lanceolate, nearly as long as the sepals; lip inferior, as long as the sepals, broadly ovate, entire, prominently concave, with 2 cristate glandular lines within; spur oblong, much shorter than the lip, about 4 mm. long; ovary ellipsoidal, 6–7 mm. long in fruit, slightly longer than the pedicel.—May–July. Honshu (s. Kantō Distr.), Kyushu (s. distr. incl. Yakushima).—Ryukyus and Formosa.

24. *YOANIA* Maxim. SHŌKI-RAN ZOKU

Stout fleshy saprophytic herbs with branched rhizomes; scapes simple, scaly; flowers relatively large, fleshy, purplish rose to rose-yellow, in loose or rather dense racemes; sepals free, spreading, oblong, the petals somewhat shorter, ovate; lip suberect, oblong, as long as the petals, concave, broadened at the base, with a large saccate, porrect, obtuse spur below the limb, bearded at the mouth; column slightly shorter than the lip, erect, flat, quadrangular-oblong, auriculate; stigma depressed, transversely broadened; rostellum obsolete; anther persistent, cuspidate; pollinia 2 in each locule, setile, granular, oblong; capsules spreading to nodding, on long pedicels.—About 3 species, in Japan, Formosa, and the Himalayas.

- 1A. Flowers 3–7, rather loose, rose-colored. 1. *Y. japonica*
1B. Flowers 6–15, rather dense, yellow. 2. *Y. amagiensis*

1. *Yuania japonica* Maxim. SHŌKI-RAN. Rhizomes elongate, fleshy; stems fleshy, stout, 15–25 cm. long, terete; scales 6–8 mm. long, somewhat spreading, rounded at the apex, fleshy, with membranous margins, convex on back; flowers 3–7, rather loose, rose-colored, the bracts ovate, 6–8 mm. long; sepals fleshy, spreading, oblong, about 22 mm. long, 10–12 mm. wide, obtuse; petals slightly shorter than the sepals; lip as long as the petals, erect, fleshy, the limb subtrapezoid, 1.6 cm. long and as wide, with a broad, papillose line within; spur porrect, oblong, rounded at apex, about 7 mm. long, 3–4 mm. wide, as high as the limb; column about 12 mm. long, the lower edges winged and continuous with the margins of the lip; ovary about 7–10 cm. long inclusive of the pedicel.—July–Aug. Woods in mountains; Hokkaido, Honshu, Kyushu; rare.

2. *Yuania amagiensis* Nakai & F. Maekawa. KIBANANO-SHŌKI-RAN. Rhizomes much branched, thickened, puberulent, membranous-scaly at the nodes; stems erect, 20–30 cm. long, fleshy, stout, terete, with scattered deltoid scales; flowers 6–15, rather dense, yellow; sepals oblong, 25–27 mm. long, rounded at apex, about 9-nerved; petals ovate, obtuse, minutely serrate; lip about 22 mm. long, inflated; spur porrect, slightly longer than the limb, incurved, 6–8 mm. long, 4–5 mm. across, rounded at the apex, the limb broadly ovate, obtuse, longitudinally ridged; ovary, inclusive of long pedicel, 8–10 cm. long.—July. Woods in foothills; Honshu (Izu, sw. Kantō and Yamato Prov.), Kyushu; rare.

25. *STIGMATODACTYLUS* Maxim. KŌROGI-RAN ZOKU

Greenish white, delicate, saprophytic herbs with small fleshy rhizomes; stems with one scalelike leaf near the middle and several more near the base; flowers few, racemose, small, the bracts ovate, small; sepals and petals alike, spreading, linear, acute; lip spreading, rounded, thin, flat, with a small bilobed appendage near the base; column erect, slightly incurved in upper part, narrowly wing-margined, with a small fingerlike appendage on the center within, toothed at base; pollinia 4, ellipsoidal, nearly waxy; ovary short-pedicelled.—About 4 species, in India, Japan, and Malaysia.

1. *Stigmatodactylus sikokianus* Maxim. KŌROGI-RAN. Pale green, glabrous, delicate, leafless herb, with tuberous rhizomes 2–3 mm. in diameter; stems 5–10 cm. long, simple, the basal scales small, the median one ovate, 3–5 mm. long, acuminate, spreading, nerveless; flowers 2 or 3, pale purplish green, loosely racemose, the bracts similar to the median cauline scale; sepals linear, membranous, obtuse, 1-nerved, scattered-ciliate

near the base, the dorsal sepal 4 mm. long, the lateral ones 2.5 mm. long; petals linear, acute, about 3.5 mm. long; lip rounded, about 4 mm. long, with obsolete teeth on upper margin, the appendage about half as long as the lip, lanceolate and deeply bifid; column erect, about 3.5 mm. long, 2-toothed; ovary pedicelled, 5–7 mm. long.—Aug.–Oct. Woods in mountains; Shikoku, Kyushu; very rare.

26. *GASTRODIA* R. Br. ONI-NO-YAGARA ZOKU

Saprophytic, leafless herbs without chlorophyll, with thickened, rather short rhizomes; stems simple, erect, loosely scaly; flowers erect or pendulous, in loose racemes, bracteate, rather small; sepals and petals connate, urceolate or short-tubular, 5-fid, the lobes short, ovate, equal, or the inner (petals) smaller; lip adnate to the base of the column, erect, more or less adnate to but shorter than the perianth, somewhat involute, flat or with 1 or 2 pairs of elevated lines within; column subterete, the stigma barely perceptible; rostellum small; pollinia granular, without caudicles; capsules erect, ellipsoidal, the pedicels short or sometimes much elongate after anthesis.—About 25 species, in Africa, India, Malaysia, Australia, and e. Asia.

- 1A. Rhizomes glabrous; stems 60–100 cm. long, rarely shorter; flowers many, 7–8 mm. long; pedicels not elongating after anthesis.
 2A. Pedicels shorter than the ovary. 1. *G. elata*
 2B. Pedicels longer than the ovary. 2. *G. gracilis*
 1B. Rhizomes with unicellular hairs; stems 3–10 cm. long; flowers few, 1–2 cm. long; pedicels much elongating after anthesis.
 3A. Stems 3–4 cm. long; flowers usually 2, about 2 cm. long, tubular; lip with 4 crispate ridges within, and a spherical appendage on the margin on each side near the base. 3. *G. nipponica*
 3B. Stems 3.5–10 cm. long; flowers 2–7, about 11 mm. long, broadly tubular-campanulate; lip with an elevated bilobed ridge above the center, and a 4-angled short-cylindric appendage on each side near the base. 6. *G. confusa*

1. *Gastrodia elata* Bl. ONI-NO-YAGARA. Tall, glabrous, pale brown herb; rhizomes oblong, somewhat fleshy, glabrous, about 10 cm. long, 3.5 cm. across; stems yellowish brown, 60–100 cm. long, terete, the scales loose, membranous, 1–2 cm. long, the lower scales short-sheathing; racemes 10–30 cm. long, many-flowered, the bracts lanceolate to linear-oblong, obtuse, membranous, weakly nerved, 7–12 mm. long, about 2 mm. wide; flowers yellowish brown, the pedicels shorter than the ovary; perianth-tube broadly ovoid, oblique at the mouth, 7–8 mm. long, slightly inflated at base, the lobes small, deltoid; lip about 2/3 as long as the tube, adnate to the under side near base, the claw short, the limb broadly ovate, obsoletely 3-lobed, the terminal lobe larger, short-fimbriate; column subterete, slightly broadened at tip, 6–7 mm. long; capsules oblong-obovoid, 12–15 mm. long, short-pedicelled.—Woods in mountains; Hokkaido, Honshu; rather rare.—Forma *viridis* (Makino) Makino. *Gastrodia viridis* Makino. Plant pale green; occurs with the typical phase.—Formosa and China.

2. *Gastrodia gracilis* Bl. NAYO-TEMMA. Rhizomes smooth, glabrous; stems 10–30 cm. long, slender, with 6–7 loosely arranged, membranous basal sheaths; racemes 2–5 cm. long, loosely 6- to 14-flowered; bracts much shorter than the pedicels, ovate or elliptic-ovate, 2–3.5 mm. long, obtuse, rarely subacute; pedicels slender, longer than the ovary, 7–10 mm. long, to 2 cm. long in fruit; flowers spreading to nodding; perianth-tube about 8 mm. long, slightly inflated at base on the lower side, the outer lobes nearly equal, very obtuse; capsules broadly ellipsoidal, about 1 cm. long.—June–July. Honshu (Awa and Aki Prov.); very rare.

3. *Gastrodia nipponica* (Honda) Honda & Tuyama. *Didymoplexis pallens* sensu auct. Japan., non Griff.; *D. nipponica* Honda.—HARUZAKI-YATSUBUSHIRO-RAN. Rhizomes fusiform, 2–3.5 cm. long, to 5 mm. across, cross-lined, with unicellular hairs; stems terete, 3–4 cm. long, with 2 or 3 scales; flowers

usually 2, about 2 cm. long, tubular, the bracts broadly ovate, slightly clasping, about 4 mm. long; perianth tube violet-brown, about 20 mm. long, 12 mm. across, narrowed to the base, broadest above the middle, the outer lobes ovate, the terminal lobe narrower, slightly retuse, the lateral lobes acuminate, obsoletely rugulose, the inner lobes oblong, about 3 mm. long, obtuse; lip about 9 mm. long, 5.5 mm. wide, the claw short, adnate to base of the perianth-tube, with a globose appendage on each side at the apex, the limb broadly ovate, obtuse, with 4 crispate ridges within, the inner ridges disappearing on the lower half, the outer ridges disappearing on the upper half; column about 7 mm. long, lanceolate.—May. Woods; Honshu (Kii Prov.), Shikoku, Kyushu; very rare.

4. *Gastrodia confusa* Tuyama. AKIZAKI-YATSUBUSHIRO-RAN. Rhizomes pyriform, 1.5–4 cm. long, 0.7–1.5 cm. across, with unicellular hairs; stems 3.5–10 cm. long, whitish, the scales few, ovate, not at all or very short-sheathing, membranous; racemes short; flowers 2–7, about 11 mm. long, broadly tubular-campanulate, the bracts ovate, gradually narrowed to tip, 4–7 mm. long, perianth-tube about 11 mm. long, 8 mm. across, slightly inflated at base on the lower side, slightly contracted at the mouth, divided to the middle on the ventral side, the outer lobes slightly incurved, the terminal lobe shorter, subtruncate and retuse, the lateral lobes ovate, subacute, the inner lobes rounded, 3–4 mm. wide at base; lip about 5.5 mm. long, 4 mm. wide, the claw short, with a depressed, tubular, 4-angled protuberance on each side at apex, the limb broadly ovate, short-cuspidate, obtuse, with a median bilobed ridge within; column about 6 mm. long, auricled at the apex, wing-margined, obovate, slightly incurved; stigma in a depression of the column on the lower portion of the ventral side; rostellum small, subtruncate; pedicels to 30 cm. long following anthesis.—Oct. Woods; Honshu (Sagami and Kii Prov.), Shikoku, Kyushu; very rare.

27. *SPIRANTHES* L. C. Rich. NEJIBANA ZOKU

Plants terrestrial, erect; rhizomes fasciculate, short; leaves narrow, mostly radical; inflorescence spicate, one-sided, spirally twisted; flowers small, sessile, white or rose; sepals free, nearly equal, the dorsal sepal frequently erect and forming a hood, the lateral sepals obliquely attached on the top of the ovary, sometimes decurrent; lip sessile or clawed, erect, concave, loosely embracing the column, flat above, entire or 3-lobed, with a callose tubercle on each side; column subterete, often decurrent on the ovary, without a foot; stigma broad; rostellum erect, short and obtuse or elongate, more or less bifid; anther erect, ovate, the locules separate; pollinia granular, sometimes with caudicles; capsules erect, oblong.—About 100 species, widely distributed in warmer and tropical regions.

1. *Spiranthes sinensis* (Pers.) Ames. *Aristotelea spiralis* Lour.; *S. spiralis* Makino, non C. Koch; *Neottia sinensis* Pers.; *S. australis* sensu auct. Asiat., non Lindl.; *N. amoena* Bieb.; *S. amoena* (Bieb.) Spreng.—NEJIBANA, MOJIZURI. Roots slightly thickened; stems 10–40 cm. long, erect, slender, few-leaved, densely white-pubescent in upper part; radical leaves linear to narrowly oblanceolate, 5–20 cm. long, 3–10 mm. wide, acute to acuminate, narrowed to the base, the stem-leaves few, smaller, appressed, lanceolate, acuminate, sheathed at base; spikes 5–15 cm. long, densely white-pubescent, densely many-flowered, the bracts narrowly ovate or oblong, 4–8 mm. long,

long-acuminate, appressed to the ovary; flowers pale rose, rarely white, 4–5 mm. across, slightly open; sepals lanceolate, 4–5 mm. long, gradually narrowed, obtuse; petals erect, slightly shorter than the sepals, linear-lanceolate; lip obovate, white, slightly longer than the sepals, minutely dentate on the margins, slightly recurved at tip, with a small callosity on each side; ovary sessile; capsules erect, ellipsoidal, 6–7 mm. long.—Apr.–Aug. Grassy places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Sakhalin, Kuriles, Siberia, China, Manchuria, Korea, Ryukyus, Formosa, India, Malaysia, and Australia.

28. GOODYERA R. Br. SHUSU-RAN ZOKU

Terrestrial, rarely subepiphytic perennials, mostly with fleshy roots; leaves mostly basal, alternate, ovate to lanceolate, petiolate; inflorescence spicate, the flowers relatively small, bracteate; sepals nearly equal, the dorsal erect, forming a hood with petals, the lateral ones spreading to suberect; lip sessile, ascending, concave, entire, acute, recurved, hairy at base; column short, nearly terete, not appendaged; stigma simple, broad; rostellum erect; anther-locules separate; pollinia oblong; capsules erect, erostate. —About 100 species, in Europe, N. America, especially abundant in the warmer part of Asia.

1A. Flowers many, 15–100 in dense spikes; sepals 3–4 mm. long.

2A. Stems stout, 40–80 cm. long, erect from a very short creeping base; spikes 7–25 cm. long; leaves acuminate, 8–15 cm. long.

2B. Stems 10–20 cm. long, declined to ascending from a long creeping base; spikes 4–7 cm. long; leaves acute, often abruptly so, 2–6 cm. long.

3A. Stems ascending; leaves ovate, 3–6 cm. long, 2–3.5 cm. wide; sepals obtuse, ovate, the lateral sepals narrowly ovate-oblong.

3B. Stems declined; leaves broadly lanceolate to ovate or narrowly so; sepals subobtusely, narrowly ovate. 1. *G. procer*
2. *G. hachijoensis*
3. *G. pendula*

4B. Flowers 1–12, usually in loose spikes; sepals 4–30 mm. long.

4A. Inflorescence 3- to 12-flowered, rarely fewer; flowers obliquely ovate in lateral view; sepals narrowly ovate, 4–10 mm. long.

5A. Inflorescence pedunculate, upper part of stem and ovary densely pubescent; sepals sparingly puberulent.

6A. Sepals 4–5 mm. long. 4. *G. repens*

6B. Sepals 7–10 mm. long.

7A. Flowers 2–3; sepals about 10 mm. long, acuminate. 5. *G. ogatae*

7B. Flowers 4–12; sepals 7–10 mm. long, obtuse.

8A. Inflorescence with minute straight or crisped hairs; bracts ascending, not appressed to the ovary; sepals 7–8 mm. long; leaves with the midrib white-striate. 6. *G. velutina*

8B. Inflorescence with rather long, crisped hairs; bracts erect, appressed to the ovary; sepals 8–10 mm. long; leaves white-reticulate on upper surface, rarely green. 7. *G. schlehtendalliana*

5B. Inflorescence sessile, glabrescent or sparingly papillose-pilose. 8. *G. maximowicziana*

4B. Inflorescence 1- to 3-flowered; flowers long-tubular; sepals linear, 2.5–3 cm. long. 9. *G. macrantha*

1. *Goodyera procer* (Ker-Gawl.) Hook. *Neottia procer* Ker-Gawl.; *G. lancifolia* Fr. & Sav.—KINGIN-SO. Stems erect from a short-creeping base, stout, fleshy, 40–80 cm. long, rather densely leafy on the lower half; leaves broadly lanceolate to oblong, 8–15 cm. long, 2–6 cm. wide, acuminate, acute to nearly rounded at base, 5- to 7-nerved, the upper leaves few, reduced, the petioles 3–7 cm. long, broadened into a short sheath at base; spikes densely many-flowered, 7–25 cm. long, slightly pubescent; sepals 3–4 mm. long, ovate, obtuse; lip broadly ovate, rounded at apex, about 2 mm. long, pilose, the inner side with 2 callose protuberances; column nearly as long as the lip; ovary glabrous.—Kyushu (Yakushima).—Ryukyus, Formosa, China, India, and Malaysia.

2. *Goodyera hachijoensis* Yatabe. *Peramium hachijoense* (Yatabe) Makino.—HACHIJÔ-SHUSU-RAN. Stems about 15 cm. long, ascending from a long-creeping base; leaves ovate, 3–6 cm. long, 2–3.5 cm. wide, acute, rounded at base, with a white line along the midnerve, the petioles 1–1.5 cm. long inclusive of the short sheaths; spike short, densely many-flowered, slightly one-sided, short-pubescent, the scape with a few scales, about 5 cm. long; bracts linear-lanceolate, acuminate, 6–12 mm. long, ciliate, longer than the ovary, embracing the

lower part; flowers small, white changing to yellow; sepals ovate, about 4 mm. long, obtuse, the dorsal sepal ovate, the lateral sepals narrowly oblong-ovate, slightly greenish; petals forming a hood with the dorsal sepal, white, oblanceolate; lip broadly ovate, rather obtuse, as long as the sepals, saccate-dilated at base, pale yellow, pubescent within; column short, about 2/3 as long as the sepals; rostellum short, bifid; pollinia bilobed in each locule; ovary about 6 mm. long, glabrous.—Sept.–Oct. Woods in mountains; Honshu (Hachijô); rare.

Var. *yakushimensis* (Nakai) Ohwi. *G. yakushimensis* Nakai.—YAKUSHIMA-SHUSU-RAN. Leaves ovate to oblong-ovate, with white spots along the midnerve, the bracts pubescent below.—Woods in mountains; Kyushu (Yakushima and Tanegashima); rather rare.

Var. *leuconeura* (F. Maekawa) Ohwi. *G. leuconeura* F. Maekawa.—SHIRAITO-SHUSU-RAN. Leaves with white nerves, the margins undulate; spur and limb of the lip slender.—Woods in mountains; Kyushu (Yakushima and Tanegashima).

Var. *matsumurana* (Schltr.) Ohwi. *G. matsumurana* Schltr.; *Peramium matsumuranum* (Schltr.) Makino.—KAGOME-RAN. Slightly larger than the preceding varieties; leaves broader, sometimes subcordate, 4–6 cm. long, 2–3 cm.

wide, white-reticulate on upper side along the nerves and veins; the bracts lanceolate.—Kyushu (Yakushima and Tanegashima); rare.—Ryukyus and Formosa.

3. *Goodyera pendula* Maxim. TSURI-SHUSU-RAN. Stems short-creeping, declined above, 10–15 cm. long; leaves few, alternate, broadly lanceolate to ovate or narrowly so, 2–3.5 cm. long, 5–10 mm. wide, acuminate, acute to cuneate at base, 3- to 5-nerved, the petioles rather broad, shortly sheathing at base, the upper 3 or 4 leaves linear-lanceolate; inflorescence with arcuate peduncles, densely many-flowered, one-sided, 4–6 cm. long, scattered crisped-pubescent, the bracts lanceolate, membranous, 4–7 mm. long, 1-nerved, spreading; flowers white, not fully open; sepals about 4 mm. long, narrowly ovate, sub-obtuse, slightly crisped-pubescent without, 1-nerved; petals narrowly oblanceolate, closely appressed to the dorsal sepal; lip slightly shorter than the sepals, saccate at base, smooth within, the limb narrowly ovate.—Aug. Tree-trunks and rocks in mountain forests; Hokkaido, Honshu, Shikoku, Kyushu; rare.

Var. *brachyphylla* F. Maekawa. HIROHA-TSURI-SHUSU-RAN. A northern variant, mostly with shorter and broader leaves. —Occurs with the typical phase.

4. *Goodyera repens* (L.) R. Br. *Satyrium repens* L. —HIME-MIYAMA-UZURA. Stems erect, 10–20 cm. long, from creeping base; leaves chiefly basal, ovate, 1–2.5 cm. long, 7–18 mm. wide, acute to subobtusely rounded to acute at base, the petioles about 1 cm. long, short-sheathing; inflorescence 3–7 cm. long, 5- to 15-flowered, slightly one-sided, long crisped-pubescent, with 1 or 2 remote scales; flowers white, the bracts lanceolate, appressed to the ovary, shorter than the flowers; sepals deltoid-ovate, 4–5 mm. long, somewhat elongate at tip, obtuse; petals oblanceolate, closely appressed to the dorsal sepal; lip as long as the sepals, inflated below, the limb short, deltoid-ovate, recurved, glabrous within; column about 2/5 as long as the sepals.—Aug. Coniferous woods in mountains; Hokkaido, Honshu, (centr. and n. distr.); rare.—Europe, Siberia, Sakhalin, s. Kuriles, Korea, Himalayas, and N. America.

5. *Goodyera ogatae* Yamamoto. SHIMA-SHUSU-RAN. Stems 10–15 cm. long, creeping at base; leaves few, on the lower portion of the stems, ovate, acute, rounded at base, the petioles short, short-sheathing at the base; peduncles with few scalelike leaves, pubescent; flowers 2–3, pale reddish brown, the bracts linear-lanceolate, about 12 mm. long, long-acuminate, 3-nerved, ciliate; sepals broadly lanceolate, about 10 mm. long, acuminate, the lateral sepals spreading; petals as long as the sepals; lip nearly as long as the sepals, inflated, elliptic, the limb rather short, deltoid, reflexed; column about 10 mm. long.—Woods; Kyushu (Yakushima); very rare.—Formosa.

6. *Goodyera velutina* Maxim. *Peramium velutinum* (Maxim.) Makino.—SHUSU-RAN, BIRŌDO-RAN. Stems 10–15 cm. long from an elongate creeping base; leaves several, oblong-ovate or ovate, 2–4 cm. long, 1–2 cm. wide, acute, deep green and purplish, white-striate on the midvein, rounded at base, the petioles sheathing below; peduncles short, whitish pilose, the scalelike leaves 2–3, linear; inflorescence 4- to 10-flowered, second, minutely hairy, the bracts ascending, linear-

lanceolate, 6–12 mm. long, long-acuminate; sepals 7–8 mm. long, narrowly ovate, subobtusely, whitish, 1-nerved; petals closely appressed to the dorsal sepal, broadly oblanceolate; lip as long as the sepals, saccate at base, pubescent within, the limb ovate, obtuse; capsule 7–10 mm. long in fruit.—Aug.–Sept. Woods; Honshu (centr. distr. and westw.), Shikoku, Kyushu; rather rare.—Korea.

7. *Goodyera schlechtendalia* Reichenb. f. *G. japonica* Bl.—MIYAMA-UZURA. Stems 12–25 cm. long from a creeping base; leaves ovate to narrowly so, 2–4 cm. long, 1–2.5 cm. wide, acute, flat, entire, rounded or subcordate at base, white-reticulate on upper side, rarely green, the petioles 1–2 cm. long, with a membranous short sheath at base; scapes elongate, densely soft crisped-pubescent, the scalelike leaves 2–3, erect, linear, often short-sheathing; inflorescence 5–10 cm. long, 7- to 12-flowered, rather long crisped-hairy; flowers rose to white, half-open; bracts erect, appressed to the ovary; sepals 8–10 mm. long, narrowly ovate to broadly lanceolate, obtuse, 1-nerved; petals broadly oblanceolate, appressed to the median sepals; lip nearly as long as the sepals, saccate at base, semi-rounded, pilose within, the limb ovate, subobtusely; column about 3/5 as long as the sepals; capsules 8–12 mm. long.—Aug.–Sept. Woods; Honshu, Shikoku, Kyushu; rare.—Korea and China.—Forma *similis* (Bl.) Makino. *G. similis* Bl.—AO-MIYAMA-UZURA. Leaves green throughout; occurs with the typical phase.

8. *Goodyera maximowicziana* Makino. *G. bifida* sensu Maxim., non Bl.; *G. foliosa* var. *laevis* Finet; *Peramium maximowiczianum* (Makino) Makino.—AKEBONO-SHUSU-RAN. Stems 7–10 cm. long, from a long-creeping base; leaves green, oblong-ovate to ovate, 2–3.5 cm. long, 1.2–2 cm. wide, acute, acute to rounded at base, often oblique, the petioles about 1 cm. long, short-sheathing at base; inflorescence sessile, rather densely 3- to 7-flowered, second, glabrescent or sparingly papillose-pilose, the bracts lanceolate, 1–1.5 cm. long, nearly erect, ciliate; flowers half-open, white; sepals narrowly ovate, obtuse, 8–10 mm. long; petals broadly oblanceolate, closely appressed to the median sepal; lip nearly as long as the sepals, saccate-inflated at base, pilose within, the limb ovate, obtuse; column about 3/5 as long as the sepals.—Woods; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.—Korea and Ryukyus (Amami Oshima).

9. *Goodyera macrantha* Maxim. *Peramium macranthum* (Maxim.) Makino.—BENT-SHUSU-RAN. Stems 4–8 cm. long from a long-creeping base; leaves ovate to narrowly so, 2–4 cm. long, 1–2.2 cm. wide, acute to obtuse, usually rounded at the base, white-reticulate on upper side, the petioles 1–2 cm. long, short-sheathing at base; inflorescence 1- to 3-flowered, loosely long crisped-pubescent, the bracts broadly linear, suberect, 1.5–2 cm. long, long-acuminate, slightly pubescent; flowers long-tubular; sepals broadly linear, 2.5–3 cm. long, obtuse, loosely pubescent without; petals linear, narrowed toward the base; lip 17–20 mm. long, saccate at base, sparsely pubescent within, the limb elongate, lanceolate, sub-acute, with a recurved tip; column about 1/3 as long as the sepals; capsules 15–18 mm. long.—July–Aug. Woods; Honshu (centr. distr. and westw.), Shikoku, Kyushu; rare.—Korea (Wangtao).

29. HETAERIA Bl.

HIME-NO-YAGARA ZOKU

Terrestrial, sometimes saprophytic herbs from creeping, rarely somewhat thickened rhizomes; stems erect; leaves ovate to lanceolate, sometimes reduced to scales; flowers small, in spikes; sepals free or connate at base, the lateral sepals broadest; petals

narrow, often closely appressed to and forming a hood with the dorsal sepal; lip erect, from the base of the column, saccate at base, with callose protuberances within, the margin often adnate to the lower margin of the column, the limb entire or bifid; column short, with 2 appendages in front; stigma broad, bilobed, depressed, with protuberances on the lower margins; anther-locules separate; pollinia scitellate, with caudicles; capsules erect.—About 65 species, in Malaysia, Polynesia, India, and se. Asia.

1A. Stems with green leaves.

2A. Lateral sepals about 3 mm. long, ovate, semi-open at anthesis. 1. *H. yakusimensis*

2B. Lateral sepals about 5 mm. long, lanceolate, fully open at anthesis. 2. *H. xenantha*

1B. Aphyllous saprophyte, without chlorophyll, wholly glabrous. 3. *H. sikokiana*

1. **Hetaeria yakusimensis** (Masam.) Masam. *Zeuxine yakusimensis* Masam.—YAKUSHIMA-AGA-SHUSU-RAN. Terrestrial, red-brown when dry; stems erect from a short-creeping base, 10–15 cm. long, 2- to 5-leaved near the base, glabrous toward the base, short-pilose on the upper part; leaves obovate or ovate, about 3 cm. long, 1.5 cm. wide, acute, glabrous, rounded at base, the petioles about 2 cm. long, sheathing at base; inflorescence about 10 cm. long, loosely 6- to 10-flowered; bracts 1-nerved, membranous, ciliate, as long as the ovary; median sepal broadly ovate, acute, about 3 mm. long, the lateral sepals oblique-oblong; petals subovate, obtuse; lip cucullate-ovate, as long as the sepals, with 2 callose protuberances within; column with 2 winglike ridges within.—Sept. Woods in mountains; Kyushu (s. distr., incl. Yakushima); rare.

2. **Hetaeria xenantha** Ohwi & T. Koyama. *Ōsumi-KINU-RAN*. Stem arising from a long creeping base, terete, glabrous, including the inflorescence 8–15 cm. tall; leaves 3 to 7 on a stem, broadly ovate or elliptic, to 4 cm. long, abruptly acute, upper surface deep green, velvety, the petiole to 1 cm. long, the lower half sheathing; scape wiry, wholly pubescent, with 2 or 3 scales below the middle, terminated by a 4–5 cm. long spikelike raceme of 3 to 6 remote flowers, the bracts scalelike, lanceolate, as long as or slightly shorter than the ovary, ciliate on the upper margin; sepals glabrous, the median

one ovate, 5 mm. long, acute, reddish or brownish green outside, the lateral lanceolate, 5 mm. long, gradually attenuate, olive-green outside; petals forming a hood with the central sepal, 4.5 mm. long, thin, elliptic-ovate, white; labellum conical-ovoid, ascending, 4.5 mm. long, 2 mm. wide, white, glabrous, with a pair of hooked processes inside the saclike base, the limb 3-lobed, the lateral lobes papillose, involute; column including rostellum 2.8 mm. long, with an enlargement on each side.—Aug–Sept. Wet evergreen woods; Kyushu (Ohsumi).

3. **Hetaeria sikokiana** (Makino & F. Maekawa) Tuyama. *Chamaegastrodia sikokiana* Makino & F. Maekawa.—HIME-NO-YAGARA. Plants pale brown, saprophytic, without green leaves; rhizomes rather thick, creeping, branching, with small loose scales; stems erect, rather fleshy, 5–15 cm. long, glabrous, with loose scales; leaves scalelike, 4–10 mm. long, thinly membranous, subobtusely 1-nerved, sheathing at base; inflorescence 2–3.5 cm. long, 5- to 10-flowered; bracts ovate-oblong or ovate, 5–8 mm. long, erect; sepals obtuse, 1-nerved, 3–4 mm. long; petals narrowly oblong, the lip about 6 mm. long, saccate-inflated at base, with 2 globose callosities within, the limb T-shaped; column with 2 horn-shaped appendages on the inner surface.—June–July. Honshu (Rikuzen Prov. and southw.), Shikoku, Kyushu; rare.

30. CHEIROSTYLIS Bl. KAIRO-RAN ZOKU

Small, terrestrial herbs from creeping rhizomes; stems leafy at base, with scalelike leaves in the upper part; inflorescence racemose, loosely flowered, bracteate; flowers rather small, usually short-pedicelled; sepals at the base more or less united into a tube becoming 3-lobed above the middle; petals 2, free, closely appressed to the inner side of the dorsal sepal; lip saccate-inflated, with two protuberances on the inside, the limb bifid, entire or toothed; column short, with an appendage near the rostellum on each side; pollinia caudiculate, bilobed in each locule; stigma lateral, bilobed.—About 20 species, in tropical and subtropical regions of Asia and Africa.

1. **Cheirostylis okabeana** Tuyama. *TANEGASHIMA-KAIRO-RAN*. Stems 10–20 cm. long, slightly fleshy, from creeping rhizomes, 4- to 6-leaved toward the base; leaves oblong-ovate to broadly ovate, 7–20 mm. long, 5–12 mm. wide, acute, mucronate, glabrous, red-brown when dry, slightly fleshy, the petioles 5–10 mm. long, broadened and short-sheathing at base; peduncles with white recurved hairs, the scales 2 or 3, remote, appressed, sheathing at base; racemes short, 2- to 5-flowered,

the bracts 5–7 mm. long, lanceolate; ovary white-pubescent, subsessile; flowers small; sepals slightly united below into a tube, the lobes or segments to 3.7 mm. long, the dorsal lobe slightly shorter; lip nearly included, with 2 callosities on inner side of inflated lower part, the limb T-shaped, the lobes ovate, entire, obtuse.—Woods in mountains; Kyushu (Tanegashima); very rare.

31. VEXILLABIUM F. Maekawa HAKUUN-RAN ZOKU

Small terrestrial herbs; stems long-creeping; leaves small, ovate, the petioles sheathing at base; inflorescence scapose, erect, spicate, few-flowered; flowers small, white, the bracts membranous; calyx campanulate, slightly pubescent outside; petals as long as and appressed to the dorsal sepal; lip slightly exserted, saccate-inflated at base, with 2 protuberances within, the claw slender, short and entire, the limb triangular to quadrangular or oblong; spur bilobulate; column erect, nearly terete, the rostellum unequally bifid, minutely papillose; pollinia scitellate.—About 4 species, in Japan and Korea.

1A. Sepals distinctly connate toward base.

2A. Limb of lip quadrangular-oblong, truncate or retuse; leaves less than 7 mm. long.

3A. Leaves 3–7 mm. long; spikes 1- to 4-flowered. 1. *V. nakaiianum*

- 3B. Leaves 1–1.5 cm. long; spikes about 7-flowered. 2. *V. fissum*
 2B. Limb of lip triangular, retuse; leaves 7–15 mm. long; spikes 1- to 3-flowered. 3. *V. yakushimensis*
 1B. Sepals only very briefly connate at base. 4. *V. inamii*

1. **Vexillabium nakaianum** F. Maekawa. HAKUUN-RAN. Stems 5–12 cm. long, long-creeping at base, with 2–4 leaves in lower part, pubescent above; leaves ovate, 3–7 mm. long, 2.5–7 mm. wide, acute, the petioles 3–6 mm. long, sheathing at base; scalelike leaves 2; spikes 1- to 4-flowered; flowers white; sepals forming a campanulate tube below the middle, pubescent outside, the dorsal lobe 3.2–3.5 mm. long, acute, the lateral lobes 4.8 mm. long; petals obovate-oblong, the lip about 4.5 mm. long, retrorsely saccate at base, forming a short, retuse spur, the claw entire, narrow, the limb about 2 mm. long, 4.5 mm. wide, retuse.—Aug. Woods; Kyushu (Mount Kurodake in Bungo); very rare.

2. **Vexillabium fissum** F. Maekawa. Ô-HAKUUN-RAN. Stems about 13 cm. long, ascending, from a short-creeping base, glabrous at base, pubescent above; leaves about 6, rounded to ovate-elliptic, 1–1.5 cm. long, 8–11 mm. wide, rounded at both ends or obtuse at apex, 3-nerved, the petioles 7–8 mm. long, dilated at base and sheathing for half the length; spikes scattered-pubescent, about 7-flowered; bracts linear-lanceolate, as long as the ovary, acute, about 6 mm. long; flowers several; sepals pubescent outside, connate below the middle, the dorsal lobe about 4 mm. long, narrowly ovate, the lateral lobes oblong, 4.5 mm. long; petals appressed to the dorsal sepal; lip about 6 mm. long, with an obtuse, saccate, retrorse base, the claw entire, the limb about 2 mm. long, 5 mm. wide.—July. Honshu (Miyake Isl. in Izu); very rare.

3. **Vexillabium yakushimensis** (Yamamoto) F. Maekawa. *Anoetochilus yakushimensis* Yamamoto—YAKUSHIMA-HIME-ARIDÔSHI-RAN. Stems 4–10 cm. long, long-creep-

ing at base, 3- to 5-leaved in the lower part, glabrous, with scattered white multicellular hairs above; leaves broadly ovate, 7–15 mm. long, rounded at base, 3- to 5-nerved, the petioles short, sheathing at base; upper reduced leaves 1–3, lanceolate, 5–8 mm. long, appressed to the stem; spikes 1- to 3-flowered; flowers white, the bracts scarious, pubescent, 3–6 mm. long, triangular-lanceolate, acute; calyx 3.5–4 mm. long on dorsal side, 5–5.5 mm. on lateral side, tubular-campanulate, loosely pubescent outside, the lobes acute; petals appressed to the dorsal sepal; lip 7–8 mm. long, the spur saccate, the claw slender, sometimes 1- to 2-toothed on the upper margins, the limb triangular, retuse, about 4 mm. long, 6 mm. wide.—Aug. Woods; Kyushu (Yakushima); very rare.

4. **Vexillabium inamii** Ohwi. ISE-RAN. Small perennial creeping herb; stems 5–6 cm. long, 3- to 4-leaved toward top; leaves orbicular-ovate, 6–10 mm. long, 5–8 mm. wide, short-petiolate; scape 2–3 cm. long, with white multicellular hairs, 1-bracteate below the middle; flowers 1–3, rose-colored, in loose 1-sided racemes, the bracts broadly lanceolate, 5–6 mm. long, appressed to the ovary, loosely ciliate; sepals only very briefly connate at base, the median deltoid-ovate, about 3.5 mm. long, erect, obtuse, 1-nerved, loosely pubescent outside at base, the lateral oblong, erect, about 5 mm. long; petals as long as the median sepal, the lip exerted from the perianth, the claw lanceolate, about twice as long as the limb, with 2 minute tubercles on the sac, the limb spreading, orbiculate-trapezoid, about 3.5 mm. long, 5 mm. wide, bifid at apex.—Aug. Evergreen forest; Honshu; rare.

32. ODONTOCHILUS BL. INABA-RAN ZOKU

Terrestrial rhizomatous erect herbs, leafy toward the base; leaves ovate to lanceolate, petiolate; inflorescence spicate, the flowers relatively small, sessile; dorsal sepal erect, forming a hood with the petals, the lateral sepals forming a chin with the foot of the column; lip with protuberances inside the saccate base, the claw spreading, fimbriate or dentate, the limb abruptly dilated upward and deeply bifid, conduplicate in bud; column very short, without frontal appendages; stigma often bifid; anther-locules distinct; pollinia sectile, with caudicles; capsules erect.—About 10 species, in India, Malaysia, and Formosa.

- 1A. Lateral sepals about 11 mm. long; lip about 23 mm. long; claw fimbriate. 1. *O. inabae*
 1B. Lateral sepals 3–3.3 mm. long; lip about 5.5 mm. long; claw entire. 2. *O. hatsumanus*

1. **Odontochilus inabae** Hayata. *Anoetochilus inabae* Hayata—INABA-RAN. Stems rather stout, 10–20 cm. long, glabrous and leafy below; leaves alternate, ovate-oblong to oblong, about 4.5 cm. long, 2 cm. wide, acute, rounded to obtuse at base, the petioles about 2 cm. long, sheathing at base; peduncles with few scales, pubescent; inflorescence loosely flowered; flowers rose; dorsal sepal ovate to broadly so, about 5.5 mm. long, slightly caudate and obtuse, the lateral sepals oblong, spreading, about 11 mm. long; petals lanceolate, appressed to the dorsal sepal; lip about 23 mm. long, saccate at base, the claw slender, fimbriate, the limb V-shaped, bifid, the lobes ascending, cuneate; column about 0.8 mm. long; ovary pubescent.—Reported to occur in Kyushu (Yakushima).—Formosa.

2. **Odontochilus hatsumanus** Ohwi & T. Koyama. HATSUSHIMA-RAN. Stem slenderly terete, arising from a

long-creeping base, 10–15 cm. tall, including the inflorescence; leaves 4–6 on a stem, the blades ovate to ovate-elliptic, to 4 cm. long, 2 cm. wide, 3-nerved, fresh green, abruptly short-acute, rounded at base, the petiole patent, nearly 15 mm. long, sheathing below; scape erect, slenderly terete, pubescent, with few scales below the middle, terminated by a spikelike raceme of 2 to 7 flowers; flowers white and pink-tinged, about 4 mm. long; bracts lanceolate, light reddish, 2/3 as long as the ovary; sepals pubescent outside, the central one ovate-acute, the lateral ovate, 3.2 mm. long; petals appressed on the central sepal, thin, elliptic, 3 mm. long; labellum patent, much exerted, T-shaped, 5.5 mm. long, the hypochilus rounded-ciliate, with a pair of horns inside, the mesochilus slenderly cylindric, the epichilus 2-lobed, the lobes ovate-acute, 1.8 mm. long; column 1.5 mm. long, with 2-fid rostellum and 2 appendages at apex.—July–Aug. Kyushu (Ohsumi).

33. MYRMECHIS Bl. ARIDŌSHI-RAN ZOKU

Small, low, terrestrial herbs from long-creeping rhizomes; leaves few, on lower part of stem, ovate, short-petiolate; flowers relatively small, spicate, few, sometimes solitary; sepals connate at base, mostly erect, the lateral sepals forming a short chin with the foot of the column; petals broadly lanceolate; lip attached to the base of the column, with 2 protuberances within, ventricose at base, saccate, spurless, the claw narrow, entire, the limb short, broad, bifid; column very short; stigmas 2, distinct, on each side of the short erect rostellum; pollinia setile; caudicles very short; capsules erect, sessile.—Few species in e. Asia.

- 1A. Lip slightly longer than the perianth, distinctly dilated in upper part on the bifid obtriangular limb. 1. *M. japonica*
 1B. Lip slightly shorter than the perianth, not dilated, subtruncate. 2. *M. tsukusiana*

1. *Myrmecis japonica* (Reichenb. f.) Rolfe. *Rhamphidia japonica* Reichenb. f.; *M. gracilis* sensu Fr. & Sav., non Bl.—ARIDŌSHI-RAN. Stems 3–8 cm. long, long-creeping at base, glabrous in lower part, the upper part with scattered, white, crisped multicellular hairs; leaves 5–7, green, broadly ovate, 5–12 mm. long, 4–8 mm. wide, obtuse, the petioles 5–10 mm. long, briefly dilated below with a short membranous sheath at base; flowers 1 or 2, rarely 3, white, the bracts scarious, 1-nerved, narrowly 3-angled, appressed to the ovary, acute, 4–6 mm. long; sepals lanceolate, 6–7 mm. long, gradually narrowed to the obtuse tip, the dorsal sepal recurved, the lateral ones ascending; petals linear; lip slightly longer than the perianth segments, saccate at base, distinctly dilated in upper part to the bifid obtriangular limb; column very short.—Woods in mountains; Hokkaido, Honshu (centr. and n. distr.); rare.

2. *Myrmecis tsukusiana* Masam. TSUKUSHI-ARIDŌSHI-RAN. Stems 4–5 cm. long, creeping at base; leaves flat, entire, ovate-rounded to ovate, 5–10 mm. long, 5–7 mm. wide, obtuse to acute, short-petiolate; peduncles 15–25 mm. long, pubescent; bracts obovate-lanceolate, embracing the base of the ovary, ciliate, membranous; flowers 1 or 2; sepals ovate-lanceolate, about 4 mm. long, 2.5 mm. wide, slightly narrowed to the obtuse tip, slightly united at base; petals lanceolate, 4.5 mm. long, 2 mm. wide; lip slightly shorter than the perianth segments, spreading, lanceolate, about 4 mm. long, 2 mm. wide at base, saccate, subtruncate at apex; column very short, erect.—July–Aug. Woods; Kyushu (Yakushima); very rare.

34. ZEUXINE Lindl. KINU-RAN ZOKU

Terrestrial, erect, unbranched herbs from a creeping base; leaves linear to ovate, petiolate, sheathing at base; flowers small, sessile, in spikes, the bracts membranous; sepals nearly equal, free, the dorsal erect, forming a hood with the narrow closely appressed petals, the lateral sepals spreading; lip slightly adnate to the base of the column, erect, included, concave, smooth or with 2 callosities within, the limb entire or bifid; column not appendaged, short, the stigma with 2 protuberances; anther-locules contiguous; pollinia granular; capsules erect, ovate.—About 40 species, in India, Malaysia, tropical Africa, and e. Asia.

1. *Zeuxine strateumatica* (L.) Schltr. *Orchis strateumatica* L.; *Z. sulcata* Lindl.; *Adenostylis strateumatica* (L.) Ames.—KINU-RAN, HOSOBARA-RAN. Stems 5–10 cm. long, rather densely leafy at base; leaves fleshy, linear, 1.5–4 cm. long, 3–4 mm. wide, acuminate, sheathing at base; spikes 2–4 cm. long, densely flowered, the bracts scarious, triangular-ovate, 7–12 mm. long, long-acuminate, 1-nerved, longer than

the flowers; flowers sessile, half-open, abruptly recurved above the ovary; sepals ovate-oblong, 5–6 mm. long, obtuse, 1-nerved; petals and lip as long as the sepals; capsules ellipsoidal, about 6 mm. long.—Apr. Kyushu (s. distr. incl. Yakushima and Tanegashima).—India, Malaysia, China, Formosa, and Ryukyus.

35. TROPIDIA Lindl. NETTAI-RAN ZOKU

Terrestrial, slender, sometimes branched herbs; leaves thin, plicate, many-nerved; flowers relatively small, in terminal spikes; bracts herbaceous; sepals not fully open, the dorsal narrowest, the lateral forming a short chin below the lip at base; petals as long as the lateral sepals; lip sessile, erect, grooved, saccate or spurred at base, the limb entire, as long as the sepals, usually acuminate; column short; rostellum elongate, acuminate, erect, with a membranous margin embracing the anther on each side; anther-locules contiguous; pollinia granular; capsules ovoid, acutely angled.—More than 20 species, in tropical Asia and the Pacific Islands.

1. *Tropidia nipponica* Masam. YAKUSHIMA-NETTAI-RAN. Stems 10–30 cm. long, slender, erect, stiff, glabrous, the lower portion with 3–7 membranous sheaths; leaves 1–4, on the upper part of the stem, thin, firm, ovate-oblong to lanceolate, 5–10 cm. long, 2–3.5 cm. wide, caudate-acuminate, narrowed to the petiole, many-nerved, plicate; uppermost leaf at the base of the peduncle broadly linear, about 4 cm. long, 3–5 mm. wide; spikes about 10-flowered, the peduncle about 6 cm. long,

the bracts lanceolate, 1–3 mm. long, acuminate; flowers yellow; dorsal sepal narrowly obovate, 6–8 mm. long, 3–3.5 mm. wide, the lateral sepals completely united into an obovate, navicular blade; petals lanceolate, about 6.5 mm. long, 3 mm. wide; lip ovate-lanceolate, about 5 mm. long, 3.5 mm. wide, saccate at base, abruptly recurved at apex; column about 3 mm. long.—July–Aug. Honshu (Hachijō Isl. in Izu, Shikoku (Tosa Prov.), Kyushu (Yakushima and Koshiki); very rare.

36. CALYPSO Salisb. HOTEI-RAN ZOKU

Terrestrial herb with a single elliptic, plicate, petiolate, radical leaf; flowers rather large, showy, solitary, terminal, nodding; sepals and petals narrow, equal, free; lip longer than the perianth lobes, spreading, broadly ovate, strongly inflated and saccate above, the lateral lobes flat, the upper margins united to the dorsal lobe which is entire or shallowly bifid; column shorter than the sepals, winged, broad and without a foot; pollinia 2 in each locule, sessile, waxy, ovoid; capsules oblong-fusiform, 6-ribbed.—A single species, in the cooler regions of Eurasia and N. America.

1. *Calypso bulbosa* (L.) Reichenb. f. var. *speciosa* (Schltr.) Makino. *C. speciosa* Schltr.; *C. bulbosa* var. *japonica* Makino, excl. syn.; *Cytherea bulbosa* var. *speciosa* (Schltr.) Makino—HOTEI-RAN. Glabrous perennial from a short, fusiform or narrowly ovoid pseudobulb; leaves ovate-elliptic, obtuse to acute, 2.5–5 cm. long, 1.5–3 cm. wide, slightly plicate, deep green above, purple beneath, the petiole 1.5–4 cm. long; scape 6–15 cm. long, erect, slender, with 2 membranous, sheathing scales near the base; flowers solitary, terminal, the bract broadly linear, 1.2–2.5 cm. long, acuminate; sepals and petals spreading, brownish rose, linear-lanceolate, 2–3 cm. long, 3–4

mm. wide, acuminate; lip pendulous, broadly ovate, 2.5–3 cm. long, white with pale brown spots inside, the pouch antorse, bifid, softly long-pubescent within, the limb contracted, rounded at apex, with undulate margins; column flattened, ovate-elliptic, 1.3–1.5 cm. long, about 1 cm. wide; capsules clavate, cylindric, about 2.5 cm. long, long-pedicelled, ascending.—May–June. Coniferous woods in mountains; Honshu (north and centr. distr.); very rare. The Japanese phase nearly corresponds with the N. American var. *occidentalis* Holz, which has the limb of the lip shorter than the apical appendages of the pouch.

37. OBERONIA Lindl. YÖRAKU-RAN ZOKU

Evergreen epiphytes; stems elongate; leaves coriaceous to herbaceous, distichous, equitant, more or less fleshy, laterally flattened or rarely terete, sheathed at base; flowers minute, numerous, in spikes, or racemes, the bracts very small; sepals free, nearly equal; petals shorter and narrower than the sepals; lip sessile, spurless, inflated on the back, fimbriate or 2- to 3-lobed, broadened at base and embracing the column in natural position; column very short, terete, narrowed at base, without a foot; pollinia 4, in 2 locules, waxy; capsules small.—About 150 species, in tropical Asia, Malaysia, Pacific Islands, and Australia.

1. *Oberonia japonica* (Maxim.) Makino. *Malaxis japonica* Maxim.; *O. makinoi* Masam.—YÖRAKU-RAN. Small, pendulous, caespitose epiphyte; stems 1–4 cm. long, densely leafy; leaves 4–10, laterally flattened, linear-oblong, 1–4 cm. long inclusive of the short sheath, 2–6 mm. wide, short-acute to obtuse, mucronate; inflorescence terminal, densely flowered, 2–8 cm. long, about 2.5 mm. across, the peduncle slender, 1–2

cm. long; bracts deltoid, membranous, 0.5–2 mm. long, acuminate, spreading; flowers yellow to greenish yellow, about 1 mm. across; sepals spreading, broadly ovate, obtuse; petals ovate; lip obovate, 5-lobed, the terminal lobe shorter than the others; capsules short-pedicelled, obovoid, about 2.5 mm. long.—Apr.–June. Tree-trunks and rocks; Honshu (s. Kantō and westw.), Shikoku, Kyushu.

38. TIPULARIA Nutt. HITOTSU-BOKURO ZOKU

Small terrestrial herbs; leaves solitary, basal, ovate, rather long-petiolate; scapes from the pseudobulb, with few sheathing scales at base; flowers small, short-pedicelled, in loose racemes, the bracts minute or absent; sepals and petals equal, spreading, free, narrow; lip erect at the base of column, sessile, as long as the sepals, slenderly spurred, 3-lobed, the lateral lobes small, the terminal lobe flat, oblong, entire or retuse; column shorter than the sepals, erect, narrowly winged above; anther terminal, pollinia 4 in 2 cells, waxy, unappendaged; capsules clavate-fusiform or oblong-cylindric, pendulous.—About 4 species, in N. America, e. Asia, and the Himalayas.

1. *Tipularia japonica* Matsum. HITOTSU-BOKURO. Pseudobulbs conical-ovoid, 1–1.5 cm. long; leaves solitary, the petioles 3–7 cm. long, the blades deltoid- to elliptic-ovate, 3.5–7 cm. long, 1.5–3 cm. wide, acuminate, rounded at base, green above, purplish beneath; scapes erect, slender, 20–30 cm. long, with 2 or 3 sheathing scales on lower part; inflorescence loosely 5- to 10-flowered, 4–6 cm. long, the bracts minute; flowers yellowish

green; sepals and petals narrowly oblanceolate, about 4 mm. long, obtuse; lip obovate, 3-lobed, about 3 mm. long, the terminal lobe obtuse, entire, the lateral ones minutely toothed; spur slender, about 5 mm. long; capsules fusiform, short-pedicelled, pendulous, about 1 cm. long.—May–June. Woods in mountains; Honshu, Shikoku, Kyushu.

39. DIDICIEA King & Prain HITOTSU-BOKURO-MODOKI ZOKU

Small terrestrial herbs with pseudobulbs; leaves solitary; inflorescence racemose; flowers small, yellowish green or dark purple, the bracts minute; sepals and petals nearly alike, erect, narrow; lip without a foot at the base of the column, erect, fleshy, oblanceolate, sometimes inflated, spurless; column short, winged or nearly terete with a groove on the inner side; anthers 2-locular, deciduous; pollinia 4, without caudicles; rostellum short, truncate.—Two species, one in Japan and another in Sikkim Himalaya.

1. *Didiciea japonica* Hara. HITOTSU-BOKURO-MODOKI. Pseudobulbs globose, about 1 cm. long; leaf ovate, about 4.5 cm. long, 2.3 cm. wide, acute, cordate, brownish purple be-

neath, 5-nerved, the petiole about 3 cm. long; scape slender, about 15 cm. long, with 2 membranous sheaths at base; inflorescence about 4 cm. long, loosely about 8-flowered, the

bracts deltoid, delicate; sepals narrowly oblong, obtuse, about 3 mm. long, 1 mm. wide, 3-nerved, brown-purple, ascending; petals slightly shorter than the sepals; lip simulating the petals, completely spurless; column about 1.5 mm. long, nearly terete,

with a groove on the ventral side, obliquely truncate; ovary about 4 mm. long, short-pedicelled.—May. Kyushu (Mount Tara in Hizen); very rare.

40. EPHIPPIANTHUS Reichenb. f. KO-ICHIYŌ-RAN ZOKU

Delicate terrestrial, glabrous herbs with slender, elongate rhizomes; leaves solitary; scapes erect with few scales on the lower portion; racemes loosely few-flowered; bracts minute, nerveless; flowers small, yellowish green; sepals and petals narrowly oblong, somewhat spreading, obtuse; lip as long as the sepals, short-clawed, narrowly oblong, spreading, short-auriculate, the limb or lobe obtuse, entire; column slender, erect, shorter than the sepals, slightly incurved in upper part, angled on each side; stigma large; anthers terminal; pollinia 4, in 2 locules, globose; ovary clavate-cylindrical, short-pedicelled.—Two species in e. Asia.

- 1A. Column slender, not flattened or appendaged; lip entire. 1. *E. schmidtii*
 1B. Column flattened, with an auriculate wing on each side on the upper portion; lip denticulate. 2. *E. sawadanus*

1. *Ephippianthus schmidtii* Reichenb. f. *E. sachalinensis* Reichenb. f.; *Liparis schmidtii* (Reichenb. f.) Benth.—KO-ICHIYŌ-RAN. Slender glabrous perennial with creeping rhizomes; leaves solitary, broadly ovate, flat, 1.5–3 cm. long, 1–2.5 cm. wide, obtuse, rounded to subcordate at base, the petioles 2–5 cm. long; scapes slender, 10–20 cm. long, with 2 sheathing scalelike leaves in lower part; racemes 1–3 cm. long, loosely 2- to 7-flowered, the bracts membranous, about 1 mm. long; flowers horizontally spreading or nodding, yellowish green; sepals narrowly oblong, about 5 mm. long, obtuse, 3-nerved; petals slightly shorter than the sepals; lip short-clawed at base, abruptly dilated above, the limb about as long as the sepals, flat, entire, oblong-ovate, slightly recurved, with a fleshy, callose protuberance on each side at base; column about 2/3 as long as the sepals; ovary pedicelled; capsules pendulous, clavate-fusiform, 8–10 mm. long.—July–Aug.

Mossy places in coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, and s. Kuriles.

2. *Ephippianthus sawadanus* (F. Maekawa) Ohwi. *Hakoneaste sawadana* F. Maekawa.—HAKONE-RAN. Leaves oblong, 1.5–3 cm. long, 1–2.5 cm. wide, obtuse, acute to sub-rounded at base, the petioles 1.5–2.5 cm. long; scapes 8–15 cm. long, with 1 or 2 remote membranous sheathing scales 5–12 mm. long; racemes 1–4 cm. long; flowers 3–5, yellowish green, the bracts membranous, 1 mm. long, obtuse, toothed; sepals 4.5–5 mm. long, obtuse, 3-nerved; petals slightly shorter than the sepals, denticulate; lip 4–5 mm. long, 2–2.2 mm. wide, slightly involute and brownish purple on inner side at tip, denticulate; column 2.5 mm. long, flattened, cuneate-obovate, with an auriculate wing on each side; ovary about 3 mm. long.—June. Woods in mountains; Honshu (Hakone, Fuji, Chichibu, Yamato); very rare.

41. MICROSTYLIS Nutt. HOZAKI-ICHIYŌ-RAN ZOKU

Plants small, terrestrial or epiphytic; stems thickened at base; leaves few, chiefly radical, membranous, broad, flat, sheathed at base; flowers small or minute, in terminal racemes, the bracts small, narrow; sepals free, spreading; petals usually narrower than the sepals, sometimes filiform; lip sessile, erect or spreading, inflated on the back, entire, 2- to 3-lobed or fimbriate, cordate or auriculate; column very short, terete, emarginate, auriculate; anthers erect, deciduous, the locules separate, persistent; pollinia 4, in 2 locules, waxy, ovoid; capsules small, ovoid.—About 200 species, widely distributed, especially abundant in the Tropics.

1. *Microstylis monophyllos* (L.) Lindl. *Ophrys monophyllos* L.; *Malaxis monophylla* (L.) Sw.; *Microstylis diphylla* Lindl.; *Acroanthos monophylla* (L.) Greene; *Liparis inconspicua* Makino.—HOZAKI-ICHIYŌ-RAN. Pseudobulb ovoid, covered with old leaf-sheaths; leaves 1 or rarely 2, thin, broadly ovate to elliptic, 4–8 cm. long, 3–5 cm. wide, subacute to obtuse, rounded to abruptly narrowed at base, the sheaths 3–8 cm. long; peduncles 15–30 cm. long, naked; racemes 8–15 cm. long, rather densely flowered, the bracts deltoid-lanceolate, 1–2

mm. long, acuminate; flowers 2.5–3 mm. across, pale green; sepals slightly recurved, linear, 2.5 mm. long; petals lanceolate, as long as the sepals, subobtusely, 1-nerved; lip as long as the sepals, the lower half reniform, abruptly narrowed at tip, sub-acute, 3-nerved; column very short; capsules obovoid, pedicelled, erect, 5–6 mm. long, crowned with the remnants of the decayed perianth.—July. Coniferous woods; Hokkaido, Honshu (centr. and n. distr.), Shikoku; rather rare.—Cooler regions of N. America and Eurasia.

42. MALAXIS Sw. YACHI-RAN ZOKU

Stems short; leaves 2 or 3, basal or nearly so, small, short-sheathing at base; flowers minute, green, racemose, short-pedicelled; sepals free, spreading, the petals much smaller, spreading; lip ascending, without a foot, longer than the petals, cordate and loosely embracing the column; column very short, terete, retuse, toothed at the apex; anthers in a depression on the column, nearly erect, persistent, the locules separate; pollinia 4, in 2 locules, waxy, obovoid-oblong.—A single species widely distributed in Eurasia and N. America.

1. *Malaxis paludosa* (L.) Sw. *Ophrys paludosa* L.; *Hammarbya paludosa* (L.) O. Kuntze.—YACHI-RAN. Stems 5–10 cm. long, from a creeping base; leaves 1–3, with small tubers in the axils, narrowly oblong to broadly lanceolate, 1–2.5

cm. long, 4–10 mm. wide, obtuse, gradually narrowed to a short-sheathing base; peduncles slender, naked; racemes 3–5 cm. long, rather densely flowered, the bracts broadly lanceolate, appressed to the ovary, 1.5–2.5 mm. long; flowers pale green,

2.5–3 mm. across; sepals narrowly ovate, 1-nerved, subobtusely, about 2 mm. long, the dorsal sepal recurved, the lateral ones spreading; petals ovate, about 1 mm. long, 1-nerved; lip on upper side of flower, erect, deltoid-ovate, 1.5 mm. long, with

lower margins slightly involute; capsules ellipsoid-globose, pedicelled, about 2.5–3 mm. long.—Aug. Bogs; Hokkaido, Honshu (centr. and n. distr.); very rare.—s. Kuriles, Sakhalin, Siberia, Europe, and N. America.

43. ELEORCHIS F. Maekawa SAWA-RAN ZOKU

Pseudobulbs small, globose; scapes erect, slender; leaves solitary, linear-lanceolate, sheathing toward the base and enveloping the scape; flowers 1 (rarely paired), rose-purple, the bracts minute, thinly membranous; sepals and petals alike, free, oblanceolate, erect, gibbous; lip narrowly obovate or oblanceolate, adnate below to the base of column; column narrowly cylindric, ridged on each side; rostellum flat, truncate; anthers terminal, reclined; pollinia 4, in 2 locules, granular, the caudicles not developed.—One species in Japan.

1. *Eleorchis japonica* (A. Gray) F. Maekawa. *Arethusa japonica* A. Gray; *Bletilla japonica* (A. Gray) Schltr.—SAWA-RAN, ASAHI-RAN. Pseudobulbs about 6 mm. across; scapes 20–30 cm. long, slender, terete, naked, with 1 or 2 sheathing scales at base; leaf radical, erect, linear-lanceolate or broadly linear, 6–15 mm. long, 4–8 mm. wide, gradually narrowed at both ends; flowers 1 (rarely paired), the bracts deltoid, thinly membranous, 2–3 mm. long; sepals oblanceolate, subacute, rose-purple, nearly erect, 2–2.5 cm. long, 5-nerved; petals nearly as long but

slightly narrower than the sepals; lip as long as the sepals, obovate-oblong, denticulate, obsolete 3-lobed, rounded to truncate at apex; column about 2 cm. long; ovary linear, 1–1.5 cm. long. (to 2.5 cm. in fruit), nearly sessile, erect.—July. Bogs; Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles.

Var. *conformis* (F. Maekawa) F. Maekawa. *E. conformis* F. Maekawa—KIRIGAMINE-ASAHI-RAN. Flowers erect, tubular; sepals 13–17 mm. long; lip flat, entire, broadly oblanceolate.—July. Bogs; Honshu; rare.

44. LIPARIS L. C. Rich. KUMO-KIRI-SŌ ZOKU

Terrestrial or epiphytic herbs; stems leafy on the pseudobulb; leaves sometimes jointed at the base, flat or conduplicate, evergreen or deciduous; flowers small, white, purple or brownish, racemose, the bracts small; sepals free, spreading, as wide as or wider than the petals; lip attached to the base of the column, the lateral lobes inconspicuous or rather prominent, embracing the column in a natural position, the terminal lobe larger, with a globose tubercle on each side at base; anthers terminal; pollinia 4, in 2 locules, waxy; capsules globose to oblong-cylindric.—About 300 species in Eurasia and N. America, especially abundant in the Tropics.

- 1A. Leaves usually solitary, evergreen, narrowly oblong or linear-oblong, with a distinct joint within the sheath; peduncles compressed, recurved in upper part; flowers one-sided; column winged. 1. *L. plicata*
- 1B. Leaves usually 2 or 3, broadly lanceolate to broadly ovate-elliptic, without a distinct joint within the sheath; peduncles erect, 3- to 5-angled.
- 2A. Pseudobulbs cylindric, 3–10 cm. long; lip cuneate-oblong.
- 3A. Lip rounded at apex, the appendages at base elliptic, obtuse; bracts reflexed. 2. *L. formosana*
- 3B. Lip retuse, the appendages at base subulate, acute; bracts spreading. 3. *L. nervosa*
- 2B. Pseudobulbs ovoid-globose, 1–2 cm. long.
- 4A. Lip oblong-cuneate or cuneate, with slightly recurved margins, truncate to rounded at apex.
- 5A. Leaves broadly lanceolate, acuminate; veinlets closely approximate, longitudinal. 4. *L. odorata*
- 5B. Leaves narrowly ovate to ovate-rounded, rather obtuse to abruptly acute; veinlets subremote.
- 6A. Leaves broadly ovate to orbicular ovate, abruptly acute, rounded to cordate at base; flowers whitish; sepals linear-oblong, acute; lip straight, with 2 callosities at base. 5. *L. auriculata*
- 6B. Leaves elliptic to oblong, obtuse at both ends; flowers greenish or greenish purple; sepals oblong, obtuse; lip abruptly reflexed above the middle, the callosities absent at base or obscure. 6. *L. kumokiri*
- 7A. Lip obovate to narrowly obovate-oblong, rounded to obtuse, sometimes mucronate or caudate, flat, abruptly narrowed at base.
- 7B. Lip about $\frac{2}{3}$ as long as the petals, caudate. 7. *L. krameri*
- 8A. Lip about as long as the petals, broadly obovate, short-pointed.
- 8B. Lip 7–8 mm. long, 4.5–5.5 mm. wide, pointed; plant 20–40 cm. high. 8. *L. japonica*
9. Lip 12–18 mm. long, 10–15 mm. wide, rounded, mucronate; plant 15–30 cm. high. 9. *L. makinoana*

1. *Liparis plicata* Fr. & Sav. *Cestichis plicata* (Fr. & Sav.) F. Maekawa—CHI-KEL-RAN. Evergreen herb; pseudobulbs elongate-conical, 1–3 cm. long, few-scaled while young; leaves usually solitary, narrowly oblong or linear-oblong, conduplicate, ribbed, 10–18 cm. long, 1.5–3 cm. wide, acuminate at both ends, distinctly jointed with the sheath; peduncles 10–18 cm. long, terminal on the pseudobulbs, flat, narrowly wing-margined, arcuately recurved in upper part; racemes loosely 5- to 10-flowered, ascending; bracts subulate-lanceolate, 3–5 mm. long; flowers pale yellowish green, one-sided; dorsal sepal linear-oblong, obtuse, 6–7 mm. long, the lateral ones slightly shorter, spreading, arcuate in upper part; petals linear, 6–7 mm. long, obtuse; lip cuneate-obovate, about 5 mm. long, rounded-truncate, smooth, gradually recurved at

tip, with 2 indistinct callosities at the base inside; column winged near the tip; capsules pedicelled, clavate-fusiform, 8–10 mm. long.—Oct.–Dec. Shikoku, Kyushu (s. distr.).—Ryukyus and Formosa.

2. *Liparis formosana* Reichenb. f. YŪKOKU-RAN. Pseudobulbs elongate, cylindric, terete, the internodes to 5 cm. long; leaves 3, obliquely ovate to elliptic, 5–15 cm. long, 3–8 cm. wide, abruptly acuminate, short-sheathed at base; peduncles terminal, 20–30 cm. long, erect; racemes terminal, many-flowered; bracts narrowly ovate, 1-nerved, membranous, reflexed, 2–3 mm. long, acute; flowers brownish purple; sepals linear-oblong, obtuse, the lateral gradually spreading, 8–10 mm. long; petals linear-oblong, as long as the lateral sepals; lip cuneate-obovate, rounded at apex, gradually recurved in

upper part, 8-10 mm. long, 5-6 mm. wide, shallowly grooved at tip, entire, the appendages at base elliptic, obtuse; column about 5 mm. long, narrowly winged at apex.—June. Woods in mountains; Kyushu.—Ryukyus, Formosa, and China.

Var. *hachijoensis* (Nakai) Ohwi. *L. hachijoensis* Nakai; *L. bicallosa* Schltr., quoad pl. Japon.; *L. bituberculata* sensu Makino, non Lindl.—SHIMA-SASABA-RAN. Flowers smaller than in the typical phase.—June-Aug. Honshu (Izu-shichitō Is.).

3. *Liparis nervosa* (Thunb.) Lindl. *Ophrys nervosa* Thunb.; *Sturmia nervosa* (Thunb.) Reichenb. f.; *L. cornicaulis* Makino; *L. bambusaefolia* Makino—KOKU-RAN. Terrestrial herb with cylindrical pseudobulbs, the internodes to 4 cm. long; leaves 2 or 3, obliquely ovate to elliptic, 5-12 cm. long, 2.5-5 cm. wide, acute to abruptly acuminate, acute and short-sheathed at base; peduncles 15-30 cm. long; racemes loosely 5- to 10-flowered, 2/5-1/2 the length of the peduncles; bracts deltoid, spreading, 1-nerved, membranous, 1-2 mm. long, acute; flowers dark purple; sepals narrowly oblong, obtuse, the lateral ones spreading, about 5 mm. long; petals linear-oblancoate, obtuse, about 5 mm. long; lip cuneate-obovate, gradually recurved at tip, shallowly grooved on the upper surface, retuse, the appendages at base subulate; column about 3 mm. long, narrowly winged; capsules pedicelled, erect, clavate-fusiform, 15-25 mm. long.—June-July. Woods; Honshu (Tokaidō, Kinki, and westw.), Shikoku, Kyushu.

4. *Liparis odorata* (Willd.) Lindl. *Malaxis odorata* Willd.; *Leptorchis odorata* (Willd.) O. Kuntze—SASABA-RAN. Pseudobulbs ovoid-globose, about 2 cm. long; leaves 3-5, membranous, imbricate at the base, broadly lanceolate to narrowly oblong, 8-15 cm. long, 2-4 cm. wide, acuminate at both ends, plicate, sheathing at base; peduncles 20-30 cm. long, erect; racemes 5-15 cm. long; bracts lanceolate, acuminate, 1-nerved, obliquely ascending, 3-6 mm. long; flowers yellowish green, with a light purple hue; sepals about 6 mm. long, lanceolate, obtuse, the lateral ones narrowly oblong, spreading under the lip; petals linear, slightly broadened toward tip, subacute, about 7 mm. long; lip obovate-cuneate, recurved at tip, nearly truncate, shallowly grooved, as long as the lateral sepals; column narrowly winged.—July. Shikoku, Kyushu.—Ryukyus, Formosa, s. China, and India.

5. *Liparis auriculata* Bl. *L. yakushimensis* Masam.—GIBŌSHI-RAN. Pseudobulbs short, fusiform-ovate, 1-2 cm. long; leaves 2, broadly ovate to orbicular-ovate, 5-10 cm. long, 3-7 cm. wide, abruptly acute, rounded to cordate at base, the sheaths 2-7 cm. long; peduncles 15-30 cm. long, erect; racemes 3-7 cm. long; bracts lanceolate, ascending, acuminate, 1.5-2.5 mm. long; flowers whitish; sepals linear-oblong, 5-6 mm. long, acute, the lateral ones spreading; petals linear, slightly broadened at tip, obtuse, about 5 mm. long; lip cuneate-obovate, about 5 mm. long, rounded at apex, nearly straight, with 2 callosities at base; column about 3.5 mm. long, narrowly winged.—July-Aug. Woods; Honshu, Shikoku, Kyushu; rather rare.

6. *Liparis kumokiri* F. Maekawa. *L. auriculata* sensu auct. Japon., pro parte, non Bl.—KUMO-KIRI-SŌ. Pseudobulbs 1-1.2 cm. long; leaves 2, elliptic to oblong, 5-12 cm. long,

2.5-5 cm. wide, obtuse or subacute, acute and short-sheathing at base; peduncles 15-25 cm. long, erect; racemes 3-7 cm. long, loosely 5- to 15-flowered; flowers pale green to purplish; bracts spreading, ovate-deltoid, 1-1.5 mm. long, acute; sepals narrowly oblong, 5.5-6.5 mm. long, obtuse, spreading; petals narrowly linear, as long as the sepals; lip cuneate-obovate, abruptly reflexed above the middle, shallowly grooved on the upper surface, rounded-truncate at the apex; column about 3 mm. long, narrowly winged with a low ridge above on each side; capsules pedicelled, erect, clavate, 10-15 mm. long.—June-Aug. Woods; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

7. *Liparis krameri* Fr. & Sav. *Leptorchis krameri* (Fr. & Sav.) O. Kuntze—JIGABACHI-SŌ. Pseudobulbs globose, 7-12 mm. long; leaves 2, ovate, 3-8 cm. long, 2-4 cm. wide, obtuse or subacute, rounded at base, the petioles sheathing at base; peduncles 8-20 cm. long, erect; racemes 3-8 cm. long, 10- to 20-flowered; flowers pale green or dark purple; bracts deltoid, subacute, spreading, 1-1.5 mm. long; sepals linear, 10-12 mm. long, subacute, the lateral ones spreading; petals reflexed, filiform, 8-10 mm. long, acute; lip 6-8 mm. long, about 2/3 as long as the petals, abruptly reflexed near the base, the limb spreading, narrowly ovate-oblong, with slightly recurved margins, caudate; column about 2 mm. long, almost wingless.—May-July. Woods; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

Var. *shichitoana* Ohwi. ? *Liparis nikkoensis* Nakai—HIME-JIGABACHI-SŌ. Plant smaller; sepals about 7 mm. long; lip 6 mm. long.—Honshu.

8. *Liparis japonica* (Miq.) Maxim. *Microstylis japonica* Miq.—SEITAKA-SUZUMUSHI-SŌ. Plants 20-40 cm. high; pseudobulbs ovoid-globose, 6-12 mm. long; leaves 2, narrowly ovate or ovate-oblong, 6-10 cm. long, 2-3.5 cm. wide, acute, cuneate or acute at base, the petioles 4-8 cm. long, sheathing at base; peduncles 20-40 cm. long, erect; racemes 10-20 cm. long, loosely many-flowered; bracts spreading, deltoid-ovate, 1-1.5 mm. long, acute; flowers pale green or purplish; sepals linear-lanceolate, 8-9 mm. long, subobtus; petals as long as the sepals, filiform; lip obovate, flat, 7-8 mm. long, 4.5-5.5 mm. wide, pointed, erect, slightly recurved at tip; column about 2.5 mm. long, narrowly deltoid-winged.—June-Aug. Woods; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and Amur.

9. *Liparis makinoana* Schltr. *L. lilifolia* sensu auct. Japon., non L. C. Rich.—SUZUMUSHI-SŌ. Plant 15-30 cm. high; pseudobulbs ovoid-globose, 8-12 mm. long; leaves 2, elliptic to oblong, 5-10 cm. long, 2.5-3.5 cm. wide, obtuse at tip, abruptly narrowed at base to the short-sheathing petiole; peduncles 15-30 cm. long; racemes 10-20 cm. long, rather loosely many-flowered; bracts spreading, deltoid-ovate, acute, 1-1.5 mm. long; flowers pale green or purplish; sepals linear-lanceolate, 8-9 mm. long, subobtus; petals as long as the sepals, filiform; lip obovate, flat, erect, 12-18 mm. long, 10-15 mm. wide, rounded, with a slightly recurved mucronate tip; column about 2.5 mm. long, narrowly winged at tip.—May-July. Woods; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

45. PHAJUS Lour. GANZEKI-RAN ZOKU

Rather large terrestrial herbs with pseudobulbs; leaves relatively large, plicate, narrowed at both ends, the petiole attached to the pseudobulb; scapes from the base of the pseudobulbs; flowers racemose, relatively large, yellowish, rarely white or purple, pedicelled, the bracts minute or leaflike, sometimes caducous; sepals free, ascending; petals narrower than the sepals; lip erect,

dilated at tip, usually short-spurred at base, the lateral lobes large and loosely embracing the column in natural position, the terminal lobe broad; column broadened in upper part, with a ridge or wing on both sides, without a foot; anthers incurved; pollinia 8, 4 in each locale, waxy; capsules oblong.—About 50 species, in w. Africa, tropical and e. Asia, and Polynesia.

1A. Leaves to 17 cm. wide; sepals and petals narrowly oblong, acuminate, about 5 cm. long; lip with the lobes undulate near tip.

1. *P. tankervilleae*

1B. Leaves 5–8 cm. wide; sepals and petals oblong, obtuse, about 3.5 cm. long; lip with the lobes strongly papillose, crispate-dentate near tip. 2. *P. minor*

1. *Phajus tankervilleae* (Banks ex L'Hérit.) Bl. *Limodorum tankervilleae* Banks ex L'Hérit.; *Bletia tankervilleae* (Banks ex L'Hérit.) R. Br.; *P. grandifolius* Lour.; *Calanthe speciosa* Vieill.—KAKU-RAN, KWAKU-RAN, KWA-RAN. Glabrous, terrestrial, tufted herb; leaves 2 or 3 from the pseudobulb, ovate-lanceolate or oblong, to 70 cm. long, 17 cm. wide, plicate, attenuate, acuminate, gradually narrowed at base to the long petiole; scapes 60–70 cm. long, erect, terete, the bladeless sheaths 4–7 cm. long; racemes erect, the bracts deciduous; sepals and petals narrowly oblong, about 5 cm. long, 1–1.5 cm. wide, nearly equal, acuminate, spreading; lip slightly shorter than the sepals, broadly rhombic-obovate, loosely embracing the column in natural position, shallowly 3-lobed, 3-keeled on the inside, the lobes short, rounded, with undulate margins; spur terete, slender, about 1 cm. long, slightly broadened toward the base; column about 2 cm. long.—Kyushu (Tanegashima); very rare; sometimes cultivated.—Ryukyus, Formosa, China, Malaysia, Polynesia, and Australia.

2. *Phajus minor* Bl. *P. maculatus* var. *minor* (Bl.) Fr.

& Sav.—GANZEKI-RAN. Pseudobulbs narrowly ovoid-conical, angled, 3–5 cm. long; leaves 3–5 on the pseudobulb, narrowly oblong to broadly oblanceolate, 20–40 cm. long, 5–8 cm. wide, acuminate at both ends, plicate, the petioles 20–30 cm. long; scapes 40–60 cm. long, erect, rather stout, with few membranous, sheathing scales; racemes 15–25 cm. long, 5- to 18-flowered, the bracts membranous, oblong, subacute, nerved, 15–20 mm. long; flowers yellow, becoming indigo-blue when dry; sepals and petals narrowly oblong, 3–3.5 cm. long, 1–1.5 cm. wide, obtuse, nerved, obliquely spreading; lip cuneate-obovate, slightly shorter than the other perianth lobes, loosely embracing the column in natural position, 3-lobed, with strongly papillose, crispate-dentate margins near tip, the lateral lobes semicircular, the terminal lobe broader and denticulate; spur 7–8 mm. long, lanceolate; column about 2 cm. long, long-pubescent on the inner surface; capsules pedicelled, pendulous, narrowly oblong, 3–4 cm. long.—June. Honshu (Izu-Shichitō Is. and Kii Prov.), Shikoku, Kyushu; rather rare. *Forma punctatus* Ohwi. Leaves white-maculate. Occurs with the typical phase.

46. CALANTHE R. Br. EBINE ZOKU

Plants terrestrial, with pseudobulbs; leaves few, radical, relatively large, plicate; scapes usually leafless; inflorescence simple, racemose, the bracts small or prominent; sepals equal, free, spreading; petals similar to the sepals or narrower; lip clawed, adnate to the base of the column, spurred or spurless, the limb spreading, often 3-lobed, the terminal lobe sometimes bifid; column short, erect, without a foot, winged or rarely wingless; anthers nearly terminal; pollinia 8, in 2 locules, waxy; capsules oblong, usually pendulous.—About 200 species, in tropical and temperate regions of Asia, 1 in Central America.

1A. Bracts caducous; scapes from lower nodes of elongate sterile shoots; flowers small, pale yellow; spur absent. 1. *C. venusta*

1B. Bracts persistent; scapes radical.

2A. Scapes from the fascicles of young leaves; flowers in elongate loose racemes.

3A. Flowers spurred.

4A. Flowers yellowish green; sepals 7–9 mm. long; spur 2–8 mm. long.

5A. Leaves 1–2 cm. wide; bracts 1–2 cm. long, linear-lanceolate; spur narrowly cylindric, about 8 mm. long. 2. *C. bungeana*

5B. Leaves 3–6.5 cm. wide; bracts about 4 mm. long, short-setaceous; spur oblong, about 2 mm. long. 3. *C. oblanceolata*

4B. Flowers white, rose, brownish or yellow; sepals 15–30 mm. long.

6A. Spur shorter than the sepals; leaves glabrous.

7A. Leaves oblanceolate to narrowly oblong; petals linear-lanceolate; bracts lanceolate, 1–2 cm. long. 4. *C. nipponica*

7B. Leaves obovate-oblong; petals obovate-spathulate or narrowly ovate; bracts 5–10 mm. long. 5. *C. discolor*

6B. Spur longer than or as long as the sepals.

8A. Leaves puberulent beneath; lip 3-lobed; spur 15–18 mm. long; ovary puberulent. 6. *C. aristulifera*

8B. Leaves glabrous beneath; lip entire, minutely fimbriate; spur 2–2.3 cm. long; ovary glabrous. 7. *C. schlechteri*

3B. Flowers spurless.

9A. Petals broadly linear; lip flat, cuspidate. 8. *C. reflexa*

9B. Petals oblanceolate; lip with cristate ridges on inner side, deeply retuse. 9. *C. torifera*

2B. Scapes from the fascicles of full-grown leaves; flowers in dense short racemes; spur slender; leaves sparsely pilose beneath.

10A. Leaves narrowly oblong to obovate-oblong, acuminate at both ends; flowers white to rose-purple; lip with 3 series of protuberances near base within; spur longer than the sepals. 10. *C. furcata*

10B. Leaves elliptic to ovate, abruptly acuminate, rounded at base; flowers white; lip with a relatively large 5-lobed callosity; spur shorter than the sepals. 11. *C. japonica*

1. *Calanthe venusta* Schltr. *C. gracilis* sensu auct. Japon., non Lindl.—TOKUSA-RAN. Plant indigo-black when dried; sterile shoots elongate, 50–100 cm. long, leafy at apex, the nodes conspicuous; leaves narrowly oblong, 20–40 cm. long, 4–7 cm. wide, acuminate at both ends, glabrous, the

lower ones smaller and sheathlike; flowering stems 40–60 cm. long, from the lower nodes of the sterile shoots, with several reduced sheathing leaves in the lower part; racemes 30–40 cm. long, spreading white-pubescent, loosely many-flowered, the bracts broadly linear, acuminate, 1.5–3 cm. long, caducous;

flowers pale yellow; spur absent; sepals reflexed-spreading, oblong-ovate, 10–13 mm. long, about 3 mm. wide, caudate-acuminate, 3-nerved; petals 7–8 mm. long, obtuse, oblong-ovate; lip as long as the sepals, quadrangular-oblong, 3-lobed, the lateral lobes ascending, ovate, the terminal lobe broadly clawed, the limb transversely oblong, truncate, crispate-denticulate; ovary pedicelled.—Nov. Woods in mountains; Kyushu (s. distr.); rather common.—Ryukyus and Formosa.

2. *Calanthe bungoana* Ohwi. TAGANE-RAN. Rhizomes short; leaves linear-oblancoate, 30–50 cm. long, 1.5–2 cm. wide, acuminate, gradually narrowed at base, glabrous, short-petiolate; scapes about 65 cm. long, white-puberulent, with 2 sheathing scales on the lower half; racemes rather densely many-flowered, about 10 cm. long, the bracts linear-lanceolate, 1–2 cm. long, green; flowers yellowish green; sepals ovate, puberulent without, about 7 mm. long, acute, reflexed-spreading; petals oblancoate, about 6 mm. long, acute; lip slightly longer than the sepals, 3-lobed, with 3 crested merging veins on the inner side, the lateral lobes 4–5 mm. long, elliptic, the terminal lobe broadened at tip, bifid; spur about 8 mm. long, straight; ovary pedicelled, puberulent.—Kyushu (Bungo Prov.); very rare.

3. *Calanthe oblanceolata* Ohwi & T. Koyama. SAKURAJIMA-EBINE. FIG. 3. Terrestrial perennial herb with thick, rather short rhizomes; leaves in fascicles of 3 or 4, oblanceolate, 40–50 cm. long, 3–6.5 cm. wide, 3- to 7-nerved, densely puberulent on under side; scape 40–70 cm. long, minutely puberulent; racemes densely many-flowered, about 20 cm. long; flowers greenish yellow, half-open; median sepal ovate-oblong, about 9 mm. long, 3-nerved, pubescent outside, the lateral elliptic-oblong; petals linear-oblancoate, about 1.3 mm. wide, the lip straight, about 9 mm. long, 3-lobed, with 3 irregular raised ridges inside, the lateral lobes small, the median obtriangular, rounded to emarginate at apex, the spur short, straight, about 2 mm. long.—May. Kyushu (s. distr.); rare.

4. *Calanthe nipponica* Makino. *C. trulliformis* var. *hastata* Finet—KINSEI-RAN. Rhizomes short; leaves 3–5, oblanceolate to narrowly oblong, 15–30 cm. long, 1.5–3.5 cm. wide, glabrous, acuminate, narrowed to a short sheath at base; scapes 30–60 cm. long, puberulent in upper part; racemes loosely 5- to 12-flowered, 15–20 cm. long, the bracts lanceolate, acuminate, 1–2 cm. long, green; sepals spreading, broadly lanceolate, 15–20 mm. long, acuminate; petals linear-lanceolate, 15–17 mm. long, acuminate, narrowed toward the base; lip deltoid-ovate, as long as the sepals, the limb abruptly broadened, shallowly 3-lobed, with crested ridges in the center, the lateral lobes short, ascending-spreading, the terminal lobe quadrangular-ovate, cuspidate, undulate on margins; spur about 5 mm. long.—June. Woods; Hokkaido, Honshu (centr. and n. distr.); rather rare.

5. *Calanthe discolor* Lindl. *C. lurida* Decne.—EBINE. Rhizomes short and thick; leaves 2 or 3, narrowly obovate-oblong, 15–25 cm. long, 4–6 cm. wide, acute, petiolate, glabrous; scapes 30–50 cm. long, puberulent in upper part, with 1 or 2 sheathing scales; racemes 5–15 cm. long, loosely about 10-flowered, the bracts lanceolate, 5–10 mm. long, scarious; sepals spreading, narrowly ovate, 15–20 mm. long, acute or mucronate, narrowed toward the base, dark brown to greenish; petals slightly smaller than the sepals, obovate-spathulate or narrowly ovate; lip flabellate, as long as the sepals, rose or white, deeply 3-lobed, with 3 median ridges, the lateral lobes ascending, broadly cuneate, entire, the terminal lobe broadly

cuneate, bifid; spur 5–10 mm. long.—Woods in foothills; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.

Var. *bicolor* (Lindl.) Makino. *C. striata* R. Br. ex Miq.; *C. striata* var. *bicolor* (Lindl.) Maxim.; *C. bicolor* Lindl.—TAKANE. Flowers larger, not fully expanding; terminal lobe of lip not prominently lobed.—Apr.–May. Kyushu.—Forma *sieboldii* (Decne.) Ohwi. *C. sieboldii* Decne.; *C. striata* var. *sieboldii* (Decne.) Maxim.; *C. striata* forma *sieboldii* (Decne.) Ohwi.—KI-EBINE. Flowers clear yellow.

6. *Calanthe aristulifera* Reichenb. f. *C. kirishimensis* Yatabe—KIRISHIMA-EBINE. Rhizomes short; leaves 2 or 3, narrowly obovate-oblong, 15–20 cm. long, 3–5 cm. wide, acute to short-acuminate, narrowly cuneate, puberulent beneath, rather long-petiolate; scapes 30–40 cm. long, puberulent in upper part, with a few scalelike leaves; racemes 8–12 cm. long, loosely about 10-flowered, brownish puberulent, the bracts linear-lanceolate, membranous, acuminate, 4–8 mm. long; flowers half-opened at anthesis, white, sometimes with a rose tint; sepals narrowly ovate-oblong, about 15 mm. long, acuminate, puberulent outside; petals narrower but as long as the sepals; lip 3-lobed, slightly shorter or as long as the sepals, deltoid-flabellate, the inner side with 3 elevated ridges, the lateral lobes ascending, the terminal lobe broadly cuneate, truncate, mucronate; spur 15–18 mm. long; ovary puberulent.—May. Honshu (Hachigo Isl.), Kyushu.

7. *Calanthe schlechteri* Hara. *C. alpina* sensu auct. Japon., non Hook. f.—KISO-EBINE. Rhizomes short; leaves 2 or 3, narrowly obovate-oblong, 15–20 cm. long, 3–4 cm. wide, acute, narrowly cuneate, glabrous; scapes 25–30 cm. long, glabrous, with 1 scale; racemes 5–7 cm. long, 3- to 8-flowered, glabrous, the bracts lanceolate, 8–15 mm. long, acuminate; flowers pendulous; sepals broadly lanceolate to narrowly ovate, 15–17 mm. long, 4–6 mm. wide, acuminate, mucronate, purplish; petals lanceolate, 12–15 mm. long, about 3 mm. wide, acuminate, purplish; lip erect, slightly shorter than the sepals, nearly rounded, entire, minutely fimbriate, pale yellow with darker striations; spur narrowed above, 2–2.3 cm. long; ovary glabrous.—July–Sept. Honshu (centr. distr.), Shikoku (Mount Ishizuchi); very rare.

8. *Calanthe reflexa* Maxim. *Paracalanthe reflexa* (Maxim.) Kudo; *C. okushiriensis* Miyabe & Tatew.; *C. reflexa* var. *okushiriensis* (Miyabe & Tatew.) Ohwi—NATSU-EBINE. Rhizomes short; leaves 3–5, narrowly oblong to broadly oblanceolate, 10–30 cm. long, 3–6 cm. wide, acuminate, usually puberulent beneath, narrowed toward the base; scapes 20–40 cm. long, puberulent above, with a solitary green scale; racemes 10–15 cm. long, loosely 10- to 20-flowered, the bracts lanceolate, acuminate, green, 1–2 cm. long, puberulent; flowers pale purple; sepals gradually acuminate, 15–20 mm. long, the dorsal sepal narrowly ovate, the lateral ones ovate, reflexed; petals 12–15 mm. long, 1.5–2 mm. wide, broadly linear, acuminate; lip flat, broadly ovate, as long as the sepals, cuspidate, deeply 3-lobed, the terminal lobe relatively large, broadly cuneate-elliptic, with undulate margins, rounded, mucronate; spur absent.—Aug. Honshu, Shikoku, Kyushu.

9. *Calanthe torifera* Schltr. *C. tricarinata* sensu auct. Japon., non Lindl.—SARUMEN-EBINE. Rhizomes short; leaves 2–4, narrowly obovate-oblong, 15–25 cm. long, 6–8 cm. wide, abruptly acuminate, narrowed toward the base, glabrous or scattered puberulent beneath; scapes 30–50 cm. long, with 1 scale about the middle; racemes 15–30 cm. long, loosely 7- to 15-flowered, the bracts membranous, narrowly triangular,

FIG. 3.—*Calanthe oblanceolata* Ohwi & T. Koyama. 1, Habit; 2, fruiting raceme; 3, tepals; 4, labellum, seen from below and from above.

5-8 mm. long, acuminate; sepals spreading, narrowly ovate-oblong, 2-2.5 cm. long, 7-10 mm. wide, acute, 5-nerved, brownish green, tinted purple; petals broadly oblanceolate, 17-22 mm. long, 4-5 mm. wide, acute; lip as long as the sepals, deeply retuse, with cristate ridges on inner side, the lateral lobes small, the terminal lobe rounded, about 15 mm. wide, purplish brown, strongly crisped-undulate, with 3 crested incised ridges within; spur absent.—May-June. Hokkaido, Honshu, Shikoku, Kyushu; rather rare.

10. *Calanthe furcata* Batem. *C. veratrifolia* sensu auct. Japon., non R. Br.; *C. triplicata* Ames, excl. syn.; *C. matsumurana* Schltr.; *C. textori* Miq.—TSURU-RAN, KWA-RAN. Rhizomes short; leaves 3-6, rather long-petiolate, narrowly oblong to obovate-oblong, 20-40 cm. long, acuminate at both ends, puberulent beneath; scapes 40-80 cm. long, arising from the fascicle of fully grown leaves, densely white-puberulent; racemes 5-10 cm. long, densely many-flowered, the bracts spreading, recurved, narrowly ovate, 7-20 mm. long, acute, few-nerved, green; flowers white to rose-purple; sepals obovate or elliptic, spreading, 12-15 mm. long, obtuse, mucronate; petals as long

as the sepals and slightly narrower; lip ascending, longer than the sepals, 3-lobed, with 3 series of yellow protuberances near the base within, the lateral lobes ascending, oblong, the terminal lobe large, broadly obtriangular, deeply bifid, the lobules rounded, ascending, cuneate; spur slender, 1.5-2 cm. long, curved upward, longer than the sepals.—July-Oct. Kyushu (s. distr., incl. Yakushima and Tanegashima).—Ryukyus, Formosa, China, Malaysia, Bonins, and Micronesia.

11. *Calanthe japonica* Bl. *C. austrokiusiuensis* Ohwi —HIRO-HA-NO-KWA-RAN. Rhizomes short; leaves few, elliptic to ovate, to 20 cm. long, 10 cm. wide, abruptly acuminate, rounded at base, puberulent beneath, the petioles 7-10 cm. long; scapes 30-40 cm. long, densely puberulent above, with 1 or 2 scales; racemes 8-10 cm. long, many-flowered, densely puberulent, the bracts spreading or reflexed, narrowly ovate, few-nerved; flowers white; sepals broadly ovate to broadly obovate, about 8 mm. long, subobtusely spreading, with minute brown pubescence outside; petals rounded-rhombic, about 6 mm. long, obtuse; lip with a relatively large 5-lobed callosity; spur shorter than the sepals.—Kyushu (s. distr.).

47. TAINIA BL. HIME-TOKEN-RAN ZOKU

Rhizomes creeping, the sterile shoots with pseudobulbs; leaves solitary and terminal on the pseudobulb, jointed at base, long-petiolate, lanceolate or oblong; scape with a few sheathing scales at base; racemes simple; flowers pedicelled, loosely arranged, relatively large; sepals narrow, the dorsal free, the lateral ones adnate to the base of the column; petals as long as the sepals, sometimes narrower; lip erect, from the base of the column, spurless or short-spurred, the lateral lobes erect, the terminal lobe spreading, broader, entire; column rather elongate, slightly incurved, narrowly winged; anthers terminal, 2-locular; pollinia 8, 4 in each locule, ovate, waxy.—About 15 or more species, in India, e. Asia, and Malaysia.

1. *Tainia laxiflora* Makino. *Oreorchis laxiflora* T. Ito ex Makino, in syn.—HIME-TOKEN-RAN. Rhizomes slender, the conical pseudobulbs about 10 mm. long, interspersed while young with sheathing scales; leaves rather thick, deep green, oblong-lanceolate, gradually acute, glabrous, conspicuously nerved, the petioles 2-3 cm. long; scapes erect, slender, 20-30 cm. long, with 1 or 2 sheaths at base; racemes about 10 cm. long, loosely flowered, the bracts linear-lanceolate, 4-5 mm. long, acuminate; flowers brownish white; sepals yellowish

brown, obliquely spreading, linear-lanceolate, 12-15 mm. long, about 2 mm. wide, acute; petals white, ascending-spreading, similar to and contiguous with the dorsal sepal; lip 8-10 mm. long, white, tinged rose-purple, cuneate, with a short chin at base, 3-lobed, the lateral lobes ascending, short, obtuse, the dorsal lobe transversely oblong, narrowed at base, truncate and entire at apex, spurless; ovary pedicelled.—May. Woods; Honshu (Izu Shichitō Isl.), Kyushu; rather rare.—Ryukyus.

48. EULOPHIA R. BR. IMO-RAN ZOKU

Terrestrial herb with pseudobulbs; leaves distichous, radical, usually from one side of pseudobulb; scapes erect, scaly, rising laterally from the base of leafy stems; racemes simple or rarely branched, the flowers relatively small, pedicelled, the bracts membranous; sepals equal, free, the lateral spreading, sometimes adnate below to the base of the column; petals spreading, often connivent above; lip erect from the base of the column, saccate or spurred at the base, 3-lobed, the lateral lobes erect, loosely embracing the column or obsolete, the terminal lobe spreading to recurved, entire or bifid, with elevated lines or crests on the center within; column short, thick, without a foot, usually winged; anthers terminal, subglobose; pollinia 2 in each cell, ovoid, waxy; capsules ovoid to oblong, not beaked, pendulous.—More than 50 species, in Africa, Asia, and Australia, a few in South America.

1. *Eulophia ochobiensis* Hayata. IMONE-YAGARA. Stout, glabrous, terrestrial herb about 50 cm. high; scapes terete, the scales few, thinly membranous, appressed, ovate, about 3 cm. long, acute, weakly nerved, short-sheathing; racemes to 30 cm. long, erect, loosely many-flowered, the bracts greenish, flat, broadly linear, 1.5-2.5 cm. long, 1.5-2.5 mm. wide, 3- or 5-nerved, acuminate; flowers slightly expanded; sepals obovate-oblong, about 2 cm. long, 8 mm. wide, abruptly acuminate, 5- to 7-nerved; petals obovate, obtuse, 3/4 as long

as the sepals; lip suberect, slightly shorter than the sepals, obovate, 3-lobed, papillose on the nerves inside, with 2 low ridges on the center, the lateral lobes rounded, 4-5 mm. long and as wide, the terminal lobe ascending, ovate-rounded, 7 mm. long and as wide, obtuse, entire, the spur compressed-conical, obtuse, about 4 mm. long and as wide; column plano-convex, about 6 mm. long, 4 mm. wide.—July. Kyushu (Tanegashima and Ohsumi Prov.); very rare.—Ryukyus and Formosa.

49. CREMASTRA Lindl. SAIHAI-RAN ZOKU

Terrestrial herbs with creeping rhizomes and pseudobulbs; leaves solitary, large, slightly plicate, narrowed to the petiole; scapes loosely sheathed; racemes simple, the flowers slender, nearly tubular, short-pedicelled, pendulous or nodding, the bracts linear, short; sepals and petals free, narrow, erect; lip from the base of the column, free, linear, erect, slightly saccate, the lateral lobes small, the terminal lobe oblong, entire; column linear, erect, essentially terete; anthers terminal; pollinia 4 in each cell, waxy; capsules ellipsoidal.—About 5 species, in c. Asia and the Himalayas.

1A. Leaves 25–40 cm. long, 4–5 cm. wide; flowers densely arranged, 3–3.5 cm. long, with erect sepals; terminal lobe of lip not geniculate.

1. *C. variabilis*

1B. Leaves 10–12 cm. long, 3–5 cm. wide; flowers loosely arranged, 18–20 mm. long, with ascending sepals; terminal lobe of lip geniculate.

2. *C. unguiculata*

1. *Cremastra variabilis* (Bl.) Nakai. *Hyacinthorchis variabilis* Bl.; *C. wallichiana* sensu auct. Japon., non Lindl.; *C. mitrata* A. Gray; *C. appendiculata* Makino, excl. syn.—SAIHAI-RAN. Terrestrial herb; pseudobulbs ovoid, about 3 cm. long; leaves solitary, rarely 2, terminal on the pseudobulb, narrowly oblong, 25–45 cm. long, 4–5 cm. wide, long-acuminate, narrowed below to the petiole, often white- or pale yellow-maculate, with 3 main nerves and intervening veinlets; scapes erect, 30–50 cm. long, terete, loosely few-sheathed; racemes 10–20 cm. long, 10- to 20-flowered, sulcate, rather dense, the bracts thinly membranous, linear-lanceolate, 7–10 mm. long, acuminate; flowers pendulous, rose to rose-purple with a brownish tinge; sepals and petals linear-oblancoate, 3–3.5 cm. long, 4–5 mm. wide, acuminate; lip about 3 cm. long, slightly broadened at base, erect, 3-lobed, the lateral lobes lanceolate, small, erect, the terminal lobe oblong, about 9 mm. long, truncate and slightly recurved at tip; column about 2.5 cm. long, slightly broadened at tip; capsules 2–2.5 cm. long, nearly sessile, pendulous.—May–June. Woods in hills and low elevations in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—s. Sakhalin, s. Kuriles, and s. Korea.

2. *Cremastra unguiculata* (Finet) Finet. *Oreorchis unguiculata* Finet.—TOKEN-RAN. Pseudobulbs ovoid-globose, about 10 mm. long; leaves 2, sometimes solitary, terminal on the pseudobulb, oblong, 10–12 cm. long, 3–5 cm. wide, acute to abruptly acuminate, 3-nerved and with intervening veinlets, deep green with rather large dark purple spots above, purplish beneath, the petioles 4–6 cm. long; scapes slender, erect, 25–40 cm. long, with 2 sheathing scales; racemes loosely few-flowered, 8–10 cm. long, glabrous; flowers ascending, not fully open, 18–20 mm. long, the bracts lanceolate, membranous, 4–6 mm. long; sepals ascending, linear-oblancoate, 18–20 mm. long, acute, narrowed at base, yellowish brown with purple striations; petals linear, 14–16 mm. long, acute, closely contiguous with the dorsal sepal; lip as long as the petals, linear, embracing the lower part of the column, barely inflated at base, white, 3-lobed, the lateral lobes erect, lanceolate, much smaller than the terminal one, the terminal lobe obovate, about 5 mm. long, rounded at apex, undulate on margin; column 12–13 mm. long.—May–June. Woods in foothills; Hokkaido, Honshu, Shikoku; rare.

50. OREORCHIS Lindl. KOKEI-RAN ZOKU

Terrestrial herbs; pseudobulbs with 1 or 2 narrow plicate leaves; scape erect, simple, with a few sheathing scales at base; flowers relatively small, in terminal racemes, pedicelled, the bracts linear, minute; sepals and petals equal, free, narrow, ascending or with incurved tips; lip as long as the sepals, inserted at the base of the column, spurless, the claw erect, the limb 3-lobed, the lateral lobes erect, short, narrow, the terminal lobe broad; column elongate, nearly terete, subclavate in upper part, wingless, without a foot; anther terminal, pollinia 4, distinct, nearly globose; capsules oblong or fusiform, reflexed.—About 10 species, in n. India, China, Formosa, Korea, Japan and e. Siberia.

1. *Oreorchis patens* (Lindl.) Lindl. *Corallorhiza patens* Lindl.; *O. lancifolia* A. Gray; *O. gracilis* Fr. & Sav.; *O. patens* var. *gracilis* (Fr. & Sav.) Makino.—KOKEI-RAN. Pseudobulbs ovoid-globose, 1.5–2 cm. long; leaves 1 or 2, narrowly to broadly lanceolate, 20–30 cm. long, 1–3 cm. wide, gradually acuminate at both ends, short-petiolate; scapes 30–40 cm. long, with 2 membranous sheaths on the lower part; racemes 10–20 cm. long, relatively many-flowered; flowers yellowish brown; bracts membranous, linear, 4–6 mm. long, acuminate; sepals and petals ascending, lanceolate, 8–10 mm. long, subobtuse;

petals closely contiguous on the dorsal sepal; lip ascending, as long as the sepals, white with dark purple spots, 3-lobed from the base, the lateral lobes lanceolate, 4–5 mm. long, obtuse, erect, the terminal lobe cuneate-obovate, denticulate, 2-ridged on the inside; column about 9 mm. long; capsules pendulous, short-pedicelled, narrowly fusiform, about 20 mm. long.—Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather rare.—China, Ussuri, Sakhalin, s. Kuriles, and Kamchatka.

51. DACTYLOSTALIX Reichenb. f. ICHIYŌ-RAN ZOKU

Terrestrial herbs with short rhizomes; leaves solitary, ovate, petiolate; scapes 1- to 2-sheathed; flowers terminal, solitary, relatively large, short-pedicelled; sepals and petals narrow, alike, ascending; lip slightly concave, short-clawed at base, spurless, 3-lobed, the lateral lobes short, erect, the terminal obovate, recurved at tip, undulate on margins; column rather long, winged, with 2 appendages at the apex; anther with 4 pollinia.—One species, in Japan.

1. *Dactylostalix ringens* Reichenb. f. *Pergamena uniflora* Finet; *Calypso japonica* Maxim. ex Komar.; *D. maculosa* Miyabe & Kudo—Ichiyō-RAN. Rhizomes creeping, slender; leaves solitary, radical, ovate, 3–6 cm. long, 3–4 cm. wide, subobtusely, obtuse to rounded at base, petiolate; scapes 10–20 cm. long, with 2 or 3 short sheaths on lower half; flowers solitary, the bracts thinly membranous, quadrangular-elliptic to ovate, 2–3 mm. long; sepals and petals pale green, oblanceolate to linear-lanceolate, 2–2.5 cm. long, subobtusely, ascending, 3-nerved; lip erect, ovate, cuneate, 3-lobed, the lateral lobes

broadly ovate, 2–3 mm. long and nearly as broad, obtuse, purplish on upper half, the terminal lobe obovate-rounded, recurved, about 7 mm. long and as wide, white with purple spots, more or less undulate on the margins, with 2 short ribs near the base; spur absent; column about 10 mm. long, flat, narrowly cuneate-oblong, rather broadly winged; ovary 3-angled; capsules clavate-fusiform, short-pedicelled, about 2 cm. long, ascending.—May–July. Woods in mountains; Hokkaido, Honshu, Shikoku.

52. DENDROBIUM Sw. SEKKOKU ZOKU

Tufted epiphytic herbs; stems usually elongate, leafy, terete, nodose, fleshy, with tight and persistent leaf-sheaths; leaves subcoriaceous, flat; flowers 1 to several, relatively large, in racemes or fascicles, the bracts minute or absent; sepals more or less alike, the dorsal free, the lateral ones oblique at the base and adnate to the base of the column, often forming a spurlike chin; petals similar to the dorsal sepal; lip attached to the base of the column-foot, narrowed at base, often 3-lobed, the limb often with 2 to 3 series of elevated ribs; column short, usually winged; anther terminal, 2-locular, pollinia 4 in each cell, waxy; capsules ovoid to oblong.—About 1,000 species, in India, Malaysia, s. Asia, and Australia.

1A. Flowers 1 or 2, white or pale rose, fasciculate; dorsal sepal and petals 2–2.5 cm. long. 1. *D. moniliforme*
1B. Flowers 3 to 8, pale greenish yellow, loosely racemose; dorsal sepal and petals 12–15 mm. long. 2. *D. tosaense*

1. *Dendrobium moniliforme* (L.) Sw. *Epidendrum moniliforme* L.; *E. monile* Thunb.; *Oncidium japonicum* Bl.; *D. monile* (Thunb.) Kraenzl.—SEKKOKU, SEIKIKOKU. Stems tufted, erect, 5–25 cm. long, terete, the internodes 2–4 cm. long, 3–6 mm. in diameter, covered by a tight membranous sheath; leaves lanceolate, 4–7 cm. long, 7–15 mm. wide, obtuse, rounded at the base; flowers 1 or 2 in the upper nodes of 3-year old stems, fasciculate, pedicelled, white or pale rose, fragrant, the minute bracts basal; dorsal sepal lanceolate, 2–2.5 cm. long, 5–7 mm. wide, acute, the lateral ones obliquely broadened at base; petals similar to the dorsal sepal, slightly shorter; lip cuneate, erect to ascending, the limb slightly recurved at tip, about as long as the petals, narrowly ovate-triangular, acute; column very short, about 2 mm. long on the back, the chin in front about 8 mm. long.—May–June. Epiphytic on tree-branches and rocks in mountains; Honshu (centr. & s. distr. incl. Izu Shichitō Is.), Shikoku, Kyushu; rather rare.—s. Korea and China.

2. *Dendrobium tosaense* Makino. KIBANA-NO-SEKKOKU. Stems tufted, 25–40 cm. long, terete, the internodes 2–6 cm. long; leaves lanceolate, 2–7 cm. long, 7–17 mm. wide, acute to subobtusely, rounded to obtuse at the base and jointed at the attachment with the sheath; racemes 4–7 cm. long, from the upper nodes of 2- to 3-year old stems, short-pendunculate, the axis slender, flexuous, the bracts linear-lanceolate, 3–6 mm. long, acute; flowers 3–8, pale greenish yellow, loosely racemose; dorsal sepal broadly lanceolate, 12–15 mm. long, acute; petals similar, 10–12 mm. long, the chin about 10 mm. long; lip ascending, the limb nearly as long as the sepals, slightly recurved at the tip, ovate, acute, narrowed to the base, with a few short dark purple striations at the center below; column pale green, rounded on the back, 3–4 mm. long, with dark purple spots within.—July–Nov. Epiphytic on tree branches; Shikoku, Kyushu; rather rare.—Ryukyus.

53. ERIA Lindl. OSA-RAN ZOKU

Epiphytic herbs with short rhizomes and pseudobulbs (stems); stems 2- to many-flowered; scapes 1- to many-flowered; flowers relatively small, in racemes, the bracts narrow; sepals equal, the dorsal lobe free or united with the lateral lobes at base, the lateral sepals forming a spurlike chin at the base and adnate with the column-foot; petals similar to the dorsal sepal; lip joined with the foot, recurved at tip, entire or with a small lateral lobe on each side; column short, concave in front, often wing-margined, the base elongate, simulating a foot in front; anther terminal, the locules 2, distinct, incompletely 4-septate; pollinia 8, 4 in each locule, on 2 glands, with caudicles; capsules oblong to linear.—About 400 species, in e. Asia, Malaysia, and India.

1A. Pseudobulbs 1–2.5 cm. long, 5–10 mm. in diameter; leaves 4–8 cm. long; flowers 1 or 2, the peduncle naked, scapose; terminal lobe of lip 3-ribbed. 1. *E. reptans*
1B. Pseudobulbs 1–6 cm. long, 5–25 mm. in diameter; leaves 8–30 cm. long; flowers 10–16, the peduncle few-scaled, scapiform; terminal lobe of lip 5-ribbed. 2. *E. yakushimensis*

1. *Eria reptans* (Fr. & Sav.) Makino. *Dendrobium reptans* Fr. & Sav.; *E. japonica* Maxim.; *E. hosokawae* Hawkes & Heller.—OSA-RAN. Pseudobulbs in a series on the short, creeping rhizomes, narrowly oblong-cylindrical to quadrangular-oblong, slightly flattened, 1–2.5 cm. long, 5–10 mm. in diameter, red-brown, sheathed while young; leaves 2, narrowly oblong to broadly lanceolate, 4–8 cm. long, 1.2–2 cm. wide, acuminate, narrowed to the base and jointed with the short

sheaths, several-nerved, deciduous in autumn; scapes 1 or 2, 2–6 cm. long, with scattered short brown crisped hairs; flowers 1 or 2, the bracts narrowly ovate, 3–4 mm. long; flowers white; dorsal sepal and petals free, broadly lanceolate, 8–10 mm. long, subobtusely, slightly incurved at tip, the lateral sepals forming a chin 3–4 mm. long at base; lip rather short, broadly cuneate, 3-ribbed within, pale reddish brown in the center, retuse, the lateral lobes relatively small, the terminal trans-

versely quadrangular-oblong, truncate; column terete, about 4 mm. long.—July–Aug. Epiphyte on trees, sometimes also occurring on mossy rocks; Honshu (sw. distr. and Izu-shichitō Isls.), Shikoku, Kyushu.—Ryukyus (Amami-Oshima).

2. *Eria yakushimensis* Nakai. Ō-OSA-RAN. Plant evergreen; pseudobulbs 1–6 cm. long, 5–25 mm. in diameter, green, slightly compressed and angular, 3-sheathed while young; leaves 2, linear-lanceolate to oblanceolate, 8–30 cm. long, 15–40 mm. wide, acute, lustrous above; scapes with few scales; ra-

cemes 5–8 cm. long, the bracts minute or absent; flowers 10–16; dorsal sepal oblong-lanceolate, 10–11 mm. long, 3–4 mm. wide, subobtusely, pale yellowish green; petals slightly shorter than the sepals, linear-oblong; lip recurved, the lateral lobes obtuse, purplish at base, the terminal lobe 5-keeled, with 1 pair disappearing toward the base; column about 3 mm. long.—Nov. Epiphyte on trees, also occurring on mossy rocks; Kyushu (Yakushima and Tanegashima); rare.

54. BULBOPHYLLUM Thouars MAMEZUTA-RAN ZOKU

Plants epiphytic, with scaly long-creeping rhizomes, the pseudobulbs 1- or 2-leaved; stem with a single joint or pseudobulb; peduncles lateral, simple, leafless; inflorescence umbellate to racemose, the flowers sometimes solitary, the bracts minute; dorsal sepal free, as long as or longer than the lateral ones, joined with the base of the column and forming a short chin; petals relatively small; lip narrowed at base and attached to the base of the column, versatile, the lateral lobes small, the terminal prominent; column erect, short, winged in upper part; pollinia waxy, usually 4.—About 700 species in e. Africa, India, Malaysia, Australia, e. Asia, and tropical America.

1A. Lateral sepals free; leaves obtuse; rhizomes without fibers of the disintegrated scales.

2A. Pseudobulbs absent; leaves elliptic to ovate, 7–13 mm. long, not prominently nerved; petals much shorter than the dorsal sepal, glabrous. 1. *B. drymoglossum*

2B. Pseudobulbs ovoid, 5–8 mm. long; leaves usually oblanceolate to narrowly oblong, 1–3.5 cm. long, 7- to 9-nerved; petals nearly as long as the dorsal sepal, ciliate. 2. *B. inconspicuum*

1B. Lateral sepals much longer than the dorsal, the lower margins sometimes partly connate; leaves subacute; rhizomes with persistent fibers of the disintegrated scales.

3A. Pseudobulbs 6–8 mm. long; leaves lanceolate, 4–8 cm. long, 6–10 mm. wide, acute; flowers about 10 mm. long. 3. *B. japonicum*

3B. Pseudobulbs 1–2 cm. long; leaves narrowly ovate-oblong, 10–17 cm. long, 3–5 cm. wide, subobtusely; flowers about 3.5 cm. long.

4. *B. makinoanum*

1. *Bulbophyllum drymoglossum* Maxim. MAMEZUTA-RAN. Plants evergreen, epiphytic, with slender elongate rhizomes; pseudobulbs absent; leaves solitary at the nodes, rather fleshy, flat, elliptic to ovate, 7–13 mm. long, 5–10 mm. wide, obtuse, nearly sessile, the nerves inconspicuous; scapes 1-flowered, 7–10 mm. long, delicate, with few small scales at the base, the bracts ovate, thinly membranous, about 1.5 mm. long, obtuse; flowers pale yellow; sepals broadly lanceolate, gradually acuminate, 7–8 mm. long; petals oblong, glabrous, much shorter than the dorsal sepal; lip broadly lanceolate, obtuse, slightly recurved, shorter than the sepals.—June. Tree-trunks; Honshu (centr. distr. and westw.), Shikoku, Kyushu; rather rare.—s. Korea.

2. *Bulbophyllum inconspicuum* Maxim. MUGI-RAN. Plants evergreen, epiphytic, with slender rhizomes; pseudobulbs ovoid, 5–8 mm. long, relatively remote; leaves oblanceolate to narrowly oblong, 1–3.5 cm. long, 6–8 mm. wide, rounded to obtuse or retuse, 7- to 9-nerved, narrowed to a short petiole; flowers 1 or 2 on short lateral peduncles, the bracts thinly membranous, oblong, about 2 mm. long; sepals ovate-elliptic, 3–3.5 mm. long, the dorsal somewhat shorter; petals nearly as long as the dorsal sepal, ciliate, spreading; lip narrowly ovate, recurved at tip.—June. Tree-trunks; Honshu (centr. and western), Shikoku, Kyushu.

3. *Bulbophyllum japonicum* (Makino) Makino. *Cirrhoptetalum japonicum* Makino—MIYAMA-MUGI-RAN. Evergreen epiphyte with rather slender, creeping fibrous rhizomes;

pseudobulbs ovoid-globose, 6–8 mm. long; leaf solitary, somewhat coriaceous, lanceolate to nearly so, 4–8 cm. long, 6–10 mm. wide, obtuse, acute at base; flowers 2 or 3, about 10 mm. long, rose-purple, in umbels, the bracts membranous, lanceolate, 1–2 mm. long, acuminate; scape 1.5–2 cm. long; sepals ascending, the dorsal oblong, about 2.5 mm. long, the lateral ones broadly lanceolate, about 7 mm. long, gradually acuminate, the outer margins contiguous; petals ovate, shorter than the dorsal sepal; lip reflexed, rather thick, rounded; column short; capsules ellipsoidal.—June–July. Tree-trunks; Honshu (centr. and western), Shikoku, Kyushu.

4. *Bulbophyllum makinoanum* (Schltr.) Masam. *Cirrhoptetalum makinoanum* Schltr.—SHIKO-RAN. Evergreen epiphyte with short, creeping, fibrous rhizomes; pseudobulbs somewhat tufted, narrowly ovoid-conical, 1–2 cm. long, green, angled or only slightly so; leaves solitary, thick and slightly lustrous, narrowly ovate-oblong, 10–17 cm. long, 3–5 cm. wide, subacute to obtuse, acute at the base, the petioles 1–1.5 cm. long; scapes slender, nodding to pendulous, 10–15 cm. long, with 1 or 2 small scales; flowers 2–4, about 3.5 cm. long, in umbels, pedicelled, yellowish brown, the bracts lanceolate, acuminate, 4–5 mm. long; sepals ascending, the dorsal one narrowly oblong, 8–10 mm. long, the lateral ones linear-lanceolate, 25–30 mm. long, gradually acuminate, slightly connate; petals about half as long as the dorsal sepal.—July–Sept. Tree-trunks in mountains; Kyushu (Yakushima and Tanegashima).—Ryukyus.

55. CYMBIDIUM Sw. SHUN-RAN ZOKU

Terrestrial or epiphytic herbs with short rhizomes (rarely saprophytic without green leaves); stems abbreviated, concealed by a tuft of leaves; leaves fasciculate, linear; scapes few-scaled, erect or declined, 1- to many-flowered; flowers rather large, solitary or in racemes, the bracts short; sepals equal, free, spreading; petals similar to the sepals or slightly shorter; lip without a foot, the lateral lobes rather broad, loosely embracing the column in natural position, the terminal lobe undivided, with 2 elevated

ridges within; column rather long, without a foot, subterete; anther terminal, the pollinia 2, with a caudicle; capsules ovoid-oblong, often with a remnant of the perianth and column at the apex.—About 70 species, in Madagascar, India, Malaysia, e. Asia, and Australia.

1A. Plant with green leaves; rhizomes short.

2A. Leaves linear.

3A. Scapes 1-flowered.

3B. Scapes more than 1-flowered.

4A. Racemes erect; sepals broadly linear, acuminate; terrestrial.

4B. Racemes pendulous; sepals oblanceolate, acute to obtuse; epiphytic.

2B. Leaves narrowly oblong to broadly oblanceolate.

5A. Leaves minutely and distinctly serrulate toward apex; flowers in July.

5B. Leaves entire; flowers in October and November.

1B. Plant saprophytic, without green leaves; rhizomes elongate.

1. *C. goeringii*

2. *C. kanran*

3. *C. dayanum* var. *austrojaponicum*

4. *C. lancifolium*

5. *C. javanicum* var. *aspidistritifolium*

6. *C. nipponicum*

1. *Cymbidium goeringii* (Reichenb. f.) Reichenb. f. *Maxillaria goeringii* Reichenb. f.; *C. virescens* Lindl.—SHUN-RAN. Rhizomes short; stems tufted; leaves evergreen, linear, 20–35 cm. long, 6–10 mm. wide, acuminate, minutely toothed, the short basal sheaths becoming fibrous with age; scapes erect, terete, fleshy, 10–25 cm. long, 1-flowered, with hyaline, sheathing scales; bracts lanceolate, 3–4 cm. long, acute; flowers greenish; sepals rather fleshy, oblanceolate, subobtusely, 3–3.5 cm. long, 7–10 mm. wide; petals simulating the sepals but slightly shorter, ascending; lip slightly shorter than the sepals, white with reddish purple spots, recurved above, papillose within, the lateral lobes small, obtuse; column about 15 mm. long.—Mar.–Apr. Grassy places in foothills; Hokkaido (Okushiri Isl.), Honshu, Shikoku, Kyushu.—China.

2. *Cymbidium kanran* Makino. KAN-RAN. Terrestrial herb; leaves evergreen, tufted, linear, arcuate, 20–70 cm. long, 6–17 mm. wide, acuminate, scabridulous on the margins; scapes 25–60 cm. long, loosely sheathed; racemes loosely 5- to 12-flowered, erect, the bracts herbaceous, linear, 8–30 mm. long, acuminate; flowers fragrant, purplish green; sepals spreading, broadly linear, acuminate, the dorsal one 3–4 cm. long, 3.5–4.5 mm. wide, longer than the lateral ones; petals slightly shorter than the sepals, linear-lanceolate, 2–3 cm. long, 4.5–5.5 mm. wide; lip slightly shorter than the petals, about half as long as the dorsal sepal, smooth, glabrous, spreading, the lateral lobes small; column 10–14 mm. long.—Dec.–Jan. Honshu (Kii Prov.), Kyushu; very rare.

3. *Cymbidium dayanum* Reichenb. f. var. *austrojaponicum* Tuyama. *C. alborubens* Makino; *C. simsonianum* sensu auct. Japon., non King & Pantling.—HETSUKA-RAN. Evergreen epiphytic herb; leaves tufted, arcuate, 30–50 cm. long, 10–13 mm. wide, acuminate, slightly narrowed at base, nearly glabrous; scapes lateral, pendulous, with few sheathing scales on the lower part; racemes few- to relatively many-flowered, 10–20 cm. long, pendulous, the bracts lanceolate, 5–8 mm. long, acuminate; sepals spreading, oblanceolate, 3–3.2 cm. long, 5–7 mm. wide, acute to obtuse, white, brownish purple near the base; petals slightly smaller, the lip about 2 cm. long, erect, the lobes ovate, the lateral lobes small, obtuse, the terminal one cuspidate; column about 13 mm. long; capsules fusiform, about 6 mm. long inclusive of the short pedicel.—Oct. Epiphytic; Kyushu (s. distr.).—Ryukyus and Formosa.

4. *Cymbidium lancifolium* Hook. *C. nagifolium* Masam.—NAGI-RAN. Rhizomes short, sparsely scaly, few-

leaved, the roots elongate, rather thick, puberulent; leaves jointed at the sheathing base, the blade narrowly oblong to broadly oblanceolate, 4–15 cm. long, 1.5–3 cm. wide, short-acuminate, narrowed at base, scabridulous on the upper margins; scapes lateral, 10–15 cm. long, few-sheathed; racemes loosely 2- to 4-flowered, pendulous, glabrous, with a slightly flexuous axis, the bracts membranous, linear-lanceolate, 8–15 mm. long, acuminate; sepals linear-lanceolate, 22–25 mm. long, 2.5–3 mm. wide, acuminate, white with a greenish flush, the lateral sepals slightly reflexed; petals narrowly oblong, about 2 cm. long, 5–6 mm. wide, subacute, white with a brown-purple band; lip white, brown-purple spotted within, obovate-oblong, 13 mm. long, about 10 mm. wide, subobtusely, fleshy; column about 13 mm. long; anther yellow, minutely mamillate; capsules erect, about 5 cm. long inclusive of the short pedicel.—July–Aug. Honshu (s. Kantō, Tōkaidō, Izu-Shichitō Is. and westw.), Shikoku, Kyushu; rare.—Ryukyus and Formosa.

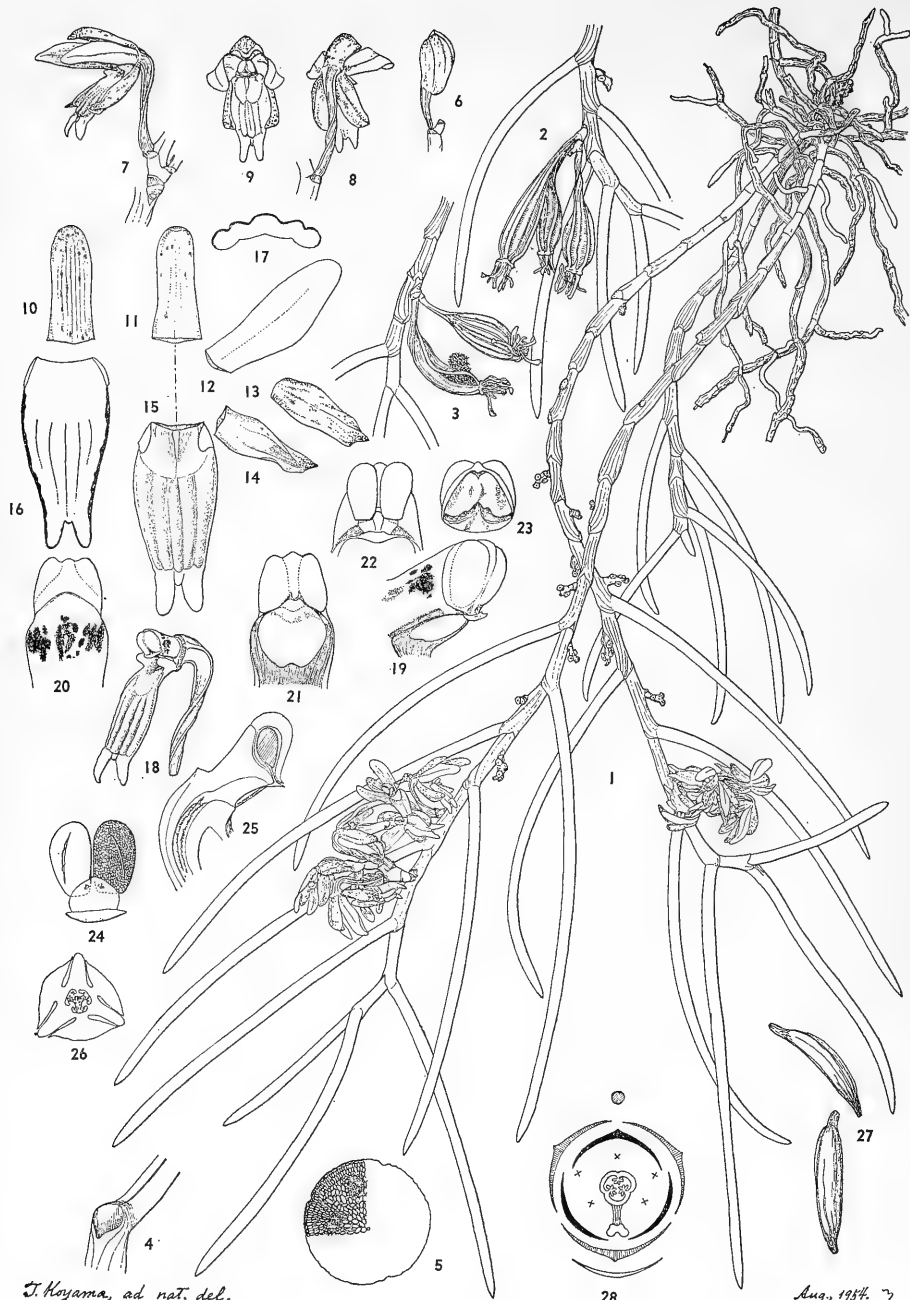

5. *Cymbidium javanicum* Bl. var. *aspidistritifolium* (Fukuyama) F. Mackawa. *C. aspidistritifolium* Fukuyama—AKIZAKI-NAGI-RAN. Closely resembles No. 4, the leaves entire; scapes shorter than the leaves; flowers grass-green, with thicker, more fleshy sepals; petals oblong, broader and shorter, about 17 mm. long, 6.6 mm. wide.—Kyushu (Tsushima); very rare.—Formosa. A variable species occurring also in the Himalayas and Malaysia.

6. *Cymbidium nipponicum* (Fr. & Sav.) Makino. *Bletia nipponica* Fr. & Sav.; *C. pedicellatum* Finet; *Pachyrhizanthia nipponicum* (Fr. & Sav.) Nakai.—MAYA-RAN. Plant leafless, saprophytic; rhizomes to 15 cm. long, slightly puberulent, scaly; scapes erect, 15–20 cm. long, the sheaths 7–20 mm. long, membranous; racemes 2- to 5-flowered, the bracts membranous, broadly lanceolate, 5–10 mm. long, long-acuminate; flowers white with a brownish purple hue; sepals oblanceolate, about 2 cm. long, 3–4 mm. wide, acuminate; petals narrowly oblong, slightly shorter than the sepals; lip about 15 mm. long, cuneate, obsoletely 3-lobed, the terminal lobe slightly recurved, minutely undulate on the margins; column 8–10 mm. long, densely papillose.—July–Aug. Honshu, Kyushu; rare.

Cymbidium sinense (Andr.) Willd. *Epidendrum sinense* Andr.; *C. hoosai* Makino.—HOSAI-RAN. Leaves 15–32 mm. wide; sepals linear-oblanceolate, 25–35 mm. long, 5–6.5 mm. wide.—Reported to occur in Kyushu (Yakushima).—Ryukyus, Formosa, and China.

56. LUISIA Gaudich. Bō-RAN ZOKU

Stout epiphytic herbs with elongate leafy stems and closely appressed sheaths; leaves jointed, terete, evergreen, fleshy; inflorescence very short, spicate; flowers sessile, relatively small, the bracts short, thick; sepals free, equal or the dorsal smaller;

T. Hayama, ad nat. del.

28

Aug., 1954. 7

FIG. 4.—*Luisia teres* (Thunb.) Bl. 1, Flowering plant; 2, 3, part of fruiting plant; 4, apical part of a leaf sheath; 5, cross section of stem; 6, flower bud; 7, 8, 9, flowers; 10, 11, 12, 13, 14, tepals; 15, 16, inner and outer side of labellum; 17, cross section of the same; 18, labellum and a gynostemium; 19, 20, 21, 22, 23, apical part of gynostemium; 24, pollinia; 25, longitudinal section of a gynostemium; 26, cross section of ovary; 27, seeds; 28, floral diagram.

petals similar to the sepals; lip sessile, from the base of the column, spurless, often longer than the sepals, nearly flat, scarcely inflated at base, with a callosity or small lateral lobe on each side near base, the limb flat, entire or bifid; column very short, thick; anther terminal, 2-locular; pollinia 2, waxy; capsules narrowly oblong, not beaked, erect.—About 40 species, in India, Malaysia, e. Asia, and the Pacific islands.

1. *Luisia teres* (Thunb.) Bl. *Epidendrum teres* Thunb.; *L. fauriei* Schltr.—BÔ-RAN. FIG. 4. Evergreen epiphyte; stems simple or sparsely branched, tufted, 10–40 cm. long, about 3–4 mm. in diameter, erect or pendulous, the internodes sheathed; leaves obliquely spreading, linear, 6–12 cm. long, 3.5–4 mm. wide, terete, abruptly obtuse, scarcely narrowed at base; spikes sessile, 1- to 5-flowered, dense, the axis short, 1.5–2 mm. thick, the bracts deltoid, 2–3 mm. long; flowers greenish yellow with a brown hue; sepals oblong, obtuse, pale green, relatively thick, the dorsal sepal about 8 mm. long, ascending, rounded on the

back, the lateral ones about 10 mm. long, spreading, obtusely keeled on the back, cucullate, contiguous with the margin of the lip; petals flat, pale green, ascending, about 10 mm. long, narrowly spatulate-oblong, rounded; lip thick, flat, spreading, pale green outside, dark brown-purple within, oblong, about 15 mm. long, ascending, auriculate, shallowly bifid, the lobes ascending, lanceolate, 2–3 mm. long; column thick, very short; capsules clavate-fusiform, 25–30 mm. long inclusive of the thick pedicel.—July–Aug. Tree-trunks; Honshu (Ise and Kii Prov.), Shikoku, Kyushu.

57. SARCANTHUS Lindl. MUKADE-RAN ZOKU

Evergreen epiphytic herbs with leafy stems; leaves terete or flat, coriaceous, joined with the nodal sheaths; inflorescence spicate, axillary, simple or branched, sometimes reduced to a single flower; flowers small, short-pedicelled, usually yellowish green; sepals and petals spreading, subequal; lip 3-lobed, the lateral lobes inserted at the mouth of the spur, small, the terminal lobe ovate to lanceolate, the limb with a thin longitudinal septum above the spur, callose below; the column wingless, the foot wanting; anther terminal, 2-locular; pollinia usually 4, sometimes 2.—About 100 species, in India, e. Asia, Malaysia, and Polynesia.

1. *Sarcanthus scolopendrifolius* Makino. MUKADE-RAN. Stems slender, creeping, branched, about 1.5 mm. in diameter; leaves distichous, 7–10 mm. long, slightly recurved, subulate, obtuse, grooved above; sheaths tubular, closely appressed to the internodes; peduncles axillary, 1-flowered, 2–3 mm. long, 1- or 2-bracteate; sepals spreading, pale rose, spatulate-oblong,

obtuse, slightly connate at the base, the petals similar but slightly shorter; lip saccate-spurred, the terminal lobe deltoid-ovate, obtuse, entire; column short; capsules clavate-ovoid, 6–7 mm. long, nearly sessile.—June–July. Trees or rocks; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu; rare.—s. Korea.

58. SACCALABUM Bl. MATSU-RAN ZOKU

Evergreen epiphyte without pseudobulbs; stems leafy; leaves spreading, distichous, coriaceous or fleshy, flat or rarely terete, the sheaths persistent, closely clasping; peduncles simple or branched; flowers in racemes, the bracts diminutive; sepals and petals alike, free; lip sessile, saccate or spurred, the lateral lobes relatively small, erect, the terminal one larger; column short, wingless, sometimes angled; the foot wanting; anther terminal, 1- or imperfectly 2-locular; pollinia 2, rarely bifid; capsules oblong-cylindric.—About 20 species in India, Malaysia, and e. Asia.

- 1A. Leaves 3–6 cm. long, 6–15 mm. wide, obscurely 7- to 9-nerved. 1. *S. japonicum*
 1B. Leaves 7–20 mm. long, 3–5 mm. wide, obscurely 3-nerved.
 2A. Leaves uniformly green; petals broadly elliptic; lip ciliate. 2. *S. ciliare*
 2B. Leaves with purple spots; petals narrowly oblong; lip not ciliate.
 3A. Leaves narrowly oblong, 7–20 mm. long, 3–5 mm. wide; lip entire, with a saccate spur. 3. *S. matsuran*
 3B. Leaves elliptic to ovate-elliptic, 5–11 mm. long, 2.5–5 mm. wide; lip 3-lobed, with a short-cylindric spur. 4. *S. toramanum*

1. *Saccalabium japonicum* Makino. *Gastrochilus japonicus* (Makino) Schltr.—KASHI-NO-KI-RAN. Stems 1–4 cm. long, densely leafy; leaves evergreen, oblanceolate, 3–6 cm. long, 6–15 mm. wide, subacute, somewhat falcate, obscurely 7- to 9-nerved, the midrib raised beneath; racemes 1–3 cm. long, 4- to 10-flowered, the bracts deltoid, 1–2 mm. long; flowers pale yellow; sepals and petals about 4 mm. long, spatulate-oblong, obtuse, rose-purple spotted on the inside; lip relatively large spurred, the spur about 3 mm. across at the mouth, about 4 mm. in depth, the lateral lobe on the margin of the mouth, the limb depressed deltoid, obtuse; column short; capsules sessile, narrowly oblong-cylindric, about 2 cm. long.—July–Aug. Shikoku, Kyushu; rare.—Ryukus.

2. *Saccalabium ciliare* (F. Mackawa) Ohwi. *Gastrochilus ciliaris* F. Mackawa.—MATSU-GE-KAYA-RAN. Stems slender; leaves dimorphic, uniformly green, numerous, spreading, obsolete 3-nerved, the midrib depressed above, some of

them elliptic, 9–10 mm. long, about 4.5 mm. wide, acute to subacute, others linear-oblong, 16–20 mm. long, 3.5–4 mm. wide, the bracts ovate, small; flowers 2–4, on an abbreviated axis, pale yellowish green, partially open; sepals narrowly oblong, 2–2.5 mm. long, obtuse; petals broadly elliptic, about 2 mm. long; lip whitish, saccate, the limb reniform, ciliate; column short.—Kyushu (Yakushima); very rare.

3. *Saccalabium matsuran* Makino. *Gastrochilus matsuran* (Makino) Schltr.—MATSU-RAN, BENI-KAYA-RAN. Stems slender, 1–3 cm. long; leaves evergreen, dense, narrowly oblong to linear-oblong, 7–20 mm. long, 3–5 mm. wide, slightly incurved at tip, purple-spotted, the midrib depressed above, elevated beneath; inflorescence 8–10 mm. long, 2- to 4-flowered, the bracts deltoid, 0.5–1 mm. long, obtuse; flowers yellowish green; sepals and petals spreading, narrowly oblong, 3–3.5 mm. long, obtuse; lip rather large, saccate-spurred, entire, the limb reniform, obtuse-truncate; column very short; capsules

obovoid-oblong, short-pedicelled, about 10 mm. long.—Tree-trunks; Honshu, Shikoku. Kyushu.

4. *Saccolabium toramanum* Makino. *Gastrochilus toramanus* (Makino) Schltr.—MOMI-RAN. Epiphytic; stems to 7 cm. long, creeping; leaves small, equal, spreading, very dense, elliptic to ovate-elliptic, 5–11 mm. long, 2.5–5 mm. wide, acute to acuminate, retuse, 3-nerved, green with purple spots, grooved above; flowers few, in short racemes on very

short peduncles; sepals elliptic, 2.5–2.7 mm. long, yellowish green with a purple center, petals similar; lip 3-lobed, cylindrical-spurred, the dorsal lobe larger, transversely oblong with rounded margins, about 1.5 mm. long, 3 mm. wide, retuse to truncate at apex, the lateral lobes minute, erect, on the mouth of the spur, the column short; capsules oblong, about 9 mm. long, pedicelled.—Oct. Honshu (Kii, s. Shinano and Iwaki), Shikoku; very rare.

59. NEOFINETIA Hu FŪ-RAN ZOKU

Epiphytic, evergreen herb with short, densely leafy, erect stems; leaves linear, distichous, conduplicate, firm, jointed, short-sheathed at base; peduncles lateral, short, 1-scaled at base; flowers long-pedicelled, rather small, the bracts small; sepals spreading, linear-lanceolate, alike, free, the petals similar; lip lingulate, erect, long-spurred, the lateral lobes small, the terminal lobe ovate, flat, entire; spur elongate, curved; column short, broad, wingless, without a foot; rostellum broad, short, bifid; capsules cylindrical, long-pedicelled.—A single species in Japan.

1. *Neofinetia falcata* (Thunb.) Hu. *Orchis falcata* Thunb.; *Angraecum falcatum* (Thunb.) Lindl.; *Oeceoclades lindleyana* Regel; *Nipponorchis falcata* (Thunb.) Masam.; *Finetia falcata* (Thunb.) Schltr.; *Angraecopsis falcata* (Thunb.) Schltr.—FŪ-RAN. Stems tufted, 1–3 cm. long, flattened; leaves evergreen, conduplicate, coriaceous, thick, lustrous, gradually arcuate, 5–10 cm. long, 7–8 mm. wide, obtuse, the sheaths short, jointed at apex; peduncles 3–10 cm. long, with 1 or 2 small lanceolate scales on the lower part;

flowers 3–5, white, the bracts ascending, lanceolate, 4–7 mm. long; sepals and petals linear-lanceolate, about 10 mm. long, obtuse; lip slightly recurved, 7–8 mm. long, lingulate, fleshy, 3-lobed, the lateral lobes subrounded, with long-decurrent lower margins, the terminal lobe narrowly ovate, 3–4 mm. long, obtuse, the spur linear, curved, about 4 cm. long; capsules cylindrical, about 3 cm. long, the pedicel about the same length.—July. Honshu (Izu Prov. and westw.), Shikoku, Kyushu; rare.—Ryukyus.

60. TAENIOPHYLLUM Bl. KUMO-RAN ZOKU

Small epiphytic herbs with aerial roots; stems very short or wanting; leaves linear (in our species entirely suppressed); peduncles very short, simple; flowers minute, short-pedicelled, the bracts minute; sepals ascending or incurved at tip, nearly equal, often slightly connate at base, the petals similar; lip saccate or spurred, 3-lobed, the lateral lobes attached near the mouth of spur or sometimes absent, the terminal lobe small, spreading, fleshy; column very short; anther terminal, 2-locular; pollinia 4, waxy; capsules oblong-linear.—About 120 species, in India, Malaysia, Australia, Polynesia, and e. Asia.

1. *Taeniophyllum aphyllum* (Makino) Makino. *Sarcochilus aphyllus* Makino.—KUMO-RAN. Minute leafless, green, epiphytic herb with fasciculate roots, 2–3 cm. long, 1–1.2 mm. in diameter; stems nearly wanting; leaves absent; peduncles few, tufted, slender, 4–7 mm. long, 1 to 3-flowered, the bracts deltoid, acute, about 1 mm. long; flowers minute; sepals pale green, not expanded, lanceolate, about 2 mm. long,

adnate to the base of the petals, gradually acuminate; petals slightly shorter than the sepals, broadly lanceolate; lip lanceolate, the margin involute, gradually acuminate toward the inflexed apex; spur saccate; column very short, adnate to the base of the lip; capsules oblong-ovoid, 4–5 mm. long, ascending, nearly sessile.—Tree-trunks; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; very rare.

61. AERIDES Lour. NAGO-RAN ZOKU

Evergreen epiphyte; stems short, not thickened, leafy; leaves distichous, coriaceous or fleshy, jointed with the embracing sheaths at base; inflorescence simple or branched, racemose; flowers usually rather small, the bracts small; sepals equal, spreading, the lateral lobes broadest, adnate to the foot of the column, the petals similar; lip adnate to the foot of column, erect or incurved, spurred, the lateral lobes small, erect, inserted near the mouth of the spur, the terminal lobe spreading, ovate; column short, extended to form a broad foot, wingless; anther terminal, 2-locular; pollinia 2; capsules oblong or clavate.—About 20 species in India, Malaysia, and e. Asia.

1. *Aerides japonicum* Reichenb. f. NAGO-RAN. Stems ascending, 3- to 5-leaved; leaves narrowly oblong, 8–15 cm. long, 1.5–2 cm. wide, obtuse or retuse, rather fleshy, the midrib depressed above; peduncles cauline, declined, 5–12 cm. long, few-flowered, the bracts ovate, obtuse, spreading, 4–5 mm. long; flowers pale greenish white; sepals ascending, ob-

long, about 12 mm. long, obtuse; petals similar to the sepals; lip as long as the sepals, 3-lobed, the lateral lobes small, the terminal lobe spatulate, rounded, undulate on the upper margin; spur saccate, inserted below the lip and bent forward; capsules short-pedicelled.—Honshu (Izu Prov. and westw.), Shikoku, Kyushu; rare.—Ryukyus.

62. SARCOCHILUS R. Br. KAYA-RAN ZOKU

Epiphytic; stems leafy; leaves distichous, evergreen, coriaceous or fleshy, linear to oblong; peduncles lateral, cauline, simple or rarely branched; sepals spreading, free, alike or the lateral lobes broader and adnate to the base of the column; petals similar to the dorsal sepal; lip inserted on the foot of the column, sometimes forming a short inflated chin at base, the lateral lobes erect; spur straight; column erect, subterete, wingless, extended to form a basal foot; anther terminal, 2-locular; pollinia 2, globose, waxy.—About 30 species, in India, Malaysia, e. Asia, and Australia.

1. *Sarcochilus japonicus* (Reichenb. f.) Miq. *Thrix-spermum japonicum* Reichenb. f.—KAYA-RAN. Stems rather slender; leaves 10–20, flat, distichous, relatively dense, lanceolate, 2–4 cm. long, 4–6 mm. wide, obtuse, mucronate, gradually narrowed toward the base; peduncles slender, 2–4 cm. long, 2- to 5-flowered, with a small scale near the middle, the bracts broadly ovate, spreading, about 3 mm. long; flowers

pale yellow; sepals narrowly oblong, 7–8 mm. long, obtuse; petals narrowly spatulate-oblong, slightly shorter than the sepals; lip shallowly 3-lobed, the lateral lobes spreading, the terminal lobe obsolete; column short; capsules cylindric, nearly sessile, 4–5 cm. long, about 3.5 mm. wide.—Apr.–May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

SUBCLASS 2. DICOTYLEDONEAE DICOTYLEDONS SŌSHIYŌ RUI

1. Archichlamydeae RIBENKA RUI

Fam. 59. SAURURACEAE DOKUDAMI KA Lizard's-tail Family

Perennial erect herbs with simple, petiolate, entire, alternate leaves; inflorescence racemose or spicate; flowers small, bisexual, bracteolate, the perianth absent; stamens 6–8, hypogynous or adnate to the ovary and essentially epigynous; anthers 2-locular, longitudinally dehiscent; pistil with 3 or 4 free or united carpels, the ovules orthotropous, 1 or 2 in each locule; fruit a capsule or berrylike, indehiscent or incompletely dehiscent; seeds ovoid or globose, the testa membranous, the endosperm copious, mealy, the embryo minute.—About 3 genera, with 4 or 5 species, in e. Asia and N. America.

1A. Stamens free from the ovary; carpels free; inflorescence without involucrel bracts. 1. *Saururus*

1B. Stamens with the lower part of filaments adnate to the carpels; carpels connate; inflorescence with 4–6 petaloid involucrel bracts at base. 2. *Houttuynia*

1. SAURURUS L. HAN-GE-SHŌ ZOKU

Glabrous perennials (except inflorescence); leaves alternate, ovate-cordate, the stipules membranous, adnate to the petiole; inflorescence spicate, terminal, bracteate on the pedicel; flowers small, the perianth absent; stamens 6 or 8, sometimes fewer, the filaments filiform, free, the anthers erect; pistil of 3 or 4 free or nearly free carpels, the ovules 2 in each carpel; fruit subglobose, folliclelike; mature seed globose, usually solitary in each carpel.—Two species, one in N. America and one in e. Asia.

1. *Saururus chinensis* (Lour.) Baill. *Spathium chinense* Lour.; *Saururus loureiri* Decne.; *Saururopsis chinensis* (Lour.) Turcz.—HAN-GE-SHŌ, KATA-SHIRO-GUSA. Foetid perennial with thick creeping rhizomes; stems 50–100 cm. long, erect, sparsely branched; leaves narrowly to broadly ovate, 5–15 cm. long, 3–8 cm. wide, acute, 5- to 7-nerved, entire, paler beneath, cordate-auriculate, the uppermost white on the lower half, the petioles rather broad, with a ridge beneath, 1–5 cm.

long, slightly clasping at base; racemes 10–15 cm. long, densely many-flowered, erect, nodding while young, sparsely pubescent with crisped hairs, the bracts ovate-rounded, about 1.5 mm. wide, the pedicels 2–3 mm. long; stamens 6 or 7; carpels 3–5, glabrous.—June–Aug. Around ponds and along rivers; Honshu, Shikoku, Kyushu; common.—Korea, Ryukyu, China, and Philippines.

2. HOUTTUYNIA Thunb. DOKUDAMI ZOKU

Erect perennial herbs with alternate, petiolate, entire, cordate leaves; stipules rather large, membranous, adnate to the petiole at base; spikes terminal, pedunculate, with 4–6 whitish involucrel bracts at base; flowers sessile, bisexual, small, naked; bracts small; stamens 3–8, the filaments adnate to the ovary; carpels 3 or 4, with parietal placentae; styles 3 or 4, simple; fruit subglobose, dehiscent below the style inside; seeds rather numerous, globose.—A single species, in e. Asia.

1. *Houttuynia cordata* Thunb. *Polypara cordata* (Thunb.) Buck; *P. cochinchinensis* Lour.—DOKUDAMI. Foetid, glabrous perennials with elongate, slender rhizomes; stems 20–50 cm. long, usually simple; leaves broadly ovate-cordate, 3–8 cm. long, 3–6 cm. wide, deep green, paler beneath, the stipules oblong, obtuse, persistent; peduncles 2–3

cm. long, the involucrel bracts usually 4, elliptic or oblong, spreading, persistent, 1.5–2 cm. long, white above; spikes 1–3 cm. long, short-cylindric, densely many-flowered, the flowers sessile.—June–July. Shaded places in lowlands; Honshu, Shikoku, Kyushu; very common.—Ryukyu, Formosa, China, Himalayas, and Java.

Fam. 60. PIPERACEAE KOSHŌ KA Pepper Family

Herbs, shrubs or rarely small trees, sometimes scandent, often fleshy; stems and branches sometimes jointed; leaves alternate, verticillate, rarely opposite, entire, the stipules sometimes absent; spikes or racemes densely many-flowered; flowers small, the perianth absent, bisexual or unisexual, bracteate; stamens 2–10; ovary unilocular, with a solitary basal orthotropous ovule; stigmas 1–6, sessile or the styles short; fruit a berry, 1-seeded, the embryo small, the endosperm fleshy.—About 5 genera, with more than 1,000 species, chiefly in the Tropics.

1A. Stigma solitary; erect sometimes fleshy herbs, often creeping at base. 1. *Peperomia*

1B. Stigmas (2)–3–4(–5); commonly scandent woody plants, sometimes herbs. 2. *Piper*

1. PEPEROMIA Ruiz & Pav. SADA-SŌ ZOKU

Annuals or perennials; stipules absent; leaves alternate, opposite, or verticillate, entire, usually fleshy, commonly with pellucid dots; spikes densely or loosely flowered; flowers minute, bracteate, sometimes sunken in the axis, bisexual, sessile, the perianth absent; stamens 2, the filaments usually short, the anthers globose or depressed-globose, 2-locular and often confluent; stigma often penicillate; berry small, scarcely fleshy, the seeds similar to the fruit in shape.—About 400 species, pantropic.

1. *Peperomia japonica* Makino. SADA-SŌ. Fleshy, densely soft-puberulent, green perennial herb; stems 10–30 cm. long, erect, terete, from ascending base, sparsely branched; leaves spreading, verticillate in 3's to 5's, slightly fleshy, elliptic, obovate or broadly elliptic, 1–2.5 cm. long, 7–15 mm.

wide, entire, rounded to broadly obtuse, the petioles 3–8 mm. long; spike erect, short-pedunculate, 2–4 cm. long, rather densely many-flowered, glabrous except the peduncle; flowers minute, sessile; fruit globose, about 0.4 mm. long.—Shikoku, Kyushu (s. distr., Yakushima and Tanegashima).

2. PIPER L. KOSHŌ ZOKU

Scandent, woody or rarely herbaceous plants or sometimes small trees, with jointed branches; leaves alternate, entire or rarely 3-lobed, 3- to many-nerved, the stipules rarely absent; spikes terminal; flowers bisexual or unisexual, usually sessile, sometimes sunken in the axis, adnate to a peltate bract; perianth absent; stamens 2–4, rarely to 8, the anthers ovoid or globose, sometimes oblong; stigmas 2–5; berry small, globose or ovoid; seeds globose.—More than 700 species, pantropic.

1. *Piper kadzura* (Choisy) Ohwi. *Ipomoea kadzura* Choisy; *P. futokadzura* Sieb.—FUTO-KAZURA. Scandent over trees and rocks, often radicate; leaves ovate (sometimes rounded-cordate in young specimens), 5–8 cm. long, usually 3–4 cm. wide, long-acuminate, rounded at base, entire, rather thick, dark green, paler beneath and often scattered soft

hairy, 5-nerved or nearly so; spikes 3–8 cm. long, pedunculate, nodding to pendulous; flowers unisexual (plants dioecious), the bracts peltate; fruit globose, red, 3–4 mm. in diameter.—May–June. Woods near seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—s. Korea and Ryukyus.

Fam. 61. CHLORANTHACEAE SENRYŌ KA Chloranthus Family

Herbs or shrubs, sometimes aromatic; leaves opposite, usually serrate, pinnately veined, the petioles joined by a horizontal ridge on stem or by a short sheath, the stipules small, linear, subtending the petiole or inserted on the margin of the sheath; inflorescence a simple or branched spike (rarely capitate), essentially terminal; flowers unisexual or bisexual, the perianth absent in the bisexual ones; stamens 1 or 3, sometimes 2, connate below, sometimes adnate to the ovary; ovary 1, 1-locular; stigma sessile or rarely with a short stalk, truncate or short-linear, undivided; ovules solitary, orthotropous; fruit a drupe, ovoid or globose, the exocarp fleshy or juicy, the endocarp hard; seeds with copious endosperm, the embryo small.—Four genera, with about 40 species, chiefly in the Tropics and warmer temperate regions.

- 1A. Stamen 1; evergreen shrubs. 1. *Sarcandra*
1B. Stamens 3, connate below; perennial herbs or shrubs. 2. *Chloranthus*

1. SARCANDRA Gardn. SENRYŌ ZOKU

Shrubs with jointed nodes; leaves evergreen, opposite or verticillate in 3's or 4's, petiolate, serrate, pinnately nerved, the stipules short, with 2 marginal projections, green; spikes terminal, sometimes branched; flowers small, naked, sessile; stamen 1, adnate on the back of ovary and jointed at base with it, the anther 2-locular, introrse; stigma sessile, truncate; ovules pendulous, ventral.—One species.

1. *Sarcandra glabra* (Thunb.) Nakai. *Bladhia glabra* Thunb.; *Chloranthus glaber* (Thunb.) Makino; *Chloranthus brachystachyus* Bl.; *Ascaria serrata* Bl.—SENRYŌ. Glabrous evergreen shrub 30–80 cm. high; stems terete, green, spreading, the nodes slightly swollen; leaves oblong or ovate-oblong, 10–15 cm. long, 4–6 cm. wide, deep green, lustrous, sharply serrate, acuminate, the petioles 5–15 mm. long; spikes terminal, short-pedunculate, simple to few-branched below,

15–30 mm. long, erect; flowers small, white; stamen 1, the anther 2-locular, introrse; fruit fleshy, globose, orange-scarlet, 5–7 mm. in diameter.—Woods; Honshu (Tōkaidō and Kinki Distr.), Shikoku, Kyushu; rather common.—s. Korea, Ryukyus, Formosa, China, India, and Malaysia.

Cv. *Flava*. *S. glabra* forma *flava* (Makino) Ohwi; *Chloranthus glaber* var. *flavus* Makino—KIMINO-SENRYŌ. Fruit yellow.—Cultivated.

2. CHLORANTHUS Sw. CHA-RAN ZOKU

Herbs or shrubs with swollen, jointed nodes; leaves simple, petiolate, serrate, the petioles connected by a transverse ridge on stem; inflorescence a terminal spike, simple or branched; flowers bisexual, the perianth absent; stamens 3, sometimes partly reduced and sterile, the anthers 1- or 2-locular, introrse or extrorse, the filaments connate, forming a dilated, 3-lobed body, often attached on one side of the ovary; stigma sessile, truncate.—More than 10 species, in s. and e. Asia.

- 1A. Evergreen shrub with leaves in evenly spaced pairs. 1. *C. spicatus*
 1B. Herbs with leaves in few pairs near the apex.
 2A. Fertile stamens 2, the median one sterile; filaments elongate, linear, short-connate at base, the connective extending beyond the anther; spike usually solitary. 2. *C. japonicus*
 2B. Stamens 3, all fertile; filaments connate below, dilated, shortly 3-lobed above; spikes 1-3, usually 2. 3. *C. serratus*

1. **Chloranthus spicatus** (Thunb.) Makino. *Nigrina spicata* Thunb.; *C. inconspicuus* Sw.—CHA-RAN. Small glabrous shrub, the branches ascending or spreading toward the base; stipules membranous, linear, 2-3 mm. long, mucronate; leaves oblong-ovate to ovate-elliptic, 4-8 cm. long, 2.5-4 cm. wide, rather obtuse, acute at base, shallowly undulate-serrate, the petioles 5-12 mm. long; inflorescence terminal, spicate, pedunculate, glabrous, the spikes 10-18, ascending, 2-3 cm. long; stamens 3, the filaments connate.—Chinese shrub long cultivated in Japan.

2. **Chloranthus japonicus** Sieb. *Tricercandra quadrijolia* A. Gray; *C. mandshuricus* Rupr.; *Tricercandra japonica* (Sieb.) Nakai—HITORI-SHIZUKA. Glabrous perennial from short, branching, creeping rhizomes; stems erect, usually simple, 20-30 cm. long; leaves small, membranous and scalelike toward the base, the uppermost consisting of 2 ordinary pairs simulating a whorl of 4 leaves, ovate or elliptic, 4-12 cm. long, 2-6 cm. wide, abruptly acute, sharply serrate, the petioles 10-15 mm. long; spikes usually simple, solitary, 2-3 cm. long, erect, the peduncle 2-5 cm. long; flowers white, sessile; fila-

ments white and conspicuous, shortly connate below and adnate to the ovary, linear, obtuse, spreading, 4-5 mm. long; fruit obliquely obovate, narrowed towards the base, 2.5-3 mm. long.—Apr.-May. Woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Sakhalin, Manchuria, and Korea.

3. **Chloranthus serratus** (Thunb.) Roem. & Schult. *Nigrina serrata* Thunb.—FUTARI-SHIZUKA. Erect glabrous perennial from branching rhizomes; stems 30-50 cm. long, usually simple; lower leaves reduced to membranous connate sheaths, the ordinary leaves 4 or 6, paired, approximate, ovate-oblong to elliptic or ovate, 8-15 cm. long, 4-7 cm. wide, acuminate, sharply serrulate, abruptly narrowed toward the base, the petioles 8-12 mm. long; spikes erect, usually 2, sometimes to 5, or solitary, 3-5 cm. long; flowers small, white; filaments 3, 2.5-3 mm. long, connate into a broadly obovate, 3-lobed body, the median lobe slightly longer than the lateral ones; anthers introrse; fruit broadly obovoid, about 3 mm. long.—Apr.-June. Woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—China.

Fam. 62. SALICACEAE YANAGI KA Willow Family

Trees and shrubs, usually dioecious; leaves alternate, rarely subopposite, simple, usually stipulate, petiolate, usually serrate; inflorescence of aments; flowers unisexual, appearing before or with the leaves, in the axils of bracts; perianth wanting; stamen 1 to many; ovary 1-locular, the style 1, stigmas 2-4; fruit a 2- to 4-valved capsule, the 2-4 placental parietal; seeds few to numerous, with a tuft of long hairs (coma), the endosperm absent.—Few genera, with about 350 species, circumboreal, in the temperate to cooler regions (few at high elevations in the Tropics); flowering mostly early in spring, but some species in summer.

- 1A. Bud-scales numerous, imbricate; spikes pendulous with laciniate to toothed bracts; flowers with a cup-shaped gland. 1. *Populus*
 1B. Bud-scales solitary; spikes with entire or denticulate bracts; flowers with 1 or 2 globose to cylindric glands or glandless.
 2A. Spikes pendulous; stigma deciduous with the upper part of the style.
 3A. Flowers anemophilous, without a gland. 2. *Chosenia*
 3B. Flowers entomophilous, with 2 dorso-ventral glands in the staminate ones, the glands lateral in the pistillate ones. ... 3. *Toisusu*
 2B. Spikes erect; flowers entomophilous or anemophilous, with 1 or 2 glands; stigma persistent. 4. *Salix*

1. POPULUS L. HAKO-YANAGI ZOKU

Dioecious trees; buds with imbricate, glandular or sometimes hairy bud-scales; leaves alternate, deciduous, usually ovate to ovate-rhomboid or subdeltoid, petiolate, entire or serrulate, involute in bud; flowers unisexual, with an oblique, cup-shaped gland, borne in the axils of laciniate, incised, or rarely entire bracts on pendulous, precocious aments; stamens 4 to many; ovary 1-locular, the style solitary, short, the stigma 2- to 4-fid; capsules 2- to 4-valved; seeds small, ovoid, brown; cotyledons elliptic.—About 30 species, in the temperate regions of the N. Hemisphere.

1A. Petioles laterally compressed above.

- 2A. Leaves deltoid or rhomboid-deltoid, glabrous, paler beneath; buds without hairs. 1. *P. nigra* cv. *Italica*
 2B. Leaves broadly ovate or rhomboid-rounded, slightly glaucous beneath, hairy while young; bud-scales pubescent. 2. *P. sieboldii*
 1B. Petioles not obviously compressed.
 3A. Leaves densely silvery lanate beneath, incised on margins. 3. *P. alba*
 3B. Leaves pale white and usually puberulous on nerves beneath, obtusely serrulate. 4. *P. maximowiczii*

1. **Populus nigra** L. cv. *Italica*. *P. nigra* var. *italica* Koehne; *P. italica* Moench—SEIYŌ-HAKO-YANAGI, POPURA. Deciduous tree of fastigate habit, staminate; branchlets glabrous, orange-red while young, the buds reddish, glabrous, viscid; leaves broadly deltoid or broadly rhombic-deltoid, abruptly short-acuminate, broadly cuneate to nearly truncate at the base, obtusely serrulate, glabrous, often with reddish nerves, the petioles 2-5 cm. long; staminate aments precocious,

3-5 cm. long, the flowers with rather numerous stamens.—Apr. The Lombardy poplar, a cultivar of European origin, often cultivated in parks and gardens.

2. **Populus sieboldii** Miq. *P. tremula* var. *villosa* sensu Fr. & Sav., non Wessmael; *P. tremula* var. *sieboldii* (Miq.) Kudo—YAMA-NARASHI, HAKO-YANAGI. Deciduous tree with rather thick, purplish gray branches, white-pubescent while young, the bud-scales white-pubescent; leaf-blades ovate to

broadly so, 4-8 cm. long, 3-7 cm. wide, acute to abruptly acute, serrate, deep green, with a small gland on each side of the rounded to broadly cuneate base, slightly glaucous beneath and white-pubescent while young; aments precocious, the staminate 4-7 cm. long, 8-10 mm. across, stamens 5-7; the pistillate 5-8 cm. long, about 7 mm. across.—Apr.—May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

3. *Populus alba* L. URAJIRO-HAKO-YANAGI, HAKUYŌ, GIN-DORO. Deciduous tree; branches and bud-scales white-woolly while young; leaf-blades ovate, elliptic or narrowly so, 4-10 cm. long, acute to obtuse, rounded to shallowly cordate at base, sinuately toothed or incised, deep green above, densely white-woolly beneath; pistillate aments about 5 cm. long; staminate flowers with 6-10 stamens.—Sometimes cultivated in Japan, native of Europe and centr. Asia.

4. *Populus maximowiczii* Henry. *P. suaveolens* var. *latifolia* Gombóc; *P. suaveolens* sensu auct. Japon., non Fisch. —DORO-YANAGI, DORO-NO-KI, DORO. Deciduous tree with thick branches, the branchlets at first pubescent, grayish; leaves subscuricaceous, ovate, elliptic or oblong, sometimes

broadly ovate, 6-10 cm. long, abruptly short-acuminate, obtuse to shallowly cordate at base, obtusely serrulate, deep green above, puberulous on the nerves and whitish beneath, the petioles 1-4 cm. long, puberulous; staminate aments 5-10 cm. long, the stamens rather numerous; pistillate aments elongate after flowering; capsules rather loosely arranged, nearly sessile.—Apr.—June. Sunny fluvial plains and riverbanks; Hokkaido, Honshu (centr. distr. and northw.).—Korea, Manchuria, Ussuri, Amur, Sakhalin, and Kamchatka.

The following are poorly known and reported to occur in Hokkaido:

(1) *Populus jesoensis* Nakai. EZO-YAMA-NARASHI. Plant glabrous; leaves larger and with longer petioles than in *P. sieboldii* Miq.

(2) *Populus davidiana* Dode. CHŌSEN-YAMA-NARASHI. Leaves smaller than in *P. jesoensis* Nakai and without glands at base of blade.—Korea, Manchuria, and Ussuri.

(3) *Populus koreana* Rehd. CHRIMEN-DORO. Young branches glabrous, viscid; nerves of leaves impressed above.

2. CHOSENIA Nakai KESHŌ-YANAGI ZOKU

Deciduous dioecious tree; buds provided with a single bud-scale; leaves relatively narrow, alternate, petiolate, usually serrate, sometimes entire, the stipules absent; flowers precocious, anemophilous; staminate aments pendulous, the bracts thinly membranous, adnate at base to the filaments; stamens 5, slightly unequal, the filaments filiform, the anthers 2-locular; pistillate aments pendulous, the bracts thinly membranous, caducous, hairy; ovary 1, 1-locular, stipitate; capsules 2-valved, the ovules 4, the endosperm absent.—A single species, in e. Asia.

1. *Chosenia arbutifolia* (Pall.) B. V. Skvortz. *Salix arbutifolia* Pall.; *C. bracteosa* (Turcz.) Nakai; *Salix macrolepis* Turcz., pro parte; *C. macrolepis* (Turcz.) Komar.; *S. splendida* Nakai; *C. splendida* (Nakai) Nakai; *S. bracteosa* Turcz.—KESHŌ-YANAGI. Upright deciduous tree; branchlets glabrous, usually glaucous, sometimes reddish; leaves with glaucous petioles 2-5(-7) mm. long, the blades oblanceolate or oblong-lanceolate, 6-8 cm. long, 1-2 cm. wide, obscurely serrate or sometimes entire, acute at both ends, quite glabrous,

rather thick; staminate aments 1-2.5 cm. long, 4-5 mm. in diameter, the axis glabrous, the bracts 3- to 5-nerved, broadly ovate, about 2.5 mm. long, obtuse, loosely hairy on back; pistillate aments 1-2 cm. long in flower, 4-5 cm. long in fruit, the bracts caducous; ovary glabrous, stipitate, the styles 2, free, jointed above, the stigma bifid, lobes linear.—Alluvial plains; Hokkaido, Honshu (Kamikochi in Shinano); locally abundant.—Korea, Sakhalin, e. Siberia, and the area surrounding the Ochotsk Sea.

3. TOISUSU Kimura ŌBA-YANAGI ZOKU

Deciduous dioecious trees with a single overlapping bud-scale, the margins free; leaves narrowly ovate, usually serrate, alternate, stipulate in vigorous shoots; aments cylindric, pendulous in anthesis, the pistillate bracts deciduous; flowers entomophilous, the staminate with 2 dorsiventral glands and 5-10 stamens, the pistillate with a gland on each side; ovary stipitate, the styles 2, free or connate to the middle, the stigmas bifid, slender, becoming deciduous with the upper part of the style; ovules 4.—Few species in e. Asia.

1. *Toisusu urbaniana* (Seemen) Kimura. *Salix cardiophylla* sensu auct. Japon., non Trautv. & Mey.; *S. urbaniana* Seemen; *T. cardiophylla* var. *urbaniana* (Seemen) Kimura—ŌBA-YANAGI. Tree; branchlets dark reddish brown, sparsely short-pubescent while young; leaves narrowly ovate to broadly lanceolate, 5-13 cm. long, 1-4.5 cm. wide, acuminate, minutely serrate, obtuse to rounded or sometimes shallowly cordate at the base, fulvous especially on the underside when young, short-puberulous on the midrib above, glabrescent in age, glaucous beneath; aments appearing with the leaves, terminal on short leafy spurs, pendulous, 5-10 cm. long, the staminate densely flowered, about 8 mm. across, the bracts broadly ovate,

obtuse, ciliate, densely silky on lower half, the pistillate elongate, to 10 cm. long; ovary densely grayish white-pubescent.—May-June. Hokkaido, Honshu (centr. distr. and northw.).—Kuriles.

Var. *schneideri* (Miyabe & Kudo) Kimura. *Salix urbaniana* var. *schneideri* Miyabe & Kudo—TOKACHI-YANAGI. Ovary glabrous.—Hokkaido, Honshu (n. distr.).—Sakhalin.

× *Toisochosenia kamikochica* (Kimura) Kimura. *Salix kamikochica* Kimura—KAMIKOCHI-YANAGI. A bigenic hybrid of *Chosenia arbutifolia* × *Toisusu urbaniana*. Occurs with the parents.

4. SALIX L. YANAGI ZOKU

Usually deciduous, dioecious trees or shrubs; leaves alternate, rarely subopposite, petiolate or sessile, lanceolate, sometimes rounded-cordate, entire to serrate, those on vigorous young shoots often stipulate; aments appearing before or with the leaves; flowers solitary in the axils of bracts, with 1 or 2 glands; staminate flowers with 1-12, usually 2, stamens, the filaments elongate sometimes united below; ovary solitary, 2 carpellate, sessile or stipitate, the style slender or absent, the stigmas 2, each usually

bifid; capsules 1-locular, 2-valved; seeds usually many, silky-comose.—More than 300 species, chiefly in the temperate and cooler regions of the N. Hemisphere, a few in S. America but none elsewhere in the S. Hemisphere.

- 1A. Staminate flowers with 2 glands.
 - 2A. Stamens 3-5; bracts yellowish, deciduous in the pistillate flowers.
 - 3A. Bud-scales with free imbricate margins. 1. *S. chaenomeloides*
 - 3B. Bud-scales united on the margins. 2. *S. subfragilis*
 - 2B. Stamens 2.
 - 4A. Erect shrubs or trees; leaves 4-15 cm. long, lanceolate, acuminate.
 - 5A. Pistillate flowers with 2 glands; leaves glabrous.
 - 6A. Spikes about 2 cm. long; leaves and branchlets green when dried; branchlets slender, often twisted; cultivated.
 3. *S. matsudana* Cv. Tortuosa
 - 6B. Spikes not over 1.5 cm. long, densely flowered; leaves and branchlets often dark brown when dried; branchlets rather thick; indigenous. 4. *S. eriocarpa*
 - 5B. Pistillate flowers with 1 gland; leaves usually pubescent.
 - 7A. Ovary glabrous.
 - 8A. Leaves linear-lanceolate; branchlets slender, drooping; styles short; cultivated. 5. *S. babylonica*
 - 8B. Leaves lanceolate to broadly so; branchlets not drooping; styles nearly absent; indigenous. 6. *S. terisifolia*
 - 7B. Ovary pubescent.
 - 9A. Leaves pale green beneath. 7. *S. yoshinoi*
 - 9B. Leaves glaucous beneath.
 - 10A. Petioles 2-5 mm. long; branchlets densely puberulent. 8. *S. jessoensis*
 - 10B. Petioles 5-10 mm. long; branchlets glabrous or glabrescent. 9. *S. koreensis*
 - 4B. Dwarf alpine subshrub; leaves obovate to rounded, rounded at apex, 6-12 mm. long, subentire. 10. *S. pauciflora*
 - 1B. Staminate flowers with 1 gland.
 - 11A. Stamens free.
 - 12A. Dwarf alpine shrubs; branchlets short, creeping, much-branched; aments terminal on short leafy branchlets.
 - 13A. Styles long; leaves 2-4 cm. long, the petioles 5-25 mm. long.
 - 14A. Leaves with prominently raised reticulate veinlets beneath. 11. *S. hidakamontana*
 - 14B. Leaves without prominently raised veinlets beneath.
 - 15A. Leaves elliptic to oblong; bracts narrowly ovate, subobtusely, pubescent on both sides; alpine in Honshu. 12. *S. nakamuraana*
 - 15B. Leaves elliptic to ovate-rounded; bracts elliptic, rounded at apex, densely pubescent; alpine in Hokkaido. 13. *S. yezoalpina*
 - 13B. Styles short; leaves 1-3 cm. long, the petioles 2-5 mm. long. 18. *S. paludicola*
 - 12B. Shrubs or trees of mountains and lowlands, with erect or ascending stems and branches.
 - 16A. Styles very short or absent.
 - 17A. Much-branched large shrubs; leaves 4-8 cm. long, 2-4 cm. wide, the petioles 1-2.5 cm. long.
 - 18A. Sapwood of young branches with short, elevated, longitudinal striations; leaves pubescent beneath. 14. *S. bakko*
 - 18B. Sapwood of young branches without striations.
 - 19A. Adult leaves pubescent beneath. 15. *S. hultenii*
 - 19B. Adult leaves glabrous on both sides. 16. *S. taraiensis*
 - 17B. Small shrubs; the branches erect, slightly branched; leaves 2.5-4 cm. long, 5-12 mm. wide, the petioles 1-5 mm. long.
 17. *S. subopposita*
 - 16B. Styles distinct, longer than the stigma.
 - 20A. Spikes terminal on short leafy branchlets.
 - 21A. Leaves rounded with a mucro or very short-acute at apex, usually distinctly toothed; ovary glabrous or white-pubescent.
 19. *S. reinii*
 - 21B. Leaves rounded to obtuse, minutely and sometimes obscurely toothed; ovary yellow-brown villous. 20. *S. hideoi*
 - 20B. Spikes lateral, sessile or nearly so.
 - 22A. Leaves oblong to broadly elliptic, acute or short-acuminate.
 - 23A. Leaves 10-20 cm. long, narrowly oblong to elliptic, often yellowish pubescent; ovary nearly sessile. 21. *S. futura*
 - 23B. Leaves 3-8 cm. long, elliptic, oblong, or obovate-elliptic, rarely lanceolate.
 - 24A. Young branchlets and the underside of leaves yellow-brown pubescent; leaves elliptic or oblong; ovary stiped.
 22. *S. vulpina*
 - 24B. Young branchlets and other parts white-pubescent or glabrous.
 - 25A. Leaves broadly cuneate to shallowly cordate at base; ovary long-stiped. 23. *S. shiraii*
 - 25B. Leaves acute to obtuse at base; ovary short-stiped.
 - 26A. Leaves ovate-oblong; fruiting spikes 3-5 cm. long; staminate spikes 2-2.5 cm. long. 24. *S. rupifraga*
 - 26B. Leaves lanceolate; fruiting spikes 6-12 cm. long; staminate spikes 3-8 cm. long. 25. *S. japonica*
 - 22B. Leaves lanceolate, gradually narrowed and acuminate.
 - 27A. Leaves glabrous from the beginning; branchlets and leaves glaucous. 26. *S. rorida*
 - 27B. Leaves pubescent at least at first.
 - 28A. Leaves silky-pubescent beneath.
 - 29A. Branchlets thick, villous; flower-buds large, densely arranged on the branchlets; leaves silky-villous beneath.
 27. *S. kinuayanagi*
 - 29B. Branchlets more slender, silvery-pubescent; flower-buds rather loosely arranged; leaves silvery-pubescent.
 28. *S. petsusu*
 - 28B. Leaves appressed-puberulent beneath. 29. *S. sachalinensis*
 - 11B. Stamens with the filaments united at base.
 - 30A. Stamens 2 with filaments connate beneath.
 - 31A. Styles absent or very short and less than half the length of the ovary; filaments pilose; leaves lanceolate to narrowly so.

- 32A. Leaves sessile or nearly so, scarcely exceeding 4 cm. in length, usually opposite and entire, rounded to shallowly cordate and slightly clasping the branches, rounded to obtuse at apex. 30. *S. integra*
- 32B. Leaves distinctly petiolate, 6–16 cm. long, serrate, obtuse to acute and not clasping, acuminate to acute. 31. *S. koriyanagi*
- 33A. Petioles 2–5 mm. long; leaves linear-lanceolate, sometimes subopposite, obtuse to rounded at base; shrub cultivated and frequently naturalized. 32. *S. miyabeana*
- 33B. Petioles 2–8 mm. long; leaves always alternate. 33. *S. gilgiana*
- 34A. Styles absent, the stigma entire. 34. *S. gracilistyla*
- 34B. Styles short but distinct, the stigma bifid. 35. *S. graciliglans*
- 31B. Styles longer than the ovary, 2–3 mm. long; leaves white-pubescent beneath, with raised lateral nerves. 36. *S. buergeriana*
- 35A. Adult leaves silky-pubescent beneath; bracts densely hairy. 37. *S. harmsiana*
- 35B. Adult leaves glabrous; bracts glabrous except at base. 38. *S. sieboldiana*
- 30B. Stamen 1, or the flowers with 1 or 2 stamens in one ament. 36. *S. buergeriana*
- 36A. Staminate aments 4–7 cm. long, about 4 mm. across; glands cylindric; bracts dark colored; pistillate aments 3–4 cm. long. 36. *S. buergeriana*
- 36B. Staminate aments 2.5–4 cm. long, 6–10 mm. across; glands ovoid; bracts darkened above; pistillate aments 2–2.5 cm. long. 36. *S. buergeriana*
- 37A. Stamen 1; bracts relatively short-villous; stipe of the ovary as long as the gland; leaves elliptic or narrowly ovate. 37. *S. harmsiana*
- 37B. Stamens 1 or 2; bracts long-villous; stipe of the ovary longer than the gland; leaves narrowly oblong. 38. *S. sieboldiana*

1. *Salix chaenomeloides* Kimura. *S. glandulosa* Seem., non Raf.—AKAME-YANAGI. Tree; young branches hairy, soon glabrate, yellowish, rather slender; leaves with petioles 5–12 mm. long with a small discoid gland near apex on each side, the blades oblong or narrowly so, sometimes elliptic, 5–12 cm. long, 1.5–5 cm. wide, short-acuminate, obtuse to acute at base, serrate with incurved teeth, glabrous and brownish red above while young, glaucous and glabrous or slightly pubescent only near base beneath, the lateral nerves many, rather prominent on both sides; staminate aments 2–6 cm. long, rather loosely flowered, the filaments glabrous, the pistillate aments 2–4 cm. long in anthesis, 6–10 cm. in fruit, the bracts 1.5 mm. long, short-pubescent; styles very short, the stigma bifid; capsules about 3 mm. long, ovoid, glabrous, the stipe 1–1.5 mm. long.—Honshu, Shikoku, Kyushu.—Korea and China.

2. *Salix subfragilis* Anderss. *S. nipponica* Fr. & Sav.; *S. triandra* var. *nipponica* (Fr. & Sav.) Seemen; *S. amygdalina* var. *nipponica* (Fr. & Sav.) C. K. Schn.; *S. triandra* sensu auct. Japon., non L.; *S. hamatidensis* Lévl.—TACHI-YANAGI. Small tree or shrub; leaves with petioles 3–10 mm. long, the blades ovate to elliptic-lanceolate, sometimes broadly lanceolate, 5–12 cm. long, 5–25 mm. wide, long-acuminate, acute at base, serrulate, whitish beneath, becoming glabrous, the lateral nerves slender, rather many; staminate aments 2–5 cm. long, about 8 mm. across, rather densely flowered; stamens 3, the filaments hairy below, the pistillate aments 2–3.5 cm. long; ovary glabrous, stipitate.—Wet lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, Ussuri, Manchuria, n. China, and Korea.

3. *Salix matsudana* Koidz. cv. *Tortuosa*. *S. matsudana* var. *tortuosa* Vilm.—UNRYŪ-YANAGI. Glabrous tree with slender tortuous, flexuous branchlets; leaves with petioles 2–8 mm. long, the blades linear-lanceolate, 5–8 cm. long, 4–10 mm. wide, long-acuminate, serrulate, cuneate to rounded at base, glaucous and slightly silky-pubescent beneath, becoming glabrate; aments 1–2 cm. long, the peduncles with entire leaves; ovary nearly sessile, the styles almost absent.—Occasionally cultivated as a garden ornamental. The typical phase of the species occurs in n. China, Korea, Manchuria, and e. Siberia.

4. *Salix eriocarpa* Fr. & Sav. *S. dolichostyla* Seemen—JA-YANAGI. Trees; branches fulvous, short-pubescent; leaves with petioles 4–7 mm. long, the blades lanceolate, 7–12 cm. long, 8–20 mm. wide, acuminate, acute at base, serrulate,

glabrous and glaucous beneath, slightly short-pilose above, the lateral nerves slender, rather many; aments appearing with the leaves, the staminate nearly sessile, with few small leaves at base, 8–20 mm. long, about 5 mm. across, densely flowered, the bracts oblong-ovate, obtuse; ovary densely white-pubescent; style short, glabrous.—Wet lowlands; Honshu, Shikoku, Kyushu.

5. *Salix babylonica* L. *S. pendula* Moench—SHIDARE-YANAGI. Tree with the branches slender, pendulous, brownish when old, short-pubescent to glabrate while young; leaves with petioles 3–6 mm. long, the blades linear-lanceolate, 8–15 cm. long, 5–12 mm. wide, acuminate, serrulate, acute at base, glabrous or with scattered appressed pubescence, glaucous beneath, the lateral nerves many; aments nearly sessile, 2–4 cm. long in the staminate, 1–2 cm. in the pistillate, densely leafy at base, the bracts narrowly ovate, with long hairs only at base, 1.2–1.5 mm. long; ovary glabrous, nearly sessile; style very short, the stigma bifid, rather thickened.—Cultivated in Japan, but spontaneous in centr. China. Introduced and cultivated species related to *S. babylonica* are:

Salix ohsidare Kimura. ŌSHIDARE. Branchlets thicker; leaves longer (10–20 cm.), 2.3–4 cm. wide; peduncles 5–8 mm. long; style slightly longer.—Uncommon; Honshu (n. distr.).

Salix elegantissima K. Koch. ROKKAKU. Leaves lanceolate, to 2 cm. wide, pale green beneath, the petioles 1–1.5 cm. long; pistillate aments to 5 cm. long, pedunculate; flowers with 2 glands, the ovary short-stiped, pubescent on the lower portion.

6. *Salix serissaefolia* Kimura. KOGOME-YANAGI. Tree with ascending grayish-brown branches, the branchlets short grayish pubescent soon glabrate; leaves with short-pilose petioles 2–6 mm. long, the blades thinly coriaceous, lanceolate to broadly lanceolate, 4–7 cm. long, 8–12 mm. wide, gradually long-acuminate, obtuse at base, serrulate, lustrous and yellowish green above, whitish beneath, the lateral nerves slender, spreading, paler colored and prominent above; pistillate aments rather slender, 1–1.7 cm. long, short-pedunculate, rather densely flowered, the bracts yellowish green, elliptic, nearly truncate or rounded at apex, about 2 mm. long, hairy only at base; ovary nearly sessile, with silky hairs near base; style very short, the stigma linear; capsules ovoid, about 2.5 mm. long.—Honshu (Kantō to Kinki Distr.).

7. *Salix yoshinoi* Koidz. YOSHINO-YANAGI. Small tree with grayish branchlets densely white-pubescent while young;

leaves with white-villous petioles about 5 mm. long, the blades lanceolate, to 10 cm. long and 2.2 cm. wide, short-acuminate, serrulate, rounded at base, sparingly pubescent above at first, becoming glabrous, densely pubescent beneath at first, later sparingly so, the lateral nerves many; aments appearing with the leaves, the pistillate 1-1.5 cm. long, short-pedunculate, the bracts ovate, sparsely hairy on outer side, rounded at apex; ovary white-villous, sessile; style elongate, glabrous; staminate aments 1.5-2.5 cm. long, about 7 mm. across, the filaments long-hairy at base.—Honshu (Kinki and Chūgoku Distr.).

8. *Salix jezoensis* Seemen. *S. hondoensis* Koidz.—SHIRO-YANAGI. Tree with brownish branches, the branchlets densely short-pubescent with grayish hairs; leaves with pubescent petioles 2-5 mm. long, the blades lanceolate or narrowly so, 5-10 cm. long, 8-15 mm. wide, long-acuminate, serrulate, the juvenile ones glaucous and densely appressed silky-pubescent but only sparingly so when mature; aments short-pedunculate, the staminate 2-3 cm. long, rather loosely flowered, the bracts oblong, rather densely hairy near base, the filaments hairy below, the pistillate 3-4.5 cm. long, densely flowered, the bracts retuse to obtuse; ovary pubescent; style very short or almost absent, the stigma oblong, entire.—Hokkaido, Honshu.

9. *Salix koreënsis* Anderss. *S. pseudojezoensis* Lévl.—KŌRAI-YANAGI. Trees with grayish brown or brownish green branches, the branchlets glabrous or short-pubescent; leaves with glabrous petioles 5-10 mm. long, the blades lanceolate, 8-13 cm. long, 12-25 mm. wide, acuminate, serrulate, rounded to acute at base, glabrous on both sides except the midrib, glaucous beneath; staminate aments 1-3 cm. long, 6-7 mm. across, densely flowered, the bracts ovate-oblong, obtuse, about 2 mm. long, long white-hairy; anthers reddish brown, the filaments hairy below, the pistillate aments 7-15 mm. long, densely flowered; ovary villous, sessile, the style relatively long, the stigma bifid.—Honshu (western distr.), Kyushu.—Korea and Manchuria.

10. *Salix pauciflora* Koidz. EZO-MAME-YANAGI. Small prostrate shrub with slender branchlets, short-pubescent, changing to red-brown in age; leaves with pubescent petioles 1-4 mm. long, the blades thinly coriaceous, obovate to elliptic, sometimes nearly rounded, 6-12 mm. long, 3-10 mm. wide, entire, subacute to obtuse or rounded at base, lustrous and glabrous above, pale green and sparsely long-pubescent on midrib beneath, glabrous or short-pubescent on margin; staminate aments globose, 5- to 30-flowered, terminal on short lateral branchlets, leafy below, 3-10 mm. long, the bracts obovate, rounded at apex, reddish on upper half, hairy on margin and inner side, glabrescent outside, 1.2-2.2 mm. long; filaments free, glabrous; pistillate aments 5- to 30-flowered, 13-17 mm. long in fruit; capsules about 5 mm. long, glabrous, stipitate; style short, the stigmas very short, bifid.—July-Aug. Alpine slopes; Hokkaido (Mount Daisetsu).—Forma *hebecarpa* Kimura. Ovary pubescent. Occurs with the typical phase.

11. *Salix hidakamontana* Hara. HIDA-KA-MINE-YANAGI. Low shrub 10-20 cm. high, with decumbent branches, the branchlets silky-pubescent while young; leaves with petioles 1-2.5 cm. long, the blades rounded to elliptic, 2-4 cm. long, 1.5-3.5 cm. wide, sometimes retuse at apex, rounded to shallowly cordate at base, entire or with obsolete undulate teeth, glabrous, glaucous, the veins and veinlets raised reticulate beneath, impressed above; pistillate aments terminal on short

leafy branchlets, densely flowered, 2-5 cm. long in fruit, the bracts ovate or oblong, obtuse or subacute, 1-1.5 mm. long, silky villous; capsules narrowly ovoid, 4-6 mm. long, glabrous, subsessile.—Alpine regions; Hokkaido (Hidaka mt. range).

12. *Salix nakamura* Koidz. RENGÉ-IWA-YANAGI, TAKANE-IWA-YANAGI. Small prostrate shrub with rooting branches, the branchlets at first slightly silky, soon glabrate, changing to dark purple-brown in age; leaves with glabrous petioles, the blades elliptic or obovate, sometimes oblong, 2-4 cm. long, 1-3 cm. wide, rounded or sometimes obtuse at apex, obtuse to acute at base, entire or with remote obsolete teeth, glaucous beneath, the lateral nerves prominently arcuate above; aments 2.5-4 cm. long, on short lateral branches, the bracts narrowly ovate or oblong, subobtusate to nearly rounded at apex, black-brown above, hairy on both sides; filaments short-connate below; ovary glabrous, short-stipitate; style distinct, the stigma short-linear, bifid.—July. Alpine slopes; Honshu (high mountains of Kai and Shinano Prov.); rare.

Var. *eriocarpa* Kimura. Ovary hairy. Occurs with the typical phase.

13. *Salix yezoalpina* Koidz. *S. cyclophylla* Seemen, non Rydb.—MARUBA-YANAGI. Low shrub with prostrate, rooting branches, the branchlets glabrous or sometimes slightly pubescent while young, becoming purple-brown in age; leaves with glabrous petioles 5-15 mm. long, the blades variously elliptic or rounded, 2-4.5 cm. long, 1-3.5 cm. wide, essentially entire, slightly silky while young, glaucous beneath, rounded, barely mucronate or retuse, broadly cuneate to shallowly cordate, the lateral nerves and reticulate veinlets slightly raised beneath; staminate aments 15-30 mm. long, densely flowered, the pistillate slightly elongate after anthesis, to 2-5 cm. long, the bracts elliptic, nearly half as long as the capsule, rounded at apex, densely long-hairy; capsules subsessile, glabrous; style slender, the stigmas rather slender, bifid, the filaments glabrous.—July. Alpine slopes; Hokkaido.

Var. *neoreticulata* (Nakai) Kimura. *S. neoreticulata* Nakai.—INU-MARUBA-YANAGI. Distinguished from the typical phase by the leaves lustrous above and the prominently raised reticulate veinlets beneath, and silky ovaries.—Hokkaido (Mount Daisetsu and Mount Rishiri).

14. *Salix bakko* Kimura. *S. caprea* sensu auct. Japon, non L.—BAKKO-YANAGI. Tree with grayish brown branches pubescent at first, the sapwood with elevated, short, longitudinal striations; leaves with petioles 1-2 cm. long, the blades oblong or elliptic, 6-13 cm. long, 3-4 cm. wide, acuminate to acute, undulate-serrate or nearly entire, acute to rounded at base, vivid green and glabrous above, glaucous and densely white crisped-pubescent; staminate aments 3-5 cm. long, rather broad, short-pedunculate, very densely flowered, the bracts narrowly oblong to lanceolate, 3-4 mm. long, subacute, densely long-hairy on both surfaces; stamens 2, the filaments free, hairy below; pistillate aments to 10 cm. long in fruit, 15-20 mm. across; ovary villous, long-stipitate; style and stigmas very short, glabrous.—Mountains; Hokkaido (western distr.), Honshu (Kinki Distr. and eastw.).

Salix leucopithecia Kimura. FURI-SODE-YANAGI. An alleged hybrid of *S. bakko* × *S. gracilistylis*; sometimes cultivated for ornament in early spring; only the staminate plant is known.

15. *Salix hulténii* Floderus var. *angustifolia* Kimura. *S. caprea* sensu auct. Japon, pro parte, non L.—EZO-NO-BAKKO-YANAGI, EZO-NO-YAMANAKO-YANAGI. Small tree or large

shrub closely allied to the preceding species, the second year branches purple-castaneous, the sapwood not or scarcely banded; leaves with petioles 1–2 cm. long, pubescent above, the blades chartaceous, narrowly obovate or oblong, 6–12 cm. long, 3–5 cm. wide, short-acuminate, with obsolete undulate teeth, acute to obtuse at base, glabrous except the midrib above, glaucous and densely crisped-pubescent.—Hokkaido, Kuriles, Sakhalin, and Kamchatka.

Salix × *yotitana* Kimura is an alleged hybrid of No. 15 possibly crossed with *S. gracilistyla*.

16. *Salix taraiakensis* Kimura. *S. hastata* sensu auct. Japon, non L.—TARAIKA-YANAGI. Large shrub with the juvenile branchlets silky pubescent, soon becoming glabrous; leaves with nearly glabrous petioles 1–1.5 cm. long, the blades chartaceous, narrowly obovate or rhomboid-elliptic, 6–10 cm. long, 2–3.5 cm. wide, acuminate to acute, obsoletely serrulate, acute at base, usually broadest at or above the middle, glabrous except for silky pubescence on nerves beneath and on the upper surface while young, glaucous beneath, deep green and lustrous above; staminate aments elliptic or short-cylindric, densely flowered, 2.5–3.8 cm. long, 18–27 mm. wide; pistillate aments 2–2.7 cm. long, short-cylindric, pedunculate, the bracts oblong, obtuse or nearly so, densely hairy on both surfaces, 2.3–2.6 mm. long; ovaries white-villous, stipitate; style short, the stigma bifid, the lobes short, rather thick; capsules about 9 mm. long.—Hokkaido (Kushiro and Nemuro Prov.).—Sakhalin.

17. *Salix subopposita* Miq. *S. repens* var. *subopposita* (Miq.) Seemen; *S. sibirica* var. *subopposita* (Miq.) C. K. Schn.—NO-YANAGI, HIME-YANAGI. Small shrub, the branches rather slender, erect, deep brown, densely short grayish pubescent while young; leaves with petioles 1–5 mm. long, the blades broadly lanceolate, broadly oblong-lanceolate to narrowly oblong, 2.5–4 cm. long, 5–12 mm. wide, acute, entire, acute at base, glabrous or nearly so above, glaucous and sparsely gray-yellow appressed-pubescent beneath, densely so while young, the nerves slightly impressed above, slightly raised beneath; staminate aments to 2.7 cm. long and 7 mm. across, densely flowered, the bracts oblong, rounded at apex, silky; pistillate aments short-cylindric, short-pedunculate, 1–2 cm. long, 8–10 mm. across in fruit, densely flowered; capsules rather densely appressed grayish pubescent, about 4 mm. long; style nearly absent, stigma bifid, short.—Honshu (Chûgoku Distr.), Kyushu.—S. Korea (Quelpaert Isl.).

18. *Salix paludicola* Koidz. MIYAMA-YACHI-YANAGI. Dwarf procumbent shrub about 5 cm. high with rooting narrow branches and yellowish brown, slightly lustrous, glabrous branchlets; leaves with glabrous petioles 2–5 mm. long, the blades glabrous, obovate, 1–3 cm. long, 5–17 mm. wide, lustrous above, glaucous beneath, obtuse to rounded, broadly cuneate at base, entire or undulate-serrulate; staminate aments densely flowered, about 3 cm. long, about 10 mm. wide; pistillate aments terminal on short lateral few-leaved branchlets, densely flowered, 3–4 cm. long in fruit, the rachis hairy, the bracts broadly ovate, yellowish brown, rounded at apex, densely hairy outside; ovary short-stipitate, densely pubescent; style short, the stigmas shortly bifid; capsules lanceolate, 7–8 mm. long, loosely pubescent.—Hokkaido (alpine zone on Mount Daisetsu); rare.

Salix × *pseudopaludicola* Kimura is an alleged hybrid between Nos. 18 and 20.

19. *Salix reinii* Fr. & Sav. *S. glabra* Fr. & Sav., non

Scop.; *S. kashista* C. K. Schn.—MIYAMA-YANAGI, MINE-YANAGI. Glabrous shrub, with relatively thick dark brown branches; leaves with petioles 5–13 mm. long, the blades obovate or elliptic, 2–6 cm. long, 1.5–3.5 cm. wide, rounded and mucronate to abruptly acute, with incurved, undulate-serrate teeth, rounded to obtuse at base, deep green above, glaucous beneath, the lateral nerves slender; staminate aments short-pedunculate, slender, 2.5–4 cm. long, rather loosely flowered, the axis short-pilose, the bracts broadly lanceolate to narrowly ovate, obtuse to acute, slightly pubescent below and near margins; pistillate aments narrowly cylindric, 3–5 cm. long; capsules stipitate, glabrous; style rather slender, the stigmas shortly bifid.—Hokkaido, Honshu (centr. and n. distr.); rather common.—s. Kuriles.

Var. *eriocarpa* Kimura. KE-MIYAMA-YANAGI. Branchlets and leaves silky hairy while young; ovaries densely white silky-hairy.—Alpine mountains; Honshu (centr. distr.).

20. *Salix hideoi* Koidz. EZO-MIYAMA-YANAGI. Similar to the preceding; shrub with glabrous branchlets at first dark purple, changing to dark brown; leaves with petioles 4–10 mm. long, the blades oblong, rarely obovate, 1–5 cm. long, 7–25 mm. wide, obtuse to rounded, obtuse at base, slightly undulate-serrate, soon glabrous, not lustrous above, pale or slightly glaucous beneath; pistillate aments pedunculate, densely flowered, about 3 cm. long at anthesis, the axis villous, the bracts oblong, rounded at apex, yellowish brown villous; style short, stigmas bifid; fruiting aments 3.5–4.5 cm. long, about 1 cm. across; capsules 6–7 mm. long, puberulous, becoming glabrate.—Hokkaido.—s. Kuriles.

21. *Salix futura* Seemen. *S. vulpinoides* Koidz.; *S. vulpina* var. *tomentosa* Koidz.—ÔNEKO-YANAGI. Large shrub, the branchlets dark brown, rather thick, at first brown-villous; leaves with petioles 8–15 mm. long, the blades narrowly oblong to elliptic, 8–20 cm. long, 3–6 cm. wide, acuminate, with margins slightly recurved, depressed-serrate, obtuse to acute at base, chartaceous, deep green and appressed pubescent above while young, glaucous and with pale to yellowish brown pubescence beneath especially on the nerves; staminate aments long-cylindric, densely flowered, sessile, about 5 mm. across, the bracts ovate, very obtuse, about 1.2 mm. long, with relatively long dense hairs on both surfaces; ovary silky-pubescent, nearly sessile; style somewhat less than 1 mm. long, the stigma short, bifid.—Honshu (centr. distr. and northw.).

Var. *psilocarpa* Kimura. Ovary glabrescent.—Occurs with the typical phase.

Salix × *sirakawensis* Kimura is a hybrid of No. 21 with *S. integra*.

22. *Salix vulpina* Anderss. *S. miquelii* Anderss.; *S. miquelii* var. *vulpina* (Anderss.) Anderss.; *S. ignicomia* Lév. & Van't.; *S. daizensiensis* Seemen, pro parte.—KITSUNE-YANAGI. Shrub with lustrous dark brown branches, whitish and yellowish brown pubescent when young; leaves with petioles 6–10 mm. long, the blades oblong to elliptic, 3–8 cm. long, 2–3.5 cm. wide, acute to rather obtuse, acute to obtuse at base, irregularly obtusely serrate, not lustrous above, more or less glaucous and usually yellow-brown pubescent along the midrib beneath; staminate aments short-pedunculate, 2.5–4 cm. long, 5–6 mm. across, densely flowered, the bracts small, reddish brown villous; filaments free or slightly connate and more or less pubescent below; capsules stipitate, glabrous; style slender, the stigmas short.—Hokkaido, Honshu, Shi-

koku, Kyushu.—s. Kuriles. In western Honshu (Kinki Distr. and westw.), Shikoku, and Kyushu this plant is sometimes differentiated as *S. alopecuroides* Kimura with aments having much more reduced leaves at base, the staminate shorter, thicker, and larger.

23. *Salix shiraii* Seemen. SHIRAI-YANAGI. Shrub with dark brown branches, gray-appressed pubescent only when young; leaves with petioles 6–10 mm. long, the blades ovate to narrowly so, 2.5–5.5 cm. long, acuminate to caudately acuminate, sometimes acute, vivid green, acutely appressed-toothed, rounded to shallowly cordate, rarely subacute at base, glaucous and glabrous, sometimes gray-pubescent beneath when young; staminate aments nearly sessile, about 4 cm. long, 5 mm. wide, densely flowered, the bracts small, broadly ovate, rounded at apex, densely white-hairy; stamens 2, the filaments free, glabrous; pistillate aments rather loosely flowered; capsules long-stipitate, glabrous, 2.5–3 mm. long; style slender, the stigmas short.—Mountains; Honshu (near Nikko).

24. *Salix rupifraga* Koidz. KOMA-IWA-YANAGI. Shrub, with grayish brown glabrous branches, often with long grayish appressed-pubescent while young; leaves with petioles 4–10 mm. long, the blades ovate-oblong to oblong, 4–6.5 cm. long, 1.5–2.5 cm. wide, acuminate to very acute, loosely and acutely appressed-toothed, acute to obtuse or sometimes nearly rounded at base, silky pubescent on both surfaces when young, becoming glabrate except the puberulent midrib above, glaucous beneath; staminate aments cylindric, 2–2.5 cm. long, about 6 mm. across, short-pedunculate, the bracts elliptic or ovate, very obtuse, long white-hairy on both surfaces, about 1.3 mm. long; pistillate aments to 5 cm. long in fruit, densely flowered; ovaries glabrous, short-stipitate; styles and stigmas very short, stigmas bifid.—Mountains; Honshu (Kai and se. Shinano Prov.).

Var. *eriocarpa* Kimura. Distinguished by the pubescent ovaries. Occurs with the typical phase.

25. *Salix japonica* Thunb. *S. babylonica* var. *japonica* Anderss.; *S. fauriei* Seemen.—SHIBA-YANAGI. Shrub with brownish slender branches pubescent while young; leaves with petioles 3–5 mm. long, silky at first, soon glabrous, the blades lanceolate to broadly so, 5–8 cm. long, 1.5–2.5 cm. wide, glabrous, appressed-toothed, obtuse to rounded at base, vivid green above, glaucous or grayish beneath; staminate aments 3–8 cm. long, about 5 mm. across, rather loosely flowered; filaments pilose below; pistillate aments short-pedunculate, linear, rather loosely flowered, 6–12 cm. long, the axis scattered short-pilose, the bracts ovate, rounded at apex, sparsely short-pilose; capsules stipitate, glabrous; style short, the stigmas oblong.—Hills and mountains; Honshu (centr. distr.); common.

26. *Salix rorida* Lacksch. *S. daphnoides* sensu auct. Japon., non Vill.; *S. lachschevitziana* Toepfer—EZO-YANAGI. Tree with glabrous, reddish, slightly glaucous branches; leaves with petioles 2–8 mm. long, the blades glabrous, lanceolate, 5–12 cm. long, 7–30 mm. wide, long-acuminate, acute to obtuse or rounded at base, glaucous beneath, serrulate; staminate aments nearly sessile, 1.5–3.5 cm. long, 12–13 mm. across, very densely flowered, the bracts narrowly obovate, 2–2.5 mm. long, glandular on margin, densely long silvery-hairy, the filaments glabrous; pistillate aments 2–4 cm. long, 1–1.5 cm. across, very densely flowered; ovaries glabrous, stipitate; style slender, rather elongate, the stigmas short, bifid.—Hokkaido, Honshu.—Sakhalin, Amur, Ussuri, and Korea.

Var. *roridaeformis* (Nakai) Ohwi. *S. roridaeformis* Nakai; *S. lachschevitziana* var. *roridaeformis* (Nakai) Kimura; *S. rorida* var. *eglandulosa* Kimura—KO-EZO-YANAGI. Bracts eglandular.—Honshu (Kamikochi in Shinano).—Korea and Sakhalin.

27. *Salix kinuyanagi* Kimura. *S. viminalis* sensu auct. Japon., non L.—KINU-YANAGI. Tree or shrub with grayish villous, rather thick branchlets; leaves with petioles 10–18 mm. long, the blades chartaceous, narrowly lanceolate, 10–20 cm. long, 1–2 cm. wide, caudately acuminate, obtuse to acute at base, with obsoletely undulate and slightly recurved margins, appressed puberulent above while young, long-silvery appressed-villous beneath; staminate aments ellipsoidal or ovoid, densely flowered, sessile, 2.5–3.5 cm. long, 15–20 mm. in diameter, the bracts broadly lanceolate, acute, villous outside, 3–3.2 mm. long; filaments free, glabrous.—Widely cultivated in Honshu, Shikoku, and Kyushu; pistillate plant unknown to us.

Salix × *thaumasta* Kimura is a hybrid of No. 27 with *S. gracilistyla*.

28. *Salix petsusa* Kimura. *S. viminalis* sensu auct. Japon., non L.; *S. viminalis* var. *yezoensis* C. K. Schn.; *S. yezoensis* (C. K. Schn.) Kimura—EZO-NO-KINU-YANAGI. Tree resembling No. 27, differing in the rather slender branches, these less densely hairy with shorter pubescence, the branchlets grayish brown, densely white-pubescent while young; leaves with pubescent petioles 8–15 mm. long, the blades lanceolate to oblong-lanceolate, 10–20 cm. long, 1.5–2 cm. wide, long-acuminate, acute to obtuse at base, entire, usually glabrous above, with dense silvery appressed hairs beneath; staminate aments short-cylindric or ovoid-cylindric, 2–3.5 cm. long, 1–1.5 cm. in diameter, sessile; pistillate aments cylindric, 3.5–6(–10) cm. in fruit, the bracts 2–2.5 mm. long, dark brown above, white-hairy on back.—Hokkaido, Honshu (centr. distr. and northw.).—Sakhalin.

29. *Salix sachalinensis* F. Schmidt. *S. opaca* Anderss. ex Seemen; *S. sikokiana* Makino; *S. makinoana* Seemen, pro parte; *S. pilgeriana* Seemen; *S. sachalinensis* var. *pilgeriana* (Seemen) C. K. Schn.—ONOE-YANAGI. Tree; branches glabrous, brownish, slightly pubescent while young, the hairs short and grayish; leaves with petioles 2–6 mm. long, the blades lanceolate to narrowly so, 6–10 cm. long, 8–20 mm. wide, gradually acuminate at both ends, entire or obsoletely undulate with slightly recurved margins, short-appressed silky pubescent beneath especially while young, pale and scarcely glaucous on under side; staminate aments short-pedunculate, densely flowered, cylindric, 2–4 cm. long, 5–6 mm. in diameter, the bracts lanceolate, obtuse, with long whitish hairs especially on margin, the filaments glabrous; pistillate aments densely flowered, 2.5–5 cm. long; capsules with short whitish pubescence, stipitate; style elongate, slender, to 1.5 mm. long, the stigma short, oblong, entire.—Valleys in mountains; Hokkaido, Honshu, Shikoku; rather common.—Amur, Ussuri, Sakhalin, Kamchatka, and Kuriles.

The following hybrids are known: *S.* × *euerata* Kimura (*S. gilgiana* × *S. sachalinensis*); *S.* × *ampherista* Kimura (*S. sachalinensis* × *S. vulpina*); *S.* × *ikenoana* Kimura (*S. integra* × *S. sachalinensis*).

30. *Salix integra* Thunb. *S. purpurea* sensu auct. Japon., non L.; *S. multinervis* Fr. & Sav.; *S. purpurea* var. *multinervis* (Fr. & Sav.) Matsum.; *S. savatieri* Camus; *S. purpurea* subsp. *amplexicaulis* sensu auct. Japon., non Bory &

Chaub.—INU-KÖRI-YANAGI. Shrub with glabrous lustrous branches; leaves nearly sessile, usually opposite, narrowly oblong to oblong, 3–6 cm. long, 7–20 mm. wide, rather thin, glabrous, rounded to subacute, obsolete serrulate or entire, rounded to shallowly cordate, whitish beneath; staminate aments 15–25 mm. long, about 7 mm. in diameter, densely flowered, the bracts broadly obovate, rounded at apex, about 2 mm. long, loosely long-ciliate, the filaments glabrous; pistillate aments 15–30 mm. long, cylindric and densely flowered at first; ovary silky, sessile; style short, the stigmas very short, bifid; capsules about 3 mm. long, grayish white, with rather dense and appressed short hairs.—Honshu, Kyushu.—Korea.

The following hybrids are recorded: *S.* × *hapala* Kimura (*S. gilgiana* × *S. integra*); *S.* × *sirakawensis* Kimura (*S. futura* × *S. integra*); *S.* × *isikawae* Kimura (*S. vulpina* × *S. sachalinensis*).

31. *Salix koriyanagi* Kimura. *S. purpurea* var. *japonica* Nakai; *S. purpurea* sensu aut. Japon., non L.—KÖRI-YANAGI. Shrub with glabrous, yellowish brown to brown branches; leaves alternate or sometimes opposite, with petioles 2–5 mm. wide, the blades linear-lanceolate, 6–8 cm. long, 5–10 mm. wide, gradually acuminate at the apex, obtuse to rounded at base, remotely serrate, thinly coriaceous, glabrous, deep green above, glaucescent beneath, the lateral nerves many, slender, rather spreading; staminate aments cylindric, densely flowered, 2–3 cm. long, the bracts obovate, long-hairy; anthers deep purple; pistillate aments 2–3 cm. long, nearly sessile, densely flowered, the bracts narrowly obovate, obtuse, about 1.5 mm. long, loosely long-hairy; ovary sessile, white-villous; style and stigma very short, stigma bifid.—Widely cultivated for making baskets and furniture.—Korea.

32. *Salix miyabeana* Seemen. *S. sapporoensis* Lévl.—EZO-NO-KAWA-YANAGI. Shrub or small tree with glabrous, pale brown branches; leaves with petioles 3–8 mm. long, the blades lanceolate or narrowly so, 5–15 cm. long, acuminate at both ends, undulate-serrate, glabrous, glaucescent beneath; staminate aments 3–5.5 cm. long, sessile, densely flowered, the filaments completely connate; anthers yellow; pistillate aments 4–8 cm. long, short-pedunculate, the bracts ovate, densely long-pubescent; ovary villous, sessile, stigma sessile, very short, undivided.—Hokkaido, Honshu (n. distr.).

33. *Salix gilgiana* Seemen. *S. gymnolepis* Lévl. & Van't; *S. purpurea* var. *sericea* Seemen, non Wimm.; *S. purpurea* subsp. *gymnolepis* (Lévl. & Van't.) Koidz.—KAWA-YANAGI. Shrub or small tree with elongate branches, at first short silky-pubescent, soon glabrate; leaves with petioles 2–8 mm. long, the blades lanceolate to narrowly so, or nearly linear, 5–12 cm. long, 5–10 mm. wide, acuminate, acute at base, glabrous, glaucous beneath, serrate; staminate aments 2–5 cm. long, sessile, the bracts obovate, rounded at apex, long-hairy, about 2 mm. long, the filaments connate, hairy on lower half, the anthers purple; pistillate aments 2–4 cm. long at anthesis, 3–5 cm. long in fruit; ovary appressed-pubescent, very short stipitate; style about 0.3 mm. long, the stigma short, bifid.—Hokkaido (Oshima), Honshu, Shikoku, Kyushu.—Korea.

34. *Salix gracilistyla* Miq. *S. thunbergiana* Bl. ex Anderss.; *S. brachystachys* sensu aut. Japon., non Benth.—NEKO-YANAGI. Shrub with rather thick erect branches, the young branchlets with long dense whitish pubescence, glabrescent; leaves with densely pubescent petioles 5–10 mm. long, the blades linear-oblong to oblanceolate, 5–12 cm. long, 1.5–

cm. wide, acute, obtuse to rounded at base, densely appressed grayish white pubescent beneath, serrulate or nearly entire, the lateral nerves prominently curved upward and elevated as in the veinlets; staminate aments 3–4 cm. long, 10–12 mm. in diameter, densely flowered, the bracts ovate, acuminate, densely long-hairy, about 2 mm. long; pistillate aments 2–5 cm. long; ovary long-hairy; capsules long-pubescent; style slender, about 2 mm. long, the stigma very short, bifid.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

Var. *Melanostachys* (Makino) C. K. Schn. *S. thunbergiana* var. *melanostachys* Makino; *S. gracilistyla* subsp. *melanostachys* Makino—KURO-YANAGI, KURO-ME. Aments and bracts dark brown; rarely cultivated; possibly only a cultivar.

The following hybrids are reported: *S.* × *thaumasta* Kimura (*S. gracilistyla* × *S. koriyanagi*); *S.* × *yoitiana* Kimura (*S. gracilistyla* × *S. hultenii* var. *angustifolia*); *S.* × *koiei* Kimura (*S. gilgiana* × *S. gracilistyla*); *S.* × *iwahisana* Kimura (*S. gracilistyla* × *S. vorida*); *S.* × *cremonophila* Kimura (*S. gracilistyla* × *S. japonica*); *S.* × *turumatii* Kimura (*S. bakko* × *S. gracilistyla*). *Salix* × *Hatusimana* Kimura (*S. gracilistyla* × *S. integra* ? or × *S. koriyanagi*) is an alleged hybrid.

35. *Salix graciligrans* Nakai. *S. nakaii* Kimura—CHŌSEN-NEKO-YANAGI. Shrub; branches glabrous, appressed-silky while young; leaves with petioles 6–10 mm. long, pubescent or glabrous, the blades linear-oblongate or linear-oblong, 6–10 cm. long, 1–3 cm. wide, acuminate, acute or narrowly cuneate at base, glabrous above, glabrate but usually pubescent beneath while young, serrulate; staminate aments 15–25 mm. long, 7–8 mm. in diameter, sessile, the bracts about 2 mm. long, oblong, acuminate to obtuse, glabrous except the long whitish hairs at base; pistillate aments 3–5 cm. long; ovary densely appressed pubescent; capsules densely pubescent; style 2–3 mm. long, the stigma very short, bifid.—Reported to occur in Honshu (Tōkaidō Distr.) and Shikoku.—Korea.

36. *Salix buergeriana* Miq. HASHI-KAERI-YANAGI, NAGABO-NO-YAMA-YANAGI. Shrub; branches glabrous, appressed-silky while young; leaves subrhombic-oblong to rhombic-obovate, sometimes broadly elliptic, acute, with incurved undulate teeth on margins, obtuse to acute at base, white villous or with brownish hairs while young, glabrate or nearly so except the midrib, glaucous beneath; staminate aments 4–7.5 cm. long, about 4 mm. in diameter, short-pedunculate, the filaments pubescent below, the bracts villous with long grayish fulvous hairs on both surfaces, broadly ovate; pistillate aments 3–4 cm. long, about 5 mm. in diameter, to 6–8 cm. long in fruit; ovary densely pubescent; capsules slightly pubescent, stipitate; style mostly elongate, the stigma bifid.—Kyushu.

37. *Salix harmsiana* Seemen. TSUKUSHI-YAMA-YANAGI. Shrub or tree; branches glabrous, white-pubescent while young; leaves oblong, elliptic or broadly so, acute, with incurved teeth on margin, sparsely pubescent; staminate aments 2.5–4 cm. long, about 6 mm. in diameter, short-pedunculate; stamen 1, pubescent below, the bracts ovate, obtuse, with long yellow-brown hairs on both sides; pistillate aments to 27 mm. long in anthesis, about 5 mm. in diameter; ovary densely pubescent, stipitate; style short, the stigma bifid.—Kyushu.

38. *Salix sieboldiana* Bl. YAMA-YANAGI. Shrub or small tree with dark brown branches; leaves with petioles

1-1.5 cm. long, the blades lanceolate-oblong to oblong, sometimes elliptic, 3-10 cm. long, 15-35 mm. wide, short-acuminate, obtuse at base, with incurved-undulate obtuse teeth on margins, white-villous while young, soon glabrate above, glaucous and glabrate or pubescent only on the midrib beneath;

staminate aments 3-3.5 cm. long, about 7 mm. in diameter, short-pedunculate, very densely flowered, the bracts ovate, obtuse, long-villous; filaments short-pubescent below; style short, the stigma bifid.—Kyushu.

Fam. 63. MYRICACEAE YAMA-MOMO KA Sweet-gale Family

Shrubs and trees sometimes aromatic; leaves evergreen or deciduous, simple, entire or serrate, penninerved, without stipules; flowers unisexual (the plants monoecious or dioecious), in axils of densely imbricate scales on aments, without a perianth, bracteoles absent or many; stamens 2 to many, usually 4-6; ovary sessile, 1-locular; style short, the stigmas 2; ovule solitary, basal, erect, orthotropous; fruit a small or rather large, globose to ovoid drupe, often with a heavy waxy coating, the exocarp juicy or fleshy, the endocarp hard; seed erect, without endosperm, the embryo erect, with fleshy, flat cotyledons.—Two genera, with about 35 species, chiefly in the Tropics, with 1 species widely distributed in boreal regions.

1. MYRICA L. YAMA-MOMO ZOKU

Staminate aments oblong to cylindric, sometimes short; pistillate aments short-cylindric to ovoid; ovary with 2-4 small bracteoles at base; leaves without stipules, entire or serrate.—More than 30 species, chiefly in the tropics, few widely distributed temperate species.

- 1A. Deciduous shrub of bogs; pistillate flowers with 2 winglike bracteoles adnate at the base; fruit small, resinous-scaly, about 2 mm. long.
1B. Evergreen tree of forests; pistillate flowers subtended by 2-4 small free bracteoles; fruit relatively large, exceeding the scales, tuberculate, about 15 mm. long.

1. *Myrica gale* L. var. *tomentosa* C. DC. *M. tomentosa* (C. DC.) Aschers. & Graebn.; *Gale japonica* Cheval.—YACHI-YANAGI. Shrub with dark brown branches, soft-pubescent while young; leaves oblanceolate to narrowly obovate, 2-4 cm. long, 7-15 mm. wide, somewhat obtuse, long-cuneate toward the base, more or less short-pubescent, with few depressed teeth on upper margins, pale green beneath, with yellow sessile glands on both surfaces, sessile or barely petiolate; pistillate aments sessile, oblong to ellipsoidal, 1-1.5 cm. long, 5-6 mm. wide at maturity; fruit about 2 mm. long, resinous, broadly ovoid, the bracteoles 2, winglike, adnate at the base to the fruit.—Apr. Bogs; Hokkaido, Honshu (Ise and eastw.); rather rare.—Kuriles, Sakhalin, n. Korea, to e.

Siberia. The typical phase occurs widely in bogs in northern areas of the N. Hemisphere.

2. *Myrica rubra* Sieb. & Zucc. *M. nagi* sensu DC., non Thunb.—YAMA-MOMO. Evergreen glabrous tree; leaves coriaceous, oblanceolate to broadly so, 6-12 cm. long, 1-3.5 cm. wide, obtuse or acute with an obtuse tip, long-cuneate at base, entire, sometimes with few appressed teeth on upper margins, the raised nerves reddish on under side, the petioles 5-10 mm. long; pistillate aments sessile, narrow, 8-12 mm. long, with small scales; fruit globose, tuberculate, 12-15 mm. across, dark red when mature.—Mar.-Apr. Honshu (sw. Kantō Distr., and Wakasa Prov. and westw.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, and China.

Fam. 64. JUGLANDACEAE KURUMI KA Walnut Family

Frequently foetid monoecious trees or shrubs; leaves alternate, imparipinnate, the leaflets sessile or short-petiolate, the stipules none; flowers unisexual, the staminate in long, lateral, usually pendulous aments, the perianth irregularly lobed or absent, the stamens 3 to many, the filaments short, the anthers oblong; pistillate flowers terminal, solitary or in racemes, 2-bracteolate at base, the perianth 3- to 6-lobed; ovary inferior, 1- or incompletely 2- to 4-locular; ovules erect, orthotropous; styles 2, stigmatic on the inner side; fruit a drupe or nut, 2- to 4-lobed; seeds large, the endosperm absent, the embryo usually corrugate, oily.—Six genera, with about 50 species, in the temperate regions of the N. Hemisphere.

- 1A. Fruit a winged nut.
2A. Nuts borne in axils of persistent bracts of upright conelike aments.
2B. Nuts borne on pendulous, loose aments.
1B. Fruit a large drupe.

1. PLATYCARYA Sieb. & Zucc. NOGURUMI ZOKU

Deciduous tree; leaves alternate, large, the leaflets doubly serrate; aments erect, the staminate slender, short-pedunculate, usually few, below the pistillate, the scales lanceolate, the flowers naked; stamens 8-10; pistillate aments solitary, ovoid-oblong, with imbricate, narrowly lanceolate, persistent, thick bract; bracteoles 2, adnate to the ovary; styles 5, short, thick; fruit an axillary winged nutlet on the conelike aments.—One species.

1. *Platycarya strobilacea* Sieb. & Zucc. *Petrophiloides strobilacea* (Sieb. & Zucc.) Reid & Chandler.—NOGURUMI, NOBU-NO-KI, YAMAGURUMI. Deciduous tree with terete

branches brown-pubescent while young; leaves rather large, the leaflets 7-15, sessile, lanceolate to narrowly ovate, 4-10 cm. long, 1-3 cm. wide, long-acuminate, doubly serrate, loosely

brown pubescent at first, soon glabrous except in the axils of the nerves beneath; aments free to several at the summit of the young branchlets, erect, the terminal aments pistillate, 3-4 cm. long, 2-3 cm. across, ellipsoidal, with dark brown, linear-lanceolate, coriaceous, acuminate scales; fruit about 5

mm. long, glabrous, obtriangular inclusive of the wing; staminate aments borne laterally below the pistillate.—June-July. Mountains; Honshu, Shikoku, Kyushu.—Korea, China, and Formosa.

2. PTEROCARYA Kunth SAWAGURUMI ZOKU

Deciduous monoecious trees; leaves alternate, pinnate, without stipules; flowers unisexual, on pendulous aments, the staminate with 2 bracteoles adnate to the bract, the perianth 1- to 4-parted, the stamens 6-18; pistillate flowers with 2 bracteoles at base, the perianth adnate to the ovary, the limb free, shortly 4-lobed; style short, bifid; nut rather small, 2-winged; seed 4-locular at base; cotyledons 4-lobed, green, epigeal.—About 10 species, chiefly in China, 1 species in Japan, 1 in Asia Minor.

1. *Pterocarya rhoifolia* Sieb. & Zucc. SAWAGURUMI. Tree; branches rather thick, terete, the branchlets short-pubescent or nearly glabrous; leaves large, clustered on the upper part of branchlets, petiolate, imparipinnate, the leaflets 11-21, ovate-oblong to lanceolate or broadly oblanceolate, 6-12 cm. long, 1.5-4 cm. wide, acuminate, serrulate, with yellowish sessile glands and brown pubescence in axils beneath; stami-

nate aments short-pedunculate; stamens 10; pistillate aments pedunculate, very loosely flowered in the axils of scales, elongate after anthesis, 20-30 cm. long in fruit; nut conical, about 8 mm. long, 12-18 mm. wide inclusive of the winglike, obtusely toothed bracteoles.—May. Valleys in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

3. JUGLANS L. KURUMI ZOKU

Deciduous trees or rarely shrubs; leaves alternate, imparipinnate, foetid, without stipules, the leaflets opposite, entire or serrate; staminate aments axillary and pendulous, elongate; flowers in the axils of scales, with 2 bracteoles, the perianth segments 1-4; stamens 3-40; pistillate aments terminal, loosely few to rather many flowered; flowers with a 3-lobed involucre consisting of a bract and 2 bracteoles, the perianth 4-lobed; style bifid, the stigma pinnate; nut large, drupelike, indehiscent, incompletely 2- or 4-locular, with a ligneous wall; cotyledons 2- to 4-lobed, retained within the nut in germination.—About 15 species, in the temperate regions of the N. Hemisphere.

1. *Juglans ailanthifolia* Carr. *J. sieboldiana* Maxim., non Goeppert; *J. allardiana* Dode; *J. coarctata* Dode; *J. lavallei* Dode; *J. sachalinensis* (Miyabe & Kudô) Komar.; *J. mirabunda* Koizd.—ONIGURUMI. Tall erect tree; branches grayish brown, densely glandular-pubescent when young; leaves large, petiolate, the leaflets 9-21, ovate-oblong, 8-12 cm. long, 3-4 cm. wide, abruptly acute to acuminate, appressed-serrulate, minutely stellate-pubescent above while young, rather densely stellate-pubescent beneath, sessile and obliquely truncate at base; petioles and rachis densely glandular; staminate aments 10-30 cm. long; pistillate aments 10- to 20-flowered, pedunculate, densely brown-pubescent with crisped hairs; nut pubescent, with a hard shell, broadly ovoid to nearly globose, 2.5-3.5 cm. long, mucronate, rugose, with raised sutures.—May. Hokkaido, Honshu, Shikoku, Kyushu; very variable.

Var. *cordiformis* (Maxim.) Rehd. *J. cordiformis* Maxim., non Wangerh.; *J. subcordiformis* Dode.—HIMEGURUMI. Nut cordate or cordate-ovoid, rather depressed, the shell relatively thin, nearly smooth, with a shallow groove on each side.—Cultivated.

Juglans regia L. var. *orientis* (Dode) Kitam. *J. orientis* Dode; *J. regia* var. *sinensis* sensu auct. Japon., non DC.—CHÖSEN-GURUMI. A widely cultivated Chinese tree with glabrous leaves and branchlets, the leaflets 3-9, obtuse, entire except in the young tree; nut relatively thin-shelled.

Juglans avellana Dode and *Juglans notha* Rehd. are alleged hybrids of *J. ailanthifolia* Carr. × *J. regia* var. *orientis* (Dode) Kitam.

Fam. 65. BETULACEAE KABA-NO-KI KA Birch Family

Deciduous trees or shrubs; leaves alternate, toothed, simple, the stipules usually caducous; staminate aments pendulous, elongate, the flowers 1-3 in axils of scales, the perianth 2- to 4-lobed, sometimes absent; stamens 2-15, the filaments free, the anther-locules distinct or connate; pistillate aments erect or pendulous, elongate or short, the flowers composed of a single 2-locular ovary; tepals present or absent; styles 2 or solitary and deeply bifid; ovules 1 or 2 in each locule, anatropous; fruit a nut, sometimes winged; endosperm absent; cotyledons fleshy.—About 7 genera, with about 100 species, chiefly in the N. Hemisphere, usually flowering in early spring.

- 1A. Staminate flowers solitary on each scale, without perianth; pistillate flowers with perianth; nut attached to a leaflike bract.
- 2A. Staminate flowers without bracteoles; pistillate flowers in spike-like aments; fruit small, subtended by a large bract.
 - 3A. Bract of the nut flat, toothed or incised. 1. *Carpinus*
 - 3B. Bract of the nut connate at base, forming a tube. 2. *Ostrya*
 - 2B. Staminate flowers 2-bracteolate; pistillate flowers 2-4, capitate; nut large, enveloped by a large foliaceous involucre. 3. *Corylus*
- 1B. Staminate flowers 3-6 on each scale, with a perianth; pistillate flowers without a perianth; nut small, on inner side of closely imbricated bracts or scales, sometimes winged on margin.
 - 4A. Stamens 2, the filaments bifid; scales of pistillate aments deciduous when mature. 4. *Betula*
 - 4B. Stamens 4, the filaments not lobed; scales persistent. 5. *Alnus*

1. CARPINUS L. KUMA-SHIDE ZOKU

Deciduous trees or large shrubs; leaves more or less 2-seriate on the branchlets, petiolate, toothed, penninerved, the lateral nerves 7- to 24-paired, straight; staminate aments pendulous, clothed with bud-scales in winter, the flowers naked, the stamens 3-15; pistillate aments terminal, the scales with 2 flowers in the axils; flowers 2-bracteolate, the perianth adnate to the ovary, with 6-10 teeth at the top; style short, the stigmas linear; nutlets surrounded by a rather large leaflike longitudinally striate scale or bract.—About 20 species in the temperate to warmer regions of the N. Hemisphere.

- 1A. Leaves with 7-15 pairs of lateral nerves, rounded to cuneate at base; staminate scales broadly ovate, subsessile; fruiting scales ovate; bark smooth.
 - 2A. Leaves 2.5-(-6) cm. long, with 10-13 pairs of lateral nerves, acute to obtuse; fruiting aments few-scaled, spreading to ascending; small tree or large shrub. 1. *C. turczaninowii*
 - 2B. Leaves 4-10 cm. long, with 12-15 pairs of lateral nerves, acute to acuminate; fruiting aments many-scaled, pendulous; trees. 2. *C. tschonoskii*
 - 3A. Leaves acute to abruptly acuminate, pilose, the petioles pilose; fruiting scales loosely long-hairy, 20-25 mm. long, toothed only on one side. 3. *C. laxiflora*
 - 3B. Leaves caudately acuminate, glabrescent, the petioles slender, reddish, glabrate; fruiting scales short-hairy, 10-18 mm. long, with a lobule at base on each side, coarsely toothed on both sides or on one side. 3. *C. laxiflora*
- 1B. Leaves with 15-24 pairs of lateral nerves, usually more or less cordate or sometimes rounded at base; staminate scales stipitate; fruiting scales ovate, toothed, membranous, closely imbricate; bark scaly.
 - 4A. Leaves narrowly ovate to ovate-oblong, 2.5-4 cm. wide, barely cordate to rounded at base, with 20-24 pairs of lateral nerves. 4. *C. japonica*
 - 4B. Leaves ovate, 4-7 cm. wide, prominently cordate, with 15-20 pairs of lateral nerves. 5. *C. cordata*

1. *Carpinus turczaninowii* Hance. *C. paxii* Winkl.; *C. stipulata* Winkl.; *C. tanakaana* Makino; *C. turczaninowii* var. *makinoi* Winkl.—IWA-SHIDE. Small tree or large shrub with pilose branchlets and petioles; stipules persistent; leaves ovate, 2.5-5(-6) cm. long, 18-20 mm. wide, acute to sub-obtuse, double-toothed, rounded at base, nearly lusterless, glabrous and with slightly raised reticulate veinlets above, appressed-pubescent beneath, with tufts of axillary hairs, the lateral nerves of 10-13 pairs; petioles 5-12 mm. long; fruiting aments ascending to spreading, 4- to 8-scaled, the peduncles pubescent, 1-2 cm. long, gradually curved; scales ovate to narrowly so, 10-18 mm. long, oblique, coarsely toothed; nuts broadly ovoid, about 4 mm. long, sparingly pilose above.—Honshu (Chûgoku Distr.), Shikoku, Kyushu.—Korea and China.

2. *Carpinus tschonoskii* Maxim. *C. yedoensis* Maxim.—INU-SHIDE. Tree with the branchlets, young leaves and petioles pubescent; leaves ovate to ovate-oblong, 4-8 cm. long, acute to short-acuminate, doubly serrulate with mucronate teeth, rounded at base, slightly appressed-pilose above, pilose beneath especially on the nerves and in the axils, the lateral nerves of 12-15 pairs, the petioles 8-12 mm. long; fruiting aments pendulous, pubescent, the peduncles 1.5-3 cm. long, loosely pubescent; scales subovate, 20-25 mm. long, pilose, coarsely toothed on one side; nuts ovoid-orbicular, about 4 mm. long, few-nerved, glabrous or thinly hairy above.—Honshu, Shikoku.—Korea and China.

3. *Carpinus laxiflora* (Sieb. & Zucc.) Bl. *Distegocarpus laxiflora* Sieb. & Zucc.—AKA-SHIDE. Tree; branches loosely pilose while young; leaves ovate or ovate-elliptic, 4-7 cm. long, 2.5-3.5 cm. wide, brownish when unfolded, caudate, doubly serrulate, rounded or rarely shallowly cordate at base, scattered long hairy while young, later appressed-pilose and with axillary tufts beneath, the petioles 8-12 mm. long, slender, glabrescent; peduncles 1.5-2 cm. long, glabrescent, sometimes

minutely puberulous above; ament scales narrowly subovate or ovate-subdeltoide, 10-18 mm. long, with a lobule on each side at base, the margin toothed on one or both sides; nut broadly deltoide-ovate, striate, glabrous or puberulous above.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

4. *Carpinus japonica* Bl. *Distegocarpus carpinus* Sieb. & Zucc.; *D. carpinoides* Sieb. & Zucc.; *C. carpinus* (Sieb. & Zucc.) Sarg.; *C. distegocarpus* Koidz.; *C. carpinoides* (Sieb. & Zucc.) Makino.—KUMA-SHIDE. Tree with pubescent young branchlets; leaves narrowly ovate to ovate-oblong, 6-10 cm. long, 2.5-4 cm. wide, long-acuminate, rounded to shallowly cordate at base, doubly serrate with acute mucronate teeth, glabrescent above, with tufts of axillary hairs and long brownish hairs on nerves beneath, the lateral nerves of 20 to 24 pairs, the petioles 8-15 mm. long, puberulent above; fruiting aments pendulous, narrowly oblong, the peduncles 2-4 cm. long, puberulent, the scales 15-22 mm. long, narrowly ovate, with short appressed hairs, coarsely toothed; nuts oblong, about 4 mm. long, with few striations.—Honshu, Shikoku, Kyushu.

Var. *cordifolia* Winkl. *C. carpinoides* var. *cordifolia* (Winkl.) Makino.—Ô-KUMA-SHIDE. A large-leaved phase, occurring with the species.

5. *Carpinus cordata* Bl. *C. erosa* Bl.; *C. cordata* var. *pseudojaponica* Winkl.—SAWA-SHIBA. Tree, the branchlets soon glabrate; leaves ovate to broadly so or elliptic-ovate, 7-13 cm. long, 4-7 cm. wide, abruptly acuminate, cordate, irregularly serrulate, with the teeth ending in a short awn, nearly glabrous or with scattered hairs on the nerves and axillary tufts of brownish short hairs on lower side, the lateral nerves of 15 to 20 pairs, the petioles 1.5-3 cm. long; fruiting aments narrowly oblong, pendulous, the peduncles glabrous or puberulous, 2-4 cm. long, the scales 2-2.5 cm. long, oblong, toothed; nuts oblong, about 5 mm. long, glabrous, with about 10 striations on each side.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

2. OSTRYA Scop. ASADA ZOKU

Deciduous trees with scaly scabrous bark; leaves petiolate, ovate or narrowly so, doubly toothed; staminate aments elongate, pendulous (naked in winter), the perianth absent; stamens 3-14, the filaments bifid above; pistillate aments slender, erect, 2-flowered in axils of the scales, the scales imbricate, deciduous in fruit; ovary with an adnate perianth surrounded by the involucre which consists of the adnate bract and bracteole; stigmas 2, linear; nuts striate, enveloped by an accrescent rather membranous involucre, coarsely hirsute below.—Seven to eight species, in the N. Hemisphere.

1. *Ostrya japonica* Sarg. *O. virginica* var. *japonica* Maxim. ex Sarg.; *O. japonica* var. *homochaeta* Honda—Asada. Tree with pubescent and glandular-pilose young branchlets; leaves rather thin, narrowly ovate or ovate-oblong, 7–12 cm. long, 3–5 cm. wide, acuminate to very acute with irregular awn-tipped teeth, pubescent and glandular-pilose on both sides or becoming glabrate except on nerves beneath, the

lateral nerves of 9 to 13 pairs, the petioles 4–8 mm. long, pubescent and glandular-pilose; fruiting aments narrowly ovoid, nodding, pedunculate, the scales ovate-elliptic, 13–17 mm. long, entire, acute, short-pubescent, connate and clasping the nut below; nuts oblong-ovate, 5–6 mm. long, glabrous or with short hairs above.—May–June. Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

3. CORYLUS L. HASHIBAMI ZOKU

Deciduous trees or shrubs; leaves alternate, simple, scattered-pilose, doubly toothed, petiolate, induplicate in bud, the stipules caducous; staminate aments elongate, pendulous (naked in winter), the flowers naked, each scale with 4–8 axillary stamens, the filaments bifid above, the anthers pilose at apex; pistillate aments capitate, the flowers paired in the axils of small bracts, the perianth short; ovary 2-locular, the ovules 1 or 2 in each locule; styles 2, the stigma exserted; nuts rather large, enveloped by an involucre, the cotyledons thick, hypogeal.—About 20 species, in the N. Hemisphere.

1A. Involucre leaflike, deeply incised, not tubular, not bristly; leaves broadly obovate, obovate-rounded or nearly obversed deltoid.

1B. Involucre connate and tubular above the nut, densely bristly; leaves obovate to broadly so. 2. *C. sieboldiana*

1. *Corylus heterophylla* Fisch. *Ō-HASHIBAMI*, *OHYŌ-HASHIBAMI*. Shrub or small tree, the branchlets pubescent and glandular-pilose while young; leaves deltoid-obovate to orbicular-obdeltoid, 5–12 cm. long and as wide, truncate and abruptly acuminate, incised and doubly toothed, cordate, pubescent above while young, with short spreading hairs beneath and loose ascending hairs on nerves, the petioles 5–20 mm. long, pubescent and glandular-pilose; nuts 1–3 in a cluster, the involucre campanulate, 2.5–3.5 cm. long, puberulent, glandular-pilose below, striate, deeply toothed on margin; nuts subglobose, about 1.5 cm. across.—Honshu (centr. distr.).—Korea, Manchuria, Ussuri, and Amur.

Var. *thunbergii* Bl. *C. heterophylla* var. *yezoensis* Koidz.; *C. yezoensis* (Koidz.) Nakai.—HASHIBAMI. Leaves obovate-orbicular to broadly obovate, abruptly short-acuminate, rarely glandular-pilose; involucre scarcely glandular-pilose.—Hokkaido, Honshu, Kyushu.

2. *Corylus sieboldiana* Bl. *C. rostrata* var. *sieboldiana* (Bl.) Maxim.; *C. rostrata* var. *mitis* Maxim.—TSUNO-HASHIBAMI. Large shrub with pubescent branches; leaves obovate to broadly so, 5–10 cm. long, abruptly acuminate, ob-

soletely incised and acutely serrulate, rounded or rarely shallowly cordate at base, often with a large brown-purple blotch on the center above, glabrous to slightly appressed-pilose on upper side, becoming yellowish brown when dry and loosely ascending-pilose on the nerves beneath, the petioles 1–1.5 cm. long, pubescent; nuts 1–3 in a cluster, short-conical, 6–8 mm. long, the involucre tubular, 1.5–5 cm. long, narrowed above the nut, shortly lobed or deeply dentate, puberulent and densely bristly-hairy.—Hokkaido, Honshu, Shikoku, Kyushu.

Var. *brevirostris* C. K. Schn. *C. brevirostris* (C. K. Schn.) Miyabe.—TOKKURI-HASHIBAMI. A phase with short involucre 1–2 cm. long.—Occurs with the typical phase.—Korea.

Var. *mandshurica* (Maxim.) C. K. Schn. *C. mandshurica* Maxim.; *C. rostrata* var. *mandshurica* (Maxim.) Regel.—Ō-TSUNO-HASHIBAMI. Leaves relatively large, distinctly incised, often cordate, pale green beneath, rather thin; involucre gradually narrowed above, with spreading bristlelike hairs; nuts larger.—Hokkaido, Honshu (n. and centr. distr.).—Korea, Manchuria, Amur, and Ussuri.

4. BETULA L. SHIRA-KAMBA ZOKU

Deciduous shrubs and trees; leaves petiolate, usually ovate, serrate-toothed, rarely incised, penninerved, the stipules deciduous; staminate aments elongate, pendulous (naked in winter), the scales usually 3-flowered in the axils, the bracteoles 2, adnate to the scale; perianth 4-parted; stamens 2, the filaments 2-fid above; pistillate aments short, sometimes cylindric, 3-flowered in the axils of bracts, the perianth absent; nuts usually wing-margined; deciduous with the scales.—About 40 species, in the temperate and cold regions of the N. Hemisphere.

1A. Fruiting aments 2–4, racemose, long-cylindric, (2–) 3–7 cm. long; leaves 8–14 cm. long, cordate. 1. *B. maximowicziana*

1B. Fruiting aments solitary, globose to short-cylindric, 1.5–5 cm. long; leaves less than 10 cm. long.

2A. Leaves distinctly glaucous beneath; fruiting aments erect. 2. *B. corylifolia*

2B. Leaves pale green and not glaucous beneath.

3A. Fruiting aments erect or pendulous, short-cylindric or oblong-cylindric, the peduncles 3–12 mm. long.

4A. Fruiting aments pendulous; bark white and smooth; leaves broadly deltoid-ovate to subdeltoid. 3. *B. platyphylla*

4B. Fruiting aments erect; bark brownish.

5A. Leaves narrowly ovate-oblong to broadly ovate, dull above, with upward pointing teeth; petioles 5–15 mm. long.

6A. Trees; leaves 4–8 cm. long.

7A. Midlobe of fruiting scales slightly shorter than the lateral lobes; leaves irregularly toothed, the lateral nerves 6- to 8-paired; petioles 5–15 mm. long. 4. *B. davurica*

7B. Midlobe of fruiting scales longer than the lateral; leaves serrulate, the lateral nerves 9- to 18-paired; petioles 4–10 mm. long.

8A. Branchlets distinctly glandular; leaves with 9–10 pairs of lateral nerves. 5. *B. schmidtii*

8B. Branchlets scarcely glandular; leaves with 14 to 18 pairs of lateral nerves. 6. *B. chichibuensis*

- 6B. Shrub; leaves 1.5–4 cm. long; petioles 5–10 mm. long. 9. *B. apoensis*
 5B. Leaves broadly deltoid-ovate or narrowly so, distinctly broader below, smooth and more or less lustrous above, the teeth more or less spreading; petioles 5–35 mm. long; lateral nerves 7– to 12(–15)-paired. 7. *B. ermanii*
 3B. Fruiting aments erect, sessile or subsessile, subglobose to oblong.
 9A. Leaves 1.5–4 cm. long, acute, with 4–8 pairs of lateral nerves; petioles 2–10 mm. long; shrub less than 1 m. high.
 10A. Leaves usually acute at base, the lateral nerves 4–6 pairs; fruiting aments 1–1.5 cm. long, 3.5–7.5 mm. across; bracts equally 3-lobed, the midlobe slightly recurved at tip; boggy places. 8. *B. tatewakiana*
 10B. Leaves usually rounded at base, the lateral nerves 6–8 pairs; fruiting aments 1–3 cm. long, 6–12 mm. across; midlobe of the bracts longer than the lateral ones, straight; rocky slopes. 9. *B. apoensis*
 9B. Leaves 4–10 cm. long, acuminate, with 8–15 pairs of lateral nerves; petioles 4–25 mm. long; fruiting aments 2–3.5 cm. long.
 11A. Leaves broadly ovate; fruiting scales 13–15 mm. long. 10. *B. globispica*
 11B. Leaves narrowly ovate to more broadly so; fruiting scales 7–8 mm. long. 11. *B. grossa*

1. *Betula maximowicziana* Regel. *B. candellae* Koidz.
 —UDAI-KAMBA, SAHADA-KAMBA. Tree with gray or orange-gray bark peeling off into papery thin pieces, the branchlets red-brown, glabrous, lustrous; leaves broadly ovate to nearly ovate-obicular, 8–14 cm. long, 6–10 cm. wide, short-acuminate, deeply cordate at base, serrate, with glandular tipped teeth, scattered pilose while young above, slightly appressed pilose on nerves and later often becoming glabrous beneath, the lateral nerves of 10 to 12 pairs, the petioles 25–35 mm. long; fruiting aments 2–4 in a cluster, racemose, pedicellate, pendulous, long-cylindric, (2–)3–7 cm. long, 6–7 mm. in diameter; fruiting scales glabrous, about 3 mm. long, 3-lobed, the lateral lobes ascending, shorter than the midlobe; nuts about 3 mm. long, the wings 2–3 times as wide as the body.—May–June. Hokkaido, Honshu (centr. and n. distr.).—s. Kuriles.

2. *Betula corylifolia* Regel & Maxim. NEKO-SHIDE, URAJURI-KAMBA. Tree with grayish or whitish bark, the branchlets glabrous or nearly so, dark purple-brown to dark red-brown; leaves elliptic, obovate or ovate, 4–8 cm. long, 2.5–5 cm. wide, rather thin, acute, coarsely doubly toothed, the base obtuse to rounded, vivid green and glabrous above, glaucous and slightly appressed-pilose on nerves beneath, the lateral nerves of 8 to 14 pairs, the petioles 7–15 mm. long, white-silky while young; fruiting aments erect, short-pedunculate, 3–4 cm. long, oblong-cylindric, the fruiting scales thinly long-pilose, 12–15 mm. long, 3-lobed, the lateral lobes ascending, about half as long as the midlobe; nuts ovoid-obicular, about 3 mm. long, narrowly winged on both sides.—Mountains; Honshu (Kinki Distr. and eastw.).

3. *Betula platyphylla* Sukatschev var. *japonica* (Miq.) Hara. *B. japonica* Sieb., non Thunb.; *B. alba* var. *japonica* Miq.; *B. alba* var. *tauschii* Regel, pro parte; *B. tauschii* (Regel) Koidz.—SHIRA-KABA, SHIRA-KAMBA. Tree with white bark, the branchlets dark purple-brown, with resinous glands while young; leaves broadly deltoid-ovate, 5–7 cm. long, 4–6 cm. wide, truncate at base, acuminate, doubly toothed, glabrous or sparsely short-pilose beneath, usually with tufts of axillary hairs, rather dull above, the lateral nerves weak, of 6 to 8 pairs, the petioles 1–3 cm. long, rather slender; fruiting aments short-cylindric, pendulous, pedunculate, 3–4.5 cm. long, 8–10 mm. in diameter, the scales 3.5–4.5 mm. long, puberulous outside, the lateral lobes spreading, obovate, 2–3 times as long as the midlobe; nuts narrowly obovate to ovate, 1.5–2.2 mm. long, puberulous, the wing 1.5–2 times wider than the nuts.—Highlands; Hokkaido, Honshu (centr. and n. distr.); locally abundant.

Var. *kamtschatica* (Regel) Hara. *B. alba* var. *kamtschatica* Regel—EZO-NO-SHIRA-KAMBA. Leaves often broadly cuneate at base.—Occurs with var. *japonica*.—The typical phase occurs in the cooler areas of c. Asia.

Betula × *avacensis* Komar. OKU-EZO-SHIRA-KAMBA, is a

hybrid between No. 3 and No. 6. Reported from Hokkaido, originally described from Kamchatka.

4. *Betula davurica* Pall. *B. maackii* Rupr.—KO-ONO-ORE, YAE-GAWA-KAMBA. Tree with gray-brown to gray bark, the branchlets very resinous, pilose; leaves rhombic-ovate to narrowly ovate, 4–8 cm. long, acute or acuminate, irregularly toothed, broadly cuneate at base, pilose on nerves beneath, the lateral nerves of 6 to 8 pairs, the petioles 5–15 mm. long, slightly pilose; fruiting aments erect, short-pedunculate, 2–2.5 cm. long, narrowly oblong, the scales glabrous, lustrous, firm, the midlobe deltoid, the lateral ones spreading, rounded, as long as the midlobe; wings about half as wide as the nut.—Hokkaido, Honshu (centr. and n. distr.).—Korea, Manchuria, Ussuri, and Amur.

Var. *okuboi* Miyabe & Tatew. HIDA-KA-YAE-GAWA. Leaves with 7–9 pairs of lateral nerves; midlobe of fruiting scales longer than the lateral ones.—Reported to occur in Hokkaido.

5. *Betula schmidtii* Regel. ONO-ORE-KAMBA. Tree with dark gray bark peeling off into small thick pieces, the branchlets dark-brown, resinous-glandular and pilose while young; leaves narrowly ovate-elliptic to ovate, acuminate, with irregular suberect small teeth, rounded to broadly cuneate at base, 4–8 cm. long, rather dull, appressed-pilose on nerves beneath, the lateral nerves of 9 to 10 pairs, the petioles 5–10 mm. long, pilose; fruiting aments short-pedunculate, oblong-cylindric, 2–3 cm. long, 8–9 mm. in diameter, erect, the scales 5–6 mm. long, slightly resinous, short-ciliate, the midlobe linear-lanceolate, the lateral ones obliquely ascending, about half as long as the midlobe, subacute; nuts ovoid, about 2 mm. long, with very narrow wings.—Honshu (centr. and n. distr.).—Korea, Manchuria, and Ussuri.

6. *Betula chichibuensis* Hara. CHICHIBU-MINEBARI. Tree; branchlets densely villous while young, scarcely glandular; leaves ovate or oblong-ovate, 3–6 cm. long, 1.5–3.2 cm. wide, short-acuminate, minutely and unequally duplicate-serrate, rounded to broadly cuneate at base, densely white-villous at least on the nerves beneath, lateral nerves of 14 to 18 pairs, the petioles 4–7 mm. long, white-villous; pistillate aments cylindric, short-peduncled, erect, 1.5–2.5 cm. long, 7–10 mm. wide, the scales 3.5–5 mm. long, deeply 3-lobed, pubescent and eglandular on back, the lateral lobes slightly shorter than the median; nuts ovate, 2–3 mm. long, scarcely winged.—Honshu (Chichibu).

7. *Betula ermanii* Cham. *B. incisa* Koidz.; *B. shikokiana* Nakai.—DAKE-KAMBA, TAKE-KAMBA. Tree or large shrub with gray-brown to gray-white bark peeling off into thin pieces, the branchlets resinous when young, soon becoming brownish purple; leaves deltoid-ovate to broadly so, 5–10 cm. long, 4–7 cm. wide, acuminate, irregularly mucronate-toothed, rounded to shallowly cordate, thinly pilose on nerves

beneath or glabrous except for axillary tufts of brown hairs, the lateral nerves of 7 to 12 pairs, the petioles 1-3.5 cm. long, usually glabrous; fruiting aments 2-3.5 cm. long, 8-10 mm. in diameter, short-cylindric to oblong, erect, the scales 6-8 mm. long, ciliate, the midlobe linear-lanceolate, the lateral ones nearly orbicular, ascending, 1/3-1/2 as long as the midlobe; nuts broadly obovate, puberulous above, 2-3 mm. long, the wing narrower than the nut.—June-July. Mountains; Hokkaido, Honshu (centr. and n. distr.), Shikoku; extremely variable.—Kuriles, Sakhalin, Kamchatka, and Korea.

Var. *japonica* (Shirai) Koidz. *B. bhojpatra* var. *japonica* Shirai; *B. nikoensis* Koidz.—NAGABA-NO-DAKE-KAMBA, NAGABA-NO-SHIRA-KAMBA, MA-KAMBA. Leaves deltoid-ovate, the lateral nerves of 14 to 15 pairs, the fruiting scales with a narrow midlobe and rather spreading lateral lobes.—Honshu (centr. distr. and Kantō Distr.).

Var. *subcordata* Koidz. AKA-KAMBA. Leaves shallowly cordate.—Occurs with the typical phase.

8. *Betula tatewakiana* M. Ohki & S. Watanabe. YACHI-KAMBA. Branching shrub about 1 m. high; branchlets pubescent while young, soon becoming glabrous, very densely glandular; leaves coriaceous, ovate or obovate, 1.2-3 cm. long, 1-2 cm. wide, acute at both ends, acutely serrate except on the lower margin, glandular and hairy beneath, especially on the nerves, the petioles 2-6 mm. long, pilose; fruiting aments erect, axillary, oblong-cylindric, 1-1.5 cm. long, 3.5-7.5 mm. across; bracts sparsely pilose on back, 3-lobed, ciliate, 2.8-4.2 mm. long, 2.7-3.4 mm. wide, the lobes subequal; nutlets obovate or elliptic, 3 mm. long, winged.—Bogs; Hokkaido (Tokachi Prov.); rare.

9. *Betula apoensis* Nakai. *B. miyoshii* Nakai; *B. miyima* Nakai.—APOI-KAMBA. Much-branched shrub about 1 m. high, the branchlets densely resinous-glandular, short-pubescent while young; leaves ovate to broadly so to ovate-orbicular, 1.5-4 cm. long, 1-3 cm. wide, acute, usually rounded at base, irregularly acute-toothed, with silky-pubescent beneath while young, glabrescent, sometimes persisting only on

the nerves, the petioles 2-10 mm. long; fruiting aments erect, subglobose to short-cylindric, 1-3 cm. long, 6-12 mm. in diameter, short-pedunculate, 2-5 mm. long, the scales 3-4 mm. long, glabrous, ciliate, the midlobe lanceolate to ovate, the lateral lobes obovate, shorter than the midlobe.—Hokkaido (Mount Apoi).

10. *Betula globispica* Shirai. JIZŌ-KAMBA, INUBUSHI. Tree with whitish peeling bark, the branchlets grayish or yellowish brown, scattered pilose while young; leaves broadly ovate, 4-7 cm. long, 3-5 cm. wide, short-acuminate, irregularly mucronate-toothed, rounded to broadly cuneate at base, smooth, slightly lustrous, soon becoming glabrous above, long-pilose on nerves beneath, the lateral nerves of 8 to 10 pairs, the petioles 5-15 mm. long, slightly pilose; fruiting aments ellipsoidal to subglobose, 2.5-3.5 cm. long, the scales 13-15 mm. long, the lobes narrowly lanceolate, obtuse, ciliate, the lateral lobes ascending, 1/2-2/3 as long as the midlobe; nuts 3-4 mm. long, broadly obovoid, with very narrow wings.—Mountains; Honshu (Kantō and centr. distr.); rare.

11. *Betula grossa* Sieb. & Zucc. *B. ulmifolia* Sieb. & Zucc.; *B. carpinifolia* Sieb. & Zucc., non Willd.; *B. solennis* Koidz.—YOGUSO-MINEBARI, AZUSA, MIZUME. Tree, with dark gray smooth bark, the branchlets yellow-brown and scattered long-pilose while young, becoming glabrous, changing to chestnut-brown; leaves rather thin, ovate, 5-10 cm. long, 3-6 cm. wide, acuminate, shallowly cordate to nearly rounded at base, acutely toothed, dull, nearly glabrous or scattered long-pilose above, pilose on nerves beneath, the lateral nerves of 8 to 14 pairs, the petioles 1-2.5 cm. long, pilose; fruiting aments sessile or nearly so, ellipsoidal to oblong, 2-2.5 cm. long, 12-15 mm. in diameter, the scales ciliate, 6-7 mm. long, the midlobe narrowly oblong, obtuse, the lateral lobes ascending, elliptic, about half as long as the midlobe; nuts ovate, about 2 mm. long, the wings slightly narrower than the nut.—Mountains; Honshu, Shikoku, Kyushu. The branches have a characteristic odor when broken.

5. ALNUS Mill. HAN-NO-KI ZOKU

Deciduous trees or shrubs; leaves alternate, pinnately nerved, toothed, rarely entire, sometimes shallowly lobed; staminate aments elongate, usually pendulous, with 3 flowers in the axil of each bract, the perianth-segments usually 4; stamens 4; pistillate aments short, globose to short-cylindric, conelike, the densely imbricate scales slightly woody, persistent and with 2 flowers in the axil of each scale, the perianth absent, the bracteoles adnate to the bract (scale); ovary sessile, 2-locular, the ovules solitary in each locule; styles 2, cylindric; nuts flat, sometimes laterally winged.—More than 30 species, in the N. Hemisphere and S. America.

- 1A. Winter-buds sessile, with 2 or more unequal scales; pistillate aments with protective winter bud-scales; staminate aments sessile, solitary; flowering with the leaves.
- 2A. Leaves narrowly ovate, with 12-26 pairs of lateral nerves.
 - 3A. Aments usually from the lateral buds, the pistillate solitary; branches glabrous, rather stout; leaves with 12-15 pairs of lateral nerves. 1. *A. sieboldiana*
 - 3B. Aments from the terminal and lateral buds near the top, the pistillate lateral, 1-6 in a group; branches usually pilose while young.
 - 4A. Leaves with 13-17 pairs of lateral nerves; pistillate aments paired, sometimes solitary, erect. 2. *A. firma*
 - 4B. Leaves with 20-26 pairs of lateral nerves; pistillate aments 3-6 in a group, nodding. 3. *A. pendula*
 - 2B. Leaves broadly ovate, with 10-12 pairs of lateral nerves. 4. *A. maximowiczii*
- 1B. Winter-buds short-stiped, with 2 or 3 nearly equal scales; pistillate aments naked during the winter; staminate aments more or less pedunculate; flowering usually before the leaves.
 - 5A. Leaves plicate in bud, broadly elliptic to ovate-orbicular or obovate-orbicular, shallowly incised on the upper margin to emarginate, the lateral nerves nearly parallel and straight.
 - 6A. Leaves ovate-orbicular to broadly elliptic, obtuse to acute, rounded to subtruncate at base, often glaucescent beneath.

5. *A. hirsuta*

- 6B. Leaves obovate-orbicular to nearly obcordate, truncate to emarginate or truncate-rounded at apex, broadly cuneate at base, without teeth on lower margin. 6. *A. matsumurae*
- 7A. Leaves glaucous beneath. 6. *A. matsumurae*
- 7B. Leaves pale green and not glaucous beneath. 6. *A. matsumurae*
- 8A. Leaves membranous, pale green beneath, irregularly undulate-toothed, with 6 or 7 pairs of weak lateral nerves, with axillary tufts of brown hairs beneath; fruiting aments oblong or short-cylindric, 15–25 mm. long, 6–8 mm. in diameter. 7. *A. fauriei*
- 8B. Leaves firm, pale brownish green beneath, the teeth minute, depressed mucronate, the lateral nerves of 7–9 pairs prominently raised beneath; fruiting aments ovate-ellipsoid, 1.5–2 cm. long, 8–12 mm. in diameter. 8. *A. serrulatoidea*
- 5B. Leaves not plicate in bud, narrowly ovate, ovate-elliptic or narrowly oblong, acuminate, the lateral nerves more or less arcuate above. 9. *A. japonica*
- 9A. Leaves dull above, cuneate or acute at base, the lateral nerves of 7–9 pairs; petioles 1.5–3 cm. long. 9. *A. japonica*
- 9B. Leaves smooth and slightly lustrous above, becoming reddish when dry especially on nerves, shallowly cordate, the lateral nerves 9–12 pairs, rather prominently raised beneath; petioles 1–1.5 cm. long. 10. *A. trabeculosa*

1. *Alnus sieboldiana* Matsum. *A. firma* var. *sieboldiana* (Matsum.) Winkl.—*ŌBA-YASHABUSHI*. Large shrub or small tree with rather stout yellow-brown to gray-brown, glabrous branches; leaves ovate or narrowly so to deltoid-ovate, 6–10 cm. long, 3–6 cm. wide, appressed pilose on the nerves beneath while young, gradually acute to short-acuminate, rounded at base, doubly serrate with mucronate teeth, pale green beneath, the lateral nerves of 12 to 15 pairs, the petioles 10–15 mm. long, glabrous; pistillate inflorescence with peduncles 1–2 cm. long, pubescent while young, ascending to spreading, rather thick; fruiting aments broadly ellipsoid, 2–2.5 cm. long.—Mar. Lowlands and foothills, especially abundant near the sea; Honshu (Kantō Distr. and westw. to Kii Prov.).

2. *Alnus firma* Sieb. & Zucc. *A. yasha* Matsum.; *A. firma* var. *yasha* (Matsum.) Winkl.—*YASHABUSHI*. Much-branched small tree or large shrub with gray-brown often pubescent branchlets often scattered pilose while young; leaves ovate or narrowly so to narrowly ovate-deltoid, 5–10 cm. long, 2.5–4.5 cm. wide, gradually acuminate, rounded at base, mucronate-toothed, with a mucro between the teeth, the nerves beneath with appressed hairs, glabrescent, the hairs sometimes also on the upper side, the lateral nerves 13–17 pairs, the petioles 7–12 mm. long; staminate inflorescence from the terminal and upper lateral buds; pistillate aments 1 or 2, the peduncles pubescent while young, erect or ascending, 5–15 mm. long, the mature aments ovoid-ellipsoid, 15–20 mm. long.—Apr. Kyushu; common in mountains.

Var. *hirtella* Fr. & Sav. *A. hirtella* (Fr. & Sav.) Koidz. —*MIYAMA-YASHABUSHI*. Branches and leaves pubescent. —Honshu; common.

3. *Alnus pendula* Matsum. *A. firma* var. *multinervis* Regel; *A. multinervis* (Regel) Callier.—*HIME-YASHABUSHI*. Much-branched small tree or large shrub with dark gray-brown, slender, evanescent pilose branches; leaves narrowly ovate to broadly lanceolate, long-acuminate, with short, mucronate, double teeth, broadly cuneate at base, pale green and appressed pilose on nerves beneath, with 20–26 pairs of lateral nerves, the petioles pilose, 3–8 mm. long; staminate aments from the terminal and upper lateral buds, the pistillate on the lower part, 3–6 in a group, nodding or subpendulous; fruiting aments broadly ellipsoid, about 15 mm. long.—Apr. Mountains; Hokkaido, Honshu; common.—E. Asia.

4. *Alnus maximowiczii* Callier. *A. viridis* var. *sibirica* sensu auct. Japon., non Regel; *A. sinuata* var. *kamtschatica* Callier; *A. viridis* subsp. *maximowiczii* (Callier) Hult.—*MIYAMA-HAN-NO-KI*. Much-branched, large to small shrub or small tree, with rather thick, gray-brown to dark gray glabrous to glabrescent branches; leaves broadly ovate to ovate-

orbicular, 6–10 cm. long, 4–7 cm. wide, abruptly short-acuminate to short-acute, rounded to shallowly cordate at base, with minute mucronate teeth, pale green and glabrous or nearly so beneath except for axillary tufts of hairs, the lateral nerves of 10 to 12 pairs, the petioles glabrous, 1–3 cm. long; staminate inflorescence from the terminal and upper lateral buds, the pistillate aments 3–5 in a group, loosely racemose on a short axis, arising from the buds below the staminate, the peduncles ascending, the pistillate aments broadly ellipsoid, 1–1.5 cm. long.—June. High mountains, often ascending to the alpine zone; Hokkaido, Honshu (centr. and n. distr.); common and very variable.—Kamchatka, Sakhalin, Kuriles, Ussuri, and Korea.

5. *Alnus hirsuta* Turcz. *A. incana* var. *hirsuta* Spach; *A. tinctoria* Sarg.; *A. sibirica* var. *hirsuta* (Turcz.) Koidz.—*KE-YAMA-HAN-NO-KI*. Tree with densely pubescent branchlets and inflorescence; leaves broadly ovate-orbicular to broadly elliptic, 7–12 cm. long and as wide, obtuse to acute, sometimes nearly rounded at apex, rounded to subtruncate at base, shallowly pinnately incised, irregularly toothed, usually short-pilose but often becoming glabrate above, densely pubescent beneath, the lateral nerves of 6 to 8 pairs, the petioles 1.5–3 cm. long; staminate inflorescence with 2–4 aments, borne from the apical and upper lateral buds, the pistillate aments 3–5, borne immediately below; fruiting aments ellipsoid to ovate-oblong, 15–25 mm. long.—Apr. Mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu; very variable.—Sakhalin, Kamchatka, Korea, and E. Siberia.

Var. *sibirica* (Fischer) C. K. Schn. *A. sibirica* Fisch.; *A. incana* var. *sibirica* Spach; *A. incana* var. *glauca* Regel.—*YAMA-HAN-NO-KI*. With nearly glabrous parts; leaves prominently glaucous beneath; a common variant in our area, occurring with the typical phase.

6. *Alnus matsumurae* Callier. *A. incana* var. *emarginata* Matsum.; *A. emarginata* (Matsum.) Shirai.—*YAHAZU-HAN-NO-KI*. Small tree or rarely large shrub with dark gray-purple glabrous branches; leaves obcordate-orbicular, 5–10 cm. long and as wide, glabrous or nearly so above, appressed-pilose on the nerves beneath while young, gray-glaucous beneath, rounded and distinctly emarginate, irregularly toothed, broadly cuneate at base, the lateral nerves of 6 to 9 pairs, the petioles glabrous, 1–3 cm. long, dark purple-brown when dried; staminate aments solitary or paired, terminal and on upper part of branches, the pistillate aments 2–5 in a group, the fruiting ones elliptic, 15–18 mm. long.—May–June. High mountains; Honshu (centr. and n. distr.); rather common.

7. *Alnus fauriei* Lév. *A. glutinosa* var. *cylindrostachya* Winkl.; *A. schneideri* Callier; *A. cylindrostachya* (Winkl.)

Makino—MIYAMA-KAWARA-HAN-NO-KI. Small tree with dark purple-brown or slightly grayish glabrous branches; leaves cuneately obovate or cuneately obovate-oblong, 5–12 cm. long, 4–11 cm. wide, rounded or sometimes slightly retuse, undulately toothed, pale green beneath, glabrous except the axillary tufts of brownish hairs or thinly pilose on nerves beneath, pale green beneath, broadly cuneate to cuneate at base, the lateral nerves of 6 to 7 pairs, the petioles glabrous, 5–15 mm. long; staminate and pistillate inflorescence each bearing 4 or 5 aments, the fruiting aments ellipsoidal to cylindric-oblong, 15–25 mm. long, 6–8 mm. in diameter.—Mountains; Honshu (n. and centr. distr. along the Japan Sea).

8. *Alnus serrulatoides* Callier. *A. maritima* var. *obtusata* Fr. & Sav.; *A. glutinosa* var. *japonica* Matsum.; *A. glutinosa* var. *obtusata* (Fr. & Sav.) Winkl.; *A. obtusata* (Fr. & Sav.) Makino—KAWARA-HAN-NO-KI. Small tree with glabrous dark brown to dark purple-brown or sometimes slightly grayish branches; leaves obovate-cuneate to broadly obovate or obovate-oblong, 6–10 cm. long, 4–9 cm. wide, rounded, truncate or emarginate, cuneate at base, glabrous above, often slightly pilose on nerves, with spreading hairs near axils beneath, serrulate, the lateral nerves of 7 to 9 pairs, slightly raised and rather reddish beneath, the petioles 8–15 mm. long; staminate inflorescence terminal, consisting of 4 or 5 aments, the pistillate from the upper axils, consisting of 1–4 aments; fruiting aments ovoid-ellipsoid, 15–20 mm. long, 8–12 mm. in diameter.—Mar.–Apr. Along rivers; Honshu (Tōkaidō, Kinki, and Chūgoku Distr.), Shikoku.

9. *Alnus japonica* (Thunb.) Steud. *Betula japonica* Thunb.—HAN-NO-KI. Tree with gray-brown, glabrescent to loosely brown-pubescent branches; leaves oblong-ovate,

ovate-elliptic to broadly lanceolate, 6–13 cm. long, 2.5–5 cm. wide, acuminate, acute to cuneate at base, glabrous except for axillary tufts of red-brown hairs beneath or slightly pubescent on both sides, pale green beneath, with 7–9 pairs of rather slender arcuate lateral nerves, the short marginal teeth mucronate, the petioles 1–3.5 cm. long; staminate inflorescence consisting of 2 to 5 aments borne on the upper part of the branches, the pistillate consisting of 1–5 aments borne just below, the fruiting aments ovoid-ellipsoid, 15–20 mm. long.—Mar. Wet lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common and frequently planted around paddy fields; variable.—Korea, Ussuri, and Manchuria.

Alnus mayrii Callier. USUGE-HIRO-HA-HAN-NO-KI, and *Alnus borealis* Koidz., HIRO-HA-HAN-NO-KI, are alleged hybrids between No. 9 and No. 5. Both are allied to *Alnus japonica* but with broader, elliptic to oblong, short-acute, indistinctly incised leaves.

10. *Alnus trabeculosa* Hand-Mazz. *A. nagurac* Inokuma—SAKURABA-HAN-NO-KI. Small tree with gray-brown branchlets, glabrous or yellowish pilose while young; leaves obovate-elliptic to oblong, 6–9 cm. long, 3–5 cm. wide, short-acuminate to abruptly acute, rather regularly serrulate, glabrous or slightly pilose on nerves beneath, reddish when dried, obtusely rounded to shallowly cordate, the lateral nerves of 9 to 12 pairs, raised beneath, the petioles 5–15 mm. long, more or less pilose on upper side; staminate inflorescence terminal, consisting of 4 or 5 aments, the pistillate of 3 to 5 aments borne just below, the fruiting aments short-pedunculate, ovoid-ellipsoid, 1.5–2 cm. long.—Wet places in lowlands and hills; Honshu (Kantō, Tōkaidō, Kinki, and Chūgoku Distr.); rather rare.—China.

Fam. 66. FAGACEAE BUNA KA Oak Family

Deciduous or evergreen monocious trees or shrubs; leaves alternate, pinnately nerved, entire, toothed or dentate, sometimes pinnatifid, the stipules usually deciduous; flowers usually in axillary spikes on the twigs; perianth 4- to 7-merous; staminate spikes (aments) slender and elongate, the flowers in axils of scales; stamens as many or twice as many as the perianth-segments or rarely more, the filaments usually slender; pistillate flowers in 2's or 3's or solitary, fasciculate or in short spikes, sometimes disposed at the base of the staminate aments; ovary 3- to 6-locular, the ovules 2 in each locule; styles 3, sometimes 6; nuts 1-seeded (sometimes 2- to 3-seeded), wholly or partially enveloped by an involucre; seeds lacking endosperm, the cotyledons fleshy.—About 10 genera, with about 600 species, in tropical and temperate regions.

- 1A. Staminate flowers many in heads; pistillate flowers in pairs on a common peduncle; involucre 2- to 4-lobed; nuts trigonous; cotyledons plicate, epigeal; flowers anemophilous. 1. *Fagus*
- 1B. Staminate flowers many in elongate, slender aments; pistillate flowers solitary or rather many, in spikes or aments; involucre entire or irregularly incised; nuts spherical; cotyledons hypogaeal. 2. *Quercus*
- 2A. Staminate aments pendulous; stigma flat; plants anemophilous. 3. *Castanea*
- 2B. Staminate aments erect; stigma punctiform; plants entomophilous. 4. *Castanopsis*
- 3A. Deciduous trees, without terminal buds; ovary 6-locular; styles 6, free; pistillate flowers 1–3 in an involucre. 5. *Pasania*
- 3B. Evergreen trees with terminal buds; ovary 3-locular; styles 3, connate below; pistillate flowers (in ours) solitary in an involucre. 6. *Castanopsis*
- 4A. Involucre entirely enclosing the nut; leaves usually in 2 series; buds flat, the scales distichous. 7. *Castanopsis*
- 4B. Involucre cuplike, exposing the nut above; leaves and scales not in 2 series; buds not flattened. 8. *Pasania*

1. FAGUS L. BUNA ZOKU

Deciduous trees with smooth bark; leaves alternate, pinnately nerved, dentate or nearly entire; staminate flowers many, in long more or less erect pedunculate heads, the perianth 4- to 7-parted; stamens 8–16; bracts of pistillate aments many, forming a connate involucre, the flowers usually geminate in the involucre; styles 3, slender, reflexed; nuts ovoid-trigonous, enveloped by a 4-lobed, spinose or scaly involucre; seeds solitary, the cotyledons rather thick, flat and plicate, epigeal.—About 10 species, in the temperate regions of the N. Hemisphere.

1A. Leaves nearly glabrous, pale green beneath, with 7 to 11 pairs of lateral nerves; fruiting peduncles 5–15 mm. long, pubescent.

- 1B. Leaves slightly pubescent and slightly glaucous beneath, with 10–14 pairs of lateral nerves; fruiting peduncles 3–4 cm. long, glabrous.
 1. *F. crenata*
 2. *F. japonica*

1. *Fagus crenata* Bl. *F. sieboldii* Endl.; *F. sylvatica* var. *sieboldii* (Endl.) Maxim.—BUNA. Tree with grayish bark; young branchlets slightly long-pubescent, soon glabrous; leaves ovate or broadly so, or rhombic-ovate, 5–8 cm. long, 3–5 cm. wide, short-acuminate, broadly cuneate to obliquely rounded at base, undulately and obsoletely toothed, long-pubescent while young especially on nerves beneath and on margin, the lateral nerves of 7 to 11 pairs, ascending, straight or nearly so, the petioles 3–10 mm. long, slightly pubescent; involucre about 15 mm. long, nearly as long as the nuts, provided with rather dense linear awnlike fleshy appendages 3–7 mm. long, the peduncles rather thick, pubescent.—May. Important forest-

tree of temperate regions; Hokkaido, Honshu, Shikoku, Kyushu.

2. *Fagus japonica* Maxim. INU-BUNA. Young branchlets soon becoming glabrous; leaves ovate or ovate-elliptic, 5–8 cm. long, 2.5–5 cm. wide, short-acuminate, obsoletely undulate, rounded to obtusely rounded at base, long-pubescent on both sides while young, soon glabrate above, the hairs persistent beneath, the lateral nerves of 10 to 14 pairs, the petioles 8–10 mm. long, soon glabrate; involucre 6–8 mm. long, about 1/2–2/3 the length of the nuts, with a short ovate-deltoid appendage, the peduncles slender, glabrous, 3–4 cm. long.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu.

2. QUERCUS L. KO-NARA ZOKU

Evergreen or deciduous trees, rarely shrubs; leaves alternate, short-petiolate or subsessile, pinnately nerved, simple, toothed or entire, sometimes pinnatifid; staminate flowers in slender, pendulous aments, the perianth 4- to 7-merous; stamens 4–12; pistillate flowers solitary or paired, usually in short spikes; ovary 3(–5)-locular; styles short or elongate, broadened above, the stigma on the upper side; nuts (acorns) globose to subcylindric, enveloped at base or nearly completely by a cup-shaped involucre (cupule) sculptured with ringlike annuli or scales.—More than 200 species, in the temperate to subtropical regions of the N. Hemisphere.

1A. Involucres with ringlike annuli; evergreen trees.

2A. Adult leaves glabrous, green beneath, often slightly brown-tinged when dried, usually decurrent on the petiole.

3A. Petioles 2–4 cm. long; leaves entire, loosely arranged on branchlets. 1. *Q. acuta*

3B. Petioles less than 2 cm. long.

4A. Leaves vivid to pale green when dry, thinly coriaceous, the midnerve not impressed above. 2. *Q. hondae*

4B. Leaves dark brownish when dry, coriaceous, densely disposed toward the tip of branchlets; midrib impressed above.

3. *Q. sessilifolia*

2B. Adult leaves glaucous or densely pubescent beneath.

5A. Underside of adult leaves, branchlets, and petioles with dense yellow-brown tomentum. 4. *Q. gilva*

5B. Underside of leaves glaucous, glabrous or with scattered appressed hairs.

6A. Leaves with persistent hairs thinly dispersed beneath, oblong or obovate-elliptic, the teeth prominent, the lateral nerves prominently raised beneath; nuts maturing in autumn of first year. 6. *Q. glauca*

6B. Leaves glabrate beneath, lanceolate or broadly lanceolate, the teeth low, the lateral nerves only slightly raised beneath.

7A. Costa not sunken on upper side; nuts ripening in autumn of the first year; branches rather stout, dark purple-brown.

5. *Q. myrsinaefolia*

7B. Costa sunken on upper side; nuts ripening in autumn of second year; branches slender, gray-brown. 7. *Q. salicina*

1B. Fruiting involucre with imbricate scales; deciduous or evergreen trees.

8A. Evergreen small tree or large shrub with leaves less than 6 cm. long. 8. *Q. phillyraeoides*

8B. Deciduous trees with leaves 6–25 cm. long.

9A. Leaves obovate to narrowly so, or elliptic, usually prominently toothed or dentate, the teeth not awn-tipped, rarely only mucronate.

10A. Branches relatively slender, glabrous or slightly pubescent while young; teeth of leaves usually ascending, obtuse or mucronate; scales of fruiting involucre short, appressed or slightly adnate and scalelike.

11A. Petioles 0–5 mm. long; leaf-blade long-pilose while young, becoming entirely glabrous, pale green or sometimes slightly glaucous beneath. 9. *Q. mongolica*

11B. Petioles 5–30 mm. long; leaf-blades with long thin deciduous hairs, usually glaucous, sometimes with persistent stellate-pubescent beneath.

12A. Leaves 6–15 cm. long, thinly appressed-pubescent beneath, with 7–12 pairs of lateral nerves; involucre distinctly stipitate; branches slender, pubescent while young. 10. *Q. serrata*

12B. Leaves 10–25(–35) cm. long, short stellate-pubescent beneath, sometimes appressed-pilose only while young, with 10–15 pairs of lateral nerves; involucre nearly sessile; branches rather stout, soon becoming glabrous. 11. *Q. aliena*

10B. Branches stout, densely short yellowish villous at least while young; leaves with large spreading rounded teeth; scales of fruiting involucre linear, elongate, spreading to somewhat recurved. 12. *Q. dentata*

9B. Leaves oblong-lanceolate, with awn-tipped teeth.

13A. Leaves whitish and densely stellate-pubescent beneath. 13. *Q. variabilis*

13B. Leaves glabrous or very thinly pilose except for tufts of axillary hairs beneath. 14. *Q. acutissima*

1. *Quercus acuta* Thunb. *Cyclobalanopsis acuta* (Thunb.) Oerst.; *Q. buergeri* Bl.; *Q. laevigata* Bl.; *Q. marginata* Bl.; *Q. buergeri* (Bl.) Oerst.; *Q. laevigata* (Bl.) Oerst.; *C. marginata* (Bl.) Oerst.—AKAGASHI. Evergreen; branches stout, dark brown, densely long red-brown pubescent while young, soon becoming glabrous; leaves coriaceous, ovate-elliptic to narrowly so, or oblong, 8–20 cm. long, 3–6 cm. wide,

abruptly long-acuminate, pubescent while young, soon becoming glabrous, entire, often slightly undulate, abruptly decurrent on the petiole, lustrous and deep green above, slightly paler and often becoming reddish beneath when dried, with 8–13 pairs of lateral nerves, the midrib not impressed above, the petioles slightly flattened, not grooved, 2–4 cm. long; staminate aments pendulous, the bracts scarious, 3–8 mm.

long; stamens 10-12; pistillate aments few-flowered, the fruiting involucre densely appressed-puberulent; nuts ellipsoidal, about 2 cm. long.—May. Honshu, Shikoku, Kyushu; common and often planted.—Korea and China.

Var. *acutaeformis* Nakai. HIRO-HA-ARAGASHI. With broader thicker leaves.—Reported from Kyushu.

Quercus × *idzuensis* Makino, a hybrid allegedly between No. 1 and No. 6.—Honshu (Idzu Prov.).

2. *Quercus hondae* Makino. *Cyclobalanopsis hondae* (Makino) Schottky.—HANAGASHI. Branches slender, dark red-brown, glabrous; leaves thinly coriaceous, rather densely disposed toward the top of the branches, lanceolate or oblanceolate, 7-13 cm. long, 2-3 cm. wide, long-acuminate, vivid or rather pale green, slightly paler beneath, subentire or with teeth undulate-ascending and awn-tipped, decurrent to an obscure or very short petiole, the midrib slightly raised or flat above, reddish beneath, the lateral nerves 8 to 13 pairs, very slender.—Mountains; Kyushu.

3. *Quercus sessilifolia* Bl. *Cyclobalanopsis sessilifolia* (Bl.) Nakai; *Q. paucidentata* Franch.; *Q. paucidentata* (Franch.) Kudō & Masam.—TSUKUBANAGASHI. Evergreen; branches dark gray-brown, pale yellow-brown villous, soon becoming glabrous; leaves coriaceous, obovate to broadly oblanceolate, 6-10 cm. long, 2-4 cm. wide, densely pale yellow-brown tomentose while young but later becoming glabrous beneath, reddish when dry, abruptly or short-acuminate, sparsely toothed or subentire, acute or subcuneate at base, the midrib impressed above, with 8-13 pairs of rather slender lateral nerves, the petioles 5-20 mm. long; stamens 10-20; fruiting involucre densely short-pubescent; nuts ellipsoidal, about 15 mm. long.—May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Quercus × *takaoyamensis* Makino. A hybrid of No. 3 and No. 1.

4. *Quercus gilva* Bl. *Cyclobalanopsis gilva* (Bl.) Oerst.—ICHIGASHI. Evergreen; branches dark purple-brown, much-branched, the branchlets, petioles, and undersides of leaves yellow-brown stellate-villous; leaves coriaceous, oblanceolate to broadly so, 5-12 cm. long, 1.5-3 cm. wide, abruptly acuminate, acute or sometimes obtuse at base, with acute short-awned teeth on upper margin, stellate-pubescent but soon glabrate and deep green above, the midrib impressed above, the lateral nerves 13 to 18 pairs, somewhat raised beneath, the petioles 5-15 mm. long; stamens 8-10; fruiting involucre short-villous; nuts ellipsoidal, about 2 cm. long.—May. Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa and China.

5. *Quercus myrsinaefolia* Bl. *Cyclobalanopsis myrsinaefolia* (Bl.) Oerst.; *Q. vibrayana* Fr. & Sav.; *Q. glauca* var. *nudata* Bl.—SHIRA-KASHI. Glabrous sparsely leaved evergreen tree, with dark purple-brown branches; leaves coriaceous, lanceolate, sometimes narrowly oblong-ovate, 5-12 cm. long, 15-25(-30) mm. wide, gradually long-acuminate, subacute to rounded at base, with short mucronate teeth on upper half, lustrous above, prominently glaucous beneath, the midrib scarcely impressed above, the lateral nerves very slender, 10 to 16 pairs, only slightly raised beneath, the petioles 1-2 cm. long; fruiting involucre stipitate.—Apr.-May. Warmer parts of Honshu, Shikoku, Kyushu.

6. *Quercus glauca* Thunb. *Cyclobalanopsis glauca* (Thunb.) Oerst.; *Q. glauca* var. *caesia* Bl.—ARA-KASHI. Evergreen; branches rather stout, dark brown, yellowish pubes-

cent while young; leaves coriaceous, oblong, elliptic, to obovate-oblong, 7-13 cm. long, 2.5-6 cm. wide, abruptly acuminate, rounded to subacute at base, with acute teeth on upper half, lustrous and glabrous above, glaucous beneath, densely appressed brownish hairy while young, becoming sparsely so when fully developed, the midrib slightly impressed above, the lateral nerves 8 to 11 pairs, prominent beneath, the petioles 1.5-2(-3) cm. long, glabrous; stamens 10-15; fruiting involucre densely puberulous; nuts ellipsoidal, about 2 cm. long.—Apr.-May. Honshu, Shikoku, Kyushu.—Formosa and China; common and variable; frequently planted, with many cultivars. Grown in gardens.

7. *Quercus salicina* Bl. *Cyclobalanopsis salicina* (Bl.) Oerst.; *Q. glauca* var. *stenophylla* Bl.; *Q. stenophylla* (Bl.) Makino; *C. stenophylla* (Bl.) Schottky; *Q. miyagii* sensu auct. Japon. pro parte, non Koidz.—URAYTIGASHI. Evergreen; branches rather slender, gray-brown or pale red-brown, much-branched, pale yellow-brown villous while young; leaves rather loosely arranged, lanceolate to broadly so, sometimes narrowly oblong, long-acuminate, obtuse to acute at base, with short upright rather long mucronate teeth on upper half, glabrous and lustrous above, yellow-brown pubescent while young becoming glaucous and glabrous beneath, the midrib impressed above, the lateral nerves 10 to 13 pairs, slightly raised beneath, the petioles 10-15 mm. long, glabrous; fruiting involucre densely puberulous; nuts ellipsoidal to oblong-ovoid, 15-22 mm. long.—May. Warmer regions; Honshu, Shikoku, Kyushu.—s. Korea.

8. *Quercus phillyraeoides* A. Gray. *Q. ilex* var. *phillyraeoides* (A. Gray) Franch.—UBAMEGASHI. Evergreen shrub or small tree with dense, dark gray-brown branches, the branchlets densely pale red-brown stellate-pubescent; leaves coriaceous, dark green, obovate-oblong to broadly so, 3-6 cm. long, 1.5-3 cm. wide, slightly lustrous, obtuse to subacute, rounded to shallowly cordate at base, undulately toothed except near base, the midrib scarcely impressed above, the lateral nerves 6 to 9 pairs, not prominent, the petioles 2-5 mm. long; stamens 4-5; fruiting involucre densely puberulous; nuts ovoid, 13-20 mm. long.—Apr.-May. Thickets and open woods near seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, China. Variable; much planted in parks and for hedges.—The following are cultivated: Forma *crispa* (Matsum.) Kitam. & Horikawa. *Q. phillyraeoides* var. *crispa* Matsum.—BIWABAGASHI, CHIRIMEGASHI. Leaves crisped.—Forma *wrightii* (Nakai) Makino. *Q. wrightii* Nakai; *Q. phillyraeoides* var. *wrightii* (Nakai) Masam.—KE-UBAMEGASHI. Leaves densely stellate-hairy on under side.

9. *Quercus mongolica* Fisch. MONGORI-NARA. Deciduous tree with rather thick, glabrous branches; leaves obovate or broadly so, 10-17 cm. long, 6-12 cm. wide, densely aggregated toward the tip of branchlets, obtuse to subacute with an obtuse tip, auriculate at base, glabrous and deep green above, pale green and sometimes slightly glaucescent beneath with scattered hairs on nerves or nearly glabrous, with coarse deeply undulate obtuse teeth, the petioles 0-5 mm. long; fruiting involucre subsessile, with keeled incurved and appressed scales; nuts ovoid-ellipsoid.—June-July. Woods in the temperate and cooler regions; Hokkaido, Honshu (Tanba Prov. and eastw., centr. and n. distr.).—s. Kuriles, Sakhalin, Manchuria, Korea, and Mongolia, and e. Siberia.

Var. *grosseserrata* (Bl.) Rehd. & Wils. *Q. crispula* Bl.;

Q. grosseserrata Bl.; *Q. crispula* var. *grosseserrata* (Bl.) Miq.—MIZU-NARA. Leaves obovate to narrowly so, acute to subacute, with rather acute teeth; involucre scales less prominently keeled and strongly appressed.—May–June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin and s. Kuriles.

10. *Quercus serrata* Thunb. *Q. glandulifera* Bl.; *Q. canescens* Bl.; *Q. urticifolia* Bl.—KO-NARA, HAHASO, NARA. Large or small deciduous tree with rather slender branchlets pubescent while young; leaves obovate to narrowly ovate, sometimes oblong, rarely broadly lanceolate, 6–15 cm. long, 2.5–7 cm. wide, acute, cuneate to acute or subrounded at base, coarsely mucronate-toothed, with grayish white appressed-pubescent especially beneath, deep green and glabrate above, the petioles 5–15 mm. long; fruiting involucre with short appressed-hairs; nuts ellipsoidal or oblong-ovoid, 15–20 mm. long.—Apr.–May. Hokkaido, Honshu, Shikoku, Kyushu; very common and highly variable.—s. Kuriles, Korea, and China.

Var. *donarium* (Nakai) Kitam. & Horikawa. *Q. donarium* Nakai.—TERIHA-KO-NARA. Leaves narrower and prominently lustrous above.—Occurs with the typical phase.

Quercus neostuxbergii Koidz. AO-NARA. Poorly known and possibly synonymous with *Q. serrata*.

11. *Quercus aliena* Bl. *Q. acutidentata* (Maxim.) Koidz.; *Q. aliena* var. *acutidentata* Maxim.—NARAGASHIWA. Deciduous tree with rather stout glabrous branches; leaves oblong-obovate or obovate, 10–25 (–35) cm. long, obtuse to subacute, undulate-toothed, glabrous above, densely brownish or grayish stellate-pubescent beneath, the petioles 1–3 cm. long, glabrous; fruiting involucre axillary, whitish puberulent; nuts ellipsoidal or ovoid, 2–2.5 cm. long.—Apr. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Hybrids of Nos. 9 and 10 are: *Quercus* × *pellucida* (Bl.) Nakai. Ô-MIZU-NARA; and *Quercus* × *major* Nakai. ÔBA-KO-NARA.

12. *Quercus dentata* Thunb. *Q. obovata* Bunge—KASHIWA. Deciduous tree with stout short gray-yellow villous

branches; leaves obovate to broadly so, 10–30 cm. long, 6–18 cm. wide, obtuse, narrowed and auriculate below, with few coarse rounded teeth, pubescent at first on the nerves above, densely pale grayish with simple or sometimes stellate hairs beneath, the lateral nerves 4 to 10 pairs, the petioles 2–5 mm. long, not prominent; fruiting involucre fasciated, sub sessile, enveloping more than half the nut, the scales broadly linear, dense, the upper ones to 12 mm. long, white-puberulous outside; nuts ovoid-globose, 15–20 mm. long.—May. Sunny slopes and thickets, lowlands to mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Kuriles, Korea, and China.

Hybrids of Nos. 10 and 12 are *Quercus* × *nipponica* Koidz. *Q. angustelepidota* Nakai—KASHIWA-KO-NARA; and *Quercus* × *takatorensis* Makino. KO-GASHIWA.

13. *Quercus variabilis* Bl. *Q. bungeana* Forbes—ABE-MAKI. Deciduous tree, the branches soon becoming glabrous; leaves narrowly ovate-oblong, 8–15 cm. long, 2.5–5 cm. wide, short-acuminate with a short awn at apex, rounded to broadly cuneate at base, obsoletely undulate-toothed, with 9 to 16 pairs of lateral nerves, the marginal teeth awn-tipped, glabrous above, densely pale yellow-brown or grayish stellate-pubescent beneath, the petioles glabrous, 10–25 mm. long; fruiting involucre nearly sessile, slightly shorter than the nut, the scales linear, elongate, dense; nuts ovoid-globose, 15–20 mm. long.—Apr.–May. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Korea and China.

14. *Quercus acutissima* Carruth. *Q. serrata* sensu auct. Japon., olim, non Thunb.—KUNUGI. Deciduous tree, the branches pubescent, becoming glabrate; leaves narrowly linear-oblong, 8–15 cm. long, 2–4 cm. wide, acute, rounded to broadly cuneate at base, pubescent on both sides at first, soon becoming glabrous above, pale green and nearly glabrate beneath except for axillary tufts of hairs, the lateral nerves 12 to 16 pairs, marginal teeth awn-tipped, the petioles 1–2 cm. long; fruiting involucre sessile, enveloping more than half the nut, the scales broadly linear, slightly reflexed, dense; nuts subglobose, about 2 cm. long and as wide.—May. Honshu, Shikoku, Kyushu.—Korea and China.

3. CASTANEA Mill. KURI ZOKU

Monocyclic deciduous trees, rarely shrubs, the branches without terminal buds; leaves petiolate, alternate, simple, toothed, with parallel lateral nerves; staminate flowers on erect or spreading slender aments; perianth 6-merous; stamens 10–20; pistillate flowers usually subtending the staminate aments, usually in fascicles of 3; ovary 6-locular; styles 6, linear; ovules 2 in each locule; nuts 1–3 (–7), brown, enclosed in spiny 2- to 4-lobed involucre.—About 10 species, in the temperate regions of the N. Hemisphere.

1. *Castanea crenata* Sieb. & Zucc. *C. stricta* Sieb. & Zucc.; *C. vesca* var. *pubinervis* Hassk.; *C. pubinervis* (Hassk.) C. K. Schn.; *C. japonica* Bl.—KURI. Tree, the branches densely gray-white short-hairy while young; leaves oblong-lanceolate or narrowly oblong, 8–15 cm. long, 3–4 cm. wide, acuminate, obtuse to shallowly cordate at base, undulately toothed with 15 to 20 pairs of lateral nerves that project beyond the margin as short awns, puberulous on nerves above, glabrescent to densely pale yellowish brown soft hairy, with discoid sessile glands beneath; staminate aments 10–15 cm.

long, densely flowered, yellowish white, erect, or suberect; fruiting involucre with long subglabrous spines; nuts 2–3, the hilum occupying the whole basal area; styles about 3 mm. long.—July. Foothills; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; much planted for the nuts.

Castanea mollissima Bl. *C. bungeana* Bl.—SHINAGURI. Leaves coarsely toothed; sessile discoid glands absent beneath; hilum smaller; young branchlets and petioles puberulent and spreading pilose; sometimes cultivated in our area.—Korea and China.

4. CASTANOPSIS Spach SHII-KO-KI ZOKU

Evergreen monoecious trees with entire or toothed, coriaceous leaves; staminate flowers in erect aments, the perianth 5- to 6-merous; stamens 10 or 12; pistillate flowers 1–3 in an involucre; ovary 3-locular; styles 3, the stigmas minute; fruit wholly enclosed in an ovoid to globose, sometimes fissured, spinose or tuberculate, or transversely striate involucre, the nut maturing the second year.—About 30 species, chiefly in e. and s. Asia, 1 species in western N. America.

1. *Castanopsis cuspidata* (Thunb.) Schottky. *Quercus cuspidata* Thunb.; *Pasania cuspidata* (Thunb.) Oerst.; *P. cuspidata* var. *thunbergii* Makino; *Lithocarpus cuspidata* (Thunb.) Nakai; *Pasaniopsis cuspidata* (Thunb.) Kudo; *Shiia cuspidata* (Thunb.) Makino—TSUBURA-JU. Much branched evergreen tree, the branchlets with scurfy appressed hairs while young; leaves rather coriaceous, ovate-oblong, broadly lanceolate or oblong, sometimes ovate, usually 5–10 cm. long, 2–3 cm. wide, long-acuminate, acute to subrounded at base, undulately toothed on upper margin, smooth, glabrous and deep green above, gray-brown to brownish beneath with appressed brownish scales, the petioles 5–10 mm. long, soon becoming smooth; staminate aments 5–10 cm. long; pistillate aments on the upper part of the branches; fruiting involucre sub-

globose, sessile, with small protuberances arranged in 1 or 2 series of transverse lines, densely soft grayish puberulent; nuts subglobose to ovoid-globose, 8–10 mm. in diameter.—May–June. Warmer parts; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea.

Var. *sieboldii* (Makino) Nakai. *Pasania cuspidata* var. *sieboldii* Makino; *Pasania sieboldii* (Makino) Makino; *Lithocarpus cuspidata* var. *sieboldii* (Makino) Nakai; *Shiia sieboldii* (Makino) Makino; *Pasaniopsis sieboldii* (Makino) Kudo—SUGA-JU. Branches thicker; leaves thicker and the nuts larger, ovoid-oblong; bark fissured in younger trees.—Warmer areas; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common in environs of Tokyo.—Korea.

5. PASANIA Oerst. MATEBA-SHII ZOKU

Evergreen trees with entire or toothed, coriaceous, petiolate leaves; staminate flowers in slender erect aments, the perianth 4- to 6-merous; stamens 6–12, longer than the perianth; pistillate flowers 1–3 or 5 together, subtending the staminate aments or borne separately, involucre; ovary 3-locular; styles 3, erect, cylindric with a punctiform stigma; nuts wholly or partially involucre, maturing the second year, the involucre with annular rings or scales.—About 100 species, in e. and s. Asia.

- 1A. Young branches nearly glabrous; leaves yellowish green beneath, with about 12 pairs of lateral nerves. 1. *P. edulis*
1B. Young branches densely short-pubescent; leaves silvery beneath, with about 7 pairs of lateral nerves. 2. *P. glabra*

1. *Pasania edulis* Makino. *Quercus edulis* Makino; *Lithocarpus edulis* (Makino) Nakai; *Q. glabra* var. *micrococca* Bl.; *Q. glabra* var. *sublepidota* Bl.; *L. sublepidota* (Bl.) Koidz.—MATEBA-SHII. Branches stout, glabrous or nearly so; leaves coriaceous, oblanceolate to obovate-oblong, sometimes oblong, 8–16 cm. long, 3–7 cm. wide, acute with an obtuse tip, acute at base, glabrous except the ascending pubescence on midrib beneath and on petioles while young, lustrous above, obsoletely scaly and somewhat brownish beneath, with 10 to 12 pairs of lateral nerves, the petioles 1.5–3 cm. long; staminate aments linear, erect; nuts narrowly ovoid to oblong, 2–2.5 cm. long, the involucre shallow, with small imbricate scales.—June. Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus.

2. *Pasania glabra* (Thunb.) Oerst. *Quercus glabra*

Thunb.; *Q. sieboldiana* Bl.; *Lithocarpus glabra* (Thunb.) Nakai; *Kuromatea glabra* (Thunb.) Kudo; *P. sieboldiana* (Bl.) Nakai—SHIRIBUKAGASHI. Branches rather stout, with densely grayish or yellowish brown pubescence while young; leaves coriaceous, oblong, sometimes broadly oblanceolate, 10–15 cm. long, 4–6 cm. wide, abruptly acute to acuminate with an obtuse tip, acute at base, pubescent on both surfaces while very young, glabrescent and lustrous above, silvery beneath with obscure lepidote scales, sometimes with few obscure undulate teeth on upper margin, the lateral nerves 6 to 8 pairs, the petioles pubescent, 8–10 mm. long; staminate aments erect, densely flowered, linear; nuts broadly ovoid or ellipsoidal, 1.5–2 cm. long, depressed at base, the involucre shallow, with small adnate scales.—Oct.–Nov. Honshu (Kinki and Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus and Formosa.

Fam. 67. ULMACEAE NIRE KA Elm Family

Monococious or hermaphroditic shrubs or trees sometimes with short spine-tipped spurs; leaves simple, petiolate, alternate, the stipules deciduous; flowers bisexual or unisexual, axillary and fasciculate, solitary or cymose; perianth 4- to 5-(-8) parted; stamens as many as the perianth lobes and opposite them, the filaments erect; ovary superior, 1-locular, the ovules anatropous, pendulous; styles solitary and bifid or 2; fruit a samara, a drupe or resembling an achene; seeds lacking endosperm, the embryo straight or curved.—About 15 genera, with about 200 species, chiefly in the N. Hemisphere.

- 1A. Leaves pinnately nerved, the lowest pair much shorter than the median ones; perianth-segments connate below; fruit dry.
2A. Flowers bisexual; fruit a samara. 1. *Ulmus*
2B. Flowers unisexual; fruit achenelike. 2. *Zelkova*
1B. Leaves palmately 3-nerved from base; perianth-segments nearly free or very shortly connate below; fruit a drupe.
3A. Flowers cymose, unisexual or polygamous; leaves serrulate, with lateral nerves not ending in the marginal teeth. 3. *Trema*
3B. Flowers unisexual, the pistillate solitary or few, in axillary fascicles, the staminate cymose.
4A. Lateral nerves of leaves arcuate near the margin, not ending in the teeth. 4. *Celtis*
4B. Lateral nerves of leaves straight, ending in the teeth. 5. *Aphananthe*

1. ULMUS L. NIRE ZOKU

Deciduous or semievergreen trees and shrubs; leaves simple, toothed, petiolate, sometimes shallowly 2- to 3-fid at the apex, usually oblique at base, the stipules lateral, free; flowers bisexual, small, precocious or in leaf axils in autumn, fasciculate or racemose, the perianth campanulate, 4- to 9-merous; stamens as many as the perianth-lobes; styles short, deeply bifid; fruit a broadly winged pedicelled pendulous samara; seeds flat, endosperm absent, the embryo straight.—About 20 species, in the temperate regions of the N. Hemisphere.

- 1A. Leaves 2-5 cm. long, 1-2 cm. wide, with simple rather obtuse teeth; samara 8-13 mm. long; flowers in autumn in leaf-axils; perianth deeply lobed. 1. *U. parvifolia*
 1B. Leaves 3-13 cm. long, 2-7 cm. wide, with usually acute, sometimes double teeth; flowers precocious, before the leaves; perianth shallowly lobed.
 2A. Seeds on upper portion of the samara; leaves unlobed, the petioles 4-12 mm. long. 2. *U. davidiana* var. *japonica*
 2B. Seeds at the center of the samara; leaves usually shallowly 3- to 5-(-9) lobed above, the petioles 3-5 mm. long. 3. *U. laciniata*

1. *Ulmus parvifolia* Jacq. *U. sieboldii* Daveau; *U. shira-sawana* Daveau—AKI-NIRE. Small much-branched tree with puberulent branches; leaves rather firm, lustrous, obliquely oblong, obovate or narrowly ovate, 2-5 cm. long, 1-2 cm. wide, obtuse to acute, obliquely obtuse at base, simply toothed, glabrous except puberulent on the midrib above, with 7 to 15 pairs of lateral nerves, the petioles 4-12 mm. long; samaras elliptic or nearly orbicular, short-pedicellate, glabrous, 8-13 mm. long, the seed near the center.—Sept. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Korea, Formosa, and China.

2. *Ulmus davidiana* Planch. var. *japonica* (Rehd.) Nakai. *U. campestris* sensu auct. Japon., non L.; *U. campestris* var. *japonica* Rehd.; *U. japonica* Sarg., non Sieb.; *U. propinqua* Koidz.—HARU-NIRE, NIRE. Deciduous tree with densely rusty-pubescent branches; leaves obovate, sometimes narrowly so, or elliptic, 3-10 cm. long, 2-6 cm. wide, doubly-toothed, abruptly acuminate, usually obliquely cuneate-obtuse at base, scabrous above, pilose beneath at least on nerves, with 7-13 pairs of lateral nerves, the petioles 4-12 mm. long; sam-

aras obovate, glabrous, 10-16 mm. long, the seeds on upper portion close to the base of style.—Apr.-June. Hokkaido, Honshu, Shikoku, Kyushu; rare.—Forma *suberosa* Nakai has corky branches.—Forma *kijimae* (Makino) Sugimoto. *U. kijimae* Makino—TSUKUSHI-NIRE. Leaves glabrous.—Kyushu. The typical variety occurs in Sakhalin, s. Kuriles, Korea, e. Siberia, and n. China.

3. *Ulmus laciniata* (Trautv.) Mayr. *U. montana* var. *laciniata* Trautv.—OHYŌ, ATSUNI, ATSUSHI. Tree with pale brown branches puberulous when young; leaves rather thin, obovate to broadly obovate-cuneate, 8-13 cm. long, 5-7 cm. wide, usually shallowly 3- to 9-lobed toward the tip, abruptly acuminate, obtuse or cuneately narrowed to an obtuse base, acutely double-toothed, scabrous and short appressed-puberulent above, pilose beneath, with 10 to 17 pairs of lateral nerves; samaras elliptic, glabrous, about 15 mm. long, the seed nearly at the center.—May-June. Temperate forests; Hokkaido, Honshu, Kyushu.—Korea, n. China, e. Siberia, and Kamchatka.

2. ZELKOVA Spach KEYAKI ZOKU

Deciduous trees or shrubs; leaves short-petiolate, alternate, stipulate, penninerved, simple-toothed; flowers polygamous, 4- to 5-merous, short-pedicelled, the staminate in the lower, the bisexual ones in the upper axils of young branchlets; stamens 4-5; style lateral; drupe short-pedicelled, small, oblique, usually rather flattened, the cotyledons broad.—Few species in e. and w. Asia.

1. *Zelkova serrata* (Thunb.) Makino. *Corchorus serratus* Thunb.; *Ulmus kaekii* Sieb.; *Planera acuminata* Lindl.; *Z. acuminata* (Lindl.) Planch.; *Z. kaekii* (Sieb.) Maxim.—KEYAKI. Tall tree with gray-brown smooth bark and much divided slender branches, the branchlets brownish red, puberulent, the lateral ones deciduous in autumn; leaves membranous, narrowly ovate or narrowly ovate-oblong, 3-7 cm. long (sometimes to 12 cm. long in young vigorous shoots), 1-2.5 (-5) cm. wide, long-acuminate, shallowly cordate to rounded at base, slightly scabrous or nearly smooth and dull above,

acutely mucronate-toothed, thinly pilose on nerves beneath while young, the petioles 1-3 mm. long, puberulous on upper side; fruit sessile, nerved, about 5 mm. across, obliquely ovate-orbicular, glabrous.—Apr.-May. Lowlands and mountains; Honshu, Shikoku, Kyushu; frequently planted around houses.—Korea, China, and perhaps Formosa.

Var. *stipulacea* Makino. ? *Zelkova schneideriana* Hand.-Mazz.—ME-GEYAKI. Leaves pilose on both surfaces.—Honshu.

3. TREMA Lour. URAJIRO-ENOKI ZOKU

Shrubs or trees; leaves alternate, rather thin, serrulate, palmately 3- to 7-nerved, the stipules lateral, free, deciduous; flowers unisexual or polygamous, small, in small axillary cymes, 4- to 5-merous; stamens erect in bud; ovary sessile; style terminal, bifid, the stigma lobes linear; ovules pendulous; drupe small, erect, ovoid to nearly globose, with thick endocarp, the endosperm fleshy, the embryo curved.—About 20 species in the Tropics and subtropics.

- 1A. Leaves whitish and densely sericeous-pubescent beneath. 1. *T. orientalis*
 1B. Leaves green beneath. 2. *T. cannabina*

1. *Trema orientalis* (L.) Bl. *Celtis orientalis* L.; *Sponia orientalis* (L.) Planch.—URAJIRO-ENOKI. Small tree with densely appressed-pilose elongate branches; leaves narrowly ovate-oblong to broadly lanceolate, 7-15 cm. long, 1.5-5 cm. wide, gradually acuminate, obliquely cordate at base, obtusely serrulate, scaberrulous and appressed short-hairy above, white and densely silky-pubescent beneath, palmately 3- to 5-nerved, the petioles 8-12 mm. long; cymes longer or shorter than the petioles, rather many-flowered; fruit ovoid-globose, black, 3-4

mm. across.—Kyushu (lowlands in Yakushima and Tanegashima).—Ryukyus, Formosa, s. China to India, Malaysia, and Australia.

2. *Trema cannabina* Lour. *Celtis amboinensis* Willd.; *T. amboinensis* (Willd.) Bl.; *T. virgata* Bl.—KIRI-ENOKI. Closely resembles the preceding; leaves green, glabrous to hirsute beneath.—Kyushu (s. distr. to Tanegashima and Yakushima).—Ryukyus, Formosa, s. China, Malaysia, India, and Australia.

4. CELTIS L. ENOKI ZOKU

Usually deciduous trees; leaves alternate, entire or toothed, often oblique at base, pinninerved, with 3 main nerves from the base, the stipules free, lateral; inflorescence cymose, staminate or polygamous, axillary or from the base of young branchlets, the flowers 5 (or 4)-merous, the bisexual 1-3, axillary, pedicelled; perianth-segments and stamens usually 5; ovary sessile, style bifid, the lobes subplumose and often twice bilobed; ovule pendulous, anatropous; drupe juicy, ovoid to globose, the endocarp bony, often rugose or reticulate; seeds with scanty endosperm, the embryo curved.—About 70 species, in temperate to tropical regions of the N. Hemisphere.

- 1A. Fruit black when mature, the pedicels 20-25 mm. long; leaves with prominent teeth. 1. *C. jessoensis*
 1B. Fruit brown or red-brown when mature, the pedicels 5-15 mm. long; leaves with shallow not prominent teeth.
 2A. Leaves 5-10 cm. long, 2.5-5 cm. wide, acute or short-acuminate, relatively thin, glabrous or nearly so above. 2. *C. sinensis* var. *japonica*
 2B. Leaves 3-7 cm. long, 2-3 (-3.5) cm. wide, caudately long-acuminate, relatively thick, firm, more or less scabrous and appressed-hairy above. 3. *C. leveillei*

1. *Celtis jessoensis* Koidz. *C. aphananthoides* Koidz.; *C. bungeana* var. *jessoensis* (Koidz.) Kudo; *C. hashimotoi* Koidz.—EZO-ENOKI. Tree with puberulous branches; leaves narrowly or sometimes broadly ovate, 6-10 cm. long, 3-5 cm. wide, acuminate, obliquely rounded to obtuse at base, with incurved teeth except near base, scabrous or nearly glabrous above, glaucous or in young individuals pale green beneath, short-hirsute especially on nerves, the petioles 2-7 mm. long, puberulous; drupe black when mature, 6-7 mm. across, the pedicels 2-2.5 cm. long, glabrous.—Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

2. *Celtis sinensis* Pers. var. *japonica* (Planch.) Nakai. *C. willdenowiana* Schult.; *C. japonica* Planch.—ENOKI. Tree with pale gray-brown branches and appressed-pilulous branchlets; leaves oblique, broadly ovate to ovate-oblong, 5-10 cm. long, 3.5-6 cm. wide, acute to short-acuminate, obtuse at base, with short incurved teeth toward the tip, the lower margin entire, smooth or slightly scabrous and glabrous above,

paler and thinly yellow-brown pilose to glabrous beneath; drupe red-brown, broadly ellipsoidal, 6-7 mm. across, the pedicels 6-15 mm. long.—Apr.-May. Lowlands and hills; Honshu, Shikoku, Kyushu; very common.—Korea and China. The typical phase occurs in S. China.

3. *Celtis leveillei* Nakai. KOBA-NO-CHŌSEN-ENOKI. Tree with gray-brown branches densely yellow-brown appressed-hairy while young; leaves rather thick and firm, obliquely oblong, obovate or elliptic, 3-7 cm. long, 2-3.5 cm. wide, caudately long-acuminate, cuneate and acute or rarely rounded at base, with rather coarse appressed teeth on upper half, both surfaces appressed-pilose, scabrous above, pale-white beneath; drupe subglobose, brown at maturity, about 6 mm. long, the pedicels pilose, 5-10 mm. long.—Honshu (Kinki Distr. and westw.), Kyushu; rather rare.—China and Korea.

Var. *holophylla* Nakai. CHŪGOKU-ENOKI. Leaves obsoletely or not prominently toothed.—Honshu (Chūgoku Distr.), Shikoku.

5. APHANANTHE Planch. MUKU-NO-KI ZOKU

Deciduous trees; leaves petiolate, alternate, toothed, with the largest lateral nerves from the base, the stipules free and lateral; staminate inflorescence cymose, axillary near base of young branchlets, rather many-flowered; flowers 4- or 5-merous; pistillate flowers solitary in upper axils, pedicelled, the segments of pistillate perianth narrower; ovary sessile; style bifid, the stigmas (style-branches) linear, rather thick; ovules pendulous; drupe ovoid to subglobose, the pericarp juicy, the endocarp hard, the endosperm scanty or absent, the embryo incurved.—Few species, in e. Asia, Malaysia, and Australia.

1. *Aphananthe aspera* (Thunb.) Planch. *Prunus aspera* Thunb.; *Homoiceltis aspera* (Thunb.) Bl.—MUKU-NO-KI. Tall tree with scabrous branches when young; leaves rather thin, ovate to narrowly so, 5-10 cm. long, 3-6 cm. wide, long-acuminate, obtusely rounded at base, acutely toothed, 3-nerved from the base, scabrous and green above, short appressed-

pilose beneath, the lateral nerves 7 to 12 pairs, ending in a tooth, the petioles 5-10 mm. long; flowers green, small; drupe ovoid-globose, short appressed-pilose, black when mature, 7-8 mm. across, the pedicels 7-8 mm. long.—May. Lowlands and hills; Honshu, Shikoku, Kyushu; common.—Korea and China.

Fam. 68. MORACEAE KUWA KA Mulberry Family

Evergreen or deciduous, dioecious or monoecious trees, shrubs or rarely herbs, often with colored juice; leaves alternate, entire or toothed, sometimes lobed, the stipules prominent, deciduous; inflorescence basically cymose; flowers small, actinomorphic, spicate, capitate, or on the inner side of a fleshy urceolate receptacle (syconium of *Ficus*); staminate flowers 2- to 4(-6)-merous, the stamens opposite the segments, the filaments erect or incurved in bud; pistillate perianth 4-lobed or -parted; stigmas 1-2; ovary superior or inferior, with a solitary pendulous ovule; fruit a small achene or drupe, the perianth and axis sometimes aggregated or connate, forming a syncarp, the embryo curved.—About 55 genera, with more than 1,000 species, chiefly in the Tropics, few in the temperate regions of the world.

1A. Trees or erect herbs; leaves alternate.

2A. Flowers variously arranged but not on the inner side of a fleshy urceolate receptacle.

3A. Stamens incurved in bud; branches unarmed.

4A. Herbs; inflorescence cymose. 1. *Fatoua*

4B. Trees or shrubs; inflorescence in spikes or heads.

- 5A. Pistillate perianth 4-parted, becoming juicy and enclosing the achene. 2. *Morus*
 5B. Pistillate perianth connate into a tube; achenes exerted when mature, with a fleshy stipe at base. 3. *Broussonetia*
 3B. Stamens erect in bud; branches often reduced to spines; fruits aggregated in a false syncarp. 4. *Cudrania*
 2B. Flowers on inner side of fleshy urceolate receptacle. 5. *Ficus*
 1B. Scandent spinulose-scabrous herbs; leaves opposite, palmately lobed. 6. *Humulus*

1. FATOUA Gaudich. KUWA-KUSA ZOKU

Annual monoecious herbs with alternate, petiolate, simple, toothed leaves, the stipules deciduous; cymes densely flowered, capitate, nearly axillary; staminate flowers 4-merous, the filaments incurved in bud; pistillate perianth usually 6-lobed; ovary oblique; style sublateral, filiform, unbranched, dentate, or branched; ovules pendulous; achenes obliquely globose, slightly flattened, enclosed in a persistent perianth, the pericarp crustaceous, the embryo curved.—Few species, in Australia, Malaysia, and e. Asia.

1. *Fatoua villosa* (Thunb.) Nakai. *Urtica villosa* Thunb.; *U. japonica* Thunb., non L. f.; *F. aspera* Sieb. & Zucc.; *F. japonica* (Thunb.) Bl.—KUWA-KUSA. Erect, branched, short-pilose annual 30-80 cm. high; leaves membranous, broadly ovate, 5-10 cm. long, 3-5 cm. wide, acuminate, subtruncate at base, obtusely toothed, coarsely appressed-pilose above, short-pilose beneath, often slightly scabrous on both

surfaces, the petioles rather slender; flowers small, greenish, rather numerous, in axillary glomerules; achenes about 1 mm. across, compressed-trigonal, dispersed with minute raised points.—Sept.-Oct. Grassy places and cultivated fields in lowlands; Honshu, Shikoku, Kyushu; common.—Ryukyus and China.

2. MORUS L. KUWA ZOKU

Diocious or monoecious deciduous shrubs or trees, unarmed, with milky juice; leaves often 3- to 5-lobed, toothed; staminate aments rather long, many-flowered; stamens 4, filaments incurved in bud; pistillate aments elongate or short, the perianth 4-parted; ovary sessile; style terminal, bifid, the stigma lobes linear; ovules pendulous; fruit an achene, enclosed by a persistent juicy perianth; seeds subglobose, with a membranous testa, the endosperm fleshy, the embryo straight.—More than 10 species, in the temperate to warmer regions of the N. Hemisphere.

- 1A. Stigmas nearly free to the base; leaves obtusely toothed. 1. *M. tiliaefolia*
 1B. Stigmas more or less connate; leaves with mucronate teeth.
 2A. Leaves with prominent, rather irregular teeth. 2. *M. bombycis*
 2B. Leaves with short, rather regular teeth. 3. *M. australis*

1. *Morus tiliaefolia* Makino. KEGUWA. Tree with rather stout, coarsely pilose, gray-brown branches; leaves broadly ovate or ovate-orbicular, 10-22 cm. long, 6-18 cm. wide, abruptly caudate-acuminate, cordate at base, obtusely toothed, often 3-lobed, deep green, scabrous above, prominently short-pilose beneath especially on nerves, the petioles densely soft-puberulent, 3-5 cm. long; spikes short-cylindric, the pistillate 15-20 mm. long.—Apr.-May. Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Korea.

2. *Morus bombycis* Koidz. *M. japonica* L. H. Bailey, non Sieb.; *M. kagayamae* Koidz.—YAMAGUWA. Tree or large shrub with glabrous or puberulous branches while young; leaves ovate or broadly so, 8-20 cm. long, 5-12 cm. wide, short-acuminate, rounded to shallowly cordate at base, nearly glabrous and smooth or slightly scabrous above, puber-

ulous beneath especially on nerves, irregularly toothed, often 3-lobed, vivid to deep green above, the petioles nearly glabrous, 1-4 cm. long; staminate spikes short-cylindric, 2-3 cm. long; fruiting spikes ellipsoidal, purple-black.—Apr.-May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Sakhalin, and s. Kuriles. Much used in feeding silk worms.

3. *Morus australis* Poir. *M. acidosa* Griff.—SHIMAGUWA. Tree with nearly glabrous branches; leaves ovate or broadly so, 8-18 cm. long, 5-15 cm. wide, rounded to shallowly cordate at base, larger in vigorous shoots, with short rather regular teeth, sometimes 3-lobed, glabrescent on both sides or puberulous beneath on nerves, slightly scabrous above, the petioles 2-6 cm. long, nearly glabrous; staminate spikes short-cylindric; fruiting spikes ellipsoidal.—Kyushu (Yakushima and Tanegashima).—China, Formosa, and Ryukyus.

3. BROUSSONETIA Vent. Kōzo ZOKU

Diocious or monoecious trees or shrubs, sometimes scandent; leaves alternate, more or less scabrous, toothed, sometimes 3- to 5-lobed, the stipules free, membranous, deciduous; staminate flowers 4-merous, the perianth-lobes valvate in bud, the filaments incurved in bud; pistillate perianth ovoid or tubular, 3- to 4-toothed, entirely surrounding the ovary; style simple, filiform, with stigmatic hairs from near base; fruiting spikes capitate; fruit stipitate, small, fleshy, exerted from the persistent perianth at maturity, the endocarp seedlike and crustaceous.—Few species, in e. and se. Asia.

- 1A. Petioles 2-10 cm. long; branches stout; leaves coarsely pilose; staminate spikes 4-8 cm. long; pistillate spikes about 2 cm. across in fruit. 1. *B. papyrifera*
 1B. Petioles 3-20 mm. long; branches slender; leaves nearly glabrous to slightly pubescent; staminate spikes about 1.5 cm. long; pistillate spikes about 1 cm. across in fruit.
 2A. Plants monoecious; branches ascending, elongate and not scandent; leaves ovate to broadly so, slightly scabrous above. 2. *B. kazinoki*
 2B. Plants dioecious; branches much elongate and scandent; leaves ovate to narrowly so, glabrate above. 3. *B. kaempferi*

1. *Broussonetia papyrifera* (L.) Vent. *Morus papyrifera* L.—カシノキ. Small tree with stout gray-brown coarsely spreading hirsute branches while young; leaves thick-herbaceous, oblique, broadly ovate, 7–18 cm. long, 5–15 cm. wide, short-acuminate, shallowly cordate at base, coarsely hirsute, dull, toothed, often deeply 3- to 5-lobed, deep green and scabrous above, pale green beneath, the stipules broadly lanceolate or obliquely narrow-ovate, acuminate, deciduous; staminate spikes cylindric, densely many-flowered, 4–8 cm. long, the peduncles 2–4 cm. long, pendulous, the perianth coarsely hairy; pistillate spikes densely many-flowered, globose, short pedunculate, about 2 cm. across, villous; style slender, filiform; drupe exserted from the perianth when mature, red, oblanceolate, the style persistent.—May–June. Honshu (warmer part of centr. distr. and westw.), Shikoku, Kyushu; cultivated for making paper.—Ryukyus, Formosa, China, and Malaysia.

2. *Broussonetia kazinoki* Sieb. *B. sieboldii* Bl.—

Kōzo. Monoecious shrub with brownish bark, the branches slender, elongate, purplish, short-pilose while young; leaves thinly membranous, oblique, ovate or broadly so, 5–15 cm. long, 3–8 cm. wide, long-acuminate, rounded to shallowly cordate at base, slightly scabrous above, short-pilose while young beneath, toothed, the petioles 3–20 mm. long, short-pilose, the stipules narrowly lanceolate; staminate spikes 1–1.5 cm. long, the peduncles about 1 cm. long; pistillate spikes globose, rather many-flowered, the peduncles nearly as long as the petioles; styles filiform, elongate; fruiting heads globose, red, the fruits stipitate, with a persistent style.—Apr.–May. Honshu, Shikoku, Kyushu; often cultivated for paper making.—Ryukyus, Formosa, China, and Korea.

3. *Broussonetia kaempferi* Sieb. *TSURU-KŌZO*. Closely resembles the preceding; dioecious, with much-elongate and scandent branches; leaves ovate to narrowly so, acuminate, toothed, rounded at base, subglabrous above, only sparingly short-pilose beneath.—Apr.–May. Shikoku, Kyushu.

4. CUDRANIA Tréc. HARIGUWA ZOKU

Dioecious, branching, sometimes scandent shrubs, the branchlets often reduced to spines; leaves alternate, short-petiolate, entire or sometimes 3-lobed, penninerved, the stipules small; inflorescence axillary, glomerate, short-peduncled, the bracteoles many; staminate flowers 4-merous, the perianth segments oblong, obtuse; pistillate perianth broader, imbricate in bud, enveloping the ovary; styles simple, undivided or bifid, the stigmatose branches elongate, filiform or rather thick; ovules pendulous; fruiting perianth and bracts accrescent, rather fleshy, forming a false headlike syncarp; fruit ovoid, rather flat, with crustaceous pericarp.—Few species in tropical Asia.

- 1A. Leaves oblong to obovate, rather coriaceous, glabrescent, the midrib impressed above especially toward the base; petioles becoming glabrous; peduncles of staminate heads 4–6 mm. long. 1. *C. cochinchinensis* var. *gerontogea*
 1B. Leaves ovate to broadly so, rather chartaceous, more or less pilose on nerves, the midrib scarcely impressed above; petioles puberulous on upper side; peduncles of staminate heads 10–12 mm. long. 2. *C. tricuspidata*

1. *Cudrania cochinchinensis* (Lour.) Kudo & Masam. var. *gerontogea* (Sieb. & Zucc.) Kudo & Masam. *Maclura gerontogea* Sieb. & Zucc.—カカツタ. Evergreen shrub; branches elongate, scandent, with erect spines in axils, woolly-pubescent on buds and stipules; leaves oblong to obovate, 4–7 cm. long, 2–3.5 cm. wide, entire, subcoriaceous, very obtuse to rounded with a minute awn at apex, slightly recurved on margin, the petioles 5–20 mm. long; flower heads axillary, the peduncles 3–6 mm. long, appressed-puberulent.—May–July. Honshu (Kinki and Chūgoku Distr.), Shikoku, Kyushu.—Formosa and China. The typical phase

occurs in e. Africa to India, Malaysia, and Australia.

2. *Cudrania tricuspidata* (Carr.) Bureau. *Maclura tricuspidata* Carr.; *Cudrania triloba* (Hance) Forbes & Hemsl.; *Cudranus trilobus* Hance.—HARIGUWA. Small puberulent tree; leaves membranous to chartaceous, ovate to broadly so, 6–10 cm. long, 3–6 cm. wide, entire or 3-lobed, abruptly acute to acuminate, with an obtuse tip, puberulous especially on midrib above and on nerves beneath; petioles 15–25 mm. long, puberulous on upper side; peduncles of staminate heads 10–12 mm. long, densely soft-pubescent.—June. Rarely planted in our area.—Korea and China.

5. FICUS L. イチジク ZOKU

Evergreen or deciduous, erect or scandent trees or shrubs, with milky juice; leaves alternate, entire or toothed, often lobed, the stipules caducous; receptacle fleshy, axillary or from the nodes of denuded branches, globose to ovate, usually enveloping the pistillate and staminate flowers, often with 3 bracts at base; staminate perianth 2- to 6-lobed, the stamens 1–6, the filaments short, erect; pistillate perianth small or reduced; ovary erect; styles solitary, somewhat lateral, the stigma peltate or filiform; achenes small, with crustaceous pericarp.—About 800 species in all tropical and warmer regions.

- 1A. Scandent woody plants; leaves evergreen, coriaceous, entire, with prominently elevated and finely reticulated veinlets beneath; receptacles axillary.
 2A. Leaves broadly lanceolate to ovate-oblong, long-acuminate, 5–12 cm. long; receptacles sessile, globose, not more than 10 mm. across. 1. *F. nipponica*
 2B. Leaves oblong or elliptic to ovate or broadly so, obtuse or subacute, 1–10 cm. long; receptacles 1.5–4 cm. across; peduncles 7–12 mm. long.
 3A. Leaves oblong or elliptic, obtuse, 4–10 cm. long, the petioles 1.5–2 cm. long; receptacles 3–4 cm. across, pyriform. 2. *F. pumila*
 3B. Leaves broadly to narrowly ovate, subacute with an obtuse tip, 1–5 cm. long, the petioles 5–10 mm. long; receptacles globose, 15–17 mm. across. 3. *F. stipulata*
 1B. Erect trees or shrubs.
 4A. Large deciduous shrub with herbaceous leaves. 4. *F. erecta*
 4B. Evergreen trees with entire coriaceous leaves.
 5A. Petioles 7–20 mm. long; leaves 5–8 (–10) cm. long, cuneately obtuse at base; receptacles sessile. 5. *F. microcarpa*
 5B. Petioles 3–6 cm. long; leaves 7–12 cm. long, rounded at base; receptacles on short peduncles 3–7 mm. long. 6. *F. wightiana*

1. *Ficus nipponica* Fr. & Sav. *F. foveolata* sensu auct. Japon., non Wall.; ? *F. wrightii* Benth.; *F. foveolata* var. *nipponica* (Fr. & Sav.) King—ITABI-KAZURA. Woody scandent shrub, the branches attached to rocks or tree-trunks by means of aerial roots, the young branches puberulous; leaves evergreen, pale green when dried, narrowly ovate-oblong, narrowly ovate or broadly lanceolate, 5–12 cm. long, 2.5–4 cm. wide, long-acuminate, rounded at base, glabrous, whitish with finely elevated prominently reticulate veinlets beneath, the lateral nerves 5- to 6-paired, prominently arcuate short of the margin, the petioles 1–2 cm. long, puberulent while young, the stipules linear-lanceolate, about 10 mm. long; receptacles axillary, sessile, globose, glabrous, 7–10 mm. across, the basal bracts ovate-orbicular, obtuse, persistent, membranous, appressed-puberulent.—Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and S. Korea.

2. *Ficus pumila* L. *F. hanceana* Maxim.—Ô-ITABI. Scandent shrub, the young branchlets appressed pubescent; leaves evergreen, coriaceous, lustrous, 4–10 cm. long, oblong to ovate-elliptic, obtuse, very obtuse to rounded at base, sometimes subovate, glabrous or puberulous on nerves beneath, recurved on margin, the lateral nerves 3 to 5 pairs, more or less ascending, straight, the veinlets very prominently raised beneath, the petioles 1.5–2 cm. long, with brown appressed hairs while young; receptacles pyriform or subglobose, sometimes ellipsoidal, 3–4 cm. across, slightly pubescent only while young, the subtending bracts deciduous, the peduncles thick, 8–15 mm. long.—Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

3. *Ficus stipulata* Thunb. *F. thunbergii* Maxim.; *F. foveolata* var. *thunbergii* (Maxim.) King—HIME-ITABI. Scandent evergreen much branched shrub, the branchlets and petioles red-brown pubescent; leaves narrowly to broadly ovate, 1–5 cm. long, 1–2 cm. wide, subacute with an obtuse tip, subrounded at base, often loosely soft-pubescent above while young, brownish spreading-puberulent on the nerves especially beneath, the lateral nerves 5 to 6 pairs, arcuate short of the margin, the veinlets prominent beneath, the petioles 5–10 mm. long; receptacles globose, 15–17 mm. across.—Warmer parts; Honshu (w. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus.

4. *Ficus erecta* Thunb. var. *erecta*. *F. japonica* Bl.

—INU-BIWA. Deciduous, erect, loosely branching shrub to 4 m. high, the branches rather thick, glabrous; leaves obovate or narrowly so, 10–20 cm. long, 4–10 cm. wide, acuminate, rounded or sometimes shallowly cordate to subobtusate at base, glabrous, entire, pale green beneath, the petioles 1–4 cm. long, glabrous; receptacles axillary, solitary, globose, abruptly narrowed below, 3-bracteate at base, glabrous, 1–1.3 cm. across, the peduncles glabrous, rather slender, 1–2 cm. long.—May–Aug. Thickets and woods, low mountains and hills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *sieboldii* (Miq.) King. *F. sieboldii* Miq.—HOSOBANU-BIWA. Leaves narrower, lanceolate.—Occurs with the typical phase.

Var. *yamadorii* Makino. KE-NU-BIWA. Coarsely pilose on branches, leaves and receptacles.—Occurs with the typical phase.—S. Korea, Ryukyus, and Formosa.

5. *Ficus microcarpa* L. f. *F. retusa* sensu auct., non L.—GAJU-MARU. Evergreen much branched glabrous tree with pendant aerial roots from the trunks and branches; leaves coriaceous, oblong or obovate, 5–8 cm. long, 3–5 cm. wide, slightly cuspidate with an obtuse tip, obtuse or cuneately obtuse at base, entire, the lateral nerves not strong, rather many, parallel except the lowest pair, the petioles 7–20 mm. long; receptacles sessile, depressed-globose, about 8 mm. across, with 3 ovate-orbicular bracts at base.—Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, China to India, Malaysia, and Australia.

6. *Ficus wightiana* Wall. *F. superba* var. *japonica* Miq.—AKO. Glabrous evergreen tree with rather stout gray-brown branches; leaves coriaceous, oblong or narrowly so, 7–12 cm. long, 3.5–5 cm. wide, rounded at both ends, with an obtusely cuspidate apex, entire, the lateral nerves 6 to 9 pairs, slender, ascending, parallel, arcuate near the margin, the petioles 3–6 cm. long, rather stout; receptacles globose, 6–8 mm. across, the peduncles 3–7 mm. long, puberulous.—Honshu (Kii Prov.), Shikoku, Kyushu; rather common on lowlands near the sea.—Ryukyus, Formosa, and China.

Ficus elastica L. INDO-GOMU-NO-KI. Subscandent tree with lustrous leaves to 30 cm. long, with numerous slender parallel lateral nerves; often planted for ornamental purposes in the warmer parts of our area.—India.

6. HUMULUS L.

KARA-HANA-SŌ ZOKU

Scandent dioecious retrorsely scabrous herbs with opposite, petiolate, membranous, palmately lobed, toothed leaves, the stipules lateral, free; staminate inflorescence a loosely branched large axillary panicle, the perianth-segments 5, imbricate in bud, the stamens 5; pistillate inflorescence a conelike, few-flowered, bracteate, pedunculate spike, the bracts accrescent after anthesis, the perianth thinly membranous, closely appressed to the sessile ovary, the style bifid, the branches deciduous; ovules pendulous; achenes broadly ovate, slightly compressed, often glandular-dotted, enveloped by the accrescent perianth, the pericarp crustaceous, the endosperm fleshy, the embryo coiled.—Two species, in the temperate regions of the N. Hemisphere.

- 1A. Leaves palmately 5- to 7-cleft; pistillate bracts ovate-orbicular in fruit, green, partly purplish brown, herbaceous, 7–10 mm. long; annual. 1. *H. japonicus*
 1B. Leaves 3-lobed or sometimes unlobed; pistillate bracts ovate to ovate-oblong in fruit, papery-membranous, pale yellow-green or slightly brown-tinged, pale inside, 15–20 mm. long; rhizomatous perennial. 2. *H. lupulus* var. *cordifolius*

1. *Humulus japonicus* Sieb. & Zucc. KANA-MUGURA. Much branched scandent, green annual, retrorsely spinose-scabrous on stems and petioles; leaves membranous, long-petiolate, palmately 5- to 7-cleft, 5–12 cm. long and as wide, cordate, regularly serrulate, the lobes acuminate, slightly narrowed toward base, with yellow sessile discoid glands beneath,

scabrous on both surfaces; staminate flowers in loosely arranged erect panicles 15–25 cm. long, pedicelled, nodding, the anthers pale yellow, pendulous on slender filiform filaments; pistillate spike conelike, broadly ovate, the bracts ovate-orbicular, 7–10 mm. long, imbricate, herbaceous, accrescent after anthesis, scabrously pilose on back and especially on mar-

gin; achenes ovate-orbicular, inflated-lenticular, yellow-brown, puberulous near the top, glandless, 4-5 mm. long and as wide. —Sept.-Oct. Thickets and roadsides in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Ryukyus, Formosa, and China.

2. *Humulus lupulus* L. var. *cordifolius* (Miq.) Maxim. *H. cordifolius* Miq.—KARA-HANA-SŌ. Much-branched, scandent, perennial herb, retrorsely prickly on stems and petioles; leaves green, long-petiolate, ovate-orbicular, 5-12 cm. long and as wide, acuminate, cordate at base, scabrous on both surfaces, rather irregularly toothed, often 3-lobed, the terminal

lobe larger than the lateral ones; pistillate spikes pendulous, short-pedunculate, pale yellow-green, ovoid-globose in fruit, the bracts obtuse, 15-20 mm. long and as wide, concave, papery-membranous, accrescent, ovate; achenes inflated-lenticular, 2.5-3 mm. long and as wide, covered with minute impressed points and yellow discoid glands; staminate inflorescence paniculate, erect, 10-15 cm. long, the flowers short-pedicelled. —Aug.-Sept. Thickets in mountains; Hokkaido, Honshu (centr. and n. distr.).—China. The typical phase occurs in Europe.

Fam. 69. URTICACEAE IRA-KUSA KA Nettle Family

Monocious or dioecious herbs, rarely trees, often with stinging hairs; leaves opposite (often unequally so) or alternate, simple, toothed or incised, petiolate, commonly with cystoliths in the epidermal cells, the stipules free or connate, often caducous; flowers in glomerate cymes, the perianth 2- to 5-cleft, sometimes utriclelike; stamens as many as the perianth-segments and opposite them, the filaments incurved in bud; ovary superior, 1-locular; style simple or nearly absent, the stigma capitate, penicillate or pinnate, sometimes filiform; ovules solitary, usually orthotropous; fruit an achene, the endosperm oily.—About 40 genera, with about 500 species, cosmopolitan.

1A. Stinging hairs present.

- 2A. Leaves opposite; stigma penicillate-capitate. 1. *Urtica*
2B. Leaves alternate; stigma filiform. 2. *Laportea*

1B. Stinging hairs absent.

- 3A. Pistillate perianth not utriclelike in fruit, usually shorter than the achene or deeply lobed to parted.

- 4A. Leaves opposite. 3. *Pilea*
4B. Leaves alternate.

- 5A. Leaves equilateral, petiolate. 4. *Nanocnide*
5B. Leaves not equilateral, sessile or short-petiolate.

- 6A. Pistillate perianth suppressed, not accrescent; bracts of the pistillate inflorescence connate, forming a disclike receptacle at base. 5. *Elatostema*

- 6B. Pistillate perianth 4- to 5-parted, covering part of the achene; bracts of pistillate inflorescence not connate. 6. *Pellionia*

- 3B. Pistillate perianth connate and wholly investing the achene in fruit.

- 7A. Leaves toothed; herbs or shrubs.

- 8A. Pistillate perianth membranous, not adnate to the achene; suffrutescent herbs with alternate or opposite leaves. .. 7. *Boehmeria*

- 8B. Pistillate perianth adnate to the achene, fleshy or juicy in fruit; woody plants with alternate leaves.

- 9A. Pistillate perianth fleshy in fruit; stigma discoid or peltate. 8. *Villebrunea*

- 9B. Pistillate perianth juicy in fruit; stigma capitate. 9. *Debregeasia*

- 7B. Leaves entire; herbs or essentially so (in ours).

- 10A. Glomerules involucre at base; stigma short-linear, penicillate; delicate herbs. 10. *Parietaria*

- 10B. Glomerules without involucre bracts; stigma filiform, pilose, suffrutescent herbs.

- 11A. Lateral nerves of leaves much shorter than the midrib; perianth-segments of the staminate flowers without a transverse fold or gibbosity on back. 11. *Pouzolzia*

- 11B. Lateral nerves reaching nearly to the apex of leaves; perianth-segments of staminate flowers with a transverse fold or gibbosity on back. 12. *Gonostegia*

1. URTICA L. IRA-KUSA ZOKU

Dioecious or monoecious annuals or perennials with stinging hairs; leaves opposite, petiolate, dentate or serrate, 3- to 5-(7)-nerved, the stipules free or connate between the petioles; flowers in glomerate cymes, the staminate 4-merous; pistillate perianth 4-merous, the segments small, unequal; ovary erect; stigma penicillate-capitate; ovules orthotropous; achenes ovate or oblong, more or less flattened, enclosed by 2 accrescent inner perianth-segments.—About 40 species, in the temperate and warmer regions of the N. Hemisphere.

1A. Stipules 4, connate, in a pair.

- 2A. Leaves broadly ovate or cordate-orbicular, with 7-11 coarse, narrowly deltoid, often double teeth on each side, the petioles slightly shorter than the leaves. 1. *U. thunbergiana*

- 2B. Leaves narrowly to broadly ovate, rounded to shallowly cordate at base, with 10-25 usually simple teeth on each side; petioles much shorter than the leaves. 3. *U. platyphylla*

1B. Stipules 4, free, lanceolate or broadly linear.

- 3A. Leaves narrowly ovate-oblong to lanceolate, 6-12 cm. long. 4. *U. angustifolia*

- 3B. Leaves ovate to broadly so, 5-10 cm. long. 2. *U. laetevirens*

1. *Urtica thunbergiana* Sieb. & Zucc. IRA-KUSA. Perennial; stems erect, simple or slightly branched, 40-80 cm. long, retrorsely puberulous; leaves broadly ovate to ovate-

orbicular, 5-12 cm. long, 4-10 cm. wide, acuminate, cordate at base, coarsely incised-serrate, with scattered coarse appressed hairs above, puberulent beneath especially on nerves,

the petioles 3-10 cm. long, white appressed-puberulent; inflorescence axillary, narrowly pyramidal or subsapate, the pistillate above the staminate; flowers small, pale green, the 2 inner segments accrescent after anthesis and investing the achene; achenes flat, green, ovate.—Oct.—Nov. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

2. *Urtica laetevirens* Maxim. KOBANO-IRA-KUSA. Erect perennial herb 50-100 cm. long; stems thinly ascending-puberulous; leaves ovate or sometimes rather narrowly ovate, 5-10 cm. long, 2.5-5 cm. wide, acuminate, rounded to broadly cuneate at base, coarsely toothed, vivid green, scattered-pilose above, often sparingly short-pilose beneath; staminate inflorescence on upper portion of stems above the pistillate, the glomerules rather loose.—July-Oct. Woods in mountains; Hokkaido, Honshu.—Korea and China.

3. *Urtica platyphylla* Wedd. *U. takadana* Ohwi—EZO-IRA-KUSA. Tall, often gregarious perennial; stems erect, 50-180 cm. long, obtusely angled, simple or slightly branched, ascending- or slightly recurved-puberulent; leaves deep green, ovate, 8-15 cm. long, 4-8 cm. wide, acuminate, rounded or shallowly cordate at base, short-pilose on both sides, especially

on nerves beneath, coarsely toothed, the petioles 2-5 cm. long, much shorter than the blade, ascending-puberulent; inflorescence narrowly pyramidal, the pistillate toward the upper portion of the plant.—July-Oct. Moist woods and riverbanks in lowlands and foothills; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Kamchatka, Sakhalin, and e. Siberia.

4. *Urtica angustifolia* Fisch. *U. dioica* var. *angustifolia* Fisch.; *U. foliosa* Bl.—HOSOGABA-IRA-KUSA. Resembles the preceding; stems 50-150 cm. long, erect, simple or slightly branched, obtusely angled, rather sparingly appressed-pilous; leaves deep green, narrowly oblong to lanceolate, 6-12 cm. long, 1.5-5 cm. wide, acuminate, rounded at base, coarsely toothed, nearly glabrous or puberulous beneath especially on nerves, the petioles 1-3 cm. long, slightly puberulous or nearly glabrous; inflorescence narrowly pyramidal.—Aug.-Sept. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, and e. Siberia.

Var. *sikokiana* (Makino) Ohwi. *U. sikokiana* Makino—NAGABA-IRA-KUSA. A western phase with slender stems, the leaves narrower and more glabrate, thinner.

2. LAPORTEA Gaudich. MUKAGO-IRA-KUSA ZOKU

Diocious or monoecious herbs, shrubs or trees with stinging hairs; leaves alternate, large, simple, toothed or entire, penninerved, rarely 3-nerved, the stipules distinct, free or connate, deciduous; panicles or spikes axillary or terminal, the bracts small or absent; staminate flowers 4- to 5-merous; perianth-segments equal or unequal, the outer ones rarely absent; ovary erect when young, ascending afterward; stigma linear, usually elongate; ovules orthotropous; achenes flat, ascending.—Abundant in the Tropics, few in temperate e. Asia and N. America; our plants are herbs with pinnately 3-nerved leaves.

- 1A. Pistillate inflorescence a one-sided panicle; leaves narrowly ovate, rounded to obtuse at base; plant with bulbils in leaf-axils; roots thickened fusiform; achenes 2.5-3 mm. long. 1. *L. bulbifera*
 1B. Pistillate inflorescence a linear spike; leaves broadly ovate, shallowly cordate to rounded at base; plant sometimes with bulbils; roots slender, not thickened; achenes 1.7-1.8 mm. long. 2. *L. macrostachya*

1. *Laportea bulbifera* (Sieb. & Zucc.) Wedd. *Urtica bulbifera* Sieb. & Zucc.; *Fleurya bulbifera* (Sieb. & Zucc.) Bl.—MUKAGO-IRA-KUSA. Green perennial 40-70 cm. high with rather stout erect stems; leaves rather long-petioled, narrowly ovate, 8-15 cm. long, 4-7 cm. wide, acuminate, obtuse to rounded at base, coarsely mucronate-toothed, puberulous on both surfaces especially on nerves; staminate inflorescence paniculate, 4-7 cm. long, peduncled, axillary; pistillate inflorescence on the upper part of the stems, 7-15 cm. long inclusive of the long peduncle, ascending, the branches spreading-puberulent on one side, the 2 lateral perianth-segments oblong or obliquely narrow-obovate, obtuse, about 2.5 mm. long, accrescent after anthesis; achenes smooth, pale green, obliquely ovate-orbicular, 2.5-3 mm. long.—Aug.-Sept. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—China.

2. *Laportea macrostachya* (Maxim.) Ohwi. *Sceptronide macrostachya* Maxim.; *L. grossedentata* Wright—MUYAMA-IRA-KUSA. Green erect perennial 40-80 cm. high, the stems slightly retrorsely puberulent; leaves petiolate, broadly ovate or orbicular, 8-20 cm. long, 5-15 cm. wide, more or less pilose on both surfaces, the stipules small; staminate inflorescence paniculate, 5-10 cm. long, puberulous, the pistillate spicate, nearly terminal on the stems, peduncled, 20-30 cm. long, ascending, puberulous, the glomerules rather loosely several-flowered, the 2 lateral perianth-segments obliquely ovate, obtuse, puberulous, nearly as long as the achene, accrescent after anthesis; achenes obliquely elliptic, flat, 1.7-1.8 mm. long, smooth.—Woods in mountains; Hokkaido, Honshu.

3. PILEA Lindl. MIZU ZOKU

Diocious or monoecious, soft, juicy annual or perennial herbs, rarely subshrubs; leaves opposite, equal or unequal, entire or toothed, 3-nerved, rarely penninerved or nearly nerveless, the stipules connate, often caducous; inflorescence cymose, axillary, loosely or densely flowered, subsapate, the bracts small; staminate flowers 2- to 5-merous, perianth-segments valvate in bud; pistillate perianth unequally 3-lobed or equally 5-lobed, the reduced stamens scalelike, opposite the segments, sometimes absent; ovary erect; stigma sessile, penicillate; achenes ovate, slightly flattened, with a membranous testa.—More than 100 species, in the Tropics except Australia; few in temperate regions.

- 1A. Leaves orbicular, less than 10 mm. long, very obtuse, undulately toothed or nearly entire, with brown spots beneath, the cystoliths more or less transversely arranged above; achenes smooth. 1. *P. peploides*
- 1B. Leaves longer than broad, 1.5–13 cm. long, acute to caudate at apex, distinctly toothed, without spots beneath, the cystoliths rather irregularly arranged above.
- 2A. Pistillate perianth unequally 3-lobed.
- 3A. Pistillate perianth divided nearly to base, the longer segments lanceolate or linear-lanceolate, obtuse; achenes more or less red-brown spotted; leaves broadly rhombic-ovate, 1.5–10 cm. long.
- 4A. Pistillate perianth-segments shorter than the achene, linear-lanceolate; achenes about 1.2 mm. long; leaves 3–10 cm. long. 2. *P. mongolica*
- 4B. Pistillate perianth-segments, or at least one of them, as long as to slightly longer than the achenes; achenes 1.8–2 mm. long; leaves 1.5–5 cm. long, acute with an obtuse tip. 3. *P. hamanoi*
- 3B. Pistillate perianth spathe-like, with 3 acute-deltoid teeth or with as many ovate lobes at apex; achenes smooth or verrucose; leaves oblong to ovate, 6–15 cm. long.
- 5A. Leaves oblong, acuminate; achenes 1.3–1.5 mm. long, smooth. 4. *P. petiolaris*
- 5B. Leaves oblong-ovate, broadest slightly below the middle, long caudate-acuminate; achenes about 0.6 mm. long, strongly verrucose. 5. *P. pseudopetiolaris*
- 2B. Pistillate perianth with 5 nearly equal segments, parted to the base; achenes smooth, not brown-spotted.
- 6A. Peduncles of pistillate inflorescence mammillate-puberulous on one side; leaves 2–12 cm. long, narrowly ovate or oblong, with 7–13 coarse teeth on each side. 6. *P. kjotensis*
- 6B. Peduncles of pistillate inflorescence glabrous; leaves 1–3(–8) cm. long, broadly ovate or ovate-orbicular, with 3–6 coarse teeth on each side. 7. *P. japonica*

1. *Pilea peploides* (Gaudich.) Hook. & Arn. *Dubreulia peploides* Gaudich.—KŌKE-MIZU. Glabrous somewhat tufted monoecious annual, 7–15 cm. high, the stems branching below; leaves orbicular or depressed-ovate, 6–10 mm. long and as wide, very obtuse to rounded at the tip, usually sparingly undulate-toothed, broadly cuneate and 3-nerved at base, the cystoliths linear, more or less transversely arranged on the upper surface, brown-spotted beneath, the petiole shorter or longer than the blade; flowers more or less capitate in leaf-axils, sessile, the perianth-segments broadly oblanceolate, shorter than the achenes; achenes smooth, pale brown, broadly lenticular-ovate, about 0.6 mm. long.—Mar.–Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyu, Formosa, China, Korea, Manchuria, Hawaii, Galapagos Isl., Malaysia, and India.

2. *Pilea mongolica* Wedd. *P. viridissima* Makino—AŌ-MIZU. Glabrous, soft, fleshy, monoecious annual; stems erect, terete, often branched, 30–50 cm. long, pale green; leaves deep green, broadly rhombic-ovate, 1.5–10 cm. long, 1–7 cm. wide, short-acuminate or subacute with an obtuse tip, broadly cuneate at base, coarsely deltoid-toothed, 3-nerved, glabrous or scattered pubescent above and on margin, the petioles unequally paired, 1.5–10 cm. long; inflorescence densely cymose, 1–3 cm. long, the pistillate perianth-segments unequal, the longer ones linear-lanceolate, obtuse, with a prominent slightly raised midrib, $\frac{1}{2}$ – $\frac{3}{4}$ as long as the achene; achenes broadly ovate-lenticular, 1–1.2 mm. long, with scattered slightly raised brown spots.—July–Oct. Shaded places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, China, and e. Siberia.

3. *Pilea hamanoi* Makino. Mizu. Glabrous, soft, juicy monoecious annual; stems erect, sparingly branched, green or purplish, 20–40 cm. long; leaves deep green, broadly rhombic to rhomboid-ovate, 1.5–5 cm. long, 1–3.5 cm. wide, acute with an obtuse tip, broadly cuneate at the 3-nerved base, glabrous, ciliate, sparingly toothed; cystoliths short; inflorescence cymose, 5–20 mm. long, axillary; pistillate perianth-segments unequal, the larger ones lanceolate or linear-oblong, as long as to slightly longer than the achene, very obtuse, with a prominent midrib; achenes broadly ovate-lenticular, pale brown-spotted, 1.8–2 mm. long.—July–Oct. Shaded places; Hokkaido, Shikoku, Kyushu.—China.

4. *Pilea petiolaris* (Sieb. & Zucc.) Bl. *Urtica petiolaris* Sieb. & Zucc.; *P. strangulata* Fr. & Sav.—MIYAMA-MIZU. Soft, juicy, monoecious perennial, 40–80 cm. high, glabrous, sometimes sparingly branched below; leaves ovate to narrowly so, or oblong, 6–15 cm. long, 3–5 cm. wide, acuminate with a rather obtuse tip, obtuse or cuneate and 3-nerved at base, shallowly toothed, the stipules rather large, deciduous; inflorescence densely cymose, 1–4 cm. long, the pistillate perianth split to the base on one side, broadly ovate, 3-toothed or -lobed, about half as long as the achene; achenes broadly ovate, usually greenish brown, lenticular, not spotted, 1.3–1.5 mm. long, broadly ovate.—Aug.–Oct. Shaded wet places in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

5. *Pilea pseudopetiolaris* Hatus. KO-MIYAMA-MIZU. Slightly succulent perennial herb; rhizomes elongate, creeping; stems erect, 40–80 cm. long; leaves narrowly ovate to ovate-elliptic, 6–10 cm. long, 2.5–4 cm. wide, caudately long-acuminate, rounded to obtuse at base, obtusely serrate, trinerved, scattered pilose above, the petioles 2–3 cm. long; female cymes axillary, solitary, about 1 cm. long, short-peduncled, densely flowered; male cymes larger, 2–3.5 cm. long, nearly sessile, glabrous; achenes ovate-fusiform, acute, about 0.6 mm. long, densely verrucose.—Aug.–Oct. Honshu, Shikoku, Kyushu.

6. *Pilea kiotosensis* Ohwi. *Achudemia iseanae* Makino; *P. iseanae* Makino—MIYAKO-MIZU. Glabrous perennial (?) herb; stems 30–40 cm. long, rather juicy and soft, sometimes slightly branched; leaves ovate to narrowly so, sometimes oblong, 2–12 cm. long, 1–5 cm. wide, caudately acuminate with an acute tip, cuneate at base, coarsely toothed, nearly glabrous on both sides, 3-nerved, the stipules about 5 mm. long, deciduous; pistillate inflorescence cymose, the peduncles short-puberulous on one side or subsessile, the perianth-segments 5, elliptic to oblong, nearly equal, obtuse, the midrib tuberculate on back; achenes about 1 mm. long, 1.5–2 times longer than the perianth, broadly ovate, lenticular, smooth, pale, not punctate.—Oct. Honshu (Kinki Distr.), Kyushu (n. distr.).

7. *Pilea japonica* (Maxim.) Hand.-Mazz. *Achudemia japonica* Maxim.—YAMA-MIZU. Glabrous monoecious annual; stems branched, 10–20 cm. long, slightly red-brown, rather slender, soft, juicy; leaves broadly ovate or ovate-orbicular, 1–3(–8) cm. long, obtuse or acute with an obtuse tip, 3-nerved, the pairs unequal, ciliate, with 1–4 coarse teeth on

each side, the petioles slender, shorter to slightly longer than the blades; flowers cymose, the peduncles glabrous or sessile, the pistillate perianth-segments 5, nearly equal, broadly lanceolate, obtuse; achenes broadly ovate, pale, sublenticular, about

1 mm. long, not punctate, smooth.—Sept.–Oct. Woods in lowlands and foothills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

4. NANOCNIDE Bl. KATEN-sō ZOKU

More or less pubescent small monoecious herbs; leaves alternate, petiolate, ovate-orbicular or depressed, toothed or incised, 3- to 5-nerved, the stipules free; staminate inflorescence in peduncled cymes, in the upper axils, the perianth 4- to 5-cleft, the segments with a transverse ridge on back; pistillate inflorescence a dense sessile axillary cyme or glomerule, the bracts free, the perianth 4-cleft, the segments often with a small apical bristle, the outer ones slightly broader, keeled on back; ovary erect; achenes oblong, covered by the perianth but dehiscing from it when mature.—Three species in Japan, China, and Ryukus.

1. *Nanocnide japonica* Bl. KATEN-sō. Gregarious perennial herb 10–30 cm. high; stems slightly pubescent above, soft, green; leaves deltoid or rhombic-ovate to orbicular, obtuse, deeply obtuse-toothed, subtruncate at base, slightly pilose on both sides, the stipules ovate, obliquely spreading, 1–2 mm. long; staminate inflorescence distinctly peduncled, the perianth white; pistillate flowers small, green, subsessile in short

dense peduncled cymes in upper axils, the segments lanceolate, slightly longer than the achene; achenes lenticular, broadly ovate, pale, punctulate, about 1.3 mm. long; stigma mammillate, densely pubescent.—Apr.–May. Shaded places in lowlands and foothills; Honshu, Shikoku, Kyushu.—Formosa and China.

5. ELATOSTEMA Forst. UWABAMI-sō ZOKU

Herbs and subshrubs; stems rather thick; leaves alternate, sometimes with an odd minute opposite one, subsessile, toothed, usually oblique at base, penninerved or 3-nerved; flowers small, unisexual, in involucre dense headlike cymes, involucre bracts free or connate, staminate perianth 4- to 5-merous; stamens opposite the perianth-segments; pistillate perianth minute, 3- to 5-parted, persistent; stigma penicillate; achenes small, ovate, usually longitudinally striate.—About 60 species, in Africa and Asia, especially abundant in the Tropics.

1A. Staminate glomerules pedunculate; leaves long-caudate; some of the nodes thickened in autumn. 1. *E. umbellatum*

1B. Staminate and pistillate glomerules sessile or nearly so; nodes never thickened.

2A. Stems spreading-pilose; leaves brownish green when dried, slightly caudate-acuminate with an obtuse tip; bracts setulose.

2. *E. densiflorum*

2B. Stems nearly glabrous; leaves vivid yellow-green when dried, acute with an obtuse tip, not elongate above; bracts densely puberulent.

3. *E. laetevirens*

1. *Elatostema umbellatum* Bl. *Procris umbellata* (Bl.) Sieb. & Zucc.; *Pellionia umbellata* (Bl.) Wedd.; *E. japonicum* Wedd.—HIME-UWABAMI-sō. Soft, green, glabrous, perennial herb; stems 15–30 cm. long, ascending to erect and unbranched below, often declined and branched above, rather fleshy or juicy, terete, short-decumbent at base; leaves 2-seriate, alternate, rather thin and soft, oblique, narrowly ovate, 1.5–7 cm. long, 8–20 mm. wide, elongate and long-caudate with an obtuse tip, sessile, penninerved, with 2–4(–5) coarse teeth; staminate glomerules pedunculate, 1–3 cm. long, the pistillate ones small, axillary, sessile, the bracts slightly puberulous above; achenes pale, about 0.6 mm. long, loosely warty.—May–July. Moist shaded places in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *majus* Maxim. *E. umbellatum* var. *involutratum* (Fr. & Sav.) Makino; *E. involutratum* Fr. & Sav.—UWABAMI-sō. Plants rather large; stems 20–50 cm. long; leaves 5–12 cm. long, 2–4 cm. wide, with 5–12 coarse teeth on each side, the bracts broadly lanceolate to elliptic; achenes about 0.8 mm. long, nearly smooth.—May–July. Moist shaded places in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

2. *Elatostema densiflorum* Fr. & Sav. *E. nipponicum* Makino—TOKI-HOKORI. Annual; stems erect below, ascending above, 10–25 cm. long, juicy, often branched, spreading-pubescent; leaves oblique, cuneate-oblong, 4–8 cm. long, 2–3 cm. wide, acute with an obtuse tip, cuneate at base on one side, rounded on the other, slightly pubescent on nerves beneath, coarsely toothed above, subtrinnerved; inflorescence sessile, the bracts short-setulose.—Sept.–Oct. Shaded places in lowlands; Honshu (n. and centr. distr.).

3. *Elatostema laetevirens* Makino. *E. sessile* var. *cuspidatum* sensu Maxim., non Wedd.—YAMA-TOKI-HOKORI. Perennial rhizomatous herb with stolons, resembling the preceding but glabrous; stems fleshy, terete, ascending above, decumbent below, 15–40 cm. long; leaves vivid green, 2-seriate, slightly elongate above and caudate with an obtuse tip; inflorescence sessile, the bracts densely short-pubescent outside.—Aug.–Oct. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

6. PELLIONIA Gaudich. SANSHŌ-sō ZOKU

Diocious or monoecious herbs sometimes from a woody base; leaves alternate, nearly sessile, 2-seriate, oblique at base, entire or toothed, the stipules small or obscure; cymes axillary, sessile or peduncled, often densely flowered, capitate; flowers 4- to 5-merous; ovary erect; stigma penicillate; achenes small.—About 20 species, in the Tropics of Asia.

1A. Stems prostrate, herbaceous.

- 2A. Leaves short curved-puberulent on nerves and midrib beneath, obliquely obovate, obtuse at apex, 8–20 mm. long. 1. *P. minima*
 2B. Leaves glabrous or minutely papillose-puberulent on midrib beneath, subovate or narrowly oblique-ovate, slightly elongate above. 2. *P. radicans*

1B. Stems woody, ascending to erect, 20–40 cm. long. 3. *P. scabra*

1. **Pellionia minima** Makino. SANSHŌ-SŌ. Deep green perennial herb; stems slender, slightly branched, elongate, creeping prostrate, 10–30 cm. long, minutely puberulous, brownish green; leaves obliquely obovate, auriculate-rounded on outer margin at base, pale green, minutely puberulent on nerves beneath, the petioles very short; staminate glomerules cymose, the peduncles 1–1.5 cm. long, puberulous; pistillate glomerules sessile, densely flowered, small, the perianth-segments linear; achenes elliptic, pale, about 0.7 mm. long, prominently raised punctate.—Apr.–June. Woods; Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.

2. **Pellionia radicans** (Sieb. & Zucc.) Wedd. *Procris radicans* Sieb. & Zucc.; *Elatostema radicans* (Sieb. & Zucc.) Wedd.—O-SANSHŌ-SŌ. Resembling the preceding but larger; stems terete, prostrate, branched, elongate, brownish green, nearly glabrous; leaves alternate, 2-seriate, subovate or obliquely ovate in smaller ones, elongate above in the larger ones, 2–5 cm. long, 1–2 cm. wide, deep green, sometimes appressed pilose above, pale green and nearly glabrous beneath, the petioles very short, 1–3 mm. long; staminate cymes 1–1.5

cm. across, the peduncles papillose-puberulous; pistillate glomerules small, subglobose; achenes about 0.8 mm. long, minutely raised punctate.—June–July. Woods; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Pellionia yosiei Hara. *Elatostema yosiei* Hara. This may be a larger phase of *P. radicans*; leaves to 9 cm. long and 3 cm. wide, the staminate inflorescence with peduncles 1–5.5 cm. long.

3. **Pellionia scabra** Benth. *P. pellucida* Merr., excl. syn. —KI-MIZU. Shrub 20–40 cm. high, branches ascending to nearly erect, rather slender, grayish, slightly puberulent; leaves thin, sessile, oblique, oblanceolate or subobovate, 6–10 cm. long, 1–3 cm. wide, caudately acuminate, cuneate and obtuse at base, short-toothed, coarsely scattered-hairy above, paler and the nerves puberulent beneath; staminate glomerules cymose, pedunculate, the pistillate glomerules subsessile or short-peduncled, densely flowered; achenes minutely punctate.—Woods; Honshu (Izu Isl., Tōkaidō and s. Kinki Distr.), Shikoku, Kyushu.—Ryukyus and China.

7. BOEHMERIA Jacq. KARA-MUSHI ZOKU

Monococious herbs or shrubs, more or less hairy; leaves opposite or alternate, petiolate, equilateral or slightly unequal, toothed, sometimes 2- to 3-lobulate, the stipules free, rarely connate, deciduous; inflorescence spicate or paniculate, the flowers small, unisexual, the glomerules sessile; staminate flowers short-pedicelled or sessile, 4-merous, rarely 3- or 5-merous; pistillate flowers usually sessile, the perianth tubular or utriclelike, the orifice with 2–4 minute teeth; ovary entirely invested by the perianth; stigma elongate, short-puberulent on one side; ovules erect; achenes enclosed within the perianth.—About 100 species, pan-tropical and difficult to determine; the following list is a conservative estimate of those occurring in our area.

1A. Leaves alternate, usually densely white-tomentose beneath; inflorescence a loose panicle.

- 2A. Branches and petioles densely coarse-pubescent; leaves ovate-orbicular. 1. *B. nivea*

2B. Branches and petioles densely short-puberulent; leaves broadly ovate. 2. *B. nipononivea*

1B. Leaves opposite, pilose or pubescent beneath but without white tomentum.

3A. Pistillate perianth-tube puberulent throughout; plants slightly hairy.

- 4A. Subshrub with woody branching base; leaves 4–8 cm. long, rhombic-ovate. 3. *B. spicata*

4B. Herbaceous, usually with simple stems; leaves 8–20 cm. long, ovate-orbicular. 4. *B. tricuspid*

3B. Pistillate perianth-tube above uniformly short appressed-puberulent or the hairs longer on the upper portion than on the lower portion.

5A. Pistillate perianth-tube glabrous on lower portion.

- 6A. Stigma very short, about 0.5 mm. long; achenes about 1.2 mm. long. 5. *B. formosana*

6B. Stigma slender, 1.5–2 mm. long; achenes about 2 mm. long. 6. *B. sieboldiana*

5B. Pistillate perianth-tube uniformly hairy, the hairs on lower part short and ascending, clearly shorter than those above.

7A. Leaves with the teeth equal.

- 8A. Leaves bullate-rugose, prominently scabrous above, more or less unequal, often 2- to 3-lobulate, the teeth small and many; maritime plants with relatively thick leaves. 7. *B. biloba*

8B. Leaves not bullate-rugose above, equilateral, with larger teeth.

- 9A. Leaves rhombic-ovate or ovate, broadly cuneate at base, short-pubescent beneath. 8. *B. kiusiana*

9B. Leaves ovate-orbicular or orbicular, rounded to cordate at base, often densely short-pubescent beneath. 9. *B. pinnosa*

7B. Leaves with the teeth unequal, often doubly toothed in upper part.

- 10A. Pistillate glomerules densely arranged and approximate; leaves membranous to rather thick, rounded to cordate or obtuse at base.

11A. Leaves velvety short-pubescent beneath, usually broadly ovate, obtusely rounded at base, the teeth usually simple.

- 11B. Leaves short-pubescent, the upper teeth often double. 10. *B. holosericea*

10B. Pistillate glomerules rather loosely arranged; leaves thinly membranous, usually truncate or very broadly cuneate at base.

12. *B. plataniifolia*

1. **Boehmeria nivea** (L.) Gaudich. *Urtica nivea* L. —NAMBAN-KARA-MUSHI. Densely hirsute perennial herb; stems simple or sparingly branched, to 1.5 m. long, grayish

white, coarse, spreading-pubescent; leaves membranous, ovate-orbicular, 10–15 cm. long, 6–12 cm. wide, slightly elongate to the caudate tip, cuneate-rounded at base, regularly dentate-

toothed, green and slightly hirsute above, densely white-woolly beneath with spreading-hairs on the nerves, the petioles slender, as long as to slightly shorter than the blade; panicles 5–10 cm. long, loosely glomerate; pistillate perianth with short ascending hairs; stigma rather short; achenes about 1 mm. long.—Sept. Cultivated and occasionally naturalized in Honshu, Shikoku, Kyushu.—Malaysia, China, and Indochina.

Var. *concolor* Wedd. *B. utilis* Bl.—RAMII. Parts larger; leaves broadly cuneate at base, the petioles usually longer than the blade; frequently cultivated in our area for fiber.—s. China, Philippines, and Malaysia.

2. *Boehmeria niponovirens* Koidz. *B. frutescens* sensu auct. Japon., non Thunb.—KARA-MUSHI. Resembles No. 1 but more slender, the stems and petioles short-hirsute; leaves broadly ovate, membranous, caudately acuminate, rounded or sometimes broadly cuneate at base, the petioles shorter than the blade; inflorescence shorter; stigma short.—Aug.–Sept. Honshu, Shikoku, Kyushu.—China and Formosa.

Var. *concolor* (Makino) Ohwi. *B. nivea* var. *concolor* Makino—AO-KARA-MUSHI. Leaves scarcely white-woolly beneath.—Occurs with the typical phase.

3. *Boehmeria spicata* (Thunb.) Thunb. *Urtica spicata* Thunb.; *U. japonica* L. f.; *B. japonica* Miq., quoad syn.—KO-AGA-SO. Subshrub with branched woody base; stems 50–100 cm. long, erect, the branches rather slender; leaves membranous, rhomboid-ovate, 4–8 cm. long, 2.5–4 cm. wide, caudate at apex, coarsely toothed, cuneate to broadly cuneate at base, slightly pilose on both sides especially on the nerves beneath, the petioles usually reddish; glomerules of staminate flowers loosely arranged, small, the pistillate perianth minutely puberulous; achenes about 1 mm. long; stigma slender, rather elongate.—Aug.–Oct. Mountains; Honshu, Shikoku, Kyushu; common.—China.

Boehmeria minor Satake. KO-YABU-MAO. Intermediate between *B. spicata* and *B. biloba*, differing from the former in the relatively larger parts, with leaves slightly bullate and rugulose above and prominently short-pilose beneath, especially on the nerves.

4. *Boehmeria tricuspidata* (Hance) Makino. *B. platyphylla* var. *tricuspidata* Hance; *B. japonica* var. *tricuspidata* (Hance) Maxim.—AKA-SO. Erect perennial herb about 50–80 cm. high; stems simple, usually reddish, nearly glabrous or sparingly short-pilose; leaves thin, ovate-obicular, 8–20 cm. long, 5–15 cm. wide, coarsely toothed, broadly cuneate to truncate at base, usually deeply incised at apex, long caudate between the incision, slightly short pilose above and on the nerves beneath; achenes about 1.5 mm. long, enclosed in the minutely puberulent perianth; stigma rather short.—July–Sept. Hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—China.

Var. *unispicatus* Makino. *B. paraspicata* Nakai—KUSA-KO-AGA-SO, MARUBA-KO-AGA-SO. Leaves scarcely incised and not caudate.—Hokkaido, Honshu, Shikoku.

5. *Boehmeria formosana* Hayata. TAIWAN-TORI-ASHI. Stems erect, often branched below, somewhat woody at base, sparingly short appressed-pilose; leaves rather membranous, ovate-oblong, 8–12 cm. long, 3–6 cm. wide, short-acuminate, cuneate to broadly cuneate at base, toothed, nearly glabrous above, sparingly short pilose on nerves beneath, the petioles 1–5 cm. long; glomerules of pistillate flowers small, forming a slender uninterrupted spike in fruit, the perianth slightly appressed-pilose; achenes about 1.5 mm. long; stigma short.—

Kyushu (Yakushima).—Ryukyus, Formosa, and China.

6. *Boehmeria sieboldiana* Bl. *B. platyphylla* var. *sieboldiana* (Bl.) Wedd.—NAGABA-YABU-MAO. Erect perennial herb; stems 1–2 m. long, scattered short-pilose above; leaves rather thin, oblong-ovate to ovate, 10–20 cm. long, 4–10 cm. wide, caudately acuminate at apex, broadly cuneate to rounded at base, regularly toothed, slightly pilose to nearly glabrous on both sides, the petioles rather slender; glomerules of pistillate flowers rather contiguous, the perianth slightly appressed-pilose on upper half; achenes 2–2.5 mm. long; stigma slender, rather elongate.—Aug.–Oct. Hills and lowlands; Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu. Poorly known are:

Boehmeria egregia Satake. SHIMA-NAGABA-YABU-MAO. Closely allied to *B. sieboldiana* but with larger parts, rather short stigmas and usually 3 stamens.—Honshu (Izu Is. and Awa Prov.).

Boehmeria pseudosieboldiana Honda. INU-YABU-MAO. With thicker leaves slightly obtuse at base.—Kyushu. Similar to but may not be conspecific with *B. sieboldiana*.

7. *Boehmeria biloba* Wedd. *B. bifida* Bl.; *Splitgerbera japonica* Miq.; *B. splitgerbera* (Miq.) Koidz.—RASEITA-SO. Coarse perennial herb; stems 30–70 cm. long, rather stout, scabrous, brownish red; leaves thick, broadly ovate, obovate-obicular or ovate-obicular, 6–15 cm. long, 4–10 cm. wide, short-acuminate, acute to cuneate at base, often shallowly 2- to 3-lobed toward the apex, rather minutely toothed, often unequal, prominently bullate and scabrous above, impressed and short-pilose on nerves and veinlets beneath; glomerules of pistillate flowers contiguous, forming a rather short thick spike in fruit, the perianth with short ascending hairs; achenes narrowly cuneate, about 1.5 mm. long.—Aug.–Oct. Waste ground and rocky cliffs near seashores; Hokkaido (s. distr.), Honshu. Poorly known are:

Boehmeria arenicola Satake. HAMA-YABU-MAO; *B. kiyozumensis* Satake. KIYOSUMI-YABU-MAO; and *B. tenuifolia* Satake. USUBA-RASEITA-SO. Reported from the seashore area of Kantō District, Honshu; all are intermediate between *B. biloba* and *B. longispica*.

8. *Boehmeria kiusiana* Satake. TSUKUSHI-YABU-MAO. Resembles *B. sieboldiana*, but with leaves very hairy beneath and the perianth of the pistillate flowers hairy; intermediate between *B. biloba* and *B. longispica*.—Aug.–Sept. Honshu (Nagato Prov.), Kyushu (Chikuzen Prov.).

9. *Boehmeria pannosa* Nakai & Satake. SAIKAI-YABU-MAO. Large, stout perennial herb; stems robust, densely short-pubescent above; leaves broadly ovate to rounded-cordate, 10–20 cm. long and as wide, short-acuminate, rounded to shallowly cordate at base, rather regularly toothed, with short coarse hairs above, densely short-pubescent beneath; glomerules of pistillate flowers in fruit loosely arranged in axillary spikes, the perianth rather densely short-hairy above.—Aug. Honshu (Nagato Prov.), Kyushu.

Boehmeria gigantea Satake. NIŌ-YABU-MAO. Large poorly understood plant with coarsely toothed leaves; perhaps closely allied to *B. pannosa*.—Honshu (Suwo Prov.).

10. *Boehmeria holosericea* Bl. *B. platyphylla* var. *holosericea* (Bl.) Wedd.—ONI-YABU-MAO. Large stout perennial; stems 1–1.5 m. long, rather densely short-pubescent; leaves rather thick, ovate-obicular, 10–15 cm. long and as wide, obtuse to shallowly truncate-cordate at base, hairy above, densely short-pubescent beneath, the upper ones with coarse acute double teeth; pistillate glomerules rather thick in fruit,

forming a contiguous elongate spike; achenes about 1.5 mm. long, the enveloping perianth pilosulous.—Aug.-Sept. Honshu, Shikoku, Kyushu.—China and Indochina.

Var. *izuosimensis* (Satake) Satake & Mizushima. *B. izu-simensis* Satake.—OSHIMA-YABU-MAO. Leaves as long as or shorter than wide, shallowly cordate to truncate at base.—Izu Is. (Oshima Is.).

11. *Boehmeria longispica* Steud. *B. grandifolia* Wedd.; *B. miqueliana* T. Tanaka—YABU-MAO. Large perennial herb with erect, rather densely short-pubescent stems 80–100 cm. long; leaves rather thick, ovate-orbicular, acuminate, rounded at base, with coarse double teeth in the upper ones, scabrous above, prominently short-pilose beneath; glomerules on elongate axillary spikes, rather contiguous; achenes about 2 mm. long, the enveloping perianth pilose.—Aug.-Oct. Hokkaido, Honshu, Shikoku, Kyushu; common.

Boehmeria robusta Satake. MARUBA-YABU-MAO. Resembles the preceding but with thinner leaves. Poorly known.—Honshu (s. Kantō Distr.).

12. *Boehmeria platanifolia* Fr. & Sav. *B. japonica* var. *platanifolia* Maxim.; *B. maximowiczii* Nakai & Satake—ME-YABU-MAO. Stems erect, simple, to 1 m. long, short-hairy above; leaves membranous, orbicular to depressed ovate-orbicular, often incised and long-caudate at apex, rounded to truncate at base, with unequal coarse teeth below and larger often double teeth on the upper margin, pilose on both sides, especially above and on nerves beneath; pistillate glomerules small, rather loosely arranged on slender axillary spikes; achenes about 1.5 mm. long, the enveloping perianth pilose.—Aug.-Oct. Lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.

8. VILLEBRUNEA Gaudich. HADO-NO-KI ZOKU

Diocious trees or shrubs; leaves alternate, long-petiolate, entire or undulately toothed, penninerved or 3-nerved, the stipules usually connate on the petioles; inflorescence mostly cymose, the glomerules small; staminate flowers 4-merous, the stamens opposite the perianth-segments; pistillate perianth connate, tubular, wholly adnate to the ovary, toothed on margin; stigma discoid or peltate, hairy on margin; achenes wholly enclosed in the fleshy perianth; seeds erect.—About 10 species, in India, Malaysia, and E. Asia.

- 1A. Branchlets and petioles with long and short hairs; leaves membranous, white-woolly beneath at least while young, pistillate and staminate glomerules sessile; bracteoles subacute. 1. *V. frutescens*
 1B. Branchlets and petioles with short appressed hairs; leaves relatively firm, dark green, without woolly hairs; pistillate glomerules pedunculate, the staminate sessile; bracteoles rather rounded at apex. 2. *V. pedunculata*

1. *Villebrunea frutescens* (Thunb.) Bl. *Urtica frutescens* Thunb.; *Oreocnide frutescens* (Thunb.) Miq.; *Nirwamia pellucida* Raf.; *Boehmeria fruticosa* Gaudich.; *Morocarpus microcephalus* Benth.; *V. fruticosa* (Gaudich.) Nakai; *V. microcephala* (Benth.) Nakai; *Pellionia pellucida* (Raf.) Merr.—IWAGANE. Erect deciduous shrub with slender elongate branches; leaves oblong, sometimes ovate or elliptic, 6–12 cm. long, 2.5–5 cm. wide, acutely caudate-acuminate, cuneate with an obtuse end or rounded at base, dentate-serrate, coarsely hirsute above and on nerves beneath, the petioles elongate, slender, the stipules free, deciduous; fruit ovoid, about 1.5 mm. long.—Mar.-May. Kyushu.—China.

2. *Villebrunea pedunculata* Shirai. *Oreocnide pedunculata* (Shirai) Masam.—HADO-NO-KI. Dark green shrub closely resembling the preceding; leaves somewhat thicker, 5–10 cm. long, 2–4 cm. wide, obtuse to rounded at base, glabrous on both sides or sparsely appressed-pilose above and short appressed-puberulent on both sides, obtusely toothed, the petioles 1–3 cm. long; staminate glomerules sessile, axillary, the peduncles of the pistillate ones 3–5 mm. long; fruit about 1.5 mm. long.—Feb.-Apr. Honshu (Aogashima in Izu Is. and Kii Prov.), Shikoku, Kyushu.—Ryukyus and Formosa.

9. DEBREGEASIA Gaudich. YANAGI-ICHIGO ZOKU

Monocious or dioecious shrubs; leaves alternate, petiolate, obtusely toothed, 3-nerved, often white-woolly beneath, the stipules connate above the petioles, bifid; glomerules globose, axillary, sessile or pedunculate, the inflorescence sometimes compound and cymose; staminate flowers 4(3–5)-merous; pistillate perianth connate, ovoid to obovoid, toothed at apex, becoming juicy in fruit; ovary erect, enclosed in the perianth; stigma capitate; achenes enclosed in the perianth.—Ethiopia to India, Malaysia, and E. Asia.

1. *Debregeasia edulis* (Sieb. & Zucc.) Wedd. *Morocarpus edulis* Sieb. & Zucc.; *Morocarpus japonicus* Miq.; *D. japonica* (Miq.) Koidz.—YANAGI-ICHIGO. Deciduous shrub with elongate branches, the branchlets with short appressed hairs; leaves lanceolate to linear-oblong, 7–15 cm. long, 12–25 mm. wide, acuminate, obtuse at base, subtrinnerved, dark green and slightly lustrous above, with appressed minute teeth on

margin, appressed-puberulent on the nerves above, densely white-woolly beneath, the petioles 1–3 cm. long; glomerules 1–3, axillary, globose, short-pedunculate, rather many-flowered; fruit orange-yellow, about 1 mm. long.—Mar.-May. Honshu (s. Kantō Distr. through Tōkaidō to s. Kinki Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

10. PARIETARIA L. HIKAGE-MIZU ZOKU

Slender often delicate annuals or perennials; leaves alternate, petiolate, small, trinerved, without stipules; flowers in small cymes, sometimes in axillary glomerules, the outer bracts sometimes connate below the glomerules; perianth of bisexual and staminate flowers (3-) 4-parted, in pistillate flowers connate into a tube; ovary free from the perianth; stigma linear, curved, bearded; achenes small, inclosed in the persistent perianth.—Seven or eight species in temperate regions.

1. *Parietaria debilis* Forst. var. *micrantha* (Ledeb.) Wedd. *P. micrantha* Ledeb.—HIKAGE-MIZU. Delicate soft-pubescent annual 10–15 cm. high; leaves alternate, long-petioled, ovate to broadly so, 8–25 mm. long, 5–15 mm. wide, obtuse, deep green; flowers few, axillary, the bracts linear;

achenes broadly ovate, black, lustrous, about 1.5 mm. long.—Aug.–Oct. Honshu, Kyushu; rather rare.—Siberia, N. China, and Korea. The typical phase occurs in warmer areas from Asia to Australia, Africa, and S. America.

11. POUZOLZIA Gaudich. ÔBA-HIME-MAO ZOKU

Glabrescent or hirsute monoecious shrubs or herbs; leaves opposite or alternate, equilateral, usually entire, 3-nerved, the lateral nerves not reaching to the tip of the blade, the cystoliths punctiform, the stipules axillary, free, persistent; flowers in axillary glomerules or in terminal spikes, the bracts small, scarious; staminate perianth 3- to 5-parted, the segments ovate, convex on back; stamens 3-5; pistillate perianth tubular, often ovoid, nerved, sessile, contracted and 2- to 4-toothed at apex; stigma filiform, deciduous, villous; achenes black or ivory, enclosed in the sometimes persistent costate perianth, shining, smooth.—More than 20 species in the Tropics, abundant in Asia.

1. *Pouzolzia zeylanica* (L.) J. Benn. *Parietaria zeylanica* L.; *Parietaria indica* L.; *Parietaria alienata* L.; *Parietaria cochinchinensis* Lour.; *Pouzolzia indica* (L.) Gaudich.; *Pouzolzia microphylla* Wight; *Pouzolzia indica* var. *alienata* (L.) Wedd.; *P. indica* var. *alienata* subvar. *microphylla* (Wight) Wedd.—ÔBA-HIME-MAO, TSURU-MAO-MODOKI, ARIE-HIME-MAO. Ascending much-branched subshrub with elongate, slender, terete, pilose branches; leaves membranous, ovate to narrowly so, or sometimes broadly lanceolate in the upper ones, 2.5–4 cm. long, 5–20 mm. wide, acute to subobtusely, rounded to subcuneate at base, opposite or alternate, entire, weakly 3-

nerved with the lateral nerves reaching 2/3–3/4 the entire length, the cystoliths white-punctiform, callose, the petioles 3–15 mm. long, the stipules deltoid, hyaline; flowers few, in axillary glomerules, nearly sessile; staminate perianth-segments 4, ovate, coarsely pilose; pistillate perianth ovoid in fruit, about 1.2 mm. long, several-ribbed, coarsely pilose; achenes ovoid, scarcely compressed, shining, smooth, black, 1 mm. long, acute at apex; stigma brown, about 1 mm. long, densely pilose, deciduous.—Aug.–Oct. Honshu (Aogashima in Izu Isls.), Kyushu (Yakushima).—Ryukyus, Formosa, China to Malaysia, and India.

12. GONOSTEGIA Turcz. TSURU-MAO ZOKU

Glabrescent to pubescent, monoecious, rarely dioecious, perennial herbs or subshrubs; leaves opposite or ternate, often alternate in the upper ones, usually equilateral, entire, 3-nerved, the lateral nerves reaching nearly to apex, the cystoliths punctiform, the stipules axillary, free or connate (interpetiolar); flowers with a scarious bract at base, in axillary glomerules or in spikes; staminate perianth 3- to 5-lobed, the segments ovate, short-acuminate, with a transverse fold on the upper half or inflexed, the stamens as many as the segments; pistillate perianth tubular, often ovoid, enclosing the achene in fruit, toothed at the mouth; stigma filiform, hairy; achenes small, lustrous.—About 15 species in India, Malaysia, and S. Asia.

1. *Gonostegia hirta* (Bl.) Miq. *Urtica hirta* Bl.; *Pouzolzia hirta* (Bl.) Hassk.; *Memorialis hirta* (Bl.) Miq.—TSURU-MAO. Perennial suffrutescent herb with much-elongated procumbent or declined branches 30–50 cm. long, short-pubescent above; leaves membranous, ovate to lanceolate, 3–7 cm. long, 1.5–3 cm. wide, acute to acuminate, rounded to shallowly cordate at base, 3- to 5-nerved, entire, with appressed

hairs on both sides or nearly glabrous, the petioles 1–3 mm. long; staminate flowers short-pedicellate, pilose; fruit ovoid, about 1 mm. long, the enveloping perianth with short white hairs especially above; stigma pilose.—Sept.–Oct. Honshu (Kii Prov. and Chûgoku Distr.), Kyushu.—China, Ryukyus, Formosa, Malaysia, and India.

Fam. 70. PODOSTEMACEAE KAWAGOKE-SÔ KA Riverweed Family

Submersed herbs attached to rocks in running water, often by frondlike or mosslike, flat, often pinnately divided photosynthetic roots; stems simple or scarcely developed, or sometimes much elongate and branched; flowers bisexual or unisexual, solitary or cymose, actinomorphic, often enclosed in a spathe when young; perianth membranous, lobed or absent; stamens 1–4, free or the filaments connate, the anthers 2-locular, longitudinally split; ovary superior, usually 2-locular, with a central placenta; styles 2–3, short or slender; ovules many; fruit a septical capsule; seeds minute, without endosperm.—About 43 genera, with about 140 species, mostly in the Tropics.

- 1A. Frondlike body rounded, obsoletely and irregularly lobulate; leaves unlobed; stamens 2, the filaments connate; capsules ribbed, 2-valved, the valves equal. 1. *Hydrobryum*
 1B. Frondlike body pinnately branching; leaves palmately lobed; stamens 1; capsules dehiscing with 2 unequal valves, the smaller valve deciduous. 2. *Cladopus*

1. HYDROBRYUM Endl. KAWAGOROMO ZOKU

Submersed herbs, the frondlike body flat, rounded, irregularly shallowly lobulate, green; flowers borne on the frond, solitary on a very short simple scape covered with scalelike or filiform green leaves, the spathe entirely enveloping the flower in bud, splitting on one side in anthesis, the perianth-segments 2, subulate, adnate at base of the filament; stamens 2, the filaments connate below; ovary 2-locular, ovoid; stigmas 2, ovate, linear or cuneate, entire or lobed; capsules ovoid, 2-valved, ribbed, many-seeded.—About 10 species in India and S. Asia.

- 1A. Frond thin, 0.1–0.3 mm. thick; subulate leaves 2–8 mm. long.
 2A. Frond 0.1–0.15 mm. thick; subulate leaves 5–8 mm. long; stigma broadly subulate, 0.3–0.5 mm. long. 1. *H. floribundum*
 2B. Frond 0.2–0.3 mm. thick; subulate leaves 2–4 mm. long; stigma cylindric, 0.4–0.5 mm. long. 2. *H. puncticulatum*
 1B. Frond about 0.5 mm. thick; subulate leaves 8–12 mm. long; stigma elongate-linear, 1.5–2 mm. long. 3. *H. japonicum*

1. **Hydrobryum floribundum** Koidz. *H. griffithii* var. *floribundum* (Koidz.) Koidz.; *Hydroaonia floribunda* (Koidz.) Koidz.—USU-KAWAGOROMO. Frond flat, fixed by means of rootlets on rocks in running water, irregularly orbicular and shallowly lobulate, green, rarely to 30 cm. across; fascicles of leaves scattered on the upper surface of the frond, the subulate leaves 5–8 mm. long, in groups of 3–6 together, deciduous from the frond before anthesis (in autumn), their minute bases becoming accrescent, the scapes clothed with elliptic navicular bracts; flowers solitary, erect, on a very short scape, completely covered with a narrowly ovate spathe when young, soon splitting down one side; stamens 2, the filaments connate below, often to above the middle, the staminodes or perianth segments 2, subulate, as long as the ovary; stigmas 2, broadly subulate; capsules oblong-ellipsoidal, longitudinally 11- to 19-ribbed.—Nov.–Dec. Kyushu (s. distr.).

2. **Hydrobryum puncticulatum** Koidz. *Hydroaonia*

puncticulata (Koidz.) Koidz.—YAKUSHIMA-KAWAGOROMO. Closely resembles the preceding but the frond fleshy, green, irregularly orbicular, rarely more than 10 cm. across, 0.2–0.3 mm. thick; subulate leaves 2–4 mm. long, in scattered fascicles of 2's to 5's; flowers smaller and fewer on a frond than in the preceding, the spathe smaller; stamens 2, the filaments variously connate; stigma cylindric to long-subulate, 0.4–0.5 mm. long, rarely to 0.8 mm. long; capsules 6- to 12-ribbed.—Dec. Kyushu (Yakushima).

3. **Hydrobryum japonicum** Imamura. *H. griffithii* var. *japonicum* (Imamura) Koidz.; *Hydroaonia japonica* (Imamura) Koidz.—KAWAGOROMO. The fronds nearly orbicular, lobulate, about 0.5 mm. thick, deep green; subulate leaves 8–12 mm. long, the bracts larger and the scapes longer; stigma 1.5–2 mm. long, long-subulate or linear; capsules dark brown, 11- to 22-ribbed, the valves 2, more or less unequal, the smaller valve often deciduous.—Nov.–Dec. Kyushu (s. distr.).

2. CLADOPUS Moeller KAWAGOKE-SŌ ZOKU

Submersed perennial herbs on rocks in running water attached by rootlets, with flat green pinnately parted frondlike bodies bearing fascicles of small, palmately-lobed leaves and very short scapes on the upper side near the frond-sinus; flowers solitary and terminal on the scape, short-pedicelled, entirely enveloped while young by an ovoid spathe, splitting at the time of anthesis; stamen 1, attached to the ovary laterally, with a subulate segment on each side near base; ovary ovoid, oblique, 2-locular, the placenta central, many-ovuled; stigmas 2, spatulate or subulate; capsules globose, 2-valved, the valves unequal, the smaller one deciduous.—Few species in Malaysia, China, and Japan.

- 1A. Fronds profusely parted; autumnal leaves of nearly equal size.
 2A. Leaves deciduous. 1. *C. japonicus*
 2B. Leaves evergreen; fronds very densely pinnatisect, the segments relatively thick, short, obtuse. 2. *C. austrosatsumensis*
 1B. Fronds loosely pinnatiparted; upper autumnal leaves larger than the lower. 3. *C. doianus*

1. **Cladopus japonicus** Imamura. *Hemidistichophyllum japonicum* (Imamura) Koidz.; *Lawiella kiusiana* Koidz.—KAWAGOKE-SŌ. Fronds flat, deciduous, tightly adhering by dense rootlets on rocks in running water, regularly and alternately pinnately parted, deep green, the segments 2–4 mm. wide, 0.2–0.4 mm. thick, thinner toward the margin; fascicles of leaves on the upper side near the sinuses of the fronds; summer leaves 3–15, usually 7–8 in a fascicle, subulate or linear, 4–8 mm. long, about 0.3 mm. wide, 0.1 mm. thick, obtuse, usually deciduous before anthesis; autumnal leaves much shorter and developing in the place of the summer ones, 6–12, 2-seriate, depressed-orbicular, bifid and palmately lobed, densely arranged on the scape and concealing it; scapes very short, erect, 2–3 mm. long; flowers enclosed in a spathe while young, erect, solitary, the spathe about 1.5 mm. long, pinkish at tip; stamen 1, the filament subulate, subtended by a subulate segment (staminode or perianth-segment) on each side; stigmas 2, shortly connate below, usually obovate-spatulate; capsules globose, 1.5 mm. long, the stipe 4–5 mm. long.—Oct.–Dec. Kyushu (s. distr.).

2. **Cladopus austrosatsumensis** (Koidz.) Ohwi. *Lawi-*

ella austrosatsumensis Koidz.—TOKIWA-PODOSUTEMON. Fronds evergreen, very densely pinnatisect, the segments 3–6 mm. wide, 0.4–0.6 mm. thick; summer leaves persistent over winter; autumnal leaves larger, stouter.—Kyushu (s. distr.).

3. **Cladopus doianus** (Koidz.) Koriba. *Lawiella doiana* Koidz.; *Hemidistichophyllum doianum* (Koidz.) Koidz.—TSUKUSHI-PODOSUTEMON. Fronds evergreen, loosely pinnatiparted, the segments about 0.5 mm. thick, 1–2 mm. broad; summer leaves densely fasciated on upper surface near the base of the leaf sinus, 3–7 mm. long, about 0.3 mm. wide, subulate, acute to obtuse, sessile; autumnal leaves rhombic-orbicular or obovate-orbicular, sessile, bifid, 4- to 8-lobulate, larger than the foregoing species, the scape longer, to 10 mm. long; flowers solitary, subtended by an ovoid-elliptic, often reddish spathe, longitudinally split, the pedicel erect; stamen 1, often bifid, the filament with a minute subulate segment (staminode or perianth-segment) on each side at base; capsules globose to ellipsoidal, about 1.5 mm. long, unequally 2-valved, the smaller valve deciduous, the stipe about 3 mm. long.—Kyushu (s. distr.).

Fam. 71. PROTEACEAE YAMA-MOGASHI KA Protea Family

Trees or shrubs, rarely herbs; leaves usually alternate, coriaceous, entire or pinnatiparted, exstipulate; flowers bisexual, the perianth uniseriate, regular or irregular, tubular, segments 4, hypogynous, gibbous, free, recurved above; stamens 4, adnate to the perianth-segments, the glands or scales 4, sometimes connate, alternate with the stamens or sometimes absent; ovary 1-locular, usually 1- to many-ovuled; fruit a drupe, follicle, samara, or achene; seeds without endosperm.—About 55 genera, with about 1,200 species, mostly in the drier regions of the S. Hemisphere.

1. *HELICIA* Lour. YAMA-MOGASHI ZOKU

Trees or shrubs; leaves alternate, entire, sometimes toothed; flowers in terminal or axillary racemes, bisexual, the perianth-segments 4, regular, each with a narrow contiguous claw that forms a narrow tube, the limb narrow, reflexed; anthers oblong, the connective extended at tip; ovary superior, sessile; style slender, elongate, the stigma terminal; ovules 2; nut ellipsoidal.—About 30 species, in tropical Asia and Australia.

1. *Helicia cochinchinensis* Lour. *H. lancifolia* Sieb. & Zucc.—YAMA-MOGASHI. Small evergreen tree with purple-brown branches and green glabrous branchlets; leaves coriaceous, oblanceolate to oblong, alternate, 5–12 cm. long, 1.5–5 cm. wide, abruptly acuminate, narrowed below, entire or with coarse teeth toward the tip, glabrous, the petioles 6–10 mm. long; inflorescence racemose, axillary, about 10 cm. long, short-peduncled, glabrous, densely many-flowered, the flowers in

pairs, short-pedicelled, the perianth slender-tubular, 12–14 mm. long just before anthesis, slightly thickened above, the segments 4, white, linear, revolute in anthesis; stamens inserted on the upper part of the perianth-segments, the anthers broadly linear, 2–2.5 mm. long; fruit berrylike, ellipsoidal, purple-black, 10–12 mm. long.—Aug.–Oct. Warmer parts; Honshu (Tōkaidō and s. Kinki to Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, China and Indochina.

Fam. 72. OLACACEAE BOROBORO-NO-KI KA Olax Family

Trees, shrubs or rarely vines; leaves alternate, rarely opposite, usually entire, exstipulate; inflorescence a few-flowered usually axillary cyme or spike, the flowers relatively small, greenish, yellowish or white, rarely purplish, actinomorphic, bisexual or unisexual; sepals small, 4–6; corolla 3–6, free or connate into a tube; stamens equal in number or 2 to 3 times the number of corolla lobes; ovary imperfectly 2- to 3-locular or 1-locular, the ovules few, pendulous, placentation axile; fruit drupe-like, 1-locular, 1-seeded, the seeds with copious endosperm.—About 40 genera, with about 230 species, mainly in the Tropics.

1. *SCHOEPIA* Schreb. BOROBORO-NO-KI ZOKU

Shrubs or trees, glabrous, often blackened when dried; leaves entire, coriaceous; flowers yellow or white, in short axillary spikes or racemes; calyx adnate to the ovary, accrescent in fruit, the lobes small; petals 4, sometimes to 6, connate into a tube; stamens as many as and opposite the corolla-lobes, inserted on the tube; ovary 3-locular, inferior; stigma 3-lobed; ovules 3, pendulous; drupe berrylike.—More than 10 species, in the Tropics of Asia and America.

1. *Schoepfia jasminodora* Sieb. & Zucc. *Schoepfiopsis jasminodora* (Sieb. & Zucc.) Miers—BOROBORO-NO-KI. Small deciduous tree, glabrous, the branches yellowish gray, the slender branchlets deciduous with the leaves; leaves rather coriaceous, ovate or broadly deltoid-ovate, 4–6 cm. long, 2–4 cm. wide, caudately acuminate, rounded and petiolate at base,

entire, the petioles rather broad, 4–7 mm. long; spikes loosely 3- to 4-flowered, peduncled, the flowers sessile, yellow, the perianth-tube 6–7 mm. long, tubular, the lobes ovate, slightly recurved above, about 3 mm. long; ovary about 2 mm. long, inferior; drupe ellipsoidal, about 8 mm. long.—Apr. Kyushu.—Ryukyus.

Fam. 73. SANTALACEAE BYAKU-DAN KA Sandalwood Family

Trees, shrubs, or herbs; sometimes parasitic; leaves alternate or opposite, sometimes reduced to scales, the stipules absent; flowers small, green, usually with bracts and bracteoles, actinomorphic, bisexual or unisexual, the perianth 3- to 8-toothed or -divided; stamens 3–6, adnate to and opposite the perianth-lobes or teeth; ovary 1-locular, inferior, rarely superior; style usually short, the stigma entire or 3- to 6-lobed; ovules 2–3, on central placenta; fruit a nut or drupe; seeds subglobose, with copious endosperm.—About 30 genera, with about 400 species, mostly tropical, a few in temperate regions.

- 1A. Herbs; leaves alternate; flowers bisexual; bracts solitary, free from the ovary. 1. *Thesium*
1B. Shrubs; leaves usually opposite; flowers unisexual; bracts 4, adnate to the ovary. 2. *Buckleya*

1. *THESIUM* L. KANABIKI-SŌ ZOKU

Green semiparasitic herbs; leaves alternate, linear, sometimes scalelike; inflorescence a spike, raceme, or compound cyme, the flowers sometimes solitary in axils, the bracts usually leaflike, subtending the flower or on the pedicel, the bracteoles 2, sometimes absent; flowers bisexual, small, the perianth-tube adnate below to the ovary, tubular to campanulate, (4-) 5-lobed above; stamens 4–5, inserted at the base of the perianth lobes; ovary inferior, 2- to 3-ovuled; fruit nutlike, small, enclosed in the perianth; seeds solitary.—About 200 species, abundant in Africa and the Mediterranean region, few in Asia and S. America.

- 1A. Pedicels ascending, very short, to 4 mm. long; fruit with raised reticulate veinlets. 1. *T. chinense*
1B. Pedicels spreading, curved, 3–15 mm. long; fruit nearly smooth except for the longitudinal nerves. 2. *T. refractum*

1. *Thesium chinense* Turcz. *T. decurrens* Bl.—KANABIKI-SŌ. Slightly glaucescent glabrous perennial herb; stems few or solitary, erect, 10–25 cm. long, sometimes branched, obtusely angled to terete; leaves rather thick, linear, 2–4 cm. long, 1–3 mm. wide, acute, entire; flowers small, green, soli-

tary on short pedicels, the bract solitary, rather small, similar to the leaves, the bracteoles 2, linear, 2–6 mm. long, the perianth 2.5–3 mm. long, tubular; fruit ellipsoidal-globose, 2–2.3 mm. long, green, with raised reticulations, crowned with the persistent perianth-lobes.—Apr.–June. Meadows in low-

lands and mountains; Honshu, Shikoku, Kyushu; common. —Korea, China, and Ryukyus.

2. *Thesium refractum* C. A. Mey. *T. longifolium* sensu auct. Japon., non Turcz.; *T. repens* sensu auct. Japon., non Ledeb. —KAMA-YARI-SŌ. Resembles the preceding but

larger; flowers on relatively long pedicels, the bracteoles shorter, the perianth 4–5 mm. long; fruit nearly smooth, longitudinally nerved.—June–July. Hokkaido.—c. Siberia, Manchuria, and Korea.

2. BUCKLEYA Torr. TSUKUBANE ZOKU

Diocious semiparasitic deciduous shrubs; leaves opposite, short-petioled, entire; staminate flowers small, 4-merous, in small terminal, axillary umbels, with a disc at base of the perianth, the bracts absent, the stamens inserted at the base of the perianth-segment; pistillate flower solitary and terminal, short-pedicelled, the bracts 4, spreading, leaflike, adnate below to the ovary, the perianth-tube adnate to ovary; staminodes absent; ovary inferior; style short; fruit ovoid or ellipsoidal, with 4 large persistent apical bracts.—Two or three species, in N. America and Japan.

1. *Buckleya lanceolata* (Sieb. & Zucc.) Miq. *Quadriala lanceolata* Sieb. & Zucc.; *Calycopteris joan* Sieb., nom. seminud.; *B. joan* (Sieb.) Makino.—TSUKUBANE. More or less short-pubescent shrub; leaves ovate, caudately acuminate, 4–8 cm.

long, 1.5–3 cm. wide; flowers pale green; fruit 7–10 mm. long, the apical bracts oblanceolate, spreading, 2.5–3 cm. long.—June. Woods at low elevations in mountains; Honshu (Kinki Distr. and eastw.).

Fam. 74. LORANTHACEAE YADORIGI KA Mistletoe Family

Shrubs parasitic on shrubs and tree branches; leaves usually opposite, entire, sometimes minute and scalelike, without stipules; flowers bisexual or unisexual, spicate or cymose (sometimes fascicled in axils), usually bracteate and bracteolate, the calyculus (a modified calyx) inserted at base of the ovary, truncate on margin, or absent, the perianth of 1 or 2 whorls with 4–8 free or connate lobes valvate in bud; stamens as many as and opposite the perianth lobes; ovary inferior, 1-locular, 1-ovuled; stigma simple; ovules erect and adnate to the wall of the ovary; fruit a 1-seeded juicy, viscid berry, the seeds adnate to the pericarp, the endosperm fleshy, the embryo straight.—About 30 genera, with about 1,500 species, mainly in the Tropics, a few in temperate regions.

1A. Flowers bisexual.

2A. Sepals free; flowers small, in spikes.

2B. Sepals connate below to a tube; flowers rather large, in cymes.

1B. Flowers unisexual, small.

3A. Leaves prominent; sepals deciduous.

3B. Leaves scalelike; sepals persistent.

1. *Hyphear*

2. *Taxillus*

3. *Viscum*

4. *Korthalsella*

1. HYPHEAR Danser HOZAKI-YADORIGI ZOKU

Parasitic shrubs with dichotomously branched stems and branches; leaves opposite, deciduous; flowers spicate, small, bisexual; sepals 4–6, free, 2-seriate, as many as the stamens; ovary inferior, the calyculus small; style short; fruit a berry.—Few in Eurasia.

1. *Hyphear tanakae* (Fr. & Sav.) Hosokawa. *Loranthus tanakae* Fr. & Sav.—HOZAKI-YADORIGI. Green glabrous shrubs with dichotomously forked dark-brown glabrous branches parasitic on deciduous trees; leaves nearly opposite, cuneate-lanceolate to oblong, 2–3.5 cm. long, 1–1.5 cm. wide, rounded at apex, narrowed at base, slightly nerved on both

sides, glabrous, entire, the petiole 1–4 mm. long; spikes terminal on short branchlets, 3–4 cm. long, loosely several- to rather many-flowered; flowers sessile, the calyculus about 1 mm. long, subcampanulate, the sepals small, 4–6; fruit ellipsoidal, 5–6 mm. long.—July. Mountains; Honshu (centr. and n. distr.); rare.—s. Korea.

2. TAXILLUS Van Tiegh. MATSU-GUMI ZOKU

Parasitic shrub often with stellate hairs; leaves subopposite; flowers in short axillary cymes, sometimes fasciculate, pedicelled, bracteate at base; sepals 4–5, reflexed above, connate below and often deeply split on the lower side; anthers 4-locular; fruit ovoid to ellipsoidal, coriaceous.—More than 60 species; abundant in s. Asia and S. Africa.

1A. Leaves oblanceolate, 1.5–3 cm. long, 3–7 mm. wide, the midrib scarcely distinct; flowers glabrous, about 15 mm. long.

1B. Leaves broadly ovate, the midribs distinct; flowers pubescent, longer.

1. *T. kaempferi*

2. *T. yadorigi*

1. *Taxillus kaempferi* (DC.) Danser. *Viscum kaempferi* DC.; *Loranthus kaempferi* (DC.) Maxim.—MATSU-GUMI. Evergreen much branched shrub, the young branchlets dark brown-pubescent; leaves nearly opposite, thick, coriaceous, oblanceolate, 1.5–3 cm. long, 3–7 mm. wide, obtuse to rounded at apex, narrowed at base, nearly nerveless, dark brown pubes-

cent beneath while very young, glabrous above, the petiole about 1 mm. long; inflorescence cymose, umbelliform, 1- to 4-flowered, short-pedunculate, the pedicels nearly as long as the ovary; flowers about 15 mm. long, deep red, the perianth-tube slender, glabrous, the lobes 4, reflexed, about 4 mm. long, brown-yellow; fruit globose, red, about 5 mm. across.—Aug.

Parasitic on *Pinus* and *Abies* in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

2. *Taxillus yadoriki* (Sieb.) Danser. *Loranthus yadoriki* Sieb. ex Maxim.—ŌBA-YADORIGI. Much-branched evergreen parasitic shrub, the branches and underside of leaves densely rusty-brown tomentose; leaves subopposite, thick and fragile, broadly ovate, obtuse, rounded at base, entire, stellate-hairy above while young, densely and persistently so beneath, with a rather prominent midrib beneath, the petioles 7–12

mm. long; inflorescence 2- to 7-flowered, short-pedunculate, the pedicels as long as the peduncles and ovary, rusty-brown villous; perianth about 3 cm. long, tubular, densely red-brown stellate-pubescent outside, black-purplish, glabrous and lustrous inside, the lobes 4, reflexed, oblanceolate, 8–10 mm. long; stamens exserted; fruit subglobose, red-brown.—Sept.–Dec. Parasitic on broad-leaved evergreen trees; Honshu (Kantō Distr. westw.), Shikoku, Kyushu.—s. Korea and Ryukyu.

3. VISCUM L. YADORIGI ZOKU

Tufted, parasitic, evergreen, dioecious or monoecious shrubs, usually dichotomously branched; leaves opposite, rather fleshy, simple; flowers small, in terminal or axillary fascicles, the perianth deciduous, 3- to 4-lobed, short; stamens inserted on the perianth-lobes, the anthers many-locular, many-pored; ovary of pistillate flowers inferior, the style very short or nearly absent; fruit a berry.—About 15 species, in Europe, Asia, Africa, and Australia.

1. *Viscum album* L. var. *coloratum* (Komar.) Ohwi. *V. album* subsp. *coloratum* Komar.; *V. album* var. *lutescens* Makino; *V. coloratum* (Komar.) Nakai; ? *Viscum magnificum* Koidz.—YADORIGI. Tufted, glabrous, green, parasitic shrub, the branches 30–60 cm. long, dichotomously or trichotomously branched, terete, rather thick, jointed at nodes; leaves thick, dull, opposite, oblanceolate, 3–6 cm. long, 6–12 mm. wide, 3- to 5-nerved, rounded to obtuse, deep green on both sides, sessile; flowers terminal on the branchlets, sessile, small,

yellow, the bracteoles cup-shaped, the perianth campanulate, 4-lobed; stigma sessile; fruit globose, pale yellow, semitranslucent, about 6 mm. across, the perianth lobes and style persistent.—Feb.–Mar. Parasitic on deciduous trees; Hokkaido, Honshu, Shikoku, Kyushu; common.—China, Korea, and Manchuria. A variable widely distributed species from w. Europe to nw. Asia.—Forma *rubroaurantiacum* (Makino) Ohwi. *V. album* var. *rubroaurantiacum* Makino—AKA-MI-YADORIGI. A rare phase with orange-red fruit.

4. KORTHALSELLA Van Tiegh. HINOKI-BA-YADORIGI ZOKU

Monoecious evergreen parasitic shrubs or subshrubs; leaves opposite, reduced to minute scales; flowers axillary in the scalelike leaves, solitary or few, sessile, minute, the perianth deeply 3-parted, the anthers 2-locular, alternate and adnate to the perianth-lobes; ovary inferior; fruit a small berry.—Africa, s. Asia, and Australia.

1. *Korthalsella japonica* (Thunb.) Engl. *Viscum japonicum* Thunb.; *Viscum opuntia* Thunb., excl. syn.; *Bifaria japonica* (Thunb.) Van Tiegh.; *Pseudixis japonicus* (Thunb.) Hayata—HINOKI-BA-YADORIGI. Small parasitic subshrub 5–12 cm. high, on evergreen trees and shrubs, glabrous, the branches green, much branched, many-jointed, the internodes flattened; leaves minute, mucrolike; flowers minute, sessile,

less than 1 mm. across, few together at the joints, the perianth deeply 3-lobed; fruit small, about 2 mm. across, broadly ellipsoidal, orange-yellow; seeds solitary, dehiscing by sudden explosion.—Apr.–Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa, China, India, Malaysia, and Australia.

Fam. 75. ARISTOLOCHIACEAE UMA-NO-SUZU-KUSA KA Birthwort Family

Herbs, shrubs or vines; leaves alternate, entire or lobed, exstipulate; flowers bisexual, solitary, spicate, or racemose, sometimes in fascicles, actinomorphic or zygomorphic, the perianth tubular, campanulate, or slightly inflated above, the limb 3-lobed or dilated on one side, valvate in bud; stamens 6, 12, or 5, the anthers subsessile, free or adnate to the style, extrorse; ovary inferior (rarely semiinferior), 4- to 6-locular, the styles 4–6, sometimes united into a column; ovules numerous, anatropous, in 2 series on the inner angle of each locule; fruit capsular or berrylike, rarely indehiscent or septicidal; seeds flat or boat-shaped, with fleshy or horny endosperm and minute embryo.—About 5 genera, with about 500 species, mainly in the Tropics.

- 1A. Perianth (calyx) campanulate to urceolate, regularly 3-lobed, actinomorphic; stamens 12 (or 6); leaves radical; stems creeping or decumbent. 1. *Asarum*
 1B. Perianth (calyx) tubular, oblique on the throat; stamens 6; leaves cauline, alternate; usually twining climber. 2. *Aristolochia*

1. ASARUM L. KAN-AOI ZOKU

Perennial herbs with creeping rhizomes; leaves few, long-petioled, cordate, reniform, or ovate-cordate, entire; flowers radical, terminal, solitary, short-pedicelled, bisexual, actinomorphic or scarcely zygomorphic; perianth (calyx) lobes 3(–4), adnate at base to the ovary then free above or gamosepalous, the tube campanulate to urceolate; stamens 12 in 2 series, often fewer, the filaments short, the connective usually rising above the anthers; ovary semiinferior or superior, (3–4) to 6-locular, the placentae parietal, intruded; styles 6, rarely 3 or 4, free or united; ovules many, 2-seriate in each locule; fruit berrylike, the seeds exposed by decaying of the lower portion, ellipsoidal, rounded on back, involute on margin, flat and with fleshy appendage on ventral face.—More than 100 species, many in our area, few in the temperate regions of Europe and N. America.

- 1A. Sepals 3, nearly free, strongly reflexed above the middle, valvately contiguous and forming a cup on lower half; filaments much longer than the anthers; styles connate into a column, the stigmas radiate; summer-green perennial; leaves 2, membranous, cordate. 1. *A. caulescens*
- 1B. Sepals 3, united below into a distinct tube; styles free or connate at base.
- 2A. Leaves annual, membranous, thin, usually paired, rarely solitary, cordate to reniform-cordate; perianth without a ringlike appendage on the throat; filaments longer than the anthers; styles very short.
- 3A. Calyx-lobes deltoid, or broadly cordate-ovate, acute or subobtus, often recurved on margin.
- 4A. Styles 6; stamens 12; leaves membranous, rather large, 5–10 cm. wide. 2. *A. sieboldii*
- 4B. Styles 3; stamens 6; leaves somewhat thicker, 4–6 cm. wide. 3. *A. dimidiatum*
- 3B. Calyx-lobes obtuse, recurved on upper half. 4. *A. heterotripoides*
- 2B. Leaves biennial, ovate-orbicular to ovate, rarely cordate, rather thick and firm; perianth with a ringlike appendage on the throat; filaments not bifid.
- 5A. Styles not bifid.
- 6A. Styles slender, entire; stigma discoid; perianth-tube prominently constricted above and urceolate.
- 7A. Perianth-tube with raised longitudinal lines inside.
- 8A. Perianth-lobes ovate-oblong, 2–2.5 cm. long, 2–3 times as long as the tube, the tube globose, with prominent raised longitudinal lines inside; petals present. 5. *A. sakawanum*
- 8B. Perianth-lobes broadly ovate, 14–16 mm. long, 1–1.5 times as long as the tube, the tube somewhat squarrose, with inconspicuous or obsolete longitudinal lines inside; petals absent. 6. *A. costatum*
- 7B. Perianth-tube with raised longitudinal and transverse lines inside.
- 9A. Perianth-tube with prominently raised longitudinal lines and inconspicuous cross-lines inside.
- 10A. Leaves 5–10 cm. long, the nerves not impressed above; flowers glabrous outside. 7. *A. hexalobum*
- 10B. Leaves 11–17 cm. long, lustrous and thick, with impressed veinlets above; flowers densely white-puberulent outside. 8. *A. crassum*
- 9B. Perianth-tube uniformly with raised netted lines inside.
- 11A. Bracts longer than the flowers; flowers small, about 10 mm. across; perianth-tube ellipsoidal, the lobes connate below, the limb not spreading. 9. *A. parviflorum*
- 11B. Bracts much shorter than the flowers; flowers larger, more than 15 mm. across; perianth-tube depressed-globose, the lobes connate below, the limb spreading.
- 12A. Leaves nearly glabrous, lustrous above; perianth-lobes ovate, slightly narrowed at base, forming an elongate-ovoid cone in bud; tube shorter than the limb. 10. *A. constrictum*
- 12B. Leaves short-hairy above, not lustrous; perianth-lobes ovate-deltoid, much-narrowed at base, forming a depressed ovoid cone in bud; tube longer than the limb. 11. *A. asperum*
- 6B. Styles either longitudinally grooved inside or winged on both sides.
- 13A. Styles longitudinally grooved inside; perianth-tube slightly constricted at apex.
- 14A. Styles less than half the length of the perianth-tube, gently recurved above; leaves ovate-orbicular or broadly elliptic, pilose on upper side. 12. *A. tamaense*
- 14B. Styles more than half as long as the perianth-tube.
- 15A. Styles prominently recurved above; leaves nearly glabrous on upper side. 13. *A. muramatsui*
- 15B. Styles rectangularly spreading at tip; leaves loosely short-pilose on upper side. 14. *A. curvistigma*
- 13B. Styles winged on both margins at tip; perianth-tube much constricted above, urceolate.
- 16A. Styles recurved and cordate at apex with a broadened wing on each side. 15. *A. asaroides*
- 16B. Styles erect, with a narrow auriclelike wing toward top on each side. 16. *A. satsumense*
- 5B. Styles bifid.
- 17A. Leaves hastate, pubescent beneath; perianth-tube slightly constricted at apex. 17. *A. blumei*
- 17B. Leaves elliptic, ovate, or orbicular-reniform.
- 18A. Perianth-tube constricted at apex, with a ring on the throat; limb with transverse wrinkles near base.
- 19A. Leaves glabrous beneath; perianth-tube glabrous outside.
- 20A. Styles 6; stamens 12.
- 21A. Perianth short-tubular. 18. *A. kiusianum*
- 21B. Perianth-tube globose. 19. *A. subglobosum*
- 20B. Styles 3; stamens 6. 20. *A. trigynum*
- 19B. Leaves scattered yellowish pilose on nerves beneath; perianth-tube hairy outside. 21. *A. yakusimense*
- 18B. Perianth-tube not constricted above; limb flat; throat without a prominent ring.
- 22A. Leaves small; perianth-tube about 10 mm. long.
- 23A. Leaves ovate to broadly so, or elliptic-ovate, acute, distinctly longer than broad.
- 24A. Pedicels and perianth-tube glabrous outside.
- 25A. Perianth-lobes not contracted at base in bud; leaves with slightly impressed nerves above. 22. *A. nipponicum*
- 25B. Perianth-lobes slightly contracted at base in bud; leaves without impressed nerves. 23. *A. nanikaiense*
- 24B. Pedicels and perianth-tube short-pubescent outside. 24. *A. kumageanum*
- 23B. Leaves reniform-orbicular to broadly ovate, rounded to obtuse, rarely acute, usually not prominently longer than broad.
- 26A. Flowering in June and July; fertile shoots without leaves the first season. 25. *A. savatieri*
- 26B. Flowering in winter or spring.
- 27A. Styles slightly longer than the perianth-tube. 26. *A. fauriei*
- 27B. Styles as long as to shorter than the perianth-tube.
- 28A. Perianth-lobes broadly ovate-deltoid, rounded to obtuse. 27. *A. viridiflorum*
- 28B. Perianth-lobes ovate.
- 29A. Leaves usually paired; perianth-lobes smooth, flat, the limb with a narrow ring on the throat. 28. *A. takaoi*

29B. Leaves solitary; perianth-lobes decurrent on the limb, the limb without a distinct ring on the throat.

22B. Flowers large; perianth-tube about 20 mm. long. 30. *A. megacalyx*

1. *Asarum caulescens* Maxim. *Japonasarum caulescens* (Maxim.) F. Maekawa—FUTABA-AOI. Rhizomes elongate, the internodes 5–15 mm. long; leaves membranous, deciduous, long-petioled, usually 2, approximate, cordate, 6–15 cm. wide, abruptly acuminate, deeply cordate at base, loosely pilose on margin and on both sides; flowers solitary, terminal, the pedicels 3–4 cm. long, longer than the flowers, loosely pubescent with multicellular hairs, the perianth-segments ovate, slightly united at base, forming a short false tube on lower half, reflexed on upper half.—Mar.–May. Woods in mountains; Honshu, Shikoku, Kyushu.

2. *Asarum sieboldii* Miq. *Asiasarum sieboldii* (Miq.) F. Maekawa—USUBA-SAISHIN. Rhizomes with short internodes; leaves usually in pairs, long-petioled, cordate or reniform-cordate, 5–10 cm. wide, usually abruptly acute, scattered short-pilose on both sides especially while young; flowers solitary, on short pedicels, glabrous, the perianth-tube depressed-globose, the lobes broadly deltoid-ovate, often recurved on margin; styles 6; stamens 12.—Mar.–Apr. Honshu, Kyushu (n. distr.).

3. *Asarum dimidiatum* F. Maekawa. *Asiasarum dimidiatum* (F. Maekawa) F. Maekawa—KUROFUNE-SAISHIN. Closely resembling the preceding but the leaves thicker, 4–6 cm. long; styles 3; stamens 6.—Apr.–May. Shikoku, Kyushu (centr. distr.).

4. *Asarum heterotropoides* F. Schmidt. *Asiasarum heterotropoides* (F. Schmidt) F. Maekawa—OKU-EZO-SAISHIN. Closely resembling No. 2, but the leaves yellowish green, usually obtuse, 4–6 cm. wide; perianth-lobes fleshy, flat, obtuse, recurved above after anthesis.—May–June. Hokkaido.—Sakhalin, s. Kuriles.

5. *Asarum sakawanum* Makino. *Heterotropa sakawana* (Makino) F. Maekawa—SAKAWA-SAISHIN. Leaves rather thick, long-petioled, broadly to narrowly ovate, 6–10 cm. long, 4–7 cm. wide, acute, deeply cordate at base, loosely short-pilose on nerves above, ciliate; flowers glabrous, relatively large, the perianth-tube globose, about 12 mm. long, the lobes obtuse, much longer than the tube, the reduced petals 3, short-tubular, the styles ascending, incurved.—Apr.–May. Shikoku (w. half of Tosa Prov.).

6. *Asarum costatum* (F. Maekawa) F. Maekawa. *Heterotropa costata* F. Maekawa—TOSA-NO-AOI. Leaves ovate-elliptic, subhastate, 10–15 cm. long, scattered-hairy on both sides, ciliate; flowers glabrous, the perianth tubular, 6-angled, the lobes obtuse, ascending, the petals absent; styles ascending, recurved.—May. Shikoku (e. half of Tosa Prov.).

7. *Asarum hexalobum* (F. Maekawa) F. Maekawa. *Heterotropa hexaloba* F. Maekawa—SANYŌ-AOI. Leaves ovate to broadly so, deeply cordate, 5–10 cm. long, 4–8 cm. wide, subobtusate or sometimes acute, long-petioled, glabrous beneath; flowers glabrous, short-pedicelled; perianth-tube depressed-globose to obconical-globose, prominently constricted at the throat, with 6 longitudinal inflations, and 6 prominently longitudinal raised and inconspicuous transverse lines inside; perianth lobes nearly spreading, ovate-orbicular to broadly ovate, about 10 mm. long, glabrous; stamens 6, the staminodes 6.—Apr. Honshu (w. Chūgoku Distr.), Kyushu (n. distr.).

Asarum perfectum (F. Maekawa) F. Maekawa. *A. hexalobum* var. *perfectum* F. Maekawa—KINCHAKU-AOI. A

close relative of No. 7, differing chiefly in the oblong leaves and rather small flowers short-pilose inside, the lobes not connivent above; stamens 12, staminodes absent. Poorly known.—Kyushu and Shikoku (w. distr.).

8. *Asarum crassum* F. Maekawa. *Heterotropa crassa* (F. Maekawa) F. Maekawa—NANGOKU-AOI. Leaves broadly ovate or ovate-cordate, 11–17 cm. long, very thick, glabrous, lustrous and with impressed veinlets above; flowers densely white-puberulent, the perianth-tube semi-globose, the lobes obliquely spreading.—Feb. Cultivated in Kyushu.

9. *Asarum parviflorum* (Hook.) Regel. *Heterotropa parviflora* Hook.; *A. elegans* Duchart.—KOBANA-KAN-AOI. Leaves ovate, acute, long-petioled; flowers small, shorter than the bracts, the perianth-tube broadly ellipsoidal, prominently constricted at apex, the limb shallowly tubulose, the lobes broadly ovate, nearly spreading.—Reported to be spontaneous in Honshu (Kantō Distr.).

10. *Asarum constrictum* F. Maekawa. *Heterotropa constricta* (F. Maekawa) F. Maekawa—TSUKUBANE-AOI. Leaves 1 or 2, ovate, 7–10 cm. long, flat, acute, cordate, lustrous, the nerves not impressed or raised, glabrous beneath; flowers on very short pedicels, the perianth-tube 7–8 mm. long, trapezoidal in lateral view, truncate and much-constricted at apex, with about 15 longitudinal ribs and cross-veins inside, the lobes spreading, ovate, about 10 mm. long.—Mar. Rarely cultivated in Honshu (near Tokyo).

11. *Asarum asperum* F. Maekawa. *Heterotropa aspera* (F. Maekawa) F. Maekawa—MIYAKO-AOI. Leaves solitary, ovate-orbicular, 6–8 cm. long, subhastate at base, dull, subobtusate, glabrous beneath; perianth-tube trapezoidal in lateral view, about 6 mm. long, 9 mm. across, prominently constricted at apex, with 15 longitudinal ribs and 2 or 3 transverse veins inside, the lobes spreading, 8–10 mm. long.—Apr. Honshu (w. distr.), Shikoku.

12. *Asarum tamaense* Makino. *Heterotropa tamaensis* (Makino) F. Maekawa—TAMA-NO-KAN-AOI. Leaves solitary, broadly elliptic to ovate-orbicular, obtuse, 5–10 cm. long, lustrous, with impressed veinlets above, glabrous beneath; flowers short-pedicelled, glabrous, the perianth short-tubular, slightly constricted at apex, subtruncate at base, the limb spreading, the lobes cordate-orbicular, densely crisped-pubescent inside.—Apr. Honshu (w. Kantō Distr.).

13. *Asarum muramatsui* Makino. *Heterotropa muramatsui* (Makino) F. Maekawa—AMAGI-KAN-AOI. Closely resembling No. 12; leaves ovate to ovate-elliptic, with prominently impressed veinlets above, nearly glabrous, strongly lustrous; styles more than half the length of the perianth-tube, strongly recurved above.—May. Honshu (Izu Prov.).

14. *Asarum curvistigma* F. Maekawa. *Heterotropa curvistigma* (F. Maekawa) F. Maekawa—KAGIATA-AOI. Leaves ovate to ovate-elliptic, 5–10 cm. long, 4–7 cm. wide; the veinlets slightly impressed above, glabrous and smooth beneath; flowers short-pedicelled, the perianth-tube broadly campanulate, slightly constricted at apex, 7–13 mm. long, 10–13 mm. wide, with 15–18 longitudinal ribs and cross-veinlets inside, the lobes spreading, usually short-pubescent inside.—Sept.–Oct. Honshu (Tōkaidō Distr.).

15. *Asarum asaroides* (Morr. & Decne.) Makino. *Heterotropa asaroides* Morr. & Decne.; *A. thunbergii* A.

Braun—TAI-RIN-AOI. Leaves broadly ovate to nearly deltoid-ovate, 8–12 cm. long, 5–10 cm. wide, long-petioled, abruptly obtuse, short-pubescent on nerves above, glabrous beneath; flowers very shortly pedicelled, relatively large, glabrous, the perianth-tube depressed-pyriform, prominently constricted at apex, 2–2.5 cm. long, finely net-veined inside, the lobes orbicular-cordate or deltoid-orbicular, spreading, undulate on margin, 1–1.5 cm. long.—Apr.–June. Honshu (w. Chûgoku Distr.), Kyushu (n. distr.).

16. *Asarum satsumense* F. Maekawa. *Heterotropa satsumensis* (F. Maekawa) F. Maekawa—SATSUMA-AOI. Resembling No. 15; leaves broadly ovate-elliptic; flowers smaller, the perianth-lobes prominently undulate on margin; styles with a short, narrow auriclelike wing on each side near top.—May. Kyushu (s. distr.).

17. *Asarum blumei* Duchart. *A. albivenium* Regel; *A. leucodictyon* Miq.; *Heterotropa blumei* (Duchart.) F. Maekawa—RAN-YŌ-AOI. Leaves solitary, broadly hastate-ovate to broadly ovate, 6–10 cm. long, 4–8 cm. wide, acute to obtuse, the basal lobes more or less spreading, short-pilose on both sides especially on nerves and on margin, long-petioled; flowers glabrous, rather distinctly pedicelled, the perianth-lobes inflated, obtusely 4-angled, in lateral view, 1–1.2 cm. long and as wide, slightly constricted at apex, net-veined inside, the lobes spreading, ovate-orbicular, slightly incurved at apex, the throats narrow.—Mar.–May. Honshu (Izu, Sagami, Suruga Prov.).

18. *Asarum kiusianum* F. Maekawa. *Heterotropa kiusiana* (F. Maekawa) F. Maekawa—TSUKUSHI-AOI. Leaves usually oblong, 6–10 cm. long, acute, deeply cordate to slightly hastate-cordate at base, smooth and scarcely lustrous above; flowers prominently pedicelled, erect, straight, pale purple or dull purple, the perianth nearly tubular, 10–15 mm. long, slightly broadened above and somewhat constricted at apex, with about 15 longitudinal ribs and lateral veinlets inside, the lobes ovate-deltoid, spreading.—Apr. Kyushu (nw. distr.).

Var. *tubulosum* (F. Maekawa) F. Maekawa. *A. tubulosum* F. Maekawa—AKEBONO-AOI. Flowers white, the perianth-tube scarcely broadened above.—Kyushu.

Var. *melanosiphon* (F. Maekawa) F. Maekawa. *A. melanosiphon* F. Maekawa—KIKYŌ-KAN-AOI. Perianth-tube dark purple, the limb thinner, smooth inside, white to paler purple.—Kyushu.

Asarum unzen F. Maekawa. *Heterotropa unzen* F. Maekawa—UNZEN-KAN-AOI. Intermediate between No. 18 and No. 15; flowers about 2.5 cm. across, the perianth-tube obovoid-cylindrical, the lobes similar to No. 15; styles simulating No. 18.—Kyushu (w. distr.).

19. *Asarum subglobosum* F. Maekawa. *Heterotropa subglobosum* F. Maekawa—MARUMI-KAN-AOI. Resembling No. 18, but the perianth-tube roundish, the limb nearly flat, smooth.—Kyushu (Hyuga Prov.).

20. *Asarum trigynum* (F. Maekawa) Araki. *Heterotropa trigyna* F. Maekawa—SANKO-KAN-AOI. Resembling No. 18, but with 3 styles and 6 stamens.—Apr. Kyushu (Koshiki Isl.).

21. *Asarum yakusimensis* Masam. *Heterotropa yakusimensis* (Masam.) F. Maekawa—YAKUSHIMA-AOI. Leaves about 8 cm. long, deltoid-ovate, thinly pubescent beneath and on petioles; flowers nearly sessile, 1.5–2 cm. across, dark purple, the perianth-tube short-cylindrical, pubescent outside, the limb often partially yellowish.—Nov.–Feb. Kyushu (Yakushima and Tanegashima).

22. *Asarum nipponicum* F. Maekawa. *Heterotropa nip-*

ponica (F. Maekawa) F. Maekawa; *A. blumei* sensu auct. Japon., non Duchart.—KAN-AOI. Leaves flat, ovate to broadly so, 6–10 cm. long, 4–7 cm. wide, glabrous beneath, subobtusely or subacute; flowers short-pedicelled, sometimes subsessile, the perianth-tube campanulate, not constricted at apex, with 9, rarely 12 longitudinal ribs and lateral veinlets inside, the lobes spreading.—Oct.–Feb. Honshu (Kantō and centr. Distr.).

Var. *brachypodium* F. Maekawa—SUZUKA-KAN-AOI. Perianth-lobes larger, much longer than the tube; leaves with more or less impressed veinlets above.—Honshu (Tōkaidō to Kinki Distr. and w. Hokuriku Distr.).

Var. *kooyanum* (Makino) F. Maekawa. *A. kooyanum* Makino—KŌYA-KAN-AOI. Perianth-lobes short, about half as long as the tube.—Honshu (Kii Prov.).

Asarum rigescens F. Maekawa. *Heterotropa rigescens* (F. Maekawa) F. Maekawa—ATSUMI-KAN-AOI. Perianth fleshy, strongly net-veined inside. Poorly known.—Jan.–Feb. Honshu (Kinki and centr. Distr.).

23. *Asarum nankaiense* F. Maekawa. *Heterotropa nankaiensis* (F. Maekawa) F. Maekawa—NANKAI-AOI. Resembles *A. nipponicum* but without impressed veinlets on leaves above; flowers in bud with 3 impressions on perianth-lobes, slightly constricted at base.—Honshu (Kii Prov.), Shikoku.

24. *Asarum kumageanum* Masam. *Heterotropa kumageanum* (Masam.) F. Maekawa—KUWA-IBA-KAN-AOI. Leaves long-petioled, thick, lustrous, cordate-oblong, 3–4 cm. wide, acute, cordate at base, appressed-pilose only on nerves above; flowers pedicelled, slightly pubescent, the perianth-tube obovate, the lobes deltoid-orbicular, about 1 cm. long and as wide, rounded at apex.—Feb.–Mar. Kyushu (Yakushima).

25. *Asarum savatieri* Franch. *Heterotropa savatieri* (Franch.) F. Maekawa—OTOME-AOI. Leaves ovate-orbicular to broadly ovate, 5–7 cm. long; flowers about 1.5 cm. across, the perianth tubular-globose, slightly constricted at apex, about 1 cm. long, with 15–21 rows of delicate reticulations, the lobes deltoid-ovate, spreading, the limb with a small mouth on the center.—July–Aug. Honshu (Sagami, Izu, and Suruga Prov.).

26. *Asarum fauriei* Franch. *Heterotropa fauriei* (Franch.) F. Maekawa—MICHINO-KU-SAISHIN. Rhizomes elongate, with long internodes; leaves 1–3, rounded to reniform-orbicular, about 3 cm. across, deep green and lustrous above, not variegated; flowers small, 1–1.5 cm. across, the perianth-tube short; styles exerted from the tube.—Apr.–May. Honshu (centr. and n. distr.).—cv. *Serpens*. *A. fauriei* var. *serpens* F. Maekawa.—SONOU-SAISHIN. A cultivar of gardens with reniform-orbicular retuse lustreless gray-green leaves with pale variegation above.

Var. *nakaianum* (F. Maekawa) Ohwi. *Asarum nakai-anum* F. Maekawa—MIYAMA-AOI. Perianth-tube very short, cup-shaped, the leaves dull.—Honshu (centr. distr.).

27. *Asarum viridiflorum* Regel. *Heterotropa viridiflora* (Regel) F. Maekawa—MOEGI-KAN-AOI. Leaves pale blue-green, orbicular, relatively thin, flat, about 5 cm. wide; flowers about 1.5 cm. across, the perianth-tube broadly tubulose, 5–9 mm. long, about 9 mm. across, very finely reticulate inside, the lobes broadly deltoid-ovate, spreading.—Mar.–Apr. Cultivated, but possibly indigenous in our area.

28. *Asarum takaoi* F. Maekawa. *Heterotropa takaoi* (F. Maekawa) F. Maekawa—HIME-KAN-AOI. Leaves often paired, ovate-orbicular to ovate, broadly obtuse to subobtusely,

5-8 cm. long, 4-7 cm. wide; flowers about 1.5 cm. across, the perianth broadly tubular, with about 18 longitudinal ribs and accompanying veinlets inside, the lobes nearly spreading, ovate, obtuse; styles nearly as long as the tube.—Feb.-Mar. Honshu (w. Tokaidō and Hokuriku to c. Kinki Distr.).

Var. *hisauchii* (F. Maekawa) F. Maekawa. *A. hisauchii* F. Maekawa—ZENIBA-SAISHIN. Leaves usually orbicular and small.—Cultivated in Kinki Distr. of Honshu (spontaneous in Tokaidō and Kinki Distr. incl. Kiso region).

Var. *dilatatum* (F. Maekawa) F. Maekawa. *Heterotropa dilatata* F. Maekawa—SUEHIRO-AOI. Perianth-tube much inflated, deeply cup-shaped, with 3 shallow wrinkles on the limb at base on the throat.—Honshu (Kinki Distr.).

29. *Asarum variegatum* A. Braun & Bouché. *Heterotropa variegata* (A. Braun & Bouché) F. Maekawa—KOB-

NO-KAN-AOI. Small herb; leaves solitary, reniform-orbicular, about 3 cm. wide, slightly retuse, flat, dull, long-petioled; flowers resembling No. 28 but thicker, the perianth-lobes decurrent to the limb, without a distinct limit between the throat.—Mar.-Apr. Known only in cultivation.

30. *Asarum megacalyx* F. Maekawa. *Heterotropa megacalyx* (F. Maekawa) F. Maekawa—KOSHI-NO-KAN-AOI. Leaves long-petioled, ovate-hastate or hastate, 9-12 cm. long, 6.5-8 cm. wide, acute, lustrous, glabrous beneath; perianth tubular-globose, about 2 cm. long and as wide, subtruncate at base, with 15 longitudinal ribs and accompanying transverse veinlets inside, the lobes spreading, broadly ovate, about 12 mm. long, 14 mm. wide.—Apr.-May. Honshu (Hokuriku and w. part of n. distr.).

2. ARISTOLOCHIA L.

UMA-NO-SUZU-KUSA ZOKU

Scandent or rarely erect perennial herbs or shrubs; leaves alternate, petiolate, entire or 3- to 5-lobed, usually cordate, 5- to 7-nerved; flowers zygomorphic, solitary or in axillary fascicles, the calyx (perianth) adnate below to the ovary, the tube narrow, usually inflated around the style, the throat slightly narrowed, the limb open or recurved, entire or 3- to 6-lobed; stamens usually 6, the anthers sessile, adnate to the style or stigma, 2-locular, the locules longitudinally split; ovary inferior, usually 6-locular, the placentae parietal; style short, 3- to 6-lobed; capsules 6-valved; seeds numerous, horizontal, flat, or recurved on margin, compressed.—About 600 species, mainly in the Tropics and subtropics, a few in the temperate regions.

- 1A. Plants pubescent; calyx-tube prominently curved, the limb orbicular and shallowly 3-lobed.
- 2A. Hairs rather dense and long; leaves subcoriaceous, usually orbicular-cordate; calyx-limb about 1.5 cm. across, yellow-green, brown-striate inside, the tube 2.5-3.5 cm. long. 1. *A. kaempferi*
- 2B. Hairs loose and relatively short; leaves thick-membranous or chartaceous, usually deeply 3-lobed; calyx-limb larger, yellow, changing to black-purple, the tube 4-5.5 cm. long. 2. *A. onoei*
- 1B. Plants glabrous; calyx-tube slightly curved, the limb obliquely cut, narrowly deltoid, entire.
- 3A. Leaves narrowly deltoid-ovate, rather thick-membranous, 1.5-3 times as long as wide, the petioles 8-20 mm. long; flowers solitary in axils; calyx-limb short-attenuate, acute. 3. *A. debilis*
- 3B. Leaves cordate, thinly membranous, nearly as long as wide, the petioles 1-7 cm. long; flowers few in axils; calyx-limb with a long filiform apex. 4. *A. contorta*

1. *Aristolochia kaempferi* Willd. *A. lineata* Duchart.; *Hocquartia kaempferi* (Willd.) Nakai.—ŌBA-UMA-NO-SUZU-KUSA. Scandent shrub, 2-3 m. high, the young branches and leaves densely soft-pubescent while young; leaves often polymorphic, petiolate, cordate-orbicular, 8-15 cm. long and as wide, sometimes 3-lobed, obtuse to subacute, cordate, subcoriaceous, glabrate above, gray-white pubescent beneath; flowers solitary in axils, pedicels 4-5 cm. long, densely brownish pubescent; calyx-tube recurved near the middle, the 3 lobes orbicular, glabrous inside, green-yellow, brown-striate, valvate and covering the throat in bud; capsules oblong, 6-ribbed, 5-7 cm. long; seeds elliptic, about 5 mm. long, rounded on back, strongly recurved, with a raised longitudinal line on ventral face.—May-June. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus and China.

2. *Aristolochia onoei* Fr. & Sav. *A. arimaensis* Makino; *A. kaempferi* var. *trilobata* Fr. & Sav.—HOSOBABA-UMA-NO-SUZU-KUSA, ARIMA-UMA-NO-SUZU-KUSA. Resembling the preceding but more slender and less hairy; leaves thinner, shorter-pubescent beneath, broadly ovate to lanceolate, usually 3-lobed; flowers rather large, the calyx-limb yellow, soon changing to black-purple.—June. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

3. *Aristolochia debilis* Sieb. & Zucc. UMA-NO-SUZU-KUSA.

Scandent glabrous perennial from stout creeping elongate rhizomes; young branches dark purple, soon glaucescent; stems slender, 30-100 cm. long, branching; leaves petiolate, narrowly ovate-deltoid, obtuse, cordate, 4-7 cm. long, 2-5 cm. wide, the petioles 8-20 mm. long; flowers solitary in axils, the pedicels 2-4 cm. long, the calyx-tube yellowish green, slender, slightly recurved above, inflated and globose at base, the limb obliquely truncate, narrowly deltoid-acute, slightly recurved on margin, brown-purple inside; capsules globose, about 1.5 cm. long.—June-Aug. Thickets and meadows in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China.

4. *Aristolochia contorta* Bunge. *A. nipponica* Makino.—MARUBA-UMA-NO-SUZU-KUSA, KO-UMA-NO-SUZU-KUSA. Resembles the preceding; plant glabrous; leaves cordate or broadly ovate-cordate, 4-10 cm. long, 3.5-8 cm. wide, acute or obtuse, cordate, thinly membranous, glaucescent, the petioles 1-7 cm. long; flowers few in axils, fascicled, the pedicels 1-4 cm. long; calyx-tube inflated and globose at base, the limb dilated, obliquely truncate, narrowly deltoid, long-acute to a filiform point; fruit obovoid-globose, about 3 cm. long.—July-Aug. Honshu.—Korea, n. China, Manchuria, and Ussuri.

Fam. 76. RAFFLESACEAE

YAKKO-SŌ KA

Rafflesia Family

Fleshy parasitic herbs with or without reduced scalelike leaves; stems short or nearly absent, scaly or naked; flowers terminal, solitary, or in a terminal raceme, actinomorphic, bisexual or unisexual, the perianth of one whorl, fleshy, globose, or campanulate, the tube adnate below to the ovary, the limb 3- to 10-lobed, the segments imbricate or valvate in bud; stamens 8 to

many, the anthers 2-locular, sessile around a fleshy genital column or inserted on the throat of the perianth-tube, free or connate; ovary superior, very rarely half-superior, 1-locular or imperfectly many-loculed by intricate lamellate placentae; stigma undivided or lobed; ovules many, orthotropous or anatropous; fruit fleshy, indehiscent or irregularly ruptured; seeds minute, many, with reticulate outer coat.—About 10 genera, with about 60 species, mainly pantropical.

1. MITRASTEMON Makino YAKKO-SŌ ZOKU

Glabrous herbs without chlorophyll, with short thickened scabrous rhizomes; stems erect, simple, short, fleshy, unbranched, scaly; scalelike leaves decussately opposite, ovate, obtuse, entire, the upper ones becoming gradually larger; flowers solitary, terminal, erect, bractless, bisexual; perianth of a single connate whorl, truncate, tubular, fleshy, persistent; stamens completely connate, the anthers extrorse, dehiscing by pores, the connective connate and forming a depressed-conical body over the stigma; ovary superior, relatively large, ovoid-globose, sessile, 1-locular, with lamellate placentae; style short, stout, the stigma thick, depressed-conical, subbilobed; testa 1-layered.—Few species, in e. and se. Asia, Central America.

1. Mitrastemon yamamotoi Makino. YAKKO-SŌ. Stems 5–7 cm. high, white, black-brown when dry; scalelike leaves thick, few-paired, 10–20 mm. long, ovate-deltoid or deltoid, ascending, subcoriaceous, rounded on back, incurved on margin; flowers 15–20 mm. long, the perianth 5–8 mm.

long; stamens 14–20 mm. long, the filaments connate and surrounding the ovary, the anthers 4–5 mm. long; stigma 4–6 mm. across.—Nov. Shikoku, Kyushu; parasitic on roots of *Castanopsis*; rare.

Fam. 77. BALANOPHORACEAE TSUCHI-TORI-MOCHI KA Balanophora Family

Variouly colored monoecious or dioecious root-parasitic herbs without chlorophyll; rhizomes tuberous, often lobed, sometimes scaly, often scabrous; stems erect, terete, usually scaly; leaves reduced to scales, alternate; spikes terminal, ovoid, clavate or globose, with stout fleshy axis, the bracts absent or many; flowers unisexual, the pistillate sessile, minute, densely arranged on the face of the axis, many, sometimes somewhat hairy, the perianth absent or small and adnate to the ovary, rarely free, bilabiate or tubular; staminate flowers larger, interspersed among the pistillate or at one end of the spike, naked or with a 3- to 8-lobed perianth; stamens 1 or 2, or as many as and opposite the perianth-lobes; ovary 1- to 3-locular, small, the ovules solitary in each locule; fruit small, indehiscent, 1-seeded.—About 15 genera, with about 100 species, mainly in the Tropics of the Old World.

1. BALANOPHORA Forst. TSUCHI-TORI-MOCHI ZOKU

Fleshy glabrous parasitic herbs; scapes with persistent alternate scalelike leaves; staminate flowers dispersed among the pistillate ones or on one end of the spike, rarely on different spikes, the perianth-tube cylindric, solid, the lobes ovate, 3–6, imbricate in bud; stamens 3–8, the filaments absent or united in a column; pistillate flowers naked; ovary ellipsoidal, 1-locular, sometimes stipitate; style single, slender; ovules solitary, anatropous; fruit indehiscent; seeds globose, the endosperm copious, oily.—About 70 species, in India, Australia, and s. Asia, few in e. Asia.

1A. Plants dioecious; staminate flowers unknown; rhizomes lenticellate; spikes blood-red or yellow-red, ovoid, or cylindric-ovoid.

1B. Plants monoecious; rhizomes not lenticellate; spikes pale yellow or whitish, ovoid to narrowly so. 1. *B. japonica*
2. *B. tobiracola*

1. Balanophora japonica Makino. *Balanía japonica* (Makino) Van Tiegh.—TSUCHI-TORI-MOCHI. Stout glabrous reddish herb 5–10 cm. high; rhizomes irregularly globose, lobed, pale brown, 2–3 cm. across, with raised whitish lenticels; scapes terete, stout, erect, few-scaled; scales suberect, fleshy, reddish, broadly ovate to oblong, entire; spikes terminal, solitary, stout, narrowly ovoid to ovoid, 3–6 cm. long, 2–3 cm. wide, blood-red; pistillate flowers minute, fleshy, with minute ovoid-globose bodies between them; ovary stipitate, ellipsoidal, small, the style linear.—Oct.–Dec. On roots of evergreen trees, especially *Symplocos*; Honshu, Shikoku, Kyushu.—Amami-Oshima.

Balanía nipponica (Makino) Masam.—MIYAMA-TSUCHI-TORI-MOCHI. More slender; spikes ovoid-cylindric to narrowly ovoid, orange- to reddish yellow, sometimes reddish.—July–Oct. On roots of deciduous trees; Honshu (centr. and n. distr.), Kyushu; rare.

2. Balanophora tobiracola Makino. *Balaneikōn tobiracola* (Makino) Setchell.—KIURE-TSUCHI-TORI-MOCHI. Resembling the preceding species; scapes 10–15 cm. long; rhizomes not lenticellate; scapes and spikes pale yellow; scales ovate; spikes monoecious, the staminate flowers larger, dispersed among the pistillate.—Oct.–Nov. On roots of *Pittosporum*, *Raphiolepis*, and *Ligustrum*; Kyushu (s. distr.)—Ryukyus and Formosa.

Var. *nipponica* (Makino) Ohwi. *B. nipponica* Makino;

Fam. 78. POLYGONACEAE TADE KA Buckwheat Family

Herbs, rarely shrubs; leaves alternate, rarely opposite, simple or lobed, the petioles often dilated below into a stipular sheath (ochrea); flowers usually small, bracteate, solitary or fasciculate in axils or in spikes or racemes, rarely in a compound panicle, bisexual, sometimes unisexual, actinomorphic, the pedicels usually jointed at apex; perianth of 4–6 free, frequently highly colored

sepals sometimes connate at base, imbricate in bud (petals absent), sometimes accrescent after anthesis; stamens 6-9, rarely many, inserted at the base of perianth-segments; ovary superior, trigonous or lenticular, 1-locular, 1-ovuled; styles 2 or 3, often connate at base; fruit an achene, indehiscent, enclosed in the persistent perianth, the pericarp hard, the testa membranous; endosperm copious, mealy, the embryo often curved.—About 30 genera, with about 800 species, cosmopolitan.

1A. Stigma fimbriate; inner perianth-segments usually accrescent after anthesis.

2A. Perianth-segments (sepals) 6; styles 3; achenes trigonous. 1. *Rumex*

2B. Perianth-segments (sepals) 4; styles 2; achenes lenticular. 2. *Oxyria*

1B. Stigma capitate or 2-lobed, rarely fimbriate but the inner perianth-segments unchanged after anthesis. 3. *Polygonum*

1. RUMEX L. GISHI-GISHI ZOKU

Perennial or annual herbs, rarely subshrubs; leaves radical and cauline, alternate, the stipules sheathed; flowers bisexual or unisexual, small, fasciated at the nodes, ultimately disposed in terminal racemes or panicles; perianth-segments biserial, 6, rarely 4, nearly equal, herbaceous or coriaceous, entire or dentate to spine-margined, the midrib sometimes swollen at the middle, the outer 3 unchanged in fruit, the inner 3 usually accrescent after anthesis; stamens 6; styles 3, the stigma lacinate-fimbriate; achenes trigonous, enclosed in the accrescent inner perianth-segments; embryo lateral.—Many species, cosmopolitan.

1A. Leaves hastate, with acute auricles on each side; flowers usually unisexual (plants dioecious); styles lateral.

2A. Perianth-segments not accrescent in fruit. 1. *R. acetosella*

2B. Perianth-segments of the inner whorl accrescent and winglike in fruit.

3A. Leaves broadly lanceolate or oblong; sheath dentate or lobed from the earlier stage. 2. *R. acetosa*

3B. Leaves narrowly ovate to broadly so; sheath entire while young. 3. *R. montanus*

1B. Leaves cuneate, rounded or cordate at base, without auricles on lower margin; flowers bisexual; styles terminal; inner perianth-segments accrescent.

4A. Inner perianth-segments orbicular to orbicular-cordate in fruit, the midrib not thickened or only slightly swollen in one sepal.

5A. Verticils or fascicles of fruit dense; leaves glabrous, the lower oblong or narrowly so, the upper linear-oblong.

6A. Leaves cordate; inner perianth-segments truncate to rounded at base. 4. *R. aquaticus*

6B. Leaves narrowed to truncate or rounded at base; inner perianth-segments cordate. 5. *R. longifolius*

5B. Verticils or fascicles of fruit interrupted; leaves with hairlike papillae especially on nerves beneath.

7A. Lower leaves ovate or broadly so.

8A. Inner perianth-segments shallowly toothed in fruit. 6. *R. madaio*

8B. Inner perianth-segments with hooked spines on margin in fruit. 7. *R. nepalensis*

7B. Lower leaves deltoid-cordate; inner perianth-segments entire. 8. *R. gmelinii*

4B. Inner perianth-segments with a prominent tubercle at the center.

9A. Inner perianth-segments orbicular to orbicular-cordate, 4-7 mm. wide, acutely toothed to nearly entire.

10A. Radical leaves cordate; inner perianth-segments orbicular-cordate or ovate-cordate, more or less distinctly toothed.

9. *R. japonicus*

10B. Radical leaves rounded to truncate or cuneate at base; inner perianth-segments ovate-orbicular, entire or nearly so.

10. *R. crispus*

9B. Inner perianth-segments ovate or narrowly so.

11A. Inner perianth-segments entire, about 1.5 mm. wide; stems usually dark purplish; leaves often partially blood-purple variegated.

11. *R. conglomeratus*

11B. Inner perianth-segments prominently toothed or spined on margin.

12A. Inner perianth-segments 2.5-3 mm. long, narrower than the spines on margin; verticils of flowers many-flowered, often globose. 12. *R. maritimus*

12B. Inner perianth-segments 4-6 mm. long, broader than the length of marginal teeth or spines; verticils of flowers few- to rather many-flowered.

13A. Lower leaves oblong-ovate or broadly ovate, cordate, with hairlike papillae beneath; verticils of flowers rather contiguous above, separated in the lower ones. 13. *R. obtusifolius*

13B. Lower leaves oblong-lanceolate, smooth, rounded at base; verticils of flowers rather widely separated. 14. *R. nipponicus*

1. *Rumex acetosella* L. HIME-SUIBA. Dioecious perennial herb, acid to taste, from slender creeping branched rhizomes, glabrous or with scattered hairlike papillae; stems slender, erect, few-leaved, sometimes branching; radical leaves long-petioled, hastate, 3-6 cm. long, 1-2 cm. wide, acute to obtuse, the cauline rather small, the sheaths scarious; inflorescence paniculate, the flowers small, about 2 mm. long, the sepals unchanged in fruit, not warty; achenes broadly elliptic, trigonous, brown, slightly lustrous, about 1.2 mm. long, the angles rather obtuse.—May-July. Waste grounds and meadows in lowlands and foothills; Hokkaido, Honshu, Shikoku, Kyushu; naturalized and very common locally.—Europe and w. Asia.

2. *Rumex acetosa* L. SUIBA. Dioecious perennial herb, acid tasting, glabrous or with obsolete granular papillae

on the inflorescence; rhizomes short, with thick adventitious roots; stems erect, 30-80 cm. long, usually simple, few-leaved; radical leaves petioled, broadly lanceolate to oblong, hastate, 5-10 cm. long; panicles terminal, erect, 10-30 cm. long, narrow, the branches erect, slender; staminate flowers with the sepals all alike, 2.5-3 mm. long, the outer sepals of the pistillate flowers elliptic, reflexed, to 1 mm. long, the inner ones strongly accrescent, often pinkish, orbicular-cordate, membranous, net-veined, about 5 mm. long and as wide; achenes elliptic, black-brown, lustrous, trigonous, about 2 mm. long, the angles acute.—May-June. Meadows; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Temperate regions of the N. Hemisphere.

3. *Rumex montanus* Desf. *R. arifolius* All., non L. f. —TAKANE-SUIBA. Closely resembles the preceding; radi-

cal and lower cauline leaves narrowly to broadly ovate, 6–15 cm. long, 3–7 cm. wide, subacute at apex, the auricles obliquely deflexed, the sheath usually entire; upper cauline leaves with longer auricles.—July–Aug. High mountains and alpine regions; Hokkaido, Honshu (centr. and n. distr.).—Europe and Siberia.

4. *Rumex aquaticus* L. NUMA-DAIŌ. Stems 80–150 cm. high, often purplish, sulcate; radical and lower cauline leaves oblong-ovate or elongate-deltoid, smooth, to 35 cm. long, broadest near base; inner sepals 5–8.5 mm. long, 4.5–7 mm. wide in fruit, ovate-deltoid, truncate to rounded at base, entire or nearly so.—Reported to be spontaneous in Honshu (n. and centr. distr.).—Temperate regions of the Old World.

5. *Rumex longifolius* DC. *R. domesticus* Hartm.; ? *R. susukianum* Reehinger f.—NO-DAIŌ. Smooth or with scattered hairlike papillae; stems 80–120 cm. long, rather stout; radical leaves long-petiole, oblong-ovate to oblong, 20–35 cm. long, 10–20 cm. wide, obtuse, cordate, slightly undulate on margin, the upper leaves linear-lanceolate to narrowly oblong, rather small, shallowly cordate or broadly cuneate at base and short-petioled; inflorescence erect, large, narrow, densely many-flowered, the pedicels slender, rather elongate; outer sepals in fruit spreading, oblong, about 1.8 mm. long, the inner whorl orbicular-cordate, membranous, weakly net-veined, 5–6(–7) mm. long and as wide, entire or with shallow obsolete teeth on margin; achenes dark-brown, lustrous, acutely 3-angled, about 3 mm. long.—June–Aug. Wet meadows in lowlands; Hokkaido, Honshu (centr. and n. distr.).—Temperate regions of Eurasia.

6. *Rumex madaio* Makino. *R. daiwoo* Makino—MA-DAIŌ. Resembles No. 5; leaves beneath with distinct hairlike papillae especially on nerves; stems stout, 80–100 cm. long; radical leaves long-petioled, ovate or broadly so, sometimes ovate-oblong, 20–30 cm. long, 12–20 cm. wide, subobtusate, cordate; verticils of flowers rather distant; lobes of the outer sepals spreading in fruit, the inner whorl orbicular-cordate, slightly toothed on margin.—May–July. Hokkaido (?), Honshu, Shikoku, Kyushu.

7. *Rumex nepalensis* Spreng. *R. andreaeanus* Makino; *R. daiwoo* var. *andreaeanus* (Makino) Makino—KIBUNE-DAIŌ. Resembles No. 6; perianth-segments of the inner whorl ovate-orbicular, slightly cordate at base, rather firm, 5–6 mm. long and as wide, rather prominently netted-veined, the margin with slender hooked spreading spines 2–3 mm. long; achenes gray-brown, lustrous, ovate, acutely 3-angled, 3–3.5 mm. long.—May–June. Stream banks and ravines in mountains; Honshu (Yamashiro Prov.); rare; possibly introduced from China.—China to the Himalayas.

8. *Rumex gmelinii* Turcz. KARAFUTO-NO-DAIŌ. Perennial herb, densely pilose on leaves beneath and with whitish hairlike papillae; rhizomes stout; stems 50–100 cm. long, few-leaved; radical leaves deltoid-cordate, 10–20 cm. long and as wide, very obtuse, long-petioled and deeply cordate, the cauline smaller, the upper short-petioled, narrowly deltoid-ovate, more or less cordate; inflorescence usually not leafy, rather large, erect, the outer sepals ascending, the lobes lanceolate, 1.5–1.8 mm. long, boat-shaped, the lobes of the inner whorl broadly ovate or broadly elliptic, membranous, obtuse, rounded at base, 4–4.5 mm. long, weakly net-veined, nearly entire; achenes ovate, acutely 3-angled, dark brown, lustrous, about 3 mm. long.—July–Sept. Wet places in high mountains;

Hokkaido; rare.—n. Korea, s. Kuriles, Sakhalin, Manchuria, and the Ochotsk Sea area.

9. *Rumex japonicus* Houtt. *R. crispus* var. *japonicus* Makino—GISHI-GISHI. Smooth green or scattered papillose-hairy perennial herb; stems erect, 40–100 cm. long, rather stout; radical leaves long-petioled, narrowly ovate-oblong to narrowly oblong, 10–25 cm. long, 4–10 cm. wide, subobtusate, cordate, undulate on margin, the upper cauline leaves small, narrow, short-petioled, cuneate at base; inflorescence narrow, dense, leafy; segments of the outer sepal-whorl spreading, ob-lanceolate, boat-shaped, the lobes of the inner whorl rather firm, cordate-orbicular, dentate, the tubercles narrowly ovoid, 2–2.5 mm. long; achenes broadly ovate, dark brown, acutely trigonous, lustrous, about 2.5 mm. long.—June–Aug. Wet meadows and along ditches in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Sakhalin, Korea, and Kamchatka.

Var. *yezoensis* (Hara) Ohwi. *R. yezoensis* Hara; ? *R. nikkoensis* Makino—Ō-GISHI-GISHI. Inner sepal-lobes 6–7 mm. wide, larger, with prominent teeth on lower margin; achenes 3–4 mm. long.—Hokkaido.

10. *Rumex crispus* L. NAGABA-GISHI-GISHI. Resembling No. 9; stems sometimes purplish, 30–80 cm. long; radical leaves lanceolate to oblong-lanceolate, 12–30 cm. long, 4–6 cm. wide, distinctly undulate on margin; inner sepals broadly ovate, sometimes subcordate, 4–5 mm. long, 3.5–4.5 mm. wide, usually entire, the tubercles 1.5–2 mm. long.—June–Oct. Naturalized in our area.—Europe, Asia, and North Africa; naturalized also in N. America.

11. *Rumex conglomeratus* Murr. ARECHI-GISHI-GISHI. Glabrous perennial; stems branched, often purplish, 30–100 cm. long; radical leaves oblong-lanceolate, 10–20 cm. long, 3–7 cm. wide, subacute, rounded to shallowly cordate, long-petioled, undulate on margin, the upper ones smaller, short-petioled; inflorescence much-branched, leafy, diffuse, the verticils small, many-flowered, the pedicels short, the outer sepals ascending-appressed, about 0.5 mm. long, the inner ones narrowly deltoid-ovate, about 3 mm. long, 1.5 mm. wide, entire, with few weak netted veinlets, the tubercles ovoid, rather prominent, about 1.2 mm. long; achenes broadly ovate, trigonous, dark brown, lustrous, about 1.5 mm. long.—June–Oct. Naturalized and common around cities in our area.—Europe.

12. *Rumex maritimus* L. *R. ochotkii* Reehinger f.—KOGANE-GISHI-GISHI. Low, rather stout, smooth or sometimes papillose-pilose annual or biennial herb; stems 10–50 cm. long, with ascending branches; lower leaves narrowly to broadly lanceolate, 7–15 cm. long, 1–3.5 cm. wide, subacute, obtuse to acute at base; inflorescence leafy, the verticils densely many-flowered, subglobose, widely separated, or upper ones contiguous; perianth in fruit yellow-brown, the outer sepals nearly spreading, about 1 mm. long, the inner deltoid-ovate, acute, 2.5–3 mm. long, 1–2 mm. wide, sparingly net-veined, the marginal spines 2–3 mm. long, the tubercles ovoid, 1–1.5 mm. long; achenes yellow-brown, oblong, about 1.2 mm. long, lustrous, acutely trigonous.—July–Aug. Waste ground near seashores; Hokkaido, Honshu (n. distr.).—Ochotsk Sea area to Siberia, India, and Europe.

13. *Rumex obtusifolius* L. EZO-NO-GISHI-GISHI. Perennial herb with hairlike papillae on the leaves beneath especially on the nerves; stems stout, 30–80 cm. long; radical

leaves long-petioled, oblong, ovate, or broadly so, 15–20 cm. long, 8–12 cm. wide, obtuse to acute, cordate; inflorescence leafy, with ascending branches; outer sepals spreading, about 1.5 mm. long, the inner narrowly deltoid-ovate or ovate-orbicular, subacute, 4–6 mm. long, 3–5 mm. wide, with rather prominent netted veinlets, short-spined or toothed on margin, the tubercles ovoid, 1.5–2 mm. long; achenes dark brown, ovate, acutely 3-angled, lustrous, about 2.5 mm. long.—June–Sept. Hokkaido, Honshu; very variable.—Eurasia and N. Africa.

14. *Rumex nipponicus* Fr. & Sav. *R. obtusifolius* var.

2. OXYRIA Hill MARUBA-GISHI-GISHI ZOKU

Low glabrous perennial herbs; radical leaves long-petioled, reniform-orbicular, entire, the margin undulate, the stipules scarious; scapes arising from short stout rhizomes, erect, naked or 1-leaved; inflorescence paniculate, the flowers few at each node, small, bisexual, the pedicels jointed at apex; perianth-segments or sepals 4, in 2 series, the outer whorl reflexed in fruit, the inner whorl slightly accrescent after anthesis, appressed to the achene; stamens 6; ovary compressed; styles 2, the stigma broad, fimbriate; achenes flat, winged on margin; embryo lateral.—Two species in the arctic and alpine regions of the N. Hemisphere.

1. *Oxyria digyna* (L.) Hill. *Rumex digynus* L.; *O. reniformis* Hook.—MARUBA-GISHI-GISHI, JIN'YŌ-SUITA. Glabrous, sometimes slightly reddish perennial herb from stout rhizomes; scapes 10–30 cm. long, naked or with a small subtending leaf below the inflorescence; leaves succulent, somewhat tufted, long-petioled, reniform-orbicular, rounded to subretuse, 1.5–2.5 cm. long, 2–4 cm. wide; inflorescence 4–10 cm.

nipponicus (Fr. & Sav.) Nakai; *R. dentatus* subsp. *nipponicus* (Fr. & Sav.) Rechinger f.—KO-GISHI-GISHI. Smooth perennial herb; branches ascending to nearly spreading; lower leaves oblong-lanceolate to lanceolate, obtuse, rounded at base, long-petioled, 4–6 cm. long, 1–2 cm. wide; inflorescence leafy, the verticils widely separated, the outer sepals ascending, the inner deltoid-ovate, 4–5 mm. long, 2–3 mm. wide, with few marginal spines about 2 mm. long; achenes similar to the preceding.—May–June. Lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China and Korea.

long, the branches erect; inner sepal-lobes spatulate-obovate, about 2 mm. long, rounded at apex, membranous; achenes ovate, flat, about 2 mm. long, with a membranous wing on margin, orbicular-cordate, retuse.—July–Aug. Wet barren alpine slopes; Hokkaido, Honshu (centr. distr.); rare.—Arctic and alpine regions of the N. Hemisphere.

3. POLYGONUM L. TADE ZOKU

Herbs, rarely subshrubs, often scandent; leaves alternate, with a sheathlike membranous stipule (ochrea) at base; flowers in fascicles or solitary, more often in spiciform panicles (spikes), racemes or panicles, the pedicels jointed; perianth-segments usually 5, 2-seriate, one of the whorls sometimes accrescent after anthesis; ovary lenticular or trigonous; styles 2 or 3, free or connate at base, the stigma capitate or rarely fimbriate; fruit enclosed within the persistent perianth; embryo curved.—About 200 species, cosmopolitan, especially abundant in the N. Hemisphere.

- 1A. Styles hooked at apex, persistent, firm; perianth-segments 4. 1. *P. filiforme*
- 1B. Style not hooked, deciduous, not hardened; perianth-segments 5, rarely 4.
- 2A. Flowers fasciculate in leaf-axils, not forming a spike or raceme; leaves small, linear to oblong, entire.
- 3A. Leaf-sheath nerveless or with short nerves near base; leaves with obsolete lateral nerves; achenes smooth, lustrous. 2. *P. plebeium*
- 3B. Leaf-sheath nerved except at apex; leaves with more or less raised lateral nerves at least beneath; achenes punctulate and scarcely lustrous.
- 4A. Achenes exerted; plant glaucescent, becoming dark brown when dried. 3. *P. polyneuron*
- 4B. Achenes scarcely exerted; plant green, scarcely glaucescent, not becoming dark brown when dried. 4. *P. aviculare*
- 2B. Flowers in spikes or racemes, except sometimes in Nos. 44–46.
- 5A. Stems scapose, simple; radical leaves conspicuous; rhizomes thickened.
- 6A. Spike solitary, always terminal.
- 7A. Stem-leaves 1 or 2, small, or none. 5. *P. tenuicaule*
- 7B. Stem-leaves usually more than 2, foliaceous.
- 8A. Spikes bearing small bulbils on the lower part. 6. *P. viviparum*
- 8B. Spikes not bearing bulbils.
- 9A. Petioles of radical leaves wingless. 7. *P. hayachinense*
- 9B. Petioles of radical leaves winged. 8. *P. bistorta*
- 6B. Spikes axillary and terminal. 9. *P. suffultum*
- 5B. Stems leafy, not scapose, often branched; radical leaves not prominent.
- 10A. Stems with retrorse prickles.
- 11A. Stipules, at least some of them, with a marginal dilated green limb.
- 12A. Leaves deltoid, nearly as long as wide.
- 13A. Stems much elongate, scandent.
- 14A. Plant glabrous; leaves peltate; spikes with a rather prominent leaflike orbicular bract at base; perianth becoming slightly fleshy and bluish in fruit; achenes black and lustrous. 10. *P. perfoliatum*
- 14B. Plant loosely puberulous; leaves basifixed; spikes without prominent leaflike bracts; perianth not becoming fleshy; achenes dull. 11. *P. senticosum*

- 13B. Stems 10–30 cm. long, not scandent. 12. *P. debile*
- 12B. Leaves ovate-deltoid or narrower, distinctly longer than wide.
- 15A. Leaflike limb of stipules deeply toothed; midlobe of leaves narrow; achenes lustrous; stellate-pubescent. 13. *P. maackianum*
- 15B. Leaflike limb of stipules entire or with a few deep incisions.
- 16A. Petioles more or less winged; achenes dull, deep brown. 14. *P. thunbergii*
- 16B. Petioles not winged; achenes gray and lustrous. 15. *P. oreophilum*
- 11B. Stipules without dilated limb.
- 17A. Leaves gradually narrowed toward the petiole, entire; erect herb, the stems sparingly prickly. 16. *P. bungeanum*
- 17B. Leaves truncate to cordate, rarely rounded at base, often 3-lobed.
- 18A. Stipules 3–4 mm. long, pilose; spikes 1- to 3-flowered. 17. *P. brevichreatum*
- 18B. Stipules 1–2 cm. long, glabrous or sparsely pilose, sometimes ciliate.
- 19A. Inflorescence once or twice forked. 18. *P. hastatoauriculatum*
- 19B. Inflorescence terminal and axillary, not forked.
- 20A. Stipules obliquely truncate, scarcely ciliate, rather acute at the tip; leaves deeply cordate at base, glabrous or loosely ciliate on margin; pedicel shorter than the bract. 19. *P. sieboldii*
- 20B. Stipules nearly rectangularly truncate, ciliate; leaves truncate to shallowly cordate at base, setulose-scarious on margin.
- 21A. Leaves with a rather distinct lobule on each side near base; pedicels longer than the bract. 20. *P. hastatosagittatum*
- 21B. Leaves without distinct lobule on each side; pedicels shorter than the bract. 21. *P. nipponense*
- 10B. Stems without prickles, glabrous or hairy.
- 22A. Stems not scandent; perianth-segments essentially unchanged in fruit.
- 23A. Annuals or rarely perennials; inflorescence a solitary spike or raceme, or compound; achenes small, lenticular or trigonous, the pericarp coriaceous or crustaceous.
- 24A. Spikes globose or capitate.
- 25A. Leaves with appressed sessile discoid glands beneath; stems to 30 cm. long. 22. *P. nepalense*
- 25B. Leaves without sessile discoid glands; stems longer. 23. *P. chinense*
- 24B. Spike cylindrical to linear.
- 26A. Stipules tubular, at least partly with a green dilated limb; leaves ovate or broadly so, cordate. 24. *P. orientale*
- 26B. Stipules without dilated limb.
- 27A. Peduncles with stipitate glands. 25. *P. viscosum*
- 27B. Peduncles without stipitate glands.
- 28A. Stipules not ciliate.
- 29A. Petioles adnate to the stipules nearly the whole length; aquatic or terrestrial perennial; spikes 1–2. 26. *P. amphibium*
- 29B. Petioles adnate to the stipules near the base; annual terrestrial herbs without floating leaves; spikes few to many.
- 30A. Stems 50–120 cm. long, stout, with thickened nodes; achenes small, about 2 mm. across; spikes to 10 cm. long, often nodding or pendulous. 27. *P. lapathifolium*
- 30B. Stems to 60 cm. long, without thickened nodes; achenes 2–3 mm. across; spikes scarcely more than 5 cm. long, erect. 28. *P. scabrum*
- 28B. Stipules ciliate.
- 31A. Perennials from long-creeping rhizomes; flowers rather large, loosely arranged, white or pink.
- 32A. Flowers white; achenes lustrous. 29. *P. japonicum*
- 32B. Flowers pink; achenes dull. 30. *P. conspicuum*
- 31B. Annuals or biennials without rhizomes.
- 33A. Perianth-segments distinctly glandular-dotted.
- 34A. Achenes lenticular; leaves and other parts very acrid. 31. *P. hydropteris*
- 34B. Achenes trigonous; leaves not acrid. 32. *P. pubescens*
- 33B. Perianth-segments scarcely glandular-dotted.
- 35A. Peduncles and upper internodes of stems and branchlets viscid. 33. *P. viscoferum*
- 35B. Peduncles and upper internodes not viscid.
- 36A. Cilia of stipules 1–2 mm. long; spikes thick. 34. *P. persicaria*
- 36B. Cilia of stipules 3–10 mm. long; spikes rather slender.
- 37A. Leaves ovate to lanceolate; ciliae of stipules elongate, usually as long as the stipules; plants of woods, thickets and grassy places.
- 38A. Plant of woods, with vivid green leaves abruptly narrowed above, the tip often caudate; spikes loosely flowered, flowers pale rose-colored. 35. *P. caespitosum* var. *laxiflorum*
- 38B. Plant of sunny grassy places, thickets, or cultivated fields, with deep green leaves gradually narrowed above, the tip obtuse; spikes densely flowered, pale-red, rarely white. 36. *P. longisetum*
- 37B. Leaves narrowly lanceolate to broadly linear, sometimes lanceolate; ciliae of stipules short or rather elongate, usually shorter than the stipule; plants of wet grassy places along rivers.
- 39A. Leaves rather thick-membranous, often with indistinct discoid glands beneath.
- 40A. Achenes lenticular.
- 41A. Spikes densely flowered, erect. 37. *P. kawagoeanum*
- 41B. Spikes loosely flowered, often nodding. 38. *P. foliosum*
- 40B. Achenes trigonous. 39. *P. trigonocarpum*

39B. Leaves thinly membranous, green or pale green, without sessile discoid glands beneath.

42A. Spikes densely flowered, erect; achenes trigonous. 40. *P. erectominus*

42B. Spikes loosely flowered, nodding above; achenes trigonous or lenticular. 41. *P. taquetii*

23B. Perennials with rhizomes; inflorescence a densely flowered panicle; achenes rather large, often exserted from the perianth, the pericarp membranous or chartaceous.

43A. Plants less than 50 cm. high; achenes included or only slightly exserted from the perianth; leaves subsessile or very short-petioled. 42. *P. ajanense*

44A. Leaves lanceolate to broadly so, gradually narrowed below, not rounded at base. 42. *P. ajanense*

44B. Leaves ovate to broadly so, rounded to very broadly cuneate at base. 43. *P. nakaii*

43B. Plants 40–100 cm. high; achenes 3–4 times as long as the perianth; lower leaves distinctly petioled. .. 44. *P. weyerichii*

22B. Stems scandent, or if not the outer perianth-segments winged on back.

45A. Plants bisexual; flowers in loose spikes or axillary fascicles.

46A. Perianth-segments not winged. 45. *P. convolvulus*

46B. Outer perianth-segments winged on the back in fruit.

47A. Fruit inclusive of perianth obovate, about 10 mm. long, prominently decurrent to the pedicel. .. 46. *P. dentatoalatum*

47B. Fruit inclusive of perianth elliptic or nearly orbicular, 5–7 mm. long, only slightly decurrent on the pedicel. 47. *P. dumetorum*

45B. Plants dioecious; flowers in dense much branched panicles.

48A. Stems scandent. 48. *P. multiflorum*

48B. Stems erect, ascending above.

49A. Leaves 6–12(–15) cm. long, scarcely glaucous, often papillose-pilose to papillose-scarious beneath; stems 50–150 cm. long. 49. *P. cuspidatum*

49B. Leaves usually 20–30 cm. long, glaucous, glabrous beneath; stems about 2.5 m. long. 50. *P. sachalinense*

1. *Polygonum filiforme* Thunb. *P. virginianum* var. *filiforme* (Thunb.) Merr.; *Tovara filiformis* (Thunb.) Nakai; *T. virginiana* var. *filiformis* (Thunb.) Steward; *Sunania filiformis* (Thunb.) Rafin.—MIZU-HIKI. Coarsely appressed-strigose perennial herb from short, rather thick rhizomes; stems 40–80 cm. long; leaves elliptic to oblong, rarely obovate or ovate, 7–15 cm. long, 4–9 cm. wide, abruptly acute with an obtuse tip, acute at the base, the petiole 5–30 mm. long; stipules 5–10 mm. long, short-ciliate; spikes few, elongate, 20–40 cm. long, loosely flowered, narrow; flowers short-pedicelled, rose-pink, rarely white, the perianth to 3 mm. long in fruit; achenes inflated-biconvex, brown, elliptic, lustrous, about 2.5 mm. long; styles 2, free, persistent, hooked at apex.—Aug.–Oct. Woods and thickets in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common; variable.

Var. *neofiliforme* (Nakai) Ohwi. *P. neofiliforme* Nakai; *Tovara neofiliformis* (Nakai) Nakai; *Sunania neofiliformis* (Nakai) Hara.—SHIN-MIZU-HIKI. Plant thinly pilose with shorter hairs; leaves usually short-acuminate.—Honshu; common.

Var. *smaragdinum* (Nakai) Ohwi. *Tovara smaragdina* Nakai ex F. Maekawa; *Sunania filiformis* forma *smaragdina* (Nakai) Hara.—NAGABA-MIZU-HIKI. Leaves narrower, ovate-oblong to broadly lanceolate; flowers and fruit slightly smaller.—Honshu (Izu).

2. *Polygonum plebeium* R. Br. *YAMBARU-MICHI-YANAGI*. Glabrous herb; stems procumbent, often rooting at the nodes, the branches with short internodes; leaves linear-oblong to lanceolate, 8–15(–20) mm. long, 1.5–3.5 mm. wide, rather thick, obtuse, subsessile, the sheaths hyaline, scarious, 2–2.5 mm. long, nearly nerveless, lacinate; perianth-segments about 2 mm. long; achenes trigonous, rhombic-ovoid, smooth, lustrous, dark brown, not exserted from the perianth.—Reported to occur in Kyushu (Yakushima).—Ryukyus, Formosa, s. China, and Malaysia to Australia.

3. *Polygonum polyneuron* Fr. & Sav. *P. gymnolepis* Fr. & Sav.; *P. propinquum* sensu auct. Japon., non Ledeb.—AKI-NO-MICHI-YANAGI, HAMA-MICHI-YANAGI. Glabrous annual; stems prominently striate, suberect, much-branched, with the branches rather thick; leaves oblanceolate to broadly so, 5–30

mm. long, 2–8 mm. wide, sometimes slightly glaucous, rather thick, subacute, slightly narrowed toward the base, subsessile, the upper leaves often much smaller and deciduous, the inflorescence then loosely spicate; sheaths 5–10 mm. long, rather many-nerved, lacinate; perianth-segments about 3 mm. long; achenes trigonous, exserted above, punctulate, dull.—Sept.–Oct. Sand dunes near seashores; Hokkaido, Honshu, Shikoku, Kyushu.

4. *Polygonum aviculare* L. *P. heterophyllum* Lindm.—MICHI-YANAGI. Glabrous annual; stems much-branched, prostrate to ascending, rarely suberect, 10–40 cm. long, slenderly striate; leaves narrowly oblong to linear-lanceolate, 1.5–4 cm. long, 3–12 mm. wide, membranous, usually green when dry, obtuse; sheaths lacinate, 5–10 mm. long, weakly nerved; perianth 2.5–3 mm. long, green, red at the apex; achenes trigonous, scarcely exserted or included, punctulate, dull.—May–Oct. Meadows and riverbanks in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Temperate regions of the N. Hemisphere.

5. *Polygonum tenuicaule* Biss. & Moore. *Bistorta tenuicaulis* (Biss. & Moore) Nakai.—HARU-TORA-NO-O. Glabrous, frequently stoloniferous perennial with short thick rhizomes; radical leaves few, long-petioled, oblong-ovate, 3–8 cm. long, 2–3 cm. wide, acuminate to acute, truncate to subrounded or shallowly cordate and abruptly decurrent to the petiole, membranous, sometimes slightly whitish beneath; scapes erect, 7–15 cm. long, 1- or 2-leaved or leafless; cauline leaves short-petioled or sessile, ovate or broadly so, sometimes ovate-cordate; sheaths brown, scarious; spike 2–3.5 cm. long, rather densely flowered, cylindric; perianth about 3 mm. long, white, slightly shorter than the stamens, as long as the pedicel; achenes slightly exserted, trigonous, lustrous; styles slender.—Apr.–June. Honshu, Shikoku, Kyushu.

6. *Polygonum viviparum* L. *MUKAGO-TORA-NO-O*. Usually glabrous erect perennial from short thick rather large rhizomes; stems 10–30 cm. long, with few leaves; radical leaves rather thick, long-petioled, linear-lanceolate to oblong-ovate, 2–10 cm. long, 8–25 mm. wide, subacute to obtuse, shallowly cordate to abruptly cuneate at base, slightly lustrous above and deep green, with fine veinlets, often glaucous beneath; spikes

solitary, 2-5 cm. long, cylindric, densely flowered, with bulbils on lower portion; flowers rose, about 3 mm. long, with slightly exerted stamens.—July-Oct. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Arctic and alpine regions of the N. Hemisphere.

7. *Polygonum hayachinense* Makino. *Bistorta hayachinensis* (Makino) Gross.—Nambu-tora-no-o. Glabrous perennial; stems erect, 10-30 cm. long, sparsely leafy, the sheaths to 3.5 cm. long; radical leaves rather firm, ovate to narrowly so, 3.8 cm. long, 15-35 mm. wide, obtuse to subacute, shallowly cordate to rounded at base, not decurrent to the petiole, rather lustrous above, often glaucous beneath; spikes solitary and terminal, ellipsoidal, densely flowered, 15-30 mm. long; perianth about 3.5 mm. long, about as long as the pedicel; stamens slightly exerted.—Aug. Alpine slopes; Honshu (Mount Hayachine in Rikuchu); very rare.

8. *Polygonum bistorta* L. *Bistorta vulgaris* Hill; *B. major* S. F. Gray.—Ibuki-tora-no-o. Glabrous perennial, sometimes white-pilose on the leaves underneath; rhizomes thick; stems 30-80 cm. long; radical leaves long-petioled, lanceolate to broadly so, 8-20 cm. long, 2-5 cm. wide, acuminate, the tip obtuse, truncate and broadly decurrent to the petiole, with rather prominent veinlets, deep green above, paler to glaucous beneath; the lower cauline leaves similar to the radical, but smaller, the upper ones cordate, with longer sheaths; spikes densely many-flowered, cylindric, 3-6 cm. long, the perianth pale pink or white, about 3 mm. long, the pedicels relatively long; stamens exerted; achenes about 3 mm. long, trigonous, lustrous.—July-Sept. Grassy slopes in highlands and subalpine regions; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—High mountains and temperate regions of the Old World.

9. *Polygonum suffutum* Maxim. *Bistorta suffulta* (Maxim.) Greene.—Kurin-yuki-fude. Perennial, glabrous or white-pilose on underside of leaves; rhizomes thickened, stems 20-40 cm. long; radical leaves membranous, long-petioled, broadly ovate, 5-10 cm. long, 3-7 cm. wide, abruptly acute to abruptly acuminate, cordate, glaucous beneath; cauline leaves 3-5, ovate-cordate, sessile and clasping, rather small, short-spicate from the axils; terminal spikes cylindric, 1-3 cm. long, rather densely flowered; perianth 2.5-3 mm. long, white; stamens exerted; achenes lustrous, slightly exerted.—Mountains; Honshu, Shikoku, Kyushu.—Korea and China.

10. *Polygonum perfoliatum* L. *Persicaria perfoliata* (L.) Gross.—Ishimi-kawa. Scandent glabrous annual; stems much elongate, branched, 1-2 m. long, retrorsely prickly; leaves deltoid, thinly membranous, retrorsely prickly on the nerves beneath, glaucous or pale green, 3-6 cm. long and as wide, acute to subacute, truncate to shallowly cordate, the margins sometimes minutely retrorsely scabrous, the petioles long, retrorsely prickly; sheaths scarcely tubular, the dilated leaflike limb orbicular, perfoliate, green; spikes short, 1-2 cm. long, subtended by an orbicular leaflike bract, the pedicels short; perianth 3-4 mm. long, pale greenish white, the segments broadly elliptic, becoming fleshy and blue in fruit; achenes inflated, obsoletely trigonous, black, lustrous, about 3 mm. long and as wide.—July-Oct. Wet thickets and along rivers in lowlands; Hokkaido, Honshu, Kyushu; common.—Korea, China, Malay Peninsula, and India.

11. *Polygonum senticosum* (Meissn.) Fr. & Sav. *Truellum japonicum* Houtt.; *Chylolalys senticosus* Meissn.; *Persicaria senticosa* (Meissn.) Gross.—Mamako-no-shiri-nu-

gui. Slender, puberulent, much-branched, scandent annual; stems 1-2 m. long, scabrous; leaves deltoid, 4-8 cm. long and as wide, acuminate, obtuse or subobtuse at the tip, broadly cordate, green, puberulous on both sides, the petioles retrorsely prickly; sheaths very short, membranous, the marginal limb clasping, reniform or subcordate; inflorescence somewhat capitate, densely several-flowered, reddish, long-peduncled, the pedicels very short, the perianth 3.5-4 mm. long, the segments elliptic; achenes ovoid-globose, inflated, obsoletely trigonous, dull, black, about 3 mm. long and as wide.—June-Sept. Thickets in lowlands and foothills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.

12. *Polygonum debile* Meissn. *P. debile* var. *triangularis* Meissn.; *Persicaria debilis* (Meissn.) Gross; *Persicaria triangularis* (Meissn.) Nakai.—Miyama-tani-soba. Soft glabrescent annual; stems ascending to erect, decumbent at base, branched, 10-30 cm. long, the nodes sometimes with soft very short retrorse prickles on the nodes, glabrous or puberulous; leaves cauline, deltoid, 2-4 cm. long and as wide, petiolate, the upper subsessile, thin, green, scattered coarsely pilose above and on the nerves beneath, short-ciliate, acuminate with an obtuse tip, truncate at base, the petioles not prickly; sheaths short, with a small dilated limb; inflorescence spicate or subcapitate, terminal and axillary, often forked, short-peduncled; flowers few, white, about 3 mm. long, the perianth-segments elliptic; achenes ovoid, trigonous, lustrous, brown, about 3 mm. long.—July-Oct. Damp woods in mountains; Honshu, Shikoku, Kyushu; rather common.

13. *Polygonum maackianum* Regel. *P. thunbergii* var. *maackianum* (Regel) Maxim.; *Persicaria maackiana* (Regel) Nakai.—Sade-kusa. Scandent or straggling annual, the entire plant minutely stellate-pubescent; stems ascending or sometimes suberect, decumbent at the base, branched, 40-100 cm. long, retrorsely prickly; leaves divided, petiolate, hastate, 4-7 cm. long, 3-7 cm. wide, cordate, the median lobe narrowly ovate, acuminate to acute, obtuse at tip, the lateral lobes similar but small, rather deflexed, the petioles and the nerves on underside of leaves retrorsely prickly; sheaths short, the orbicular green limb 5-15 mm. across; inflorescence pedunculate, few-flowered, cymose, the peduncles usually with stipitate glands, the pedicels very short; flowers reddish, 4-5 mm. long, the perianth-segments elliptic; achenes ovoid, trigonous, about 3.5 mm. long, lustrous, dark brown.—Aug-Oct. Wet places along ditches, riverbanks, and paddy fields on lowlands; Honshu, Shikoku, Kyushu; rather common.—Korea, China and Ussuri.

14. *Polygonum thunbergii* Sieb. & Zucc. *P. debile* var. *hastatum* Meissn.; *P. hastat trilobum* Meissn.; *P. stoloniferum* F. Schmidt; *Persicaria thunbergii* (Sieb. & Zucc.) Gross; *Persicaria stellatomentosa* Nakai.—Mizo-soba. Glabrous or pilose, very rarely stellate-pilose annual; stems elongate, erect from the decumbent base, 30-100 cm. long, retrorsely prickly, glabrous; leaves petiolate, the upper ones sessile, retrorsely prickly on the nerves beneath, hastate, coarsely pilose on both sides, 4-10 cm. long, 3-7 cm. wide, truncate to shallowly cordate, the midlobe ovate to broadly so, acuminate, subobtuse at the tip, the lateral (basal) lobes smaller, acute to obtuse, the petioles often narrowly winged, usually retrorse-prickly; sheaths 5-8 mm. long, obliquely truncate at apex, membranous, short-ciliate, rarely with a minute limb; inflorescence cymose, 10- to 20-flowered, the peduncles short-pubescent and stipitate-glandular, the pedicels very short; flowers

reddish or rarely pale green, 5–6 mm. long; achenes included, ovoid, trigonous, acute, yellow-brown, dull.—Aug.–Oct. Wet grassy places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable; possibly this species hybridizes with No. 13.—China, Korea, and Ussuri.

15. *Polygonum oreophilum* (Makino) Ohwi. *Polygonum thunbergii* var. *oreophilum* Makino; *Persicaria thunbergii* var. *oreophila* (Makino) Nemoto; *Persicaria oreophila* (Makino) Hiyama—YAMA-MIZO-SOBA. Stems slender, elongate, diffuse, loosely branched, sparsely retrorse-prickly, the internodes elongate; leaves thinly hairy on both sides, hastate, broadly ovate, truncate at base, the midlobe large, not contracted at base, the lateral ones spreading, deltoid or ovate-deltoid, acute or rather obtuse; petioles rather long, not winged; inflorescence terminal and axillary; achenes gray, lustrous.—Mountains; Honshu.

16. *Polygonum bungeanum* Turcz. *Persicaria bungeana* (Turcz.) Nakai; *Polygonum chanetii* Lév.—HARI-TADE. Annual; stems erect, branched, 20–60 cm. long, scantily short-prickly; leaves lanceolate, 5–10 cm. long, 1–2.5 cm. wide, acute to subobtuse, acute at base, short-pilose on the underside especially on nerves, the petioles 5–12 mm. long; sheaths 3–8 mm. long, membranous, slightly pilose; spikes 2–5 cm. long, very loosely flowered, the peduncles with stipitate glands; flowers pale green, slightly red-tinged, about 3 mm. long, on very short pedicels, the perianth-segments elliptic; achenes subglobose, much inflated, biconvex, black, scarcely lustrous, about 2.5 mm. long and as wide.—July–Sept. Sparsely naturalized in Honshu.—Korea, China, Ussuri, and Manchuria.

17. *Polygonum brevichreatum* Makino. *Persicaria brevichreata* (Makino) Ohki; *Persicaria ramosa* Nakai—NAGABA-NO-YA-NO-NEGUSA. Slender annual, 30–50 cm. high; stems elongate, branched, long-decumbent at the base, with rather hairlike retrorse prickles; leaves thin, broadly lanceolate, 3–7 cm. long, 1–2 cm. wide, acute to acuminate, subobtuse at tip, sagittate, green, glabrous, or scattered-strigose above, often loosely stellate-pubescent beneath on lower leaves, the basal lobules deltoid and obliquely deflexed, the petioles 2–10 mm. long, the sheaths tubular, slightly pilose, 3–4 mm. long, long-ciliate; spikes terminal and lateral, remotely 1- to 3-flowered, the peduncles short ascending-setose, often glandular; flowers pale green with a pale reddish tinge, 3–4 mm. long; achenes broadly ovoid-ellipsoidal, inflated-trigonous, about 3 mm. long, yellow-brown, lustrous.—Aug.–Oct. Shaded grassy places in foothills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea.

18. *Polygonum hastatoauriculatum* Makino. *P. auriculatum* Makino, non Meissn.; *Persicaria hastatoauriculata* (Makino) Nakai—HOSABA-NO-UNAGI-TSUKAMI. Annual; stems elongate, 30–80 cm. long, ascending or erect from long-decumbent slender branching base, striate, with loose retrorse prickles; lower leaves petiolate, the upper thinly chartaceous, sessile to short-petiolate, hastate, lanceolate to narrowly so, 4–8 cm. long, 5–15 mm. wide, gradually narrowed above to an obtuse tip, cordate, the lobules deflexed auriculate on each side, the margin scabrous, the sheaths scarios, glabrous, 1–1.5 cm. long, often lobed on one side; spikes 1–3 cm. long, interruptedly 3- to 5-flowered, the peduncles stipitate-glandular; flowers reddish, 2.5–3 mm. long; achenes orbicular, inflated-biconvex or obtusely trigonous, about 2 mm. long; achenes

orbicular, inflated-biconvex, or obtusely trigonous, about 2 mm. long, pale, dull.—Aug.–Nov. Wet places; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—s. Korea and Ryukyu.

19. *Polygonum sieboldii* Meissn. *P. sagittatum* sensu auct. Japon., non L.; *P. sagittatum* var. *sieboldii* (Meissn.) Maxim.; *P. anguillanum* Koidz.; *Persicaria sieboldii* (Meissn.) Ohki—UNAGI-TSUKAMI. Glabrous annual; stems slender, angled, ascending to erect, decumbent and branched at the base, often prominently retrorse-prickly, 20–100 cm. long; leaves rather thin, broadly lanceolate or narrowly ovate-oblong, 4–8 cm. long, 1.5–3 cm. wide, obtuse to subacuminate and obtuse at the tip, slightly glaucous, glabrous on both sides, deeply cordate; stipules scarios, 5–10 mm. long, glabrous, obliquely cut; spikes globose to ovoid-globose, densely flowered, about 10 mm. long, the peduncles slender, glabrous, the pedicels very short; flowers slightly reddish, 3–3.5 mm. long; achenes obtusely trigonous, ovoid-globose, nearly lustreless, black, about 3 mm. long.—June–Sept. Wet grassy places in lowlands.—Hokkaido, Honshu.—Korea, China, Manchuria, and e. Siberia.

Var. *sericeum* Nakai. *Persicaria sieboldii* var. *tomentosa* Hara—KE-AKI-NO-UNAGI-TSUKAMI. Leaves and sometimes the peduncles pilose.—Hokkaido, Honshu; rare.—Korea.

20. *Polygonum hastatosagittatum* Makino. *Persicaria hastatosagittata* (Makino) Nakai; *Polygonum strigosum* var. *hastatosagittatum* (Makino) Steward—NAGABA-NO-UNAGI-TSUKAMI. Annual; stems slender, elongate, from decumbent branching base, 30–80 cm. long, scattered retrorse-prickly; leaves narrowly ovate-oblong to lanceolate, subacuminate, truncate to shallowly cordate at base, the lower corners (lobes) rounded or deltoid to subhastate, the nerves beneath retrorse-prickly, antorsely scabrous-setulose on upper margin, retrorsely so on lower margin, the petioles usually retrorse-prickly, the sheaths scarios, tubular, 2–3.5 cm. long, truncate, ciliate; spikes globose to broadly ovoid, few toward the ends of the branches, densely rather many-flowered, 1–1.5 cm. long, the peduncles short-pubescent and glandular-pilose; flowers about 3 mm. long, the pedicels 3–5 mm. long, often glandular-pilose, longer than the bracts; achenes ovoid, trigonous, lustrous, deep brown, about 3 mm. long.—Sept.–Oct. Wet grassy places in lowlands; Honshu, Kyushu; rather common.

21. *Polygonum nipponense* Makino. *P. hastatosagittatum* var. *latifolium* Makino; *Persicaria nipponensis* (Makino) Gross—YA-NO-NEGUSA. Closely allied to the preceding; leaves broader, oblong to elliptic-ovate, abruptly acute, 5–8 cm. long, 2.5–4.5 cm. wide, truncate to shallowly cordate at base without a distinct lobe on lower margin; flowers with pedicels 1–2 mm. long, shorter than the flowers.—Sept.–Oct. Wet grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea.

22. *Polygonum nepalense* Meissn. *P. alatum* var. *nepalense* (Meissn.) Hook. f.; *Persicaria nepalensis* (Meissn.) Miyabe; *Polygonum quadrifidum* Hayata; *P. lyratum* Nakai—TANI-SOBA. Annual; stems branched and decumbent below, 30–50 cm. long, glabrous, the nodes with fleshy retrorse hairs; leaves petiolate or sessile, ovate-deltoid, gradually acute, 1.5–5 cm. long, 1–3 cm. wide, rounded to truncate and abruptly decurrent on the winged petiole, scattered pilose and with a yellowish sessile discoid gland beneath, glabrous above, the sheaths thinly membranous, 4–8 mm. long, nearly nerveless; spikes globose, terminal and axillary, densely flowered, with a

leaflike bract at base, the peduncles short, often with stipitate glands on the upper parts; flowers white, 2.5–3 mm. long; achenes black, biconvex, orbicular, about 1.5 mm. across, impressed-punctulate, dull.—Aug.–Oct. Damp woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, China, Formosa, and India.

23. *Polygonum chinense* L. *P. chinense* var. *thunbergii* Meissn.; *Rumex umbellatus* Houtt.; *Persicaria umbellata* (Houtt.) Nakai.—TSURU-SOBA. Perennial herb; stems elongate, much branched, glabrous, sometimes scandent; leaves broadly ovate to oblong-ovate, 4–10 cm. long, 3–6 cm. wide, glabrous or with few rather fleshy hairs on nerves beneath, abruptly acuminate to acute, truncate at base, the petioles short, the sheaths membranous, obliquely truncate, nerved, 1–1.5 cm. long; inflorescence globose, an erect terminal panicle, densely 10- to 20-flowered, 6–10 mm. across, the peduncles often with scattered fleshy hairs; flowers white, the perianth-segments about 3 mm. long, slightly accrescent, to 4 mm. long after flowering, slightly fleshy; achenes glabrous, black, trigonous, ovoid-globose, about 2.5 mm. long, dull.—Thickets and hedges in lowlands and hills; Honshu (Izu Isls., Kii Prov. and Chūgoku Distr.), Shikoku, Kyushu; common southw.—China, Ryukyus, and Formosa.

24. *Polygonum orientale* L. *P. orientale* var. *pilosum* (Roxb.) Meissn.; *P. pilosum* Roxb.; *Amblygonum pilosum* (Roxb.) Nakai.—Ō-KE-TADE. Prominently spreading-pilose annual; stems rather stout, erect, much branched, 1–1.5 m. long; leaves broadly ovate to ovate-cordate, 10–20 cm. long, 7–15 cm. wide, short-acuminate, cordate or the upper ones subrounded at base, long-petiolate, the sheaths tubular, membranous, pilose, 7–30 mm. long, somewhat wing-margined; inflorescence branched, the flower spikes rather dense, peduncled, nodding to pendulous, 5–12 cm. long; flowers red to pink, 3–4 mm. long; achenes orbicular, about 3 mm. long, dull, compressed.—Cultivated and often naturalized.—China, India, and Malaysia.

25. *Polygonum viscosum* Hamilt. *Persicaria viscosa* (Hamilt.) Gross.—NIOI-TADE. Annual; stems erect, branched above, 40–120 cm. long, coarsely long-hairy and short stipitate-glandular; leaves short-petiolate, lanceolate to deltoid-lanceolate, gradually acuminate, cuneate to rather abruptly narrowed at base, 7–15 cm. long, 1.5–4 cm. wide, often with sessile discoid glands on the upper side or on both sides, the sheaths tubular, pilose, 7–15 mm. long; spikes 3–5 cm. long, densely many-flowered, the peduncles and bracts long-hairy and short-stipitate glandular; flowers reddish, 2.5–3 mm. long; achenes black-brown, trigonous, 2.5–3 mm. long, broadly ovoid.—Aug.–Oct. Honshu, Shikoku, Kyushu.—Korea, China, and India.

26. *Polygonum amphibium* L. *Persicaria amphibia* (L.) S. F. Gray; *Persicaria amurensis* (Korsh.) Nieuwl.; *Polygonum amphibium* var. *amurense* Korsh. and var. *vestitum* Hemsl.—EZO-NO-MIZU-TADE. Perennial herb with creeping rhizomes; stems elongate, glabrous, slightly branched in the floating form, short and ascending in the terrestrial form; floating leaves oblong, 5–15 cm. long, 2–6 cm. wide, glabrous, lustrous above, red-brown when dried, obtuse to rounded with a mucro at apex, shallowly cordate at base, the lateral nerves rather numerous, spreading, the petioles rather long, the sheaths membranous, glabrous; spikes axillary, 2–4 cm. long, pedunculate, often branched below, cylindric, erect, densely many-flowered; flowers reddish, 3–4 mm. long, the

pedicels longer than the bracts; achenes black-brown, biconvex, suborbicular, about 2.5 mm. long, slightly lustrous.—June–Sept. Ponds and shallow lakes; Hokkaido, Honshu (Mutsu and Ugo Prov.).—Temperate regions of the N. Hemisphere.

27. *Polygonum lapathifolium* L. *P. nodosum* Pers.; *Persicaria nodosa* (Pers.) Opiz; *Polygonum tenuiflorum* Presl; *P. komarovii* Lévl.—Ō-INU-TADE. Annual; stems rather stout, much-branched, erect, glabrous, 50–120 cm. long, reddish, the nodes swollen; leaves lanceolate, 7–20 cm. long, 1.5–5 cm. wide, acuminate, acute at base, often red-brown when dried, with minute strigose hairs on both sides especially on nerves and on margin, the lateral nerves 20 to 30 pairs, the petioles short; sheath tubular, slenderly nerved, glabrous or rarely short-ciliate, 1–2 cm. long; spikes many, cylindric, nodding or pendulous, densely many-flowered, 4–10 cm. long; flowers about 2.5 mm. long, white or reddish, the perianth-segments 4, the lateral nerves of the 2 outer segments distinct, dichotomously forked in 2 recurved branches; achenes flat, suborbicular, lustrous, deep brown, 1.5–2 mm. across.—June–Nov. Sunny grassy places and waste grounds in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Temperate regions of the N. Hemisphere.

28. *Polygonum scabrum* Moench. *P. lapathifolium* L. pro parte; *P. tomentosum* Schrank, non Willd.; *P. incanum* F. W. Schmidt.—SANA-E-TADE. Closely resembling No. 27, but smaller; stems 20–60 cm. long, slightly branched; leaves narrowly lanceolate to narrowly ovate, 5–12 cm. long, 0.8–3.5 cm. wide, obtuse to subacute, scabrous, also appressed pilous on midrib on both sides and on margin, the lateral nerves 7 to 15 pairs, ascending, arcuate, the petioles short; sheaths membranous, tubular, 7–15 mm. long; spikes ellipsoidal to short-cylindric, 1–4 cm. long, erect, densely many-flowered; flowers white or reddish, about 3 mm. long, the perianth-segments nearly as long as the achenes; achenes flat, orbicular, lustrous, dark brown, 2–3 mm. across.—May–Oct. Grassy sunny places and waste grounds in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Temperate and warmer regions of the N. Hemisphere.

29. *Polygonum japonicum* Meissn. *Persicaria japonica* (Meissn.) Gross.—SHIROBANA-SAKURA-TADE. Dioecious perennial herb with long creeping rhizomes; stems erect, 60–100 cm. long, sparingly branched, glabrescent to slightly appressed-pilose; leaves rather thick and firm, lanceolate, 7–12 cm. long, 1–2 cm. wide, acuminate at both ends, strigose above especially toward the margin and on the nerves beneath, the lateral nerves 15 to 25 pairs, the petioles very short; sheaths tubular, nerved, truncate at apex, membranous, with rather firm bristly cilia 8–15 mm. long; spikes terminal, few to several, linear or narrowly cylindric, 7–12 cm. long, nodding, loosely to rather densely many-flowered, the pedicels distinct, the perianth white, sometimes greenish below in fruit, 3–4 mm. long; stamens shorter than the style in pistillate flowers; styles 2 or 3; achenes lenticular or compressed-trigonous, lustrous, elliptic-ovate, 2–2.5 mm. long.—Aug.–Oct. Wet grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—s. Korea, Ryukyus, and China.

30. *Polygonum conspicuum* (Nakai) Nakai. *P. japonicum* var. *conspicuum* Nakai; *Persicaria conspicua* (Nakai) Nakai; *Polygonum sterile* Nakai; *Persicaria sterilis* (Nakai) Nakai.—SAKURA-TADE. Closely resembles the preceding; stems less branched; spikes solitary to few; flowers larger, more loosely arranged, reddish, the perianth-segments 4–6 mm. long,

more widely spreading; achenes compressed-trigonal, dull. —Aug.-Oct. Wet sunny places in lowlands; Honshu, Shikoku, Kyushu; rather common. —Korea.

31. Polygonum hydropiper L. *Persicaria hydropiper* (L.) Spach; *Persicaria vernalis* Nakai—YANAGI-TADE, MATSUDA. Annual; stems often profusely branched, erect, 40–80 cm. long, glabrous; leaves lanceolate to narrowly ovate, 3–12 cm. long, 1–3 cm. wide, acuminate to obtuse, acute at base, short-petiole, essentially glabrous, slightly scabrous on margin, the underside with obscure impressed discoid glands; sheaths short-tubular, membranous, glabrous, ciliate; spikes slender, narrow, nodding, 5–10 cm. long, sometimes shorter and included within the sheath, loosely flowered, the bracts usually sparingly short-ciliate; perianth green-yellow, reddish on the upper portion, 2.5–4 mm. long; achenes flattened, black, punctulate, dull, ovate to ovate-orbicular, 2–3 mm. long. —Aug.-Oct. Wet places in lowlands and hills, especially along rivers and streams; Hokkaido, Honshu, Shikoku, Kyushu; very common and exceedingly variable. —Widely distributed in the N. Hemisphere. —Cv. *Fastigiatum*. *P. hydropiper* var. *fastigiatum* Makino; *P. fastigiatum* Makino; *P. maximowiczii* Regel; *P. hydropiper* var. *maximowiczii* (Regel) Makino—AZABU-TADE. Slender cultivar with narrow, smaller leaves and flowers; achenes about 1.5 mm. long; used as flavoring. —Forma *angustissimum* Makino. ITO-TADE. Very slender phase with nearly linear leaves. —Forma *gramineum* (Meissn.) Ohwi. *P. gramineum* Meissn. —SATSUMA-TADE. Allied to *f. angustissimum*; the petioles 1–2.5 cm. long, distinct.

32. Polygonum pubescens Bl. *P. flaccidum* sensu auct., non Roxb.; *Persicaria rotleri* Hara, excl. syn.; *Persicaria flaccida* Nakai, excl. syn. —BONTOKU-TADE. Annual; stems erect, branched, 40–80 cm. long, glabrous or appressed short-pubescent; leaves lanceolate to broadly so, 5–10 cm. long, 1–2.5 cm. wide, acuminate, gradually narrowed below to the short petiole, appressed short-pubescent, at least on the nerves beneath, often dark blotched on the middle above, and with scattered, obscure, impressed glands, the sheaths tubular, membranous, 8–13 mm. long, short-pilose, with cilia 3–8 mm. long; spikes narrowly linear, nodding, loosely flowered, 5–10 cm. long, the bracts strigose-ciliate; flowers about 3 mm. long, the perianth-segments green on the lower half, reddish on upper half, glandular-dotted; achenes about 2 mm. long, trigonous, ovoid, black, punctulate, lustreless. —Sept.-Oct. Wet places; Honshu, Shikoku, Kyushu; common. —Korea, China, Formosa, Ryukyu, Malaysia, and India.

33. Polygonum viscoferum Makino. *Persicaria viscofera* (Makino) Gross—NEBARI-TADE. Annual with long ascending coarse hairs; stems simple or branched at base, erect, rather thick, 40–80 cm. long; leaves lanceolate or broadly so, 4–10 cm. long, 1–2 cm. wide, acuminate, obtuse to subacute at the subsessile base; sheaths tubular, 5–10 mm. long, ciliate; spikes several to more than 10, erect, 3–5 cm. long, rather densely many-flowered, the peduncles on the upper part and the upper internodes viscid; flowers greenish or rarely with a reddish tinge, pedicellate, about 2 mm. long; achenes black, lustrous, trigonous, obovoid, 1.8–2 mm. long. —July-Sept. Waste ground in hills and foothills; Hokkaido, Honshu, Shikoku, Kyushu. —Ryukyu and Korea.

Var. *robustum* Makino. *P. makinoi* Nakai; *Persicaria makinoi* (Nakai) Nakai; *Polygonum excurrans* Steward—ŌNEBARI-TADE. Relatively large, erect, less hairy, loosely

pilose and appressed short-strigose on leaves above or toward margin; flowers greenish. —Waste ground in hills and low mountains; Hokkaido, Honshu, Kyushu. —Korea.

34. Polygonum persicaria L. *Persicaria vulgaris* Webb & Moq.; *Persicaria mitis* auct. Japon., non Gilib. —HARU-TADE. Erect annual 20–50 cm. high; stems rather soft, the branches ascending at base, glabrous or often pubescent; leaves lanceolate or broadly so, 6–12 cm. long, 1–3 cm. wide, obtuse, acute at base, loosely short-pilose or glabrous except on the nerves and margin, short-petioled, the lateral nerves not prominent, 7 to 10 pairs, the sheaths thin-membranous, 3–10 mm. long, glabrescent, with cilia 1–2 mm. long; spikes few, terminal, cylindric, erect, 2–5 cm. long, densely many-flowered, the peduncles sometimes loosely glandular-pilose; flowers reddish, 2.5–3 mm. long, the perianth-segments with very slender nerves; achenes ovate-orbicular, compressed or trigonous, black-brown, lustrous, about 2 mm. long. —May-June (Oct.). Hokkaido, Honshu, Shikoku, Kyushu; rather common. —Eurasia and N. America.

35. Polygonum caespitosum Bl. var. *laxiflorum* Meissn. *P. yokusaianum* Makino; *Persicaria yokusaiana* (Makino) Nakai; *Polygonum caespitosum* subsp. *yokusaianum* (Makino) TADE—HANA-TADE. Slender, decumbent, branched, glabrescent annual; leaves thinly membranous, ovate to narrowly so, sometimes broadly lanceolate, 3–7 cm. long, 1.5–3 cm. wide, abruptly acuminate, caudate at tip, vivid green, loosely ascending-pilose above and on nerves beneath, short-petiole; sheaths 3–8 mm. long, tubular, the cilia about as long as the sheath; spikes several, linear, 3–10 cm. long, loosely flowered, often interrupted; flowers clear pinkish, 2–3 mm. long; achenes dark brown, lustrous, trigonous, ovoid, about 2 mm. long. —Aug.-Sept. Woods in foothills; Hokkaido, Honshu, Shikoku, Kyushu; rather common. —Korea and China. The typical phase occurs in Formosa and Malaysia.

36. Polygonum longisetum de Bruyn. *P. blumei* Meissn.; *P. kinashii* Lévl. & Van't.; *Persicaria longiseta* (de Bruyn) Kitag.; *Persicaria blumei* (Meissn.) Gross—INU-TADE. Annual, usually more or less pubescent; stems erect or ascending, branched, decumbent at base, glabrous; leaves broadly lanceolate to narrowly oblong-ovate, deep green, 4–8 cm. long, 1–2.5 cm. wide, gradually narrowed and obtuse at tip, acute at base, glabrous or appressed short-pilose above and on nerves beneath, short-petiole; sheaths 5–10 mm. long, the cilia about as long as the sheath; spikes several, terminal, cylindric, rather densely many-flowered, erect; flowers reddish, 2–2.5 mm. long; achenes black-brown, lustrous, trigonous, ovoid, 1.8–2.2 mm. long. —July-Nov. Wet, grassy, sunny places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common. —Korea, China, Ryukyu, and Malaysia. —Forma *albiflorum* (Makino) Ohwi. *P. blumei* var. *albiflorum* Makino—SHIROBANA-ITU-TADE. A rare phase with white flowers.

37. Polygonum kawagoeanum Makino. *Persicaria kawagoeana* (Makino) Nakai; *Polygonum minus* subsp. *procerum* Danser—SHIMA-HIME-TADE. Annual, 30–60 cm. high; stems somewhat tufted, erect from branched decumbent base, usually red-brown, slender, with slightly thickened nodes; leaves linear-lanceolate or broadly linear, 4–8 cm. long, 4–8 mm. wide, acute or gradually acuminate, obtuse to acute at base, reddish brown tinged, glabrescent or appressed-pilose on both sides, often with sessile discoid glands beneath, sessile or short-petiole; sheaths 5–13 mm. long, appressed-pilose, the

cilia rather elongate; spikes cylindric, 2-3 cm. long, densely many-flowered, erect; flowers about 1.5 mm. long, green with a red tinge; achenes broadly obovoid, black-brown, lustrous, lenticular, about 1.2 mm. long.—Aug.-Oct. Wet places; Honshu (Kazusa Prov.), Kyushu; rather rare.—Ryukyus.

38. *Polygonum foliosum* H. Lindb. var. *paludicola* (Makino) Kitam. *Persicaria foliosa* var. *paludicola* (Makino) Hara; *Persicaria paludicola* (Makino) Nakai—YANAGI-NUKABO. Usually a more or less reddish annual, 30-60 cm. high; stems slender, elongate, branched above, decumbent at base; leaves broadly linear or narrowly lanceolate, 4-8 cm. long, 3-7 mm. wide, gradually acuminate to acute, nearly sessile or very short-petiolate, sparsely short-appressed pilose on upper side, on the margins and on nerves beneath, often with sessile discoid glands beneath; sheaths 5-10 mm. long, short-pilose, the cilia rather short; spikes rather many, linear, terminal and lateral, loosely flowered, 3-5 cm. long, nodding; flowers green with a red tinge, 1.5-1.8 mm. long; achenes lenticular, elliptic, about 1.5 mm. long, lustrous, black-brown.—Sept.-Oct. Wet places in abandoned paddy fields, on riverbanks and along ditches; Hokkaido, Honshu, Kyushu.—Korea. The typical phase occurs in Eurasia.

Var. *nikaii* (Makino) Kitam. *P. nikaii* Makino; *P. paludicola* var. *nikaii* Makino; *Persicaria foliosa* var. *nikaii* (Makino) Hara; *P. nikaii* (Makino) Nakai—SAIKOKU-NUKABO. Spikes very loosely flowered; flowers compressed, 2-2.5 mm. long.—Sept.-Oct. Wet places; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China.

39. *Polygonum trigonocarpum* (Makino) Kudo & Masam. *P. minus* forma *trigonocarpum* Makino; *Persicaria trigonocarpa* (Makino) Nakai—HOSOBABO. Slender annual; stems loosely branched, 30-50 cm. long, reddish brown, glabrous; leaves narrowly lanceolate to linear, 3-7 cm. long, 4-8 mm. wide, gradually narrowed and acute at apex and at base, short appressed-pilose, especially on nerves and on margin, with sessile discoid glands beneath, the petioles very short; sheaths 5-12 mm. long, appressed-pilose and rather long-ciliate; spikes narrowly cylindric, 2-3 cm. long, densely rather many-flowered; flowers 2-2.2 mm. long, reddish, the perianth often with a few sessile glands; achenes trigonous, ovoid, lustrous, about 1.8 mm. long.—Sept.-Oct. Wet places; Hokkaido, Honshu.

40. *Polygonum erectominus* Makino. *Persicaria erectominor* (Makino) Nakai—HIME-TADE. Annual; stems loosely branched, erect from decumbent or ascending, geniculate base, loosely rather few-leaved; leaves broadly linear to narrowly lanceolate, 3-8 cm. long, 5-10 mm. wide, subacute or acuminate, obtuse at the tip, vivid to pale green, sometimes purplish beneath, glabrous on upper side, the margin pilose, loosely short-pilose on the nerves beneath, short-petiolate; sheaths 5-12 mm. long, appressed-pilose and short-ciliate, pale green, thinly membranous; spikes erect, short-cylindric, 1.5-2 cm. long, many-flowered, interrupted below; flowers glaucous, red, about 2 mm. long; achenes broadly ovoid-ellipsoidal, black, lustrous, trigonous, 1.5-2 mm. long.—May-Oct. Wet places along rivers and margins of ponds in lowlands; Honshu, Shikoku, Kyushu; rather rare.—Korea and China.

41. *Polygonum taquetii* Lév. *Persicaria taquetii* (Lév.) Koide; *Polygonum minutulum* Makino; *Persicaria minutula* (Makino) Nakai; *Polygonum taquetii* var. *minutulum* (Makino) Ohwi—NUKABO-TADE. Slender ascending to decumbent annual 20-40 cm. high; stems branched especially

below, sometimes scattered appressed-pilose, pale green or pale brown-yellow; leaves thin, lanceolate to broadly linear, 2-5 cm. long, 3-7 mm. wide, obtuse to subacute, narrowed to a subsessile base, usually pale green, nearly glabrous to scattered appressed-pilose on both sides; sheaths 3-8 mm. long, pale green, appressed pilose and rather short-ciliate; spikes linear or filiform, often branching below, nodding or pendulous, terminal and axillary, very loosely or remotely flowered, 2-4 cm. long, on capillary peduncles; flowers pale green and rose tinged, 1.5-2 mm. long; achenes ovate, trigonous or lenticular, deep brown, 1.5-1.7 mm. long.—Sept.-Oct. Wet sandy places along rivers in lowlands; Honshu, Shikoku, Kyushu.—Korea.

42. *Polygonum ajanense* (Regel & Tiling) Grig. *P. polymorphum* var. *ajanense* Regel & Tiling; *Pleuropterypyrum ajanense* (Regel & Tiling) Nakai—HIME-TWA-TADE. Glabrous or pubescent perennial; stems flexuous, erect, sometimes branched, 10-30 cm. long, with ascending branches; leaves lanceolate or broadly so, 3-6 cm. long, 4-10 mm. wide, obtuse or acute, gradually narrowed below to the sessile base; sheaths scarious; inflorescence rather densely flowered, forming a terminal nodding panicle; flowers pale green, 3-4 mm. long; achenes included in the perianth, acutely trigonous, brown, lustrous, ovoid, about 3.5 mm. long.—July-Aug. Alpine gravelly and sandy slopes; Hokkaido; rare.—s. Kuriles, Sakhalin, n. Korea, and e. Siberia.

43. *Polygonum nakaii* (Hara) Ohwi. *Pleuropterypyrum nakaii* Hara; *P. japonicum* Nakai, excl. syn.—OYAMASOBA. Rhizomatous loosely tufted perennial; stems erect, spreading, flexuous, 20-40 cm. long, glabrous, rather stout, profusely branched; leaves ovate to broadly so, 4-12 cm. long, 2-5 cm. wide, acute to acuminate, rounded to broadly cuneate at base, slightly pubescent, soon glabrate, very shortly petiolate or subsessile; sheaths membranous, long scattered-pubescent or glabrate; spikes erect, terminal, densely many-flowered, paniculate, much-branched below; flowers pale green, 3-4 mm. long; achenes slightly longer to as long as the perianth, acutely trigonous, dark yellow-brown, broadly ovoid, 3-3.5 mm. long, lustrous.—July-Sept. Alpine gravelly to sandy slopes; Hokkaido (Hidaka Prov.), Honshu (centr. distr. and northw.).

44. *Polygonum weyrichii* F. Schmidt. *Pleuropterypyrum weyrichii* (F. Schmidt) Gross—URAJIRO-TADE. Rhizomes rather thick; stems slightly flexuous, erect, stout, 30-100 cm. long, soft-pubescent, branched above; leaves broadly to narrowly ovate, 8-17 cm. long, acuminate, rounded to cuneately rounded at base, appressed-pubescent above, densely white-tomentose beneath, the petioles distinct, usually 1-4 cm. long in the lower ones; sheaths pubescent, rather long; inflorescence paniculate, large, soft-pubescent, much-branched; flowers 2-2.5 mm. long, pale yellow-green; achenes somewhat membranous, broadly ellipsoidal, lustrous, brown, about 8 mm. long, 3 or 4 times as long as the perianth.—July-Aug. Hokkaido (gravelly places near seashores and on alpine slopes), Honshu (alpine slopes of n. and centr. distr.).—s. Kuriles and Sakhalin.

Var. *alpinum* Maxim. *P. paniculatum* sensu Fr. & Sav., non Bl.; *P. savatieri* Nakai; *Pleuropterypyrum savatieri* (Nakai) Koide; *P. alpinum* (Maxim.) Koide.—ON-TADE. Less densely pubescent, green beneath.—Alpine gravelly or sandy slopes; Hokkaido, Honshu (n. and centr. distr.).—s. Kuriles and Sakhalin.

45. *Polygonum convolvulus* L. *Bilderdykia convol-*

vulus (L.) Dumort.—SOBA-KAZURA. Minutely pilose-papillose annual; stems slender, scandent, 40–100 cm. long; leaves sagittate-cordate, 3–4.5 cm. long, 2.5–4.5 cm. wide, acute to acuminate, cordate at the base, the petioles 1–5 cm. long; sheaths obliquely truncate, 2–5 mm. long; flowers in loose terminal panicles and in small axillary fascicles, greenish, about 3.5 mm. long in fruit, wingless; achenes ovoid, dull, punctulate, enclosed in the perianth, acutely trigonous, about 3 mm. long.—June–Sept. Naturalized; Hokkaido, Honshu, Kyushu.—Eurasia.

46. *Polygonum dentatoalatum* F. Schmidt. *P. scandens* var. *dentatoalatum* (F. Schmidt) Maxim.; *Bilderdykia scandens* var. *dentatoalata* (F. Schmidt) Nakai.—ŌTSURU-ITADORI. Minutely pilose-papillose annual; stems scandent, slender, elongate, sometimes more than 1 m. long; leaves 3–6 cm. long, 2.5–4 cm. wide, acute to short-acuminate, cordate, the basal lobes rounded, the petioles 1–6 cm. long; sheaths short; flowers in short terminal and lateral spikes, or in fascicles in leaf-axils, rather long-pedicellate; fruit obovoid inclusive of the wing, decurrent on the pedicel, about 10 mm. long, pale green, accrescent after anthesis, the outer 3 perianth-segments winged on the back; achenes black, trigonous, cordate, about 4 mm. long, rather lustrous.—Aug.–Oct. Hokkaido, Honshu (Kinki Distr. and eastw.).—Sakhalin.

47. *Polygonum dumetorum* L. *Bilderdykia dumetorum* (L.) Dumort.; *B. pauciflora* Nakai, excl. syn.—TSURUTADE. Closely resembles the preceding; leaves subsagittate-ovate, often long-acuminate, cordate, the lobes subacute; fruit ellipsoidal to subglobose inclusive of the wings, 5–7 mm. long, slightly and abruptly decurrent below on the relatively short pedicel; achenes black, slightly lustrous, about 2.7 mm. long.—July–Sept. Hokkaido, Honshu, Kyushu (Tsushima).—Eurasia.

48. *Polygonum multiflorum* Thunb. *Pleuropteris cordatus* Turcz.—TSURU-DOKUDAMI. Scandent dioecious perennial herb from relatively thick rhizomes, minutely pilose-papillose; stems much-elongate, branched, scandent, 1–2 m. or longer; leaves ovate-cordate, 3–6 cm. long, 2.5–4.5 cm. wide, short-acuminate, with rounded lower margins, rather long-petiolate; sheaths rather short; spikes branched, terminal, paniculate; flowers white, small, 1.5–2 mm. long, accrescent after anthesis; fruit broadly obovate to suborbicular, 7–8 mm.

long, the 3 prominent wings abruptly decurrent below on the pedicel; achenes dark brown, lustrous, acutely trigonous, about 2.5 mm. long.—Sept.–Oct. Naturalized in our area.—China.

49. *Polygonum cuspidatum* Sieb. & Zucc. *Reynoutria japonica* Houtt.; *P. confertum* Hook. f.; *P. zuccarinii* Small; *Pleuropteris zuccarinii* (Small) Small; *Polygonum reynoutria* Makino; *Pleuropteris cuspidatum* (Sieb. & Zucc.) Gross; *R. yabeanana* Honda; *R. uzenensis* (Honda) Honda; *R. japonica* var. *uzenensis* Honda; *R. hastata* Nakai; *Polygonum sieboldii* de Vries, non Meissn.—ITADORI. Rather stout dioecious perennial herb with thick rhizomes; stems ascending from an erect base, 50–150 cm. long, hollow, branched above; leaves broadly ovate to ovate-elliptic, 6–15 cm. long, short acuminate, pale green, usually papillose to short-pilose beneath, usually truncate at base, the petioles 1–3 cm. long; sheaths thinly membranous; spikes branched, numerous, terminal, paniculate; flowers densely arranged, white, 2.5–3 mm. long, the pistillate accrescent after anthesis; fruit with the outer perianth-segments winged on back, 6–10 mm. long, subcuneate at base; achenes ovate-elliptic, 2–2.5 mm. long, black-brown, lustrous, acutely trigonous.—July–Oct. Sunny places in hills and high mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Korea, China, and Formosa.

Var. *compactum* (Hook. f.) Bailey. *P. compactum* Hook. f.; *P. sieboldii* var. *compactum* (Hook. f.) Bailey.—MEIGETSU-SŌ. A dwarf alpine phase often tinged with red.

Var. *terminale* (Honda) Ohwi. *Reynoutria japonica* var. *terminalis* Honda; *R. hachidyoensis* var. *terminalis* Honda—HACHIGO-ITADORI. Leaves larger, lustrous.—Honshu (Izu Isls.).

50. *Polygonum sachalinense* F. Schmidt. *Reynoutria sachalinensis* (F. Schmidt) Nakai; *R. sachalinensis* var. *brachyphylla* Honda; *R. brachyphylla* (Honda) Nakai.—ŌITADORI. Resembles the preceding but stouter, glaucous, not papillose; stems 1–2 m. long; leaves 15–30 cm. long, 10–20 cm. wide, glaucous beneath, glabrous, cordate; inflorescence densely pubescent; fruit cuneate-obovate; achenes ovate, about 3 mm. long.—Aug.–Sept. Along ravines and streams in mountains; Hokkaido, Honshu (Japan Sea side of center. and n. distr.); rather common.—Sakhalin and s. Kuriles.

Fam. 79. CHENOPODIACEAE AKAZA KA Goosefoot Family

Herbs, rarely shrubs (sometimes fleshy); leaves alternate, occasionally opposite, simple, the stipules absent, rarely minute; inflorescence various, in axillary fascicles, or the fascicles arranged on panicle branches; flowers small, bracteate or bractless, bisexual or unisexual (plants sometimes polygamous), greenish, actinomorphic; perianth-segments 2–5, free or connate at base, sometimes absent; stamens 2–5, opposite the segments; ovary usually superior, free from the perianth, 1-locular; ovules solitary, amphitropous; styles 1–3; fruit a nutlet enclosed by an uricle, the embryo annular or spirally coiled.—About 100 genera, with about 1,500 species, cosmopolitan, especially abundant in drier regions.

1A. Leaves flat; embryo annular, usually with copious endosperm in the center.

2A. Flowers bisexual, in fascicles or in panicles; sepals distinct, persistent; testa crustaceous.

3A. Sepals without wings. 1. *Chenopodium*

3B. Sepals with a horizontal wing on back. 2. *Kochia*

2B. Flowers unisexual, the pistillate without a perianth, with 2 large bracts. 3. *Atriplex*

1B. Leaves linear, terete or scalelike; embryo spirally coiled; endosperm absent or scanty.

4A. Stems jointed; leaves opposite, scalelike; embryo conduplicate. 4. *Salicornia*

4B. Stems not jointed; leaves alternate, linear to terete; embryo spiral.

5A. Leaves not spine-pointed; sepals not winged on back. 5. *Suaeda*

5B. Leaves spine-pointed; sepals transversally winged in fruit. 6. *Salzola*

1. CHENOPODIUM L. AKAZA ZOKU

Pilose to puberulent annual or perennial herbs; leaves petiolate, flat, entire or pinnately lobed; flowers small, bisexual, sessile, bracteate, in glomerules, these often arranged in spikes or panicles; perianth-segments 2 or 3, free or slightly connate, deciduous with the fruit; stamens 1-5; styles 2-3; fruit indehiscent, an achene or utricle, the seed solitary, horizontal or vertical, the endosperm mealy, embryo annular.—About 80 species, cosmopolitan, especially abundant in temperate regions.

- 1A. Branchlets of inflorescence short-spinose; flowers cymose; leaves entire, not mealy. 1. *C. aristatum*
 1B. Branchlets of inflorescence not short-spinose; flowers fasciculate, spicate or in panicles.
 2A. Plants not glandular-pilose; embryo in a perfect ring.
 3A. Stems decumbent or ascending; sepals 2-5; seeds oriented horizontally and vertically. 5. *C. glaucum*
 3B. Stems erect; sepals 5; seeds oriented horizontally.
 4A. Leaves entire, sometimes with dilated lower margin.
 5A. Leaves narrowly lanceolate to ovate-oblong, sometimes ovate-orbicular, rather thick; inflorescence-axis rather stout, densely flowered, rather densely reddish farinaceous while young. 4. *C. virgatum*
 5B. Leaves deltoid or rhombic-ovate, sometimes ovate, thin; inflorescence-axis slender, rather loosely flowered, often whitish mealy while young.
 6A. Sepals broadly obovate to elliptic; nutlets smooth, the seeds keeled on margin, slightly depressed on the faces. 2. *C. bryoniaefolium*
 6B. Sepals oblong to narrowly obovate; nutlets slightly granular, the seeds lenticular, not keeled on margin. .. 3. *C. koraiense*
 4B. Leaves more or less toothed.
 7A. Seeds about 1 mm. across; leaves white-mealy at least while young beneath, not elongate above.
 8A. Leaves rhombic, deltoid-ovate, or narrowly ovate, sometimes broadly lanceolate, irregularly toothed; seeds keeled on margin; flowering and fruiting in September and October. 6. *C. album*
 8B. Leaves oblong-ovate to lanceolate, deeply undulate-toothed, with lowest pair of teeth lobelike, ascending; seeds not keeled; flowering and fruiting in July and August in our area. 7. *C. ficifolium*
 7B. Seeds about 2 mm. across; leaves green, relatively large, elongate above. 8. *C. hybridum*
 2B. Plants glandular-pilose especially on leaves beneath; embryo imperfectly ringed. 9. *C. ambrosioides*

1. *Chenopodium aristatum* L. *Teloxys aristata* (L.) Moq.—HARISEMBON. Glabrous, smooth or loosely pilose annual with erect branched stems 10-40 cm. long; leaves broadly linear to linear-lanceolate, 1.5-3 cm. long, 2-4 mm. wide, obtuse or subacute, rather thick, gradually decurrent toward the sessile or short-petioled base; inflorescence rather large, densely flowered while young, more expanded and rather loose in fruit, pale green, the branchlets 2-4 mm. long, short-spinose; sepals oblong, about 0.5 mm. long, obtuse, green on back, rather broadly white-membranous on margin; seeds horizontal, discoid, black, about 0.5 mm. across, the embryo imperfectly annular.—July-Aug. Honshu (centr. distr.); rare.—Korea, s. China, and s. Siberia.

2. *Chenopodium bryoniaefolium* Bunge. MIDORI-AKAZA. Annual; stems erect, branched, 50-100 cm. long, the branches glabrous, elongate, ascending; leaves thin, hastate-ovate to deltoid or ovate, 3-5 cm. long, 2.5-4.5 cm. wide, obtuse or acute, with a large tooth on each side or 3-lobed, with spreading acute to obtuse lateral teeth, broadly cuneate to subtruncate at base, slightly glaucous, mealy beneath while young, the petioles 1-4 cm. long; inflorescence loosely flowered; sepals 5, elliptic or broadly obovate, obtuse, greenish on back, 1-1.3 mm. long; utricles orbicular, flat, smooth, the seeds black, about 1.3 mm. across, discoid, lustrous, indistinctly striolate, keeled on margin.—Aug. Mountains; Honshu (Kantō Distr.); rare.—e. Siberia and Manchuria.

3. *Chenopodium koraiense* Nakai. *C. acuminatum* var. *ovatum* sensu Nakai, non Fenzl—IWA-AKAZA, YAMA-AKAZA. Glabrous slightly mealy annual with elongate ascending branches; leaves thinly membranous, deltoid-ovate, rhombic-ovate, or narrowly rhombic-ovate, 1-4 cm. long, 0.8-3 cm. wide, acute, broadly cuneate and often dilated toward the base, slightly glaucous, the petioles 5-20 mm. long; inflorescence elongate, loosely flowered; sepals 5, 0.8-1 mm. long, oblong, obtuse, green on back; utricles horizontal, deep brown, slightly granular-tubercled, the seeds lenticular, flat, 1-1.2 mm. across,

lustrous, black, rugulose, obtuse and not keeled on margin.—Aug.-Oct. Honshu (Chūgoku Distr.), Kyushu (n. distr.).—Korea.

4. *Chenopodium virgatum* Thunb. *C. acuminatum* var. *japonicum* Fr. & Sav.; *C. acuminatum* var. *virgatum* sensu auct. Japon., non Moq.—KAWARA-AKAZA, MARUBA-AKAZA. Annual herb, densely red-brown puberulent while young; stems erect, 30-60 cm. long, the branches ascending to suberect; leaves rather thick, white-mealy while young especially beneath, narrowly lanceolate to ovate-orbicular, 1-4 cm. long, 0.6-2 cm. wide, obtuse to acute, often short-awned at apex, cuneate to acute at base, the petioles 5-25 mm. long; inflorescence a terminal densely flowered panicle; sepals obovate, about 1 mm. long, with a broad green band on back and faint transverse ridges near the middle; utricles smooth, the seeds black, about 1 mm. across, horizontal, planoconvex, with an obtuse margin.—June-Oct. Waste ground along rivers and seashores; Honshu, Shikoku, Kyushu; common.—Ryukyus and Formosa.

5. *Chenopodium glaucum* L. URAJIRO-AKAZA. Glabrous annual; stems decumbent to ascending, rather fleshy, much-branched, 15-30 cm. long; leaves oblong-ovate, sometimes broadly lanceolate, 2-4 cm. long, 5-15 mm. wide, obtuse, acuminate at base, slightly fleshy, deep green above, whitish mealy beneath, with few deeply undulate teeth, the petioles 5-20 mm. long; inflorescence spicate, axillary and terminal, short, rather densely flowered; sepals 2-3 or 5, about 0.5 mm. long, membranous, obtuse, with a slender green rib on back; utricles horizontal and vertical, the seeds smooth, dark brown, shining, flat, about 0.8 mm. across, obtuse on margin.—June-Sept. Chiefly in waste ground along seashores; Hokkaido, Honshu, Shikoku.—Eurasia.

6. *Chenopodium album* L. SHIRO-AKAZA, SHIROZA. Glabrous annual, white-mealy on young parts and underside of leaves; stems much branched, striate, 60-150 cm. long; leaves deltoid-ovate to rhombic-ovate, narrowly ovate in the upper

ones, 3-6 cm. long, 1.5-3.5 cm. wide, obtuse to subacute, with small deeply undulate teeth, the petioles 1-4 cm. long; flowers in fascicles or glomerules, these arranged in panicles; sepals obovate, about 1 mm. long, obtuse, with a broad green band, low-keeled in the middle; seeds flat, black, 1-1.3 mm. across, shining.—Waste ground and cultivated fields in lowlands and hills; very common.—Temperate regions of Eurasia.

Var. *centrorubrum* Makino. *C. centrorubrum* (Makino) Nakai—AKAZA. Leaves often deltoid-ovate, reddish mealy while young, the panicles somewhat looser.—Rarely cultivated, frequently naturalized in our area.—India (?) or China (?).

Chenopodium purpurascens Jacq. *C. album* var. *purpurascens* Makino; *C. elegantissimum* Koidz.—MURASAKI-AKAZA. Tall purplish stout plant with leaves sometimes more than 10 cm. long; fascicles of flowers dispersed on the much-branched pendulous panicle; seeds usually pale brownish. Sometimes cultivated in the warmer parts of our area.

7. *Chenopodium ficifolium* Smith. KO-AKAZA. Annual, slightly white-mealy on young parts and underside of leaves; stems 30-60 cm. long; leaves green, deltoid-oblong or narrowly deltoid-ovate, 2-5 cm. long, 1-3 cm. wide, obtuse, cuneate at base, deeply undulate-toothed, the lowest pair of teeth lobelike, the petioles slender; fascicles of flowers subinterrupted, forming a dense panicle; sepals obovate, about

1 mm. long, obtuse, green on back, the midrib raised; seeds black, about 1 mm. across, discoid, with obtuse margin.—June-Aug. Hokkaido, Honshu, Kyushu; rather common in waste ground and along roadsides in lowlands.—Europe to w. Siberia.

8. *Chenopodium hybridum* L. *C. bonus-henricus* sensu Makino & Nemoto, non L.—USUBA-AKAZA. Glabrous green rather tall annual with angled stems; leaves broadly ovate, 6-13 cm. long, 3-7 cm. wide, much elongate above, acuminate, the few large lobes deltoid; spikes rather loosely flowered; flowers rather large; sepals ovate, obtuse, about 2 mm. long, green, ribbed on the back; seeds discoid, flat, about 2 mm. across, minutely pitted.—Sept. Hokkaido.—Europe.

9. *Chenopodium ambrosioides* L. *C. ambrosioides* var. *pubescens* Makino—KE-ARITA-SŌ. Green or yellow-green annual with pale white glandular-hairs, not farinose; stems much-branched, ascending, 60-80 cm. long; leaves narrowly ovate to lanceolate, 2-5 cm. long, 5-15 mm. wide, acute to obtuse, undulate to sinuate, short-petioled; spikes leafy, short or elongate; flowers small; sepals usually 3, about 0.8 mm. long, green; seeds horizontal or vertical, shining, thick-lenticular, about 0.6 mm. across.—July-Nov. Naturalized in Honshu, Shikoku, Kyushu; common in waste ground and along roadsides.—Tropical America.

2. KOCHIA Roth HŌKIGI ZOKU

Usually silky-pilose herbs often woody at base; leaves alternate, sessile, narrow, entire; flowers small, sessile, solitary or in axillary fascicles, bisexual and pistillate, the bracts and bracteoles absent; perianth subglobose, urceolate, or depressed-urceolate, 5-parted, the segments incurved, with a horizontal wing on back; stamens 5; ovary broadly ovoid; styles slender; stigmas 2 or 3, capillary, tubercled; fruit utriculate, enclosed in the perianth, depressed-globose, the pericarp membranous, persistent, loosely enclosing the seed; seeds horizontal, orbicular, flattened, the testa membranous, the embryo nearly annular.—About 80 species, Europe, Asia, Australia, and Africa.

1. *Kochia scoparia* (L.) Schrad. *Chenopodium scoparia* L.—HŌKIGI. Much-branched annual; stems erect, 50-100 cm. long, soft-pubescent above; leaves narrowly oblanceolate, lanceolate, or narrowly so, 2-5 cm. long, 2-8 mm. wide, subacuminate to acute, gradually narrowed below and petioled in the lower ones, subtrinermed, more or less long-pilose; flowers few, in axillary fascicles, sessile, pale green, often forming a terminal spike by the reduction of the upper leaves; perianth urceolate-globose, depressed, 5-merous, the segments subdeltoid, the wing on back horizontal, spreading, subchartaceous;

styles very short, the stigmas 2, slender; seeds about 1.5 mm. across, broadly obovate, enclosed in the slightly accrescent perianth.—Aug.-Oct. Cultivated for making brooms.—Europe to s. Asia and China.

Var. *littorea* Makino. *Kochia littorea* (Makino) Makino—ISO-HŌKIGI. Stems rather strongly flexuose, with ascending to nearly spreading branches.—Sept.-Oct. Near seashores; Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.—Korea.

3. ATRIPLEX L. HAMA-AKAZA ZOKU

Monoecious or dioecious herbs or shrubs often with scurfy indument; stems leafy; leaves alternate, rarely opposite, petioled or sessile; fascicles of flowers unbranched or paniculate; staminate flowers ebracteate, the sepals 3-5, the stamens of the same number; pistillate flowers surrounded by 2 accrescent bracts, the perianth absent, the ovary globose, the stigmas 2; utricles enveloped by 2 bracts, the pericarp often membranous, the seeds erect or horizontal, the embryo annular.—More than 100 species, cosmopolitan.

- 1A. Leaves ovate-deltoid to lanceolate, 2-4 cm. wide; pistillate bracts 6-10 cm. long and wide; seeds dark brown, 3-4 mm. across, slightly lustrous; stems with ascending branches. 1. *A. subcordata*
- 1B. Leaves lanceolate to linear, 3-15 mm. wide; pistillate bracts 3-4 mm. long and as wide in fruit; seeds black, about 1.5 mm. across, lustrous; stems with suberect branches. 2. *A. gmelinii*

1. *Atriplex subcordata* Kitag. *A. tatarica* sensu auct. Japon., non L.; *A. patulus* sensu auct. Japon., non L.; *A. littoralis* var. *dilatata* Fr. & Sav.—HAMA-AKAZA, KO-HAMA-AKAZA. Scurfy annual; stems erect, 40-60 cm. long, with ascending branches; leaves ovate-deltoid, narrowly ovate to

lanceolate, 3-8 cm. long, 2-4 cm. wide, acute to subobtusely, slightly glaucescent, broadly cuneate to gradually narrowed at base, often with few teeth; fascicles of flowers axillary, forming a terminal spike; pistillate bracts subsessile in fruit, subdeltoid, truncate to shallowly cordate at base, subentire, acute

to subacuminate, nearly smooth, 6-10 mm. long, 5-9 mm. wide, with shallow grooves at base; seeds dark brown, suborbicular, flat, 3-4 mm. across.—Aug.-Oct. Sandy seashores; Hokkaido, Honshu.—Kuriles and Sakhalin.

Atriplex hastata L. of Europe with opposite lower leaves is sometimes naturalized in our area.

2. *Atriplex gmelinii* C. A. Mey. *A. littoralis* var. *japonica* Koidz.; *A. subcordata* var. *japonica* (Koidz.) Honda; *A. littoralis* var. *angustissima* sensu auct. Japon., non Moq.—HOSOGA-NO-HAMA-AKAZA. Annual; stems erect, branched,

glabrous, 30-50 cm. long, with suberect branches; leaves alternate, lanceolate to narrowly so, sometimes linear, 5-10 cm. long, 3-15 mm. wide, acute to subacute, narrowed at base, entire or few-toothed, glabrous, white-scurfy while young, the petioles 5-15 mm. long; flowers fasciculate in upper axils, forming a terminal spike; pistillate bracts sessile in fruit, broadly ovate-deltoid, acute, 3-nerved, not tubercled, entire or subentire, 3-4 mm. long and as wide; seeds black, orbicular, flat, lustrous, about 1.5 mm. across.—Sandy seashores; Hokkaido, Honshu.—Kuriles, Kamchatka, Sakhalin, and Korea.

4. SALICORNIA L. AKKESHI-SŌ ZOKU

Fleshy glabrous herbs or small shrubs with opposite, terete, jointed branches; leaves opposite, scalelike, usually connate at base; inflorescence spicate, the flowers 3-7, fascicled and impressed in upper leaf-axils, bisexual or staminate in the lateral ones, sessile, the perianth obconical or rhomboidal, fleshy, shallowly 3- to 4-toothed or truncate on margin, spongy in fruit; stamens 2 or 1; ovary ovoid; styles or stigmas 2; utricles enclosed in the perianth; seeds erect, flat, the embryo conduplicate.—About 30 species, cosmopolitan in saline soil.

1. *Salicornia europaea* L. *S. europaea* var. *herbacea* L.; *S. herbacea* L.—AKKESHI-SŌ. Fleshy, usually reddish annual, 10-30 cm. high, the branches opposite, erect; leaves scalelike, small, connate at the base in a short tube; spikes 1-5 cm. long, 3-4 mm. across, terete, joints about 3 mm. long, the peri-

anth rhomboid-ovoid, small.—Aug.-Oct. Saline marshes; Hokkaido, Honshu (n. distr.), Shikoku; rare southward.—Wet saline places especially along seashores in the temperate regions of the N. Hemisphere.

5. SUAEDA Forsk. MATSU-NA ZOKU

Usually glabrous herbs or shrubs; leaves alternate, fleshy, narrow or flat, entire; flowers small, axillary, sessile or nearly so, solitary or fascicled, bisexual or unisexual, with 1 bract and 2 bracteoles; perianth 5-fid to -divided, the segments rather fleshy, rarely appendaged on back; stamens 5; ovary sessile; stigmas 2-5, short; utricles globose, ovate or flat, enveloped by and sometimes adnate below to the perianth; seeds horizontal, oblique or vertical, globose, often flat, the embryo spiral.—About 100 species, in saline soils along seashores, cosmopolitan.

- 1A. Leaves linear to linear-oblong or oblanceolate, slightly flattened, very obtuse to subacute; perianth 2-4 mm. across in fruit; testa pale, membranous.
- 2A. Plant and flowers purplish in fruit; leaves rounded to very obtuse; utricles 2.5-4 mm. across. 1. *S. japonica*
- 2B. Plant green, the flowers changing to red in fruit; leaves acute to subobtuse; utricles 2-2.5 mm. across. 2. *S. malacosperma*
- 1B. Leaves narrowly linear, obtuse to subacute.
- 3A. Utricles 2.5-3 mm. across; flowers 1 or 2, axillary, the upper ones short-pedicelled. 3. *S. asparagoides*
- 3B. Utricles 1.2-1.5 mm. across; flowers 3-5, axillary, sessile. 4. *S. maritima*

1. *Suaeda japonica* Makino. SHICHIMEN-SŌ. Glabrous annual; stems erect, much branched, later becoming slightly woody, 20-40 cm. long; leaves many, fleshy, sessile, terete, linear to oblanceolate, very obtuse, 5-35 mm. long, 2-4 mm. wide; flowers few in leaf-axils, sessile, the perianth rather fleshy, to 4 mm. across in fruit, the segments ovate-orbicular, subobtuse; utricles depressed-globose, the pericarp tightly appressed around the seeds; stigmas 2; seeds lenticular, horizontal, 1.5-2 mm. across, the testa membranous.—Sept.-Oct. Seashores; Kyushu (n. distr.).—Korea.

2. *Suaeda malacosperma* Hara. HIRO-HA-MATSU-NA. Glabrous annual; stems 10-30 cm. long, usually branched; leaves broadly linear, to 35 mm. long, 4 mm. wide, fleshy, slightly flattened, acute to subobtuse and minutely cuspidate, sessile, bluish green; flowers 1-4, axillary, sessile, usually pistillate, the bracteoles minute, hyaline, the perianth depressed-globose, the segments rather fleshy in fruit, thickened deltoid on the back; utricles depressed-globose; seeds white, the testa membranous.—Oct.-Nov. Seashores; Honshu (Bingo Prov.), Kyushu.

3. *Suaeda asparagoides* (Miq.) Makino. *Salsola* (?) *asparagoides* Miq.; *Schoeberia maritima* var. *asparagoides* Fr.

& Sav.; *Suaeda glauca* sensu auct. Japon., non Bunge.—MATSU-NA. Glabrous annual; stems erect, 50-80 cm. long, much branched, later becoming woody, the branches ascending; leaves green, narrowly linear, 1-3 cm. long, subobtuse to subacute; inflorescence loosely arranged on an elongated branching axis, aphyllous toward upper part; flowers small, green, in 1- to 2-flowered fascicles, very short pedicelled or sessile, the bracts and bracteoles deltoid, membranous, 0.5-0.8 mm. long; perianth-segments 5, connate at base, narrowly ovate; utricles globose or slightly depressed, 2.5-3 mm. across.—Aug.-Sept. Seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

4. *Suaeda maritima* (L.) Dumort. *Chenopodium maritimum* L.—HAMA-MATSU-NA. Glabrous annual; stems much-branched, erect, 30-50 cm. long; leaves narrowly linear, acute or subacute, 1-3 cm. long; inflorescence in 3- to 5-flowered axillary fascicles, the flowers small, sessile; perianth-segments 5, elliptic, not accrescent in fruit; utricles 1.2-1.5 mm. across, depressed-globose; seeds black, shining, discoid or lenticular, about 1 mm. across.—Sept.-Oct. Sandy seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Along seashores in the N. Hemisphere.

6. *SALSOLA* L. ОКА-ИЙИКИ ZOKU

Herb or shrubs, glabrous or short-pilose; branches not jointed; leaves alternate, rarely opposite, narrow, sessile, sometimes scalelike, usually spine-pointed; flowers small, solitary or in fascicles in leaf-axils, often accrescent in fruit, bisexual, 2-bracteolate; perianth 4- to 5-merous, the segments oblong or lanceolate, concave, often incurved at apex, thickened and becoming horizontally winged on back; stamens 5 or fewer, staminodes absent; ovary globose; stigmas 2(-3), linear; utricles enclosed by the lower portion of perianth, broadly ovoid to globose, depressed at the apex or mucronate, the pericarp not adnate to the seed; seeds horizontal, the embryo spiral.—About 100 species, mainly in saline soils and along seashores, especially abundant in the N. Hemisphere.

1. *Salsola komarovii* Iljin. *S. soda* sensu auct. Japon., non L.—ОКА-ИЙИКИ. Glabrous annual; stems decumbent or ascending, spreading, much branched, 10-30 cm. long; leaves alternate, green, fleshy, linear-terete, spine-pointed, 1-2.5 cm. long; flowers solitary in axils, sessile, the bracteoles 2, narrowly ovate, 4-5 mm. long; tepals 5, cartilaginous in fruit,

transversely ridged on back, inflexed in upper portion; fruit depressed-obconical, about 2 mm. across; seeds as large as the fruit, the testa white, membranous, easily separable.—July-Oct. Sandy places along sea beaches; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, n. China, and e. Siberia.

Fam. 80. *AMARANTHACEAE* HIYU KA Amaranth Family

Herbs, sometimes shrubs; leaves opposite or alternate, simple, entire or with obsolete teeth, the stipules absent; flowers small, greenish, white, rose, or rarely yellow, bisexual, rarely unisexual, actinomorphic; inflorescence densely cymose, disposed in spikes or panicles; perianth-segments 4-5, free or connate at base, regular, scarious; stamens 1-5, opposite the perianth-segments, more or less connate at base, often with a membranous appendage between them; carpels 2-3, connate; ovary superior, 1-locular; ovules 1 to many, campylotropous, erect; fruit a circumscissile capsule, or frequently a utricle, rarely a drupe or berry; seeds lenticular, the testa shining; endosperm mealy, the embryo annular.—About 64 genera, with about 800 species, especially abundant in the Tropics.

- 1A. Leaves alternate; anthers 2-locular.
 - 2A. Flowers unisexual or polygamous; ovules solitary. 1. *Amaranthus*
 - 2B. Flowers bisexual; ovules 2 to many. 2. *Celosia*
- 1B. Leaves opposite.
 - 3A. Anthers 2-locular; flowers in elongate spikes, deflexed in fruit. 3. *A. caudatus*
 - 3B. Anthers 1-locular; flowers in heads, not deflexed in fruit. 4. *Alternanthera*
 - 4A. Stigma sessile, usually capitate, entire or nearly so. 5. *Philoxerus*
 - 4B. Stigmas 2, subulate, on a very short style. 5. *Philoxerus*

1. *AMARANTHUS* L. HIYU ZOKU

Erect or decumbent, often slightly pubescent, monoecious or polygamous annuals; leaves alternate, flat, petiolate, ovate, lanceolate or rhombic, usually entire; flowers small, in axillary glomerules, forming a terminal spike or panicle, green, sometimes white or reddish, the bracts often spine-tipped, sometimes minute, the bracteoles 2; perianth-segments 5, sometimes 3, membranous, persistent; stamens 1-3 or -5, free; ovary ovoid; style very short, the stigmas 2-3; ovules solitary, erect; utricle indehiscent or circumscissile; seeds erect, orbicular, flat, shining, smooth, the embryo annular.—About 50 species, cosmopolitan.

- 1A. Utricles transversely or imperfectly dehiscent; bracts usually prominent.
 - 2A. Perianth-segments and stamens 5; spikes elongate; tall herbs with rather stout thickened stems.
 - 3A. Leaf-axils without spines; utricles transversely dehiscent.
 - 4A. Spikes erect or ascending, greenish; bracts with an acute green spine at apex; perianth-segments broadly spatulate; seeds black.
 - 5A. Bracts 4-6 mm. long inclusive of the longer spine; perianth 3 mm. long, about half as long as the bract; spikes thicker, pale green. 1. *A. retroflexus*
 - 5B. Bracts 2-4 mm. long; perianth 1.5-2 mm. long, about $\frac{2}{3}$ as long as the bract; spikes narrower, green. 2. *A. patulus*
 - 4B. Spikes narrow, pendulous above, reddish or white; bracts with a slender pale rather short spine at apex; perianth-segments obovate; seeds usually white, reddish tinged toward the margin. 3. *A. caudatus*
 - 3B. Leaf-axils with spines; utricles imperfectly dehiscent. 4. *A. spinosus*
 - 2B. Perianth-segments 3; stamens 2-3; spikes usually not elongate.
 - 6A. Stems 80-150 cm. long, stout; leaves 5-20 cm. long.
 - 7A. Spikes not elongate; leaves linear to rhombic-ovate. 5. *A. tricolor*
 - 7B. Spikes elongate in the terminal ones; leaves broadly ovate-deltoid. 6. *A. mangostanus*
 - 6B. Stems 10-60 cm. long, rather slender, much-branched; leaves 1-4 cm. long.
 - 8A. Stems and branches decumbent; bracts narrowly ovate, green; utricles smooth. 7. *A. gracizans*
 - 8B. Stems and branches erect; bracts spine-tipped; utricles rugose. 8. *A. albus*
- 1B. Utricles indehiscent; bracts not prominent, shorter than the perianth.
 - 9A. Utricles prominently rugose. 9. *A. viridis*
 - 9B. Utricles smooth.
 - 10A. Leaves 2.5-4 cm. wide; stems erect, with ascending base. 10. *A. lividus*
 - 10B. Leaves 1-1.5(-2) cm. wide; stems ascending to decumbent. 11. *A. deflexus*

1. *Amaranthus retroflexus* L. AOGEITŌ, AOBIYU. Rather coarse annual; stems rather stout, green, soft-pubescent, 1-2 m. long, branched; leaves rhombic-ovate, 5-10 cm. long, 3-6 cm. wide, acute or subobtusate with a short mucro, cuneate at base, glabrous above, soft-pubescent on the nerves beneath, the petioles 3-8 cm. long; inflorescence paniculate, elongate, erect or ascending, often short-branched below, the axis densely soft-pubescent; flowers pale green (plants polygamous), densely disposed, the bracts subulate, 4-6 mm. long, spine-pointed, the lower margins membranous; perianth-segments about 3 mm. long, oblanceolate, obtuse to rounded, short-awned, white-membranous on margin, slightly longer than the utricle.—Aug.-Oct. A weed in lowlands; Hokkaido, Honshu, Kyushu; very common.—A pantropic weed.

2. *Amaranthus patulus* Bertol. *A. hybridus* subsp. *cruentus* var. *patulus* (Bertol.) Thell.—HOSO-AOGEITŌ. Resembles the preceding; spikes green, the bracts 2-4 mm. long; perianth 1.5-2 mm. long, the segments obtuse with a minute point, slightly shorter than the utricle; stigma very short.—Aug.-Oct. A weed in lowlands; Honshu, Shikoku, Kyushu.—Europe.

Amaranthus paniculatus L. SUGIMORIGETŌ. Annual with slender red to yellow spikes, the bracts with shorter spines.—Sometimes cultivated as an ornamental in our area.

3. *Amaranthus caudatus* L. SENNIN-KOKU, HIMOGETŌ. Erect, slightly pubescent annual to 1 m. high; leaves rhombic-ovate, 5-10 cm. long, 3-6 cm. wide, acute, mucronulate, nearly glabrous above, scattered soft-pubescent on the nerves beneath; inflorescence much elongate, branched below, pendulous or nodding, rose to white, the bracts 2-3 mm. long, membranous, rounded at apex, slightly toothed, slightly shorter to as long as the utricle.—Commonly cultivated in our area as an ornamental.—Tropics.

4. *Amaranthus spinosus* L. HAIBIYU. Scattered short-pubescent to nearly glabrous annual, 40-80 cm. high, with angled stems; leaves narrowly to sometimes broadly ovate, 3-8 cm. long, 1.5-4 cm. wide, obtuse with a small mucro at tip, cuneate at base, the petioles 1-8 cm. long, subtended by spreading spines about 1 cm. long; lower spikes axillary and globose, the upper elongate, the bracts narrowly lanceolate; perianth-segments 5, about 1.3 mm. long, nearly as long as the utricle, narrowly oblong, membranous, cuspidate; fruit imperfectly circumscissile; stigma rather long, about 1 mm. long, filiform.—Aug.-Oct. Honshu, Kyushu.—Tropical America, now widely naturalized as a weed in the warmer regions of the world.

5. *Amaranthus tricolor* L. *A. melancholicus* L.; *A. gangeticus* L.—HAGETŌ. Annual, often slightly soft-pubescent while young, later glabrescent; stems 80-150 cm. long, erect, coarse; leaves linear-lanceolate to rhombic-ovate, 7-20 cm. long, 2-7 cm. wide, acute or subacute, short-mucronate, cuneate at base, often variously colored and blotched with red and yellow, the petioles 3-10 cm. long; spike axillary, globose, densely flowered, pale green, the bracts narrowly ovate, membranous, awn-tipped, slightly shorter than the perianth; perianth-segments 3, broadly lanceolate, short-awned, about 3 mm. long; fruit about 2/3 as long as the perianth.—Aug.-Oct. Widely cultivated in our gardens.—Tropical Asia.

6. *Amaranthus mangostanus* L. *A. inamoensis* Willd.—HIYU. Nearly glabrous annual; stems erect, 80-150 cm. long; leaves broadly rhombic-ovate, or broadly deltoid-ovate, 5-12 cm. long, 2-7 cm. wide, obtuse, retuse at apex, broadly

cuneate and decurrent on the petiole; petioles 3-10 cm. long; lower spikes globose, the upper ones elongate, interrupted, pale green, the bracts ovate, awn-pointed, shorter than the perianth, membranous; perianth-segments narrowly ovate, membranous, awn-tipped, about 3 mm. long; stamens 3; utricles shorter than the perianth.—Aug.-Oct. Cultivated as a vegetable.—India.

7. *Amaranthus graecizans* L. *A. blitoides* S. Wats.—INU-HIME-SHIROBIYU. Annual, glabrous or nearly so; stems branched, ascending to procumbent, 10-60 cm. long; leaves narrowly obovate, 8-25 mm. long, 2.5-15 mm. wide, obtuse, mucronate or subacute, acute at base, the petioles 5-15 mm. long; spikes small, axillary, subglobose, the bracts narrowly ovate or broadly lanceolate, green, short-awned at apex; perianth-segments shorter than the bracts, narrowly oblong, cuspidate, about 1 mm. long; utricles nearly smooth, slightly longer than the perianth.—Sept.-Oct. North American weed naturalized in Honshu.

8. *Amaranthus albus* L. HIME-SHIROBIYU. Resembles *A. graecizans*; leaves oblong or subspathulate, 8-13 mm. long, 2-7 mm. wide, obtuse with a short mucro at tip, decurrent below on the petiole, 3-8 mm. long; spikes axillary, rather few-flowered, the bracts linear-subulate, recurved above, 2-3 mm. long, the perianth-segments much shorter than the bracts, membranous, acute; utricles rugose, longer than the perianth.—Aug.-Sept. Naturalized in Honshu (Kinki Distr.).—N. America.

9. *Amaranthus viridis* L. *Euxolus viridis* (L.) Moq.; *Chenopodium caudatum* Jacq.; *E. caudatus* (Jacq.) Moq.; *A. gracilis* Desf.—AOBIYU, HONAGA-INUBIYU. Nearly glabrous annual; stems erect, sparsely branched, 50-80 cm. long; leaves broadly deltoid-ovate, 4-8 cm. long, 2.5-6 cm. wide, retuse, broadly cuneate to subtruncate at base; spikes on upper part of the stems, to 8 cm. long, the bracts membranous, narrowly ovate, minute, 0.8 mm. long, much shorter than the perianth, minutely awned at apex; perianth-segments 3, broadly oblanceolate, acute, with a green midrib, 1-1.2 mm. long; utricles globose, slightly longer than the perianth, prominently rugose, indehiscent.—July-Oct. Honshu, Kyushu.—Tropical American weed widely naturalized in the warmer regions of the world.

10. *Amaranthus lividus* L. *A. blitum* L., pro parte; *A. ascendens* sensu auct. Japon., non Loisel.; *Euxolus ascendens* (Loisel.) Hara; *E. viridis* var. *ascendens* (Loisel.) Moq.—INU-BIYU. Resembles *A. viridis*; leaves deeply retuse, broadly cuneate at base; spikes rather stout, the lateral ones usually not elongate, the perianth-segments lanceolate; utricles nearly smooth.—June-Oct. Hokkaido, Honshu, Kyushu.—Cosmopolitan weed of European (?) origin.

11. *Amaranthus deflexus* L. *Euxolus deflexus* (L.) Raf.—HAIBIYU. Scattered short-pubescent; stems much branched, ascending or decumbent, 10-30 cm. long; leaves ovate or narrowly ovate-deltoid, 1-4 cm. long, 5-20 mm. wide, obtuse, retuse or subacute, cuneate at base, nearly glabrous, the petioles 1-3 cm. long; inflorescence terminal, subelongate, 2-4 cm. long, sparsely branched below, the bracts narrowly ovate, short-awned at tip, about 1 mm. long; perianth-segments 2-3, oblong, acuminate, with a green midrib on back, about 2 mm. long; utricles about 1.5 times as long as the perianth, finely few-nerved.—Aug.-Oct. Naturalized near Tokyo.—Europe, N. America, N. Africa, and S. America.

2. CELOSIA L. KEITŌ ZOKU

Mostly annuals; leaves alternate, petiolate, linear to broadly ovate, entire; spikes axillary and terminal, densely many-flowered; flowers rather small, white or reddish, lustrous, bisexual, sessile, with a bract and 2 bracteoles at base, the perianth-segments 5, scarious, oblong to lanceolate, subobtusely, finely nerved, erect; stamens 5, connate below into a cup; ovary ovoid; style single, short to elongate, the stigmas 2-3; ovules 2-8; utricles globose or ovoid, circumscissile; seeds erect, lenticular, black, shining, smooth, the embryo annular.—About 60 species, in the Tropics.

- 1A. Spikes long-peduncled, the flowers not fasciated; flowers 8-10 mm. long. 1. *C. argentea*
 1B. Spikes short-peduncled or sessile, often fasciated; flowers about 4 mm. long. 2. *C. cristata*

1. *Celosia argentea* L. NOGEITŌ. Glabrous annual; stems erect, 40-80 cm. long; leaves lanceolate to narrowly ovate, 5-8 cm. long, 1-2.5 cm. wide, acute or gradually acuminate, decurrent on the petiole or sessile; spikes lanceolate or cylindric, 5-8 cm. long, 1-2.5 cm. wide, densely many-flowered, the bracts and bracteoles broadly lanceolate, about 4 mm. long, white, scarious, acuminate; perianth-segments lanceolate, 8-10 mm. long, acuminate, white, 1-nerved above, with few weak nerves below; utricles globose, about half as long as the peri-

anth; style about 3 mm. long, erect; seeds about 1.5 mm. across.—July-Nov. Honshu (w. distr.), Shikoku, Kyushu; naturalized.—A pantropic weed.

2. *Celosia cristata* L. KEITŌ. Coarse annual, the stems and leaves reddish; leaves rather large, ovate, ovate-deltoid or lanceolate; spikes often fasciated, sessile or short-peduncled, red, yellow, or white, the perianth-segments about 4 mm. long.—Aug.-Oct. Widely cultivated in gardens in our area.—Pantropic.

3. ACHYRANTHES L. INOKOZUCHI ZOKU

Herbs, rarely woody at base; stems branched, thickened on nodes; leaves opposite, petiolate, ovate to lanceolate, entire; inflorescence an elongate terminal spike, greenish or white, the bracts persistent, membranous, reflexed in fruit, the bracteoles 2, erect, subulate, deciduous with the fruit; flowers bisexual, sessile, deflexed in fruit, the perianth-segments 4-5, subcoriaceous, nearly equal, lanceolate, connivent; stamens 5, rarely 4, connate at base, the staminodes entire or fimbriate; ovary oblong; style single, the stigma capitate; ovules solitary; utricles membranous, enclosed in the persistent perianth, indurated; seeds solitary, oblong.—About 20 species, mainly tropical.

- 1A. Appendage of bracteoles nearly orbicular, about 0.7 mm. long; staminodes slightly toothed or shallowly bifid; roots scarcely thickened; plant nearly glabrous or glabrescent. 1. *A. japonica*
 1B. Appendage of bracteoles obtusely deltoid to suborbicular, 0.3-0.5 mm. long; staminodes subrounded or nearly quadrangular, slightly toothed or subentire; roots thickened.
 2A. Leaves glabrescent, thinly membranous, lanceolate to broadly so. 2. *A. longifolia*
 2B. Leaves usually prominently pubescent, thickly membranous, elliptic to ovate. 3. *A. fauriei*

1. *Achyranthes japonica* (Miq.) Nakai. *A. bidentula* var. *japonica* Miq.—HIKAGE-INOKOZUCHI. Nearly glabrous to slightly pubescent perennials with scarcely thickened roots; stems 50-100 cm. long, obtusely quadrangular, branched, the nodes thickened; leaves oblong, elliptic or obovate, 10-20 cm. long, 4-10 cm. wide, acuminate; inflorescence elongate, usually loosely flowered in fruit, the bracts membranous, ovate-deltoid, with a green long-protruding midrib, to $\frac{1}{2}$ as long as the perianth; flowers horizontal in anthesis, deflexed in fruit, the bracteoles subulate, shorter than the perianth, the basal auricles membranous, whitish, about 0.8 mm. long, nerveless, orbicular, the perianth 4-5 mm. long, the segments linear-lanceolate, acuminate, the inner ones slightly shorter, the staminodes sessile, denticulate or obsoletely 2-lobulate; utricles oblong, about 2.5 mm. long, about 1 mm. across, thinly membranous, 1-seeded, the style slender, erect, about 1 mm. long.—Aug.-Sept. Woods in lowlands and hills; Honshu, Shikoku, Kyushu; common.

Var. *hachijoensis* Honda. HACHIJŌ-INOKOZUCHI. A maritime phase with thicker glabrescent lustrous leaves.—Honshu (Hachijō Isl. and westw.), Shikoku, Kyushu.—Ryukyus.

2. *Achyranthes longifolia* (Makino) Makino. *A. bidentula* var. *longifolia* Makino.—YANAGI-INOKOZUCHI. Resembles the preceding, the roots thickened; leaves lanceolate to broadly so, 10-20 cm. long, 2-5 cm. wide, gradually acuminate at both ends, nearly glabrous; bracts often with shallow teeth; style about 1.5 mm. long.—Aug.-Sept. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—China and Formosa.

3. *Achyranthes fauriei* Lév. & Van't. HINATA-INOKOZUCHI. Resembles the preceding two species but rather prominently pubescent; leaves elliptic, broadly ovate or oblong, 10-15 cm. long, 4-10 cm. wide, short-acuminate, usually prominently pubescent; bracts ovate, with a protruding midrib, the auricles of the bracteoles thinly membranous, about 0.5 mm. long, orbicular; perianth 5-5.5 mm. long; staminodes quadrangular, with obsolete teeth on upper margin or entire; style about 1 mm. long.—Aug.-Sept. Thickets and roadsides in lowlands to hills; Hokkaido (?), Honshu, Shikoku, Kyushu; common.—China.

4. ALTERNANTHERA Forsk. TSURU-NOGEITŌ ZOKU

Prostrate or decumbent, rarely erect, branched, glabrous to tomentose herbs; leaves opposite, sessile or short-petiolate, obovate to linear, entire or obsoletely toothed; glomerules small, sometimes congested, the flowers small, usually white, the bracts, bracteoles, and perianth-segments obtuse to long-acuminate, the perianth-segments 5, sessile, dorsally compressed, unequal;

stamens 2-5, connate below, the filaments interposed between the staminodes or the staminodes absent, the anthers 1-locular; ovary orbicular; style short or absent, the stigma usually capitate; ovules solitary, pendulous on an elongate filiform funicle; utricles compressed, ovoid to orbicular-obcordate; seeds lenticular, with a smooth, coriaceous testa, the embryo annular.—About 170 species, mostly in the New World Tropics, several widely dispersed as pantropical weeds.

1A. Leaves 5-15 mm. wide; perianth-segments narrowly ovate, glabrous, acute, with a prominent rather stout midrib on back.

1B. Leaves 3-6 mm. wide; perianth-segments lanceolate, acuminate, with a weaker midrib on back, usually with few long soft dorsal hairs.

1. *A. sessilis*

2. *A. nodiflora*

1. *Alternanthera sessilis* (L.) R. Br. *Gomphrena sessilis* L.; *Illecebrum sessile* (L.) L.—TSURU-NOGEITŌ. Prostrate or decumbent somewhat fleshy densely branched annual; stems and branches terete, the nodes with long white curved hairs, the internodes with two longitudinal rows of hairs while young; leaves spreading, glabrous, lanceolate to oblanceolate, 3-7 cm. long, 5-15 mm. wide, obtuse, sparsely crenate-toothed or subentire, gradually narrowed to a short-petioled or subsessile base, the midrib rather prominent; glomerules solitary or few, many-flowered, axillary, sessile, globose, the bracts and bracteoles minute; perianth-segments 5, white-scarious, more or less lustrous, smooth, glabrous, 2-2.5 mm. long, narrowly ovate, acute, with a prominent midrib especially toward the top; stamens 2-3, less than half as long as the perianth, the anthers minute, yellow; utricles obtusely margined, slightly shorter than the perianth, obcordate; seeds reddish brown, about 1 mm. across, shining.—July-Sept. Naturalized in the warmer parts of our area. A pantropic weed.

2. *Alternanthera nodiflora* R. Br. *A. denticulata* R. Br.—HOSOBATA-TSURU-NOGEITŌ. Much-branched prostrate annual with long soft slender white hairs on nodes while young; branches terete, often rooting at the nodes, with two longitudinal lines of short white crisped hairs on the internodes while very young; leaves broadly linear to linear-lanceolate, soft, 2.5-6 cm. long, 3-6 mm. wide, subobtusely, obsoletely mucronate-toothed or subentire, sessile or short-petioled; glomerules one to few, axillary, densely many-flowered, sessile, about 4 mm. across, the bracts and bracteoles less than half as long as the perianth, white-scarious; perianth 2-2.5 mm. long, the segments lanceolate to broadly so, long-acuminate, sparsely soft white-hairy, the midrib faint on back; utricles gray-brown, obcordate-reniform, retuse; seeds brownish yellow, shining, about 0.7 mm. across.—June-Nov. Naturalized in lowlands in the warmer parts.—Tropical Asia to Australia and Africa.

5. PHILOXERUS R. Br. ISO-FUSAGI ZOKU

Decumbent to erect, glabrous or densely hairy mostly fleshy herbs; leaves opposite, obovate-spathulate, narrowly oblong or linear, entire; inflorescence globose to cylindric, axillary and terminal, white or reddish, sessile or short-peduncled, the bract solitary, papyraceous, the bracteoles 2, keeled; flowers bisexual, short-pedicelled, the perianth dorsally flattened, the segments 5, oblong, obtuse, nerved, chartaceous; stamens 5, the filaments slightly connate at base, the anthers 1-locular; ovary flattened; style very short, the stigmas 2; ovules solitary, pendulous; utricles indehiscent, the seeds lenticular, smooth, the embryo annular.—About 15 species, along seashores, e. N. America, w. Africa, Australia, and s. Japan.

1. *Phloxeris wrightii* Hook. f. ISO-FUSAGI. Rather fleshy tufted perennial herb forming dense mats on seashores; stems glabrous, decumbent to ascending, branched below, 2-5 cm. long; leaves glabrous, narrowly spatulate-obovate, 4-8 mm. long, 2-3 mm. wide, very obtuse, gradually narrowed to the base; inflorescence a terminal very short-peduncled few-

flowered head; flowers rose-colored, the bracts and bracteoles small, membranous, ovate, about half as long as the perianth; perianth-segments elliptic, 3-3.5 mm. long, obtuse, scarious; seeds dull brown.—July-Oct. Rocks along seashores usually where washed by waves; Kyushu (Yakushima); rather rare.

Fam. 81. PHYTOLACCACEAE YAMA-GOBŌ KA Pokeweed Family

Herbs, rarely shrubs or trees; leaves alternate, entire, usually without stipules; inflorescence usually racemose; flowers bisexual or polygamous, sometimes unisexual, the sepals 4-5, free or connate below, imbricate in bud, the petals absent; stamens as many as or more than and alternate with the sepals; ovary superior, several locular, or composed of several free carpels; styles short or absent, the stigmas linear, filiform or subulate, usually papillose inside; ovules solitary in each carpel, amphitropous or campylotropous; fruit usually a berry, capsule or samaralike.—About 22 genera, with about 120 species, mostly pantropic.

1. PHYTOLACCA L. YAMA-GOBŌ ZOKU

Tall herbs, shrubs, or trees with erect or scandent glabrous or pulverulent branches; leaves alternate, sessile or petiolate, large, entire, exstipulate; racemes terminal, the pedicels bracteate and with 1-3 bracteoles at the base; sepals (4-)5, persistent; stamens 5-30, inserted at the base of the sepals; ovary subglobose; carpels 5-15, free or connate; fruit a globose berry; seeds flattened, the embryo annular, the endosperm mealy.—About 35 species, in the Tropics and subtropics, especially abundant in America.

1A. Inflorescence erect in fruit, the peduncles 1-3 cm. long.

2A. Carpels free, 8; seeds smooth. 1. *P. esculenta*

2B. Carpels connate, 7-10; seeds with slender concentric striations. 2. *P. japonica*

1B. Inflorescence nodding in fruit, the peduncles 4-12 cm. long; carpels 10, connate; seeds smooth. 3. *P. americana*

1. *Phytolacca esculenta* Van Houtte. *P. acinosa* var. *esculenta* Maxim.; *P. kaempferi* A. Gray; *P. acinosa* var. *kaempferi* (A. Gray) Makino—YAMA-GOBŌ. Glabrous perennial; stems stout, to 1 m. long, branched, green; leaves suborbicular to ovate-elliptic, 10–15 cm. long, abruptly acuminate, acute at base, entire, the petioles 1.5–2.5 cm. long; racemes 5–12 cm. long, rather densely flowered, short-peduncled, slightly scurfy, the pedicels 10–12 mm. long; flowers white, about 8 mm. across, the sepals elliptic; berry depressed-globose, purple-black; seeds reniform-orbicular, rather compressed, black, shining, smooth, about 3 mm. long.—June–Sept. Rarely cultivated as a vegetable; sometimes naturalized.—China.

2. *Phytolacca japonica* Makino. MARUMI-NO-YAMA-GOBŌ. Resembles the preceding; leaves oblong to ovate-ob-

long; racemes erect, distinctly scurfy; flowers pale rose-colored; berry globose; seeds reniform-orbicular, rather flattened, black, shining, about 3 mm. across, with fine concentric lines.—June–Sept. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

3. *Phytolacca americana* L. *P. decandra* L.—YŌSHU-YAMA-GOBŌ. Resembles No. 1; stems 1–1.5 m. long, reddish purple, glabrous; leaves ovate-elliptic to oblong, 10–30 cm. long, 5–16 cm. wide, short-acuminate, abruptly acute at base, the petioles 1–4 cm. long; racemes nodding in fruit, rather densely many-flowered, 10–15 cm. long; flowers white with a rosy tinge, rather small; berry depressed-globose; seeds reniform-orbicular, rather flat, about 3 mm. across, shining, black, smooth.—June–Nov. Naturalized in lowlands and hills; common.—N. America.

Fam. 82. AIZOACEAE ZAKURO-SŌ KA Mesembryanthemum Family

Herbs, rarely shrubs; leaves opposite or verticillate, stipulate or exstipulate; flowers small, actinomorphic, bisexual, solitary or fasciculate, sometimes cymose, the sepals 4 or 5, free or connate below, the petals 4 or 5, small or absent, free or connate below; stamens 4 or 5 or fewer, rarely more; ovary superior or inferior, the carpels 3–5, sometimes connate, the ovules 1 to many; capsules loculicidal or circumscissile; seeds amphitropous, the embryo slender, curved.—About 100 genera, with more than 600 species, mostly in the Tropics, especially abundant in Africa.

- 1A. Calyx-tube adnate to the ovary; fleshy plant with exstipulate alternate leaves. 1. *Tetragonia*
 1B. Calyx-lobes free from the ovary; slender herbs with falsely verticillate leaves and small stipules. 2. *Mollugo*

1. TETRAGONIA L. TSURU-NA ZOKU

Herbs or subshrubs, glabrous, hairy or tubercled, rather fleshy; leaves alternate, flat, entire, exstipulate; flowers axillary, sessile or pedicelled, green or yellow-green; calyx 3- to 5-lobed, the tube adnate to the ovary, often angled; petals absent; stamens 1 to many, inserted on the calyx-tube; ovary inferior, 3- to 8- rarely 1- or 2-locular; styles as many as the locules of the ovary, the ovules solitary in each locule, pendulous; fruit nutlike, indehiscent, the seeds subreniform, the embryo curved, subcylindric.—About 100 species, mainly in the Tropics, especially in Africa.

1. *Tetragonia tetragonoides* (Pall.) O. Kuntze. *Desmodia tetragonoides* Pall.; *T. expansa* Murr.; *T. japonica* Thunb.—TSURU-NA. Fleshy, glabrous, mealy, perennial herb; stems branched, decumbent below, 40–60 cm. long; leaves thick, ovate-deltoid, 4–6 cm. long, 3–4.5 cm. wide, obtuse, broadly cuneate to subtruncate at base, the petiole about 2 cm. long; flowers 1 or 2 in leaf-axils, the pedicels very short,

rather stout, the calyx-tube 3–4 mm. long, accrescent and becoming 6–7 mm. long in fruit, with 4 or 5 large spinelike tubercles on the shoulder, the calyx-teeth broadly ovate; petals absent; nut several-seeded, indehiscent.—Apr.–Nov. Sandy seashores; Hokkaido (sw. distr.), Honshu, Shikoku; common; sometimes cultivated as a vegetable.—China, s. Asia, S. America, and Australia.

2. MOLLUGO L. ZAKURO-SŌ ZOKU

Glabrous to pilose herbs; leaves alternate to falsely verticillate, flat, the stipules membranous; flowers green, in terminal, fasciculate, axillary cymes; sepals 5, equal, membranous, persistent; petals absent; stamen 3–5, rarely many, usually alternate with the sepals; ovary ovoid, 3- to 5-locular; styles 3–5; ovules many, sometimes few in each locule; capsules membranous, loculicidally dehiscent.—About 15 species, mostly in the Tropics.

- 1A. Sepals obsoletely 1-nerved; capsules globose; seeds minutely warty; leaves in verticils of 3–5. 1. *M. pentaphylla*
 1B. Sepals 3-nerved; capsules ovoid-ellipsoid; seeds with few raised lines; leaves in verticils of 4–7. 2. *M. verticillata*

1. *Mollugo pentaphylla* L. *M. stricta* L.—ZAKURO-SŌ. Delicate glabrous annual; stems much-branched, 10–30 cm. long, ascending to diffuse, angled; leaves in verticils of 3–5, slightly lustrous above, lanceolate to oblanceolate, 1.5–3 cm. long, 3–7 mm. wide, obtuse to subacute, acute at base, entire, 1-nerved; inflorescence loosely flowered, the bracts delicate, membranous, the pedicels 1–4 mm. long; sepals 5, elliptic, obtuse to rounded, obsoletely 1-nerved, about 1.5 mm. long; capsules globose, about 2 mm. long; seeds rather numerous,

dark brown, nearly lusterless, reniform-orbicular, flat, about 0.5 mm. across, minutely warty.—July–Oct. Waste ground and cultivated fields; Honshu, Shikoku, Kyushu; common in lowlands and hills.—China, Malay Peninsula, and India.

2. *Mollugo verticillata* L. KURUMABA-ZAKURO-SŌ. Slender glabrous diffuse annual; stems branched, 10–20 cm. long, nearly terete; leaves in verticils of 4–7, oblanceolate to broadly linear, 12–25 mm. long, 2–7 mm. wide, obtuse or subacute, 1-nerved, gradually narrowed to a short petiole; flowers sev-

eral, in axillary fascicles, the pedicels 2-5 mm. long, the sepals oblong, obtuse or rounded, 1.5-2 mm. long, 3-nerved; capsules ovoid-ellipsoid, about 3 mm. long; seeds yellow-brown, lus-

trous, reniform-orbicular, about 0.3 mm. across, with few raised concentric lines.—July-Aug. Naturalized in our area.

Fam. 83. PORTULACACEAE SUBERI-HIYU KA Purslane Family

Often fleshy herbs or small shrubs, glabrous to long-pubescent; leaves alternate or opposite, entire, the stipules scarious or sometimes changing to a tuft of hairs or absent; flowers solitary, racemose or paniculate, actinomorphic, bisexual; sepals usually 2, rarely 5, free or adnate to the base of the ovary, imbricate in bud; petals 4-5, rarely many, inferior or perigynous, free or connate below, imbricate in bud; stamens as many as the petals, sometimes fewer or more; ovary 1-locular; styles 2-8, connate below; ovules 2 to many, amphitropous, or basal on a free-central placenta; capsules membranous or crustaceous, with as many valves as the styles, circumscissile or rarely indehiscent; seeds many, small, rarely 1 or 2, sometimes strophiolate, the testa crustaceous, the embryo curved.—About 16 genera with about 500 species, mainly in S. America, Australia, and S. Africa, a few in the N. Hemisphere.

- 1A. Ovary partially united with the calyx; capsules circumscissile. 1. *Portulaca*
1B. Ovary free from the calyx; capsules longitudinally dehiscent. 2. *Montia*

1. PORTULACA L. SUBERI-HIYU ZOKU

Diffuse to ascending, glabrous or rarely pilose herbs; leaves simple; flowers terminal, the sepals 2, connate below and adnate partially to the ovary, the petals 4 or 5, sometimes many; stamens 7-20, inserted on the sepals; ovary many-ovuled, partially united with the calyx; styles deeply 3- to 8-fid; capsules circumscissile, membranous.—About 20 species, mainly in America, a few in the Tropics.

1. *Portulaca oleracea* L. SUBERI-HIYU. Fleshy glabrous annual; stems decumbent to ascending, much branched, terete, 10-30 cm. long, reddish brown; leaves alternate, fasciculate, cuneate-obovate, 15-25 mm. long, 5-15 mm. wide, rounded at apex, short-petiolate, flat; flowers sessile, yellow; sepals 2, keeled on back; petals obovate, retuse, about 4 mm.

long; stamens 7-12; seeds obliquely globose, about 0.5 mm. across, black, sparsely tubercled toward margin.—July-Sept. Waste ground and cultivated fields in lowlands and foothills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Cosmopolitan.

2. MONTIA L. NUMA-HAKOBE ZOKU

Delicate glabrous annual; leaves opposite, slightly fleshy; flowers very small, solitary or in few-flowered racemes; sepals 2, ovate-orbicular, herbaceous, persistent; petals 3-5, slightly connate below; stamens 3-5, inserted near base of the petals; ovary free, 3-ovuled; styles 3-fid; capsules globose, 3-valved, longitudinally dehiscent; seeds suborbicular, nearly flat.—About 5 species, in the cold regions of both hemispheres.

1. *Montia lamprosperma* Cham. *M. fontana* var. *lamprosperma* (Cham.) Fenzl; *M. fontana* sensu auct. Japon., non L.; *M. rivularis* sensu auct. Japon., non Gmel.—NUMA-HAKOBE. Stems 3-8 cm. long, decumbent at base; leaves opposite, spatulate-oblongate to narrowly obovate, 5-10 mm. long, 1.5-4 mm. wide, obtuse, narrowed below and petiolelike; flowers 2 or 3, terminal, the pedicels 3-10 mm. long, the bracts very small, membranous; sepals 2, orbicular, about 1 mm.

long; petals 5, small, slightly unequal; capsules globose, 2- to 3-seeded; style very short; seeds obovate-orbicular, slightly flattened, black, slightly lustrous, about 1.2 mm. across, nearly smooth, superficial cells slightly impressed on margin.—June-Aug. Wet places along rivulets in mountains; Hokkaido, Honshu (Nikko).—Europe, Asia, N. America, Africa, and New Zealand.

Fam. 84. CARYOPHYLLACEAE NADESHIKO KA Chickweed Family

Herbs, rarely shrubby below, branches often thickened and jointed at the nodes; leaves opposite, gradually reduced to small bracts above, entire, nerveless or 1- to 3-nerved, usually shortly connate at the nodes, sometimes with scarious or bristly stipules; flowers bisexual, rarely unisexual, sometimes partially cleistogamous, solitary or cymose or in panicles, actinomorphic; sepals 4-5 (-7), persistent, free or connate below into a tube, imbricate in bud; petals as many as the sepals or absent, entire or lobed; stamens 4-10, rarely fewer, receptacle (gynophore) sometimes prominent; ovary 1-locular, rarely imperfectly 2- to 5-locular at the base, the ovules 2 to many, inserted at base or on the free-central placenta; styles 2-5; capsules dehiscent loculicidally and/or septically with as many valves or twice the number of the styles, rarely indehiscent; seeds many, rarely 1; endosperm mealy.—About 80 genera, with about 2,000 species, cosmopolitan.

- 1A. Sepals free.
2A. Stipules present.
3A. Styles connate at base; stipules of few bristles. 1. *Drymaria*

- 3B. Styles free; stipules scarious.
 4A. Styles and carpels 5. 2. *Spergula*
 4B. Styles and carpels 3. 3. *Spergularia*
- 2B. Stipules absent.
 5A. Petals entire or absent.
 6A. Styles as many as the sepals and alternate with them. 4. *Sagina*
 6B. Styles fewer than the sepals.
 7A. Valves of the capsule as many as the style, entire.
 8A. Rather fleshy seashore plants, with flat leaves; disc prominent, 8- to 10-lobed; fruit fleshy. 5. *Honkenya*
 8B. Small tufted alpine plants, with subulate leaves; disc not prominent; fruit a dry capsule. 6. *Minuartia*
 7B. Valves of the capsule bifid.
 9A. Seeds not strophiolate. 7. *Arenaria*
 9B. Seeds strophiolate. 8. *Moehringia*
- 5B. Petals retuse to 2-parted, rarely entire or absent.
 10A. Cleistogamic flowers present; roots at least some of them thickened. 9. *Pseudostellaria*
 10B. Cleistogamic flowers absent; roots not thickened (in ours).
 11A. Styles 5, opposite the sepals, rarely 3 or 4; capsules cylindric. 10. *Cerastium*
 11B. Styles 3, rarely 5 but alternate with the sepals; capsules ovoid to globose. 11. *Stellaria*
- 1B. Sepals connate below into a prominent tube; petals distinctly clawed; stipules absent.
 12A. Styles 2; calyx-tube with many longitudinal nerves, with 1 to few pairs of bracts at base; seeds peltately attached. 12. *Dianthus*
 12B. Styles 3-5; calyx-tube 5- to 10-nerved, sometimes up to 20-nerved, bractless or the bracts not at the base; seeds laterally attached.
 13A. Fruit a berry becoming crustaceous and irregularly dehiscent. 13. *Cucubalus*
 13B. Fruit a capsule, dehiscent by teeth or valves.
 14A. Capsules and ovary 1-locular.
 15A. Teeth of capsules usually 5, as many as the styles. 14. *Lychnis*
 15B. Teeth of capsules usually 6, twice as many as the styles. 15. *Melandrium*
 14B. Capsules and ovary 3- to 5-locular at base. 16. *Silene*

1. DRYMARIA Willd. YAMBARU-HAKOBE ZOKU

Diffuse, rarely erect, dichotomously branched herbs; leaves flat, the stipules small, bristly or fugaceous; flowers pedicellate, small, in spreading terminal axillary cymes; sepals 5, herbaceous or scarious on the margin, free; petals 5, 2- to 6-fid; stamens 5 or fewer; ovary 1-locular, few to many-ovuled; styles 3-fid; capsules 3-valved; seeds reniform-globose or laterally flattened, with a lateral hilum.—About 40 species, mainly in tropical America, a few widely dispersed in the Tropics of the Old World.

1. *Drymaria cordata* Willd. ex Roem. & Schult. var. *pacifica* Mizushima. OMUNAGUSA. Much-branched, slender, glabrous herb with obtusely angled branches; leaves thinly membranous, depressed cordate-orbicular, 8-15 mm. wide, slightly shorter than broad, rounded, entire, truncately rounded at base, weakly 3-nerved, the petioles nearly absent to 3 mm. long, the stipules consisting of a few whitish setae; cymes terminal, soon becoming lateral, glabrous, loosely several-flowered, the peduncles slender, 3-5 cm. long, the bracts scarious, broadly lanceolate, acute, greenish on the back, the pedicels smooth; sepals 5, about 3 mm. long, narrowly oblong,

rounded and pale green on back, weakly 3-nerved, the margins scarious; petals white, slightly shorter than the sepals, oblanceolate, cleft to the middle, the lobes linear-lanceolate, acutish; stamens slightly more than half as long as the sepals, the anthers pale yellow; styles 3, slightly connate at base; capsules ovoid, about 2 mm. long, the valves 3, ovate, entire, membranous; seeds 4 or 5, dark brown, about 0.5 mm. long, mammillate.—Apr.-May. Lowlands; Honshu (Hachijo Isl.).—Bonins, Hawaii, S. America, and Africa. The typical phase occurs in S. America and Africa.

2. SPERGULA L. Ô-TSUME-KUSA ZOKU

Annual or biennial herbs, dichotomously or fasciculately branched; leaves subulate, apparently verticillate, the stipules scarious, small; flowers pedicelled, the cymes racemose; sepals 5; petals 5, entire; stamens 10, rarely 5; ovary 1-locular, many-ovuled; styles 5, alternate with the sepals; capsules 5-valved, entire, the valves opposite the sepals; seeds flat, acutely margined or winged.—Two or three species in the Old World, spread elsewhere as a weed.

1. *Spergula arvensis* L. NOHARA-TSUME-KUSA. Tufted annual or biennial, glabrous or slightly short-pubescent above; stems ascending, 20-50 cm. long, slender, the stipules small, about 1 mm. long; leaves narrowly linear or subulate, 1.5-4 cm. long, 0.5-1 mm. wide, obtuse, verticillate in 12's to 20's; inflorescence loosely flowered, often once to twice branched, 5-10 cm. long, the bracts small, membranous, the pedicels 1.5-4 cm. long, deflexed in fruit; sepals 3-4 mm. long, ovate, acute, slightly longer or as long as the petals; capsules slightly

longer than the sepals; seeds orbicular, slightly flattened, about 1.2 mm. across, black, narrowly winged with scattered pale mammillae on both surfaces.—July-Aug. Waste grounds and cultivated fields in lowlands; Hokkaido, Honshu (Kantô and centr. distr.).—Naturalized from Europe.

Var. *sativa* (Boenn.) Koch. *S. sativa* Boenn.—Ô-TSUME-KUSA. Seeds smooth.—Occurs with the typical phase.

Var. *maxima* Koch. Ô-TSUME-KUSA-MODOKI. With large mammillate seeds.—Naturalized in our area from Europe.

3. SPERGULARIA Pers. USHIO-TSUME-KUSA ZOKU

Spreading diffuse herbs mainly growing near the seashore and in saline soils; leaves linear to subulate, the axillary tufts of leaves often appearing verticillate, the stipules scarious; flowers pedicelled, white or pinkish, axillary, the cymes often racemose; sepals 5; petals 5, entire, rarely fewer or absent; stamens 10 or fewer; ovary 1-locular, many-ovuled; styles 3, free; capsules 3-valved; seeds reniform-globose or laterally flattened, often winged on margin.—About 30 species.

- 1A. Stipules free, lanceolate or narrowly deltoid; flowers pale pinkish; capsules slightly longer than the sepals. 1. *S. rubra*
 1B. Stipules connate at base, the free portion broadly deltoid, often shallowly toothed; flowers white; capsules $1\frac{1}{2}$ times longer than the sepals. 2. *S. marina*

1. *Spergularia rubra* (L.) Presl. *Arenaria rubra* L.; *Tissa rubra* (L.) Britt.—USU-BENI-TSUME-KUSA. Annual or biennial herb often glandular-pilose on upper part and on sepals; stems decumbent and branching below, 5–15 cm. long, usually tufted; stipules 3–3.5 mm. long, thinly scarious, white, lustrous; leaves linear, 8–15 mm. long, 0.5–1 mm. wide, ending in a minute awn; flowers axillary, the pedicels 3–8 mm. long; sepals broadly lanceolate, obsoletely nerved, subobtus, 3–4 mm. long, narrowly scarious on margin; petals oblanceolate, 2–3 mm. long, obtuse; capsules 4–5 mm. long, ovoid-globose; seeds subovate-globose, about 0.3 mm. across, with scattered obsoletely tubercles on back.—June–Oct. Seashores; Hokkaido.—Seashores in the cold temperate to frigid regions of the N. Hemisphere.

2. *Spergularia marina* (L.) Griseb. *Arenaria rubra* var. *marina* L.; *A. marina* (L.) All.; *S. salina* J. & C. Presl;

S. marina var. *asiatica* (Hara) Hara; *S. salina* var. *asiatica* Hara.—USHIO-TSUME-KUSA. Resembles the preceding species but larger; stems 10–20 cm. long, the upper parts and sepals often slightly glandular-pilose; stipules broadly deltoid or broadly ovate, 1.5–2 mm. long, thinly membranous, white, lustrous, connate on lower half, often 2- to 3-toothed on margin; leaves linear; flowers axillary, the pedicels 3–8 mm. long; sepals narrowly ovate or narrowly ovate-oblong, obtuse, obsoletely 3-nerved, white-scarious on margins, 3–4 mm. long; petals narrowly ovate, about 2 mm. long, white, obtuse; capsules 5–6 mm. long; seeds ovate, slightly flattened, minutely mammillate to nearly smooth, 0.5–0.7 mm. long, barely winged.—July–Sept. Wet saline habitats near the sea; Hokkaido, Honshu, Kyushu (n. distr.).—Sakhalin, Korea, Manchuria, and cooler regions of the N. Hemisphere.

4. SAGINA L. TSUME-KUSA ZOKU

Small annuals, biennials or perennials; leaves subulate, opposite, exstipulate; flowers small, solitary in leaf axils or in terminal cymes, pedicelled, white; sepals 4 or 5; petals 4 or 5 or absent, entire, rarely retuse; stamens as many or fewer than the sepals, sometimes twice as many; ovary 1-locular; styles as many as and alternate with the sepals; capsules 4- or 5-valved, the valves opposite the sepals; seeds minute.—More than 10 species, in the N. Hemisphere.

- 1A. Plant glabrous throughout; pedicels recurved while young, straight at maturity. 1. *S. saginoides*
 1B. Plant usually glandular-pilose in upper part or sometimes glabrous; pedicels straight from the beginning. 2. *S. japonica*
 2A. Superficial cells of seeds with a wart in the center. 2. *S. japonica*
 2B. Superficial cells of seeds smooth, not warty. 3. *S. maxima*

1. *Sagina saginoides* (L.) Karst. *Spergula saginoides* L.; *Sagina linnaei* Presl.—CHISHIMA-TSUME-KUSA. Small glabrous perennial; leaves linear, mucronate or very short-awned; pedicels 1–2.5 cm. long, slender, ascending or erect, recurved near the tip in young fruit, strict in fruit; sepals 5, rarely 4, ovate-oblong, elliptic, or ovate, 1.5–2 mm. long, obtuse to rounded; petals nearly rounded to obovate, about half to nearly as long as the calyx; stamens 5–10; capsules as long as to slightly longer than the calyx; seeds light brown, 0.3–0.4 mm. across, nearly smooth, distinctly grooved dorsally.—July–Aug. Alpine; Hokkaido, Honshu (centr. distr.); rare.—Sakhalin, Kuriles, Kamchatka, Siberia, Caucasus, Europe, and N. America.

2. *Sagina japonica* (Sw.) Ohwi. *Spergula japonica* Sw.; *Spergella japonica* Sw. ex Steud.; *Sagina maxima* sensu auct. Japon., non A. Gray; *S. sinensis* Hance; *S. taquetii* Lév.—TSUME-KUSA, TAKANO-TSUME. Small tufted glabrous annual or biennial, the pedicels, sepals, and sometimes the upper part of the stems glandular-pilose; stems 2–20 cm. long, ascending and branched below; leaves subulate, slightly flattened, 7–18 mm. long, 0.8–1.5 mm. wide, entire, acutely and minutely

spine-tipped; flowers axillary, solitary, sometimes forming a terminal leafy cyme; sepals 5, elliptic, rounded at apex, about 2 mm. long; petals narrowly ovate, slightly shorter than to nearly as long as the sepals, entire, rounded at apex, white; stamens 5–10; capsules ovoid-globose, slightly longer than the sepals, deeply 5-parted; seeds minute, ovoid, about 0.4 mm. long, minutely warty, dark brown.—Mar.–Oct. Lowlands to mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common especially around dooryards.—China and Korea to India.

3. *Sagina maxima* A. Gray. *S. taquetii* auct., non Lév.—HAMA-TSUME-KUSA. Resembles the preceding but slightly stouter, often with a rosette of basal leaves in winter and the leaves slightly broader and thicker, the pedicels and sepals glandular-pilose; seeds yellow-brown, without warts, the cells slightly convex, scarcely impressed.—June–Aug. Near seashores; Hokkaido, Honshu.—Korea and Formosa.

Var. *crassicaulis* (S. Wats.) Hara. *S. crassicaulis* S. Wats.—EZO-HAMA-TSUME-KUSA. Pedicels and sepals glabrous.—Hokkaido.—Kamchatka and western N. America.

5. HONKENYA Ehrh. HAMA-HAKOBE ZOKU

Slightly fleshy glabrous perennial herb; stems decumbent and much-branched at base; leaves ovate to oblanceolate; flowers small, bisexual or staminate, whitish, solitary in axils or cymose; sepals 5; petals 5, entire, small, shorter than the sepals; stamens 10; ovary 1-locular; styles 3, sometimes 4 or 5; capsules rather fleshy, globose, 3- to 5-valved, the valves entire; seeds many, rather large, not strophilote.—One species, on seashores in the cooler regions of the N. Hemisphere.

1. *Honkenya peplodes* (L.) Ehrh. var. *major* Hook. *Ammodenia major* (Hook.) Kudo; *H. peplodes* var. *oblongifolia* (Torr. & A. Gray) Fenzl; *H. oblongifolia* Torr. & A. Gray; *A. peplodes* var. *oblongifolia* (Torr. & A. Gray) Maxim.—HAMA-HAKOBE. Lustrous fleshy green perennial from slender creeping rhizomes; stems tufted, much branched, decumbent at base, 10-30 cm. long; leaves oblong, ovate or broadly oblanceolate, 1.5-4 cm. long, 4-20 mm. wide, acute to obtuse, mucronate, sessile; flowers in upper axils, sometimes

leafy-cymose, short-pedicelled, yellowish green; sepals 4-5 mm. long, narrowly ovate, subacute; petals white, obovate, smaller than the sepals, obtuse; capsules globose, about 8 mm. across; seeds 3-4 mm. long.—June-Sept. Gravelly slopes along seashores; Hokkaido, Honshu (n. distr.).—Korea, Sakhalin, Kuriles, and the Ochotsk Sea area.—Alaska. The typical phase occurs in the Arctic regions of n. Europe to Spain, and N. America.

6. MINUARTIA L. TAKANE-TSUME-KUSA ZOKU

Small tufted perennial herbs; leaves subulate, densely disposed on the short stems and branches, 1- to 3-nerved, often with a short awn; flowers solitary or in cymes, white, rarely pinkish; sepals 5, 1- to 3-nerved; petals entire, longer to shorter than the sepals; stamens 10; ovary 1-locular; styles 3; capsules narrowly ovoid to ovoid-cylindric, shallowly 3-cleft, the valves nearly entire.—About 100 species, in high latitudes and mountainous regions of the N. Hemisphere.

- 1A. Sepals acuminate or acute, minutely awn-tipped; petals slightly longer than to as long as the sepals; capsules 3-3.5 mm. long, slightly longer than the sepals. 1. *M. verna* var. *japonica*
 1B. Sepals obtuse, not awn-tipped; petals always longer than the sepals; capsules 6-15 mm. long, 1.5-2.5 times as long as the sepals.
 2A. Leaves 3-nerved, more or less ciliate; seeds with long tubercles on margin. 2. *M. macrocarpa*
 2B. Leaves 1-nerved, glabrous or nearly so except near base.
 3A. Seeds glabrous. 3. *M. hondoensis*
 3B. Seeds minutely tuberculate. 4. *M. arctica*

1. *Minuartia japonica* (L.) Hiern var. *japonica* Hara. *M. verna* sensu auct. Japon., non Hiern—HOSOKA-TSUME-KUSA, KOKA-NO-TSUME-KUSA. Stems much branched near the base, tufted, erect or ascending, 4-12 cm. long, slender, short-pubescent on upper parts; leaves subulate, 3-10 mm. long, 0.2-0.3 mm. wide, acute to subacute, minutely awn-tipped, glabrous, persistent; flowers 1-5; sepals narrowly ovate or broadly lanceolate, about 3 mm. long, 3-nerved, glabrous or sparingly short-pilose; petals obovate, obtuse, white, as long as to slightly longer than the sepals; seeds reniform-orbicular, 0.6 mm. long, the superficial cells scarcely elevated.—July-Aug. Rocky cliffs and slopes in alpine regions; Hokkaido, Honshu (n. and centr. distr.).—The species occurs widely over Eurasia to N. Africa.

2. *Minuartia macrocarpa* (Pursh) Ostenf. var. *jooi* (Makino) Hara. *Alpine jooi* Makino; *A. macrocarpa* sensu auct. Japon., non Fenzl—MIYAMA-TSUME-KUSA. Low spreading perennial herb, the stems creeping, much branched, the branches erect, 3-5 cm. long, spreading-pubescent above; leaves dense, numerous, subulate, somewhat flattened, often slightly arcuate, yellowish green, subobtusate to subacute, 7-12 mm. long, about 1 mm. wide, sparingly ciliate; flowers solitary, terminal, erect, short-pedicellate; sepals linear-oblong to lanceolate, 6-7 mm. long, obsoletely 3-nerved, obtuse; petals narrowly obovate, white, 7-8 mm. long, obtuse; capsules 10-15 mm. long; seeds

about 1.5 mm. across, tuberculate.—July-Aug. Dry alpine slopes; Honshu (centr. distr.); rare.

Var. *minutiflora* Hult. *M. subfalcata* Nakai, excl. syn.—EZO-MIYAMA-TSUME-KUSA. Leaves hairy with scattered cellular hairs on the margin.—Alpine slopes; Hokkaido.—Kamchatka.

3. *Minuartia hondoensis* Ohwi. *M. arctica* var. *hondoensis* Ohwi; *Alpine arctica* Makino, non Fenzl—TAKANE-TSUME-KUSA. Low tufted perennial herb; stems much branched below, 3-7 cm. high, slender, ascending below, erect above, the upper internodes glandular short-hairy; leaves dense, subulate, 8-15 mm. long, 0.5-0.7 mm. wide, obtuse, green, slightly purplish red at base, sometimes loosely short-pilose on margin near base, 1-nerved; flowers usually solitary, the pedicels with glandular and short eglandular hairs; sepals linear-oblong, obtuse, slightly pilose, 5-6 mm. long, 3-nerved; petals white, narrowly obovate, rounded at apex, 7-9 mm. long; capsules 8-10 mm. long; seeds reniform-orbicular, 0.6-1 mm. across, smooth, superficial cells scarcely convex.—Dry slopes and on rocks in high mountains; Honshu (n. and centr. distr.).

4. *Minuartia arctica* (Stev.) Asch. & Graebn. *Arenaria arctica* Stev.—EZO-TAKANE-TSUME-KUSA. Closely resembles the preceding; seeds tuberculate.—July-Aug. Alpine slopes; Hokkaido.—Cold regions of the N. Hemisphere.

7. ARENARIA L. NOMI-NO-TSUZURI ZOKU

Annual or perennial herb; leaves flat, rarely linear to subulate; inflorescence paniculate-cymose; flowers rarely solitary, white; sepals 5, herbaceous; petals as many and alternate with the sepals, entire, or sometimes absent; stamens 10; styles usually 3; capsules ovoid, enclosed by the persistent calyx, dehiscent or with 3 lobes, each 2-cleft or with 6 lobes; seeds many to few, subglobose to discoid, the hilum naked.—Circumboreal.

- 1A. Annual or biennial herb; petals shorter than the sepals. 1. *A. serpyllifolia*
 1B. Perennial herbs; petals slightly longer than the sepals.
 2A. Stems with minute papillose hairs, more or less in 2 series; leaves nearly glabrous, broadly lanceolate to narrowly ovate, 3–7 mm. long, 1.5–3 mm. wide; sepals 3–4 mm. long, acuminate. 2. *A. katoana*
 2B. Stems with crisped hairs all around; leaves soft-pubescent especially on margin, oblong to broadly ovate, 1–2 cm. long, 5–10 mm. wide; sepals 6–8 mm. long, subobtus. 3. *A. merckjoides*

1. *Arenaria serpyllifolia* L. *A. serpyllifolia* var. *leptoclados* auct. Japan., non Reichenb., and var. *tenuior* auct. Japan., non Mert. & Koch.—*NOMI-NO-TSUZURI*. Short-pubescent annual or biennial; stems slender, much-branched, 5–20 cm. long; leaves small, narrowly to broadly ovate or elliptic, sometimes lanceolate in upper ones, 3–7 mm. long, 1–5 mm. wide, acuminate to acute, mucronate, sessile; flowers in leafy cymes, axillary, solitary, terminal; pedicels spreading or ascending, 5–15 mm. long, slender; sepals broadly lanceolate, acuminate, 3–4 mm. long; petals about half as long as the sepals, obovate-orbicular, obtuse, white; capsules slightly longer than the sepals; seeds obliquely elliptic, 0.3–0.5 mm. long, dark brown, thick-discoid, the superficial cells slightly convex-elliptic.—Mar.–June. Sunny slopes and waste ground in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Europe and Asia.

2. *Arenaria katoana* Makino. *KATŌ-HAKOBE*. Perennial; stems tufted, branched below, terete, 5–8 cm. long, rather densely leaved, with 2 longitudinal rows of minute hairs; leaves sessile, ovate or narrowly so to broadly lanceolate, 3–7 mm. long, 1.5–3 mm. wide, acuminate, glabrous except a few short hairs on margin near base; flowers 1 or 2, the pedicels minutely pubescent, 5–12 mm. long; sepals broadly lanceolate,

glabrous, acuminate, 3–4 mm. long; petals ovate, white, 5–6 mm. long, subobtus; styles slender, erect, about 2 mm. long; capsules conical-ovoid, about 5 mm. long; seeds reniform-orbicular, minutely mammillate, nearly 1 mm. long.—July–Aug. Alpine; Hokkaido (Mount Yubari), Honshu (Mount Hayachine in Rikuchu, and Mount Shibutsu in Kotsuke); rare.

Var. *lanceolata* Tatew. *A. tatewakii* Nakai.—*APOTSUME-KUSA*. Leaves narrower, lanceolate to narrowly so.—Hokkaido (Mount Apoi in Hidaka Prov.).

3. *Arenaria merckjoides* Maxim. *A. chokaiensis* Yatabe.—*CHŌKAI-FUSUMA*, *MEAKAN-FUSUMA*. Rhizomes slender, elongate, much branched; stems tufted, angled, 5–15 cm. long, rarely simple; leaves oblong to elliptic or ovate, 1–2 cm. long, 5–10 mm. wide, acute with an obtuse tip, pubescent while young, sparsely so later and confined to the margins, rather fleshy, sessile; flowers 1–4, the pedicels soft-pubescent, 10–15 mm. long; sepals lanceolate, obtuse, slightly pubescent; petals narrowly ovate; seeds reniform-orbicular, red-brown, about 1.5 mm. across inclusive of the rather thickish marginal wing.—July–Aug. Alpine; Hokkaido (Mount Meakan), Honshu (Mount Chokai and Mount Gassan); rare.

8. MOEHRINGIA L. ŌYAMA-FUSUMA ZOKU

Rather low annuals or perennials; leaves flat, thin, sometimes linear, sessile or short-petiolate; flowers axillary, solitary or cymose, small, white; sepals and petals 4 or 5; stamens 8–10; styles 2 or 3; capsules ellipsoidal, the valves 4–6; seeds rather few, usually lustrous, with a membranous strophiole on the hilum.—About 20 species, temperate regions of the N. Hemisphere.

- 1A. Leaves ovate to broadly so, distinctly petioled; sepals acuminate, broadly lanceolate, longer than the capsule. 1. *M. trinervia*
 1B. Leaves oblong to narrowly so, sessile; sepals very obtuse, elliptic, about half as long as the capsule. 2. *M. lateriflora*

1. *Moehringia trinervia* (L.) Clairv. *Arenaria trinervia* L.; *M. platysperma* Maxim.; *M. trinervia* var. *platysperma* (Maxim.) Makino.—*TACHI-HAKOBE*. Short-pubescent biennial; stems erect or ascending, mostly decumbent and branched below, 7–20 cm. long; leaves ovate or broadly so, 1–2.5 cm. long, 5–12 mm. wide, acute or cuspidate, abruptly narrowed to subrounded at base, subtrinerve, subsessile or distinctly petiolate in the lower ones, short-ciliate; flowers solitary in axils, white, the pedicels 1–4 cm. long; sepals broadly lanceolate, 1-nerved, acuminate, short-pilose on the nerves, broadly white and glabrous on the margin, 3.5–5 mm. long; petals obovate, entire, 1/3–1/2 as long as the sepals; capsules 2.5–3 mm. long, the valves 6, recurved above; seeds reniform-orbicular, lenticular, about 0.8 mm. across, with a small strophiole at base.—Mar.–July. Foothills; Hokkaido,

Honshu, Shikoku, Kyushu; rather rare.—Europe, Siberia, and Formosa.

2. *Moehringia lateriflora* (L.) Fenzl. *Arenaria lateriflora* L.—*ŌYAMA-FUSUMA*. Perennial herb; stems slender, 10–15 cm. long, branched, slender; leaves oblong to narrowly so, sometimes elliptic, 1–2.5 cm. long, 3–10 mm. wide, obtuse or subobtus, sessile, short-pilose on margin and on nerves beneath; inflorescence axillary or terminal, 1- to 3-flowered, 1–3 cm. long, puberulent, often with a pair of minute bracts near the middle; sepals elliptic, obtuse to subrounded at apex, 2–3 mm. long, obsoletely 1- to 3-nerved; petals entire, longer or nearly as long as the sepals; capsules 3.5–5.5 mm. long, 3-valved, the valves bifid, erect; seeds about 1 mm. long.—Meadows in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Temperate regions of the N. Hemisphere.

9. PSEUDOSTELLARIA Pax WACHIGAI-SŌ ZOKU

Low perennial herbs usually with thickened roots; stems erect or ascending, sometimes long-creeping after anthesis; leaves flat, 1-nerved; flowers dimorphic, the chasmogamic flowers 1 to several on or near the top of stems, in cymes; sepals 5, sometimes 6 or 7; petals as many as the sepals, white, slightly longer than the sepals, entire or bifid; stamens usually 8 or 10; styles 2–4; ovary globose, the ovules rather numerous, the placenta nearly basal; capsules globose, 2- to 4-valved, the valves bifid; cleistogamous flowers usually on lower part of stems, short-pedicelled or subsessile, the sepals 4 or 5, the petals absent; stamens reduced; seeds slightly compressed, tubercled.—More than 10 species, in e. Asia to the Altai mts. and the Himalayas to Europe.

1A. Upper 2 pairs of leaves approximate; flowers 1-5, terminal.

2A. Chasmogamic flowers solitary, terminal, usually 6- to 8-merous, the pedicels glabrous; roots few-fascicled, only slightly thickened.

1. *P. palibiniana*

2B. Chasmogamic flowers 1 or 2(-5), terminal, 5-merous, the pedicels puberulous on one side; main root solitary, fusiform.

2. *P. heterophylla*

1B. Leaf pairs not approximate; flowers terminal and lateral.

3A. Leaves glabrous except on margin at base, linear to ovate, narrowed below.

4A. Leaves nearly all alike, linear to linear-lanceolate; flowers usually few to several in a terminal cyme. 3. *P. sylvatica*

4B. Leaves heteromorphic, the upper ovate or narrowly ovate, the lower spatulate; flowers 1-3, solitary in axils, terminal.

4. *P. heterantha*

3B. Leaves ciliate, ovate to broadly ovate, rounded at base. 5. *P. japonica*

1. *Pseudostellaria palibiniana* (Takeda) Ohwi. *Krascheninnikovia palibiniana* Takeda; *K. palibiniana* var. *polymera* Nakai—HIGENE-WACHIGAI-SŌ. Roots 1-4, elongate, slightly thickened; stems 10-20 cm. long, the internodes with 2 longitudinal series of soft hairs; lower leaves spatulate-oblancheolate, 2 to 4 pairs, obtuse, slightly pubescent toward the base, the upper leaves approximate, broadly lanceolate to ovate or broadly so, 3-4 cm. long, 1.5-2.5 mm. wide, abruptly acute to obtuse, rather broadly cuneate at base, glabrous, sessile; flowers solitary, white, the pedicels 1.5-2.5 cm. long, glabrous; sepals 5-8, sometimes sparsely ciliate at base; petals broadly oblanceolate, entire, 6-8 mm. long, obtuse; cleistogamous flowers near base of stems, short-petioled.—Apr.-May. Woods in mountains; Honshu (Iwaki Prov. southw. to centr. distr.).—Korea.

2. *Pseudostellaria heterophylla* (Miq.) Pax. *Krascheninnikovia heterophylla* Miq.; *K. koidzumiana* Ohwi; *Pseudostellaria koidzumiana* (Ohwi) Ohwi—WADA-SŌ. Resembles the preceding; main root thickened, fusiform near base; stems 10-15 cm. long, with 2 longitudinal rows of short hairs on the internodes; upper leaves ovate to broadly so or rhombic-ovate, usually acute, 3-6 cm. long, 1-4 cm. wide, often slightly pilose on the nerves beneath, sessile; flowers 1-5, fasciculate, terminal, white, the pedicels 1-2 cm. long, short-pubescent; sepals 5, slightly pilose on back; petals 5, narrowly oblong, bifid, 7-8 mm. long; cleistogamous flowers short-pedicellate, on nodes below the chasmogamic ones.—Apr.-May. Honshu, Kyushu.—Korea, China, and Manchuria.

3. *Pseudostellaria sylvatica* (Maxim.) Pax. *Krascheninnikovia sylvatica* Maxim.—KUSHIRO-WACHIGAI-SŌ. Roots 1 to few, thickened and fusiform; stems simple, usually solitary, 4-angled, 15-30 cm. long, with 2 longitudinal rows of short hairs on the internodes; leaves linear to linear-lanceolate, 3-7 cm. long, 2-7 mm. wide, acuminate, subsessile, glabrous except for a few hairs at base; flowers few (sometimes soli-

tary), usually in a loose terminal cyme, white, the pedicels short-pubescent on one side, 15-30 mm. long; sepals 5, glabrous; petals narrowly obovate, 5-6 mm. long, shallowly 2-lobulate; cleistogamous flowers pedicelled, borne on the lower nodes.—May-June. Hokkaido, Honshu (Rikuchu Prov.); rare.—Korea, China, and e. Siberia.

4. *Pseudostellaria heterantha* (Maxim.) Pax. *Krascheninnikovia heterantha* Maxim.; *K. maximowicziana* Fr. & Sav.; *P. musashiensis* Hiyama—WACHIGAI-SŌ. Delicate herb, roots 1 or 2, thickened, fusiform; stems 1 or 2, often decumbent at base, 8-12 cm. long; leaves narrowly oblanceolate to subspatulate, 10-25(-40) mm. long, 2-4 mm. wide, acute or subacute, glabrous except for a few soft hairs at base, the upper leaves often ovate or narrowly so, short-petioled, 15-30 mm. long, 7-12 mm. wide, abruptly acuminate to acute; flowers 1 or 2(-3), white, solitary in leaf axils, terminal, the pedicels 2-3 cm. long, with a longitudinal series of short hairs; sepals 5; petals 5, obovate, about 6 mm. long, rounded to obtusely mucronate; cleistogamous flowers few, pedicelled, borne near the base.—Apr.-June. Woods in the foothills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China and India.

5. *Pseudostellaria japonica* (Korsh.) Pax. *Krascheninnikovia japonica* Korsh.; *C. ciliata* Honda —Nambu-WACHIGAI-SŌ. Roots thickened, fusiform; stems erect, 15-20 cm. long, with 2 longitudinal rows of short hairs; lower leaves few-paired, nearly linear to lanceolate, 1.5-2.5 cm. long, 2-3 mm. wide, the upper leaves 4-paired, ovate or broadly so, 1.5-3 cm. long, 1-2 cm. wide, acute to short-acuminate, rounded at base, sessile, loosely pilose on both sides, rather long-pilose on margin and on nerves beneath; flowers 1-3, terminal and axillary, the pedicels about 15 mm. long, pubescent; sepals 5; petals obovate, 4-6 mm. long, white.—Honshu (n. distr.).—Manchuria.

10. CERASTIUM L. MIMINAGUSA ZOKU

Annuals, biennials or perennials usually more or less pubescent or tomentose; cymes terminal, leafy or bracteate; sepals 5, rarely 4; petals 5, rarely 4, retuse to bifid, sometimes fimbriate or entire, white; stamens 10 or fewer; ovary 1-locular, many-ovuled; styles 5 and opposite the sepals, rarely 3 or 4; capsules cylindrical, with twice as many teeth as the styles; seeds reniform-obicular or broadly obovate, slightly flattened.—About 70 species, cosmopolitan, except lowlands of the Tropics.

1A. Petals bifid or fimbriate; teeth of capsules erect, with revolute margins.

2A. Petals shorter to barely longer than the sepals; biennials or short-lived perennials.

3A. Pedicels shorter than to as long as the sepals; sepals pale green; inflorescence small, densely flowered; biennial or annual.

3B. Pedicels at least some of them longer than the sepals; sepals often purplish on margin; inflorescence rather loose; short-lived perennials. 1. *C. viscosum*

2B. Petals distinctly longer than the sepals; perennials. 2. *C. vulgatum*

4A. Seeds 1-1.2 mm. wide, mammillate; growing on rocks or in meadows near seashores. 3. *C. fischerianum*

4B. Seeds less than 1 mm. wide, with low semirounded warts; plants of mountains.

- 5A. Stems 25–35 cm. long, loosely tufted; radical leaves spatulate, the cauline broadly lanceolate, 15–20 mm. long, 3–6 mm. wide. *C. furcatum*
 4A. *C. furcatum*
 5B. Stems 10–15(–20) cm. long, densely tufted; radical and cauline leaves linear-lanceolate, 8–20 mm. long, 1.5–3 mm. wide. *C. schizopetalum*
 5C. *C. schizopetalum*
 1B. Petals entire; teeth of capsules flat, reflexed; leaves 4–8 cm. long, 1–2 cm. wide. 6. *C. pauciflorum* var. *oxalidiflorum*

1. *Cerastium viscosum* L. *C. glomeratum* Thuill.—ORANDA-MIMINAGUSA. Biennial herb, short spreading-pilose and glandular-pubescent; stems 10–60 cm. long, somewhat

tufted; radical leaves broadly spatulate or broadly lanceolate, the cauline narrowly oblong to ovate, 7–20 mm. long, 4–12 mm. wide, obtuse, mucronate; inflorescence dense, the bracts green, small, the pedicels shorter than to as long as the sepals; sepals lanceolate, acute, 4–5 mm. long, with long ascending hairs on back, slightly membranous on margin; petals shorter than the sepals; seeds about 0.5 mm. wide.—Apr.–May. Meadows and roadsides in lowlands and foothills; Honshu, Shikoku, Kyushu; very common.—Introduced from Europe.

2. *Cerastium vulgatum* L. *C. caespitosum* Gilib.; *C. holosteoides* Fries; *C. triviale* Link.—O-MIMINAGUSA. Perennial herb, 15–30 cm. high, pilose and often glandular-hairy on upper parts; stems erect, tufted; leaves ovate to narrowly ovate-oblong, 1–4 cm. long, 4–12 mm. wide, acute to subobtusely mucronate; inflorescence spreading in fruit, the pedicels 5–25 mm. long, erect in anthesis, abruptly curved near top in fruit; flowers white; sepals broadly lanceolate to narrowly ovate, pubescent, purplish toward the scarious margin, subacute to obtuse, 5.5–6.5 mm. long; petals nearly as long as the sepals; capsules 8–10 mm. long; seeds 0.6–0.7 mm. wide, low-tubercled.—June–July. Lowlands to foothills; Hokkaido.—Europe, Siberia, n. Korea, and Sakhalin.

Var. *hallaianense* Nakai. *C. caespitosum* var. *ianthes* (Williams) Hara; *C. ianthes* Williams; *C. holosteoides* var. *hallaianense* (Nakai) Mizushima.—MIMINAGUSA. Slightly smaller in all parts than in the typical phase; sepals 4.5(–5.5) mm. long.—May–June. Lowlands to foothills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.

3. *Cerastium fischerianum* Ser. *C. alpinum* var. *fischerianum* (Ser.) Regel; *C. schmidtianum* Takeda; *C. robustum* Williams; ? *C. risirienense* Miyabe & Tatew.—OBANA-NO-MIMINAGUSA. Rather tufted, spreading-pubescent perennial; stems 15–60 cm. long; leaves oblong-lanceolate, narrowly ovate or elliptic, 1–5 cm. long, 3–20 mm. wide; inflorescence loose, the pedicels 1–3 cm. long; sepals ovate-oblong or narrowly oblong, 6–8 mm. long, obtuse, with scarious margins; petals cuneate-obovate, 10–12 mm. long, bifid, rarely 2-lobed or twice toothed; capsules 12–15 mm. long; seeds mammillate, 1–1.2 mm. wide.—June–Aug. Lowlands, especially near sea-shores; Hokkaido, Honshu, Kyushu (n. distr.); variable.

Kamchatka, Kuriles, Sakhalin, Ochotsk Sea region, and n. Korea.

4. *Cerastium furcatum* Cham. & Schltdl. var. *tetrastichium* (Takeda) Ohwi. *C. takedae* Hara; *C. takedae* var. *tetrastichium* Takeda; ? *C. mitsumoriense* Miyabe & Tatew.—HOSABA-MIMINAGUSA. Slightly pubescent, loosely tufted

perennial; stems 25–35 cm. long, with a single longitudinal line of hairs on the internodes; radical leaves spatulate, obtuse, 5–15 mm. long, sometimes spreading-hairy, the cauline lanceolate to ovate-oblong, glabrescent, 15–20 mm. long, 3–6 mm. wide; inflorescence loosely few-flowered, the pedicels 1–2 cm. long, short-pubescent; sepals 3.5–5 mm. long, ovate-oblong, the margins broadly scarious; petals about 8 mm. long, spatulate-oblong, bifid, rarely twice-lobed.—July–Aug. Alpine; Honshu (centr. distr.).

Var. *ibukiense* Ohwi. *C. vulgatum* var. *alpinum* sensu Fr. & Sav., non Koch.—KOBANO-MIMINAGUSA. Stems ascending and branching below; flowers smaller than in the preceding variety; petals about 7 mm. long.—May–June. Mountains; Honshu (Mount Ibuki in Oomi); rare.—The typical phase occurs in e. Siberia, Manchuria, Korea, and n. China.

5. *Cerastium schizopetalum* Maxim. MIYAMA-MIMINAGUSA. Densely tufted, pubescent perennial; stems 10–20 cm. long, branched at base, rather elongate; leaves linear-lanceolate or narrowly lanceolate, 8–20 mm. long, 1.5–3 mm. wide, acute to subacute; inflorescence loosely few-flowered, glandular-pilose, the pedicels 1–2 cm. long; sepals ovate-oblong, 3–5 mm. long, glabrous and scarious on margin, obtuse; petals 10–12 mm. long, bifid, the lobes again shallowly 2- to 3-lobed; capsules 7–8 mm. long; seeds about 0.6 mm. long, minutely tubercled.—July–Aug. Alpine; Honshu (centr. distr.).

Var. *bifidum* Takeda. *C. rupicola* Ohwi. KUMOMAMIMINAGUSA. Petals simply bifid.—Alpine regions of Honshu (Mount Shirouma).

6. *Cerastium pauciflorum* Stev. var. *oxalidiflorum* (Makino) Ohwi. *C. oxalidiflorum* Makino.—TAGASODE-SO. Densely tufted pubescent perennial herb; stems 30–40 cm. long; leaves broadly lanceolate, 4–8 cm. long, 1–2 cm. wide, subacuminate to acute with an obtuse tip; inflorescence rather loosely more than 10-flowered, glandular-pilose, the pedicels 2–5 cm. long; sepals elliptic to ovate-oblong, obtuse, 5–6 mm. long, scarious on margin; petals cuneate, entire, rounded at apex, about 15 mm. long; capsules 11–17 mm. long, the teeth reflexed; seeds tubercled, about 1 mm. across.—May–June. Mountains; Honshu (centr. distr.); rare.—The typical phase occurs in Siberia and Manchuria.

11. STELLARIA L. HAKOBE ZOKU

Erect to decumbent, often tufted herbs, rarely with branched hairs; flowers solitary in the leaf axils or in cymes, white to green; sepals 5; petals 5, bifid, sometimes lacerate or retuse, rarely absent; ovary 1-locular, many- or rarely few-ovuled; styles 3, rarely 5, alternate with the sepals; capsules 3 (5-) valved, the valves bilobed, the valves reniform-globose or flattened, rarely winged or tubercled on the margin.—About 100 species, cosmopolitan in temperate and cold regions.

1A. Leaves at least the lower ones distinctly petioled, ovate or deltoid-ovate; hairs if present simple and not branched.

2A. Styles 5. 1. *S. aquatica*

2B. Styles 3.

3A. Pedicels and stems with a longitudinal series of soft hairs.

4A. Leaves 4–8 cm. long, ciliate; sepals obsoletely nerved. 2. *S. bungeana*

- 4B. Leaves 1-4 cm. long, nearly glabrous; sepals 1-nerved.
 5A. Sepals acute, distinctly 1-ribbed; petals usually longer than the sepals. 3. *S. sessiliflora*
 5B. Sepals obtuse, 1-nerved; petals as long as to shorter than the sepals.
 6A. Stamens 1-7; seeds 1-1.2 mm. wide, with semirounded obtuse tubercles. 4. *S. media*
 6B. Stamens 5-10; seeds about 1.5 mm. wide, with conical subacute tubercles. 5. *S. neglecta*
 3B. Pedicels and stems glabrous; leaves often with a few long multicellular appressed hairs on the upper side. 6. *S. diversiflora*
 1B. Leaves sessile or nearly sessile, with branched hairs.
 7A. Leaves broadly ovate, with branched hairs.
 8A. Petals longer than the sepals. 7. *S. uchiyamana*
 8B. Petals absent. 8. *S. tomentella*
 7B. Leaves linear to oblong, rarely ovate, with simple hairs.
 9A. Petals bifid or absent; leaves and stems glabrous or glabrescent.
 10A. Leaves usually not more than 5 cm. long and 1.2 cm. wide; capsules dehiscent, many-seeded.
 11A. Leaves linear or broadly so, 1-2.5 mm. wide.
 12A. Stems slightly scabrous; petals as long as to slightly longer than the sepals. 9. *S. longifolia*
 12B. Stems smooth; petals about twice as long as the sepals.
 13A. Leaves ascending, linear, scarcely broadened below; stems 20-50 cm. long; plant of wet places in lowlands. 10. *S. filicaulis*
 13B. Leaves horizontally spreading, slightly broadened below; stems 10-20 cm. long; plant of gravelly slopes in alpine zone.
 14A. Seeds tubercled on margin. 11. *S. nipponica*
 14B. Seeds winged on margin. 12. *S. pterosperma*
 11B. Leaves lanceolate, oblong or sometimes ovate.
 15A. Leaves ovate to lanceolate, acuminate to very acute, rather firm.
 16A. Plant glaucous; leaves 1-3 cm. long; flowers solitary in upper axils, ebracteate; petals $1\frac{1}{2}$ times as long as the sepals. 13. *S. ruscifolia*
 16B. Plant yellow-green or pale green; leaves 2-4 cm. long; flowers cymose, the bracts small; petals shorter than the sepals or absent. 14. *S. fenizii*
 15B. Leaves oblong to oblong-lanceolate, obtuse to subacute, 1-2.5 cm. long, herbaceous or membranous.
 17A. Bracts thinly membranous, white; plant usually glaucous. 15. *S. alsine* var. *undulata*
 17B. Bracts green; flowers axillary and solitary.
 18A. Petals longer than the sepals. 16. *S. humifusa*
 18B. Petals absent. 17. *S. calycantha*
 10B. Leaves 4-12 cm. long, 1.5-3 cm. wide; capsules indehiscent, 1-seeded. 18. *S. monosperma* var. *japonica*
 9B. Petals fimbriate; stems and leaves silky-pubescent. 19. *S. radians*

1. *Stellaria aquatica* (L.) Scop. *Cerastium aquaticum* L.; *Malachium aquaticum* (L.) Fries.—USHI-HAKOBE. Biennial or perennial, decumbent at base, erect above, slightly glandular-pubescent on upper parts, 20-50 cm. high; leaves ovate or broadly so, glabrescent, 1-6 cm. long, 0.8-3 cm. wide, rounded to shallowly cordate, the lower ones petioled, those above sessile; flowers in leafy cymes, the pedicels 5-15 mm. long, deflexed in fruit; sepals narrowly ovate, obtuse, 4-5.5 mm. long, short-glandular; petals nearly as long as the sepals, deeply 2-parted, white; styles 5, short; capsules 5-valved, the valves bifid; seeds ellipsoidal, about 0.8 mm. long, slightly flattened, mammillate.—Apr.-Oct. Banks and roadsides in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Temperate regions of the N. Hemisphere and N. Africa.

2. *Stellaria bungeana* Fenzl. *S. nemorum* var. *bungeana* (Fenzl) Regel.—EZO-NO-MIYAMA-HAKOBE, Ô-HAKOBE. Stems 50-80 cm. long, branched below, ascending to suberect above, the internodes with a longitudinal line of soft pubescence; leaves ovate-oblong or ovate, 4-8 cm. long, 2-3 cm. wide, abruptly acuminate, rounded at base, ciliate, the midrib often slightly pubescent on both sides, pale green above, the upper ones sessile, the lower petioled; cymes relatively large, many-flowered, the bracts small, green, leaflike, the pedicels with a line of soft hairs; sepals ovate, subobtusely, 4-5 mm. long, pubescent; petals slightly longer than the sepals, 2-fid; capsules globose; seeds reniform-orbicular, about 1.2 mm. across, densely mammillate, dark brown, slightly flattened.—May-Sept. Hokkaido.—c. Siberia, Manchuria, n. Korea, and Sakhalin.

3. *Stellaria sessiliflora* Yabe. *S. nemorum* var. *japonica*

Fr. & Sav.; *S. japonica* (Fr. & Sav.) Makino, non Miq.; *S. franchetii* Honda.—MIYAMA-HAKOBE. Perennial herb; stems 20-30 cm. long, usually ascending to decumbent at base, with a longitudinal line of short soft hairs; leaves petioled, ovate or broadly so, or sometimes cordate-orbicular, 1-4 cm. long, 7-25 mm. wide, acuminate to acute, rounded to shallowly cordate at base, often mucronate, green on both sides, glabrous above, the midrib beneath slightly pubescent; flowers axillary, the pedicels 0-4 cm. long, with a longitudinal line of short soft hairs; sepals lanceolate, 1-nerved, long-pubescent, acute, 4-6 mm. long; petals usually slightly longer than the sepals, deeply bifid; capsules ovoid-globose, 6-valved; seeds dark brown, obliquely reniform-orbicular, 1-1.2 mm. long, densely mammillate with semirounded tubercles.—May-July. Along streams in woods in uplands; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu.

4. *Stellaria media* (L.) Vill. *Alsine media* L.; *S. media* var. *minor* Makino; *S. minor* (Makino) Honda.—KÔ-HAKOBE. Biennial or annual; stems 10-20 cm. long, decumbent at base, much branched, often purplish, with a longitudinal line of soft hairs; leaves ovate, 1-2 cm. long, 8-15 mm. wide, acute, rounded to obtuse at base, glabrous, often slightly pubescent on margin near base, petioled in the lower, sessile in the upper ones; flowers in upper axils, the bracts green, leaflike, the pedicels 5-40 mm. long, with a line of short hairs; sepals narrowly oblong, obtuse, obsoletely 1-nerved, 3-4 mm. long, soft-pubescent; petals white, deeply bifid, slightly shorter than the sepals; stamens 1-7, usually 3-5; seeds slightly flattened, with obtuse mammillae, 1-1.2 mm. across, reniform-orbicular.—Mar.-Sept. Sunny waste places, cultivated fields

and roadsides in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Nearly cosmopolitan.

5. *Stellaria neglecta* Weihe. *S. media* sensu auct. Japon., pro parte, non Vill.; *S. media* var. *neglecta* (Weihe) Weihe; *S. media* var. *procera* Klett & Richt.—MIDORI-HAKOBE. Closely resembles the preceding, but slightly larger and paler green; stamens 8–10, sometimes 5–6; seeds about 1.5 mm. across, more or less distinctly flattened, mammillate, especially on the margin.—Mar–Sept. Hokkaido, Honshu, Shikoku, Kyushu.—Eurasia.

6. *Stellaria diversiflora* Maxim. *S. diandra* Maxim.; *S. diversiflora* var. *diandra* (Maxim.) Makino—SAWA-HAKOBE, TSURU-HAKOBE. Perennial; stems 5–30 cm. long, often decumbent at base, branched, glabrous, terete; leaves petiolate, broadly ovate to deltoid-ovate, 1–3.5 cm. long, 0.8–2.5 cm. wide, acute to acuminate and often mucronate, glabrous beneath, with scattered appressed multicellular hairs above, green on both sides, the petioles usually slightly hairy; pedicels axillary, glabrous, 5–30 mm. long; sepals lanceolate, 1-nerved, glabrescent, acute, 4–6 mm. long; petals shorter to as long as the sepals, 2-fid, sometimes absent; stamens 2–10; capsules globose, 6-valved; seeds ellipsoidal, slightly flattened, about 1.3 mm. long, dark brown, mammillate.—May–July. Woods in mountains; Honshu, Shikoku, Kyushu.

7. *Stellaria uchiyamana* Makino. YAMA-HAKOBE. Perennial herb; stems, leaves and sepals stellate-pubescent, the hairs 2- to 6-branched; stems long-creeping and branched below, ascending above, 20–30 cm. long; leaves ovate-obicular to broadly ovate, 1–2.5 cm. long, 0.8–2.5 cm. wide, the petioles 1–2 mm. long, 1-nerved; flowers axillary, solitary, the pedicels stellate-pilose, 2–4 cm. long; sepals lanceolate, acuminate, subtrinnerved, 4–5 mm. long; petals white, slightly longer than the sepals, deeply bifid; capsules narrowly ovoid; seeds ellipsoidal, 1.5 mm. long, with semirounded mammillae.—Apr.–June. Low elevations; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

8. *Stellaria tomentella* Ohwi. *S. tomentosa* Maxim., non Link.; *S. tinuata* Ohwi—AO-HAKOBE. Resembles the preceding, but rather smaller and the stellate hairs slightly larger; leaves scarcely petioled; sepals lanceolate, subobtusate, 3–4 mm. long, subinnerved; petals absent.—Apr.–June. Woods in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

9. *Stellaria longifolia* Muhl. *S. friesiana* Steud.; *S. mosquensis* Bieb.—NAGABA-TSUME-KUSA. Slender, mostly erect, glabrous, usually tufted perennial; stems 20–40 cm. long, branched below, 4-angled, minutely scabrous; leaves linear to broadly so, 1.5–2.5 cm. long, 1.5–2.5 mm. wide, acute, minutely scabrous, the midrib impressed above, raised beneath; inflorescence pedunculate, several-flowered, loose, the pedicels smooth, the bracts small, scarious; sepals ovate, glabrous, obsoletely 3-nerved, obtuse to subacute, 2.5–3 mm. long; petals slightly longer than the sepals, deeply 2-cleft; capsules oblong, 4–5 mm. long, brownish; seeds obliquely obovate, slightly flattened, about 0.8 mm. long, nearly smooth, dull.—June–Aug. Woods in mountains; Hokkaido.—Cold regions of the N. Hemisphere.

10. *Stellaria filicaulis* Makino. ITO-HAKOBE. Glabrous perennial, 30–50 cm. high; stems slender, erect, sparsely branched, 4-angled; leaves linear, 2–3 cm. long, 1–2 mm. wide, acute or acuminate, the midrib impressed above, raised beneath; flowers white, solitary, the pedicels 2–5 cm. long, slender,

deflexed in fruit; sepals lanceolate or narrowly so, acuminate, 1-ribbed, 4–5 mm. long; petals about 1.7 times as long as the sepals, deeply bifid; capsules oblong, yellowish, 1.5 times as long as the sepals; seeds dark brown, about 0.7 mm. long, ellipsoidal, obscurely rugulose.—May–June. Wet places in lowlands; Honshu (Kantō Distr.).—Korea and Manchuria.

11. *Stellaria nipponica* Ohwi. *S. florida* var. *angustifolia* Maxim.—IWA-TSUME-KUSA. Perennial herb essentially glabrous except slightly hairy on the lower portion; stems tufted, erect, branched below, 10–20 cm. long; leaves linear, horizontally spreading, gradually acuminate, 2–3.5 cm. long, 1–2 mm. wide, the midrib raised beneath; flowers 1–3, the pedicels erect, 2–6 cm. long, the bracts rather small; sepals lanceolate, acuminate, mostly 3-nerved, 4–5.5 mm. long; petals white, 1.5–2 times as long as the sepals, deeply bifid; capsules ellipsoidal, slightly shorter than to as long as the sepals; seeds flat, brown, reniform-obicular, about 1 mm. long, tubercled on margin.—July–Sept. Rocky slopes in mountains; Honshu (alpine regions in centr. distr.).

Var. *yezoensis* Hara. Ō-IWA-TSUME-KUSA. With a firmer, stouter habit than in the typical phase, the sepals more distinctly 3-nerved and rather larger, the seeds more densely tuberculate with longer mammillae on margin.—Alpine regions; Hokkaido (Mount Apoi in Hidaka).

12. *Stellaria pterosperma* Ohwi. EZO-IWA-TSUME-KUSA. Closely resembles the preceding; leaves rather thicker, firmer, 1–2 cm. long, 1.5–2.5 mm. wide, loosely soft-pubescent on margin; flowers 1–3, the pedicels 2–5 cm. long, straight, the bracts small, membranous to subfoliaceous; capsules narrowly oblong, as long as to slightly longer than the sepals; seeds reniform-obicular, about 2 mm. long inclusive of the winged margin.—July–Sept. Alpine; Hokkaido (Mount Daitsutsu).

13. *Stellaria ruscifolia* Willd. SHIKOTAN-HAKOBE. Glabrous, coriaceous, glaucous perennial herb; stems 8–15 cm. long, usually unbranched; leaves ovate to narrowly so, 1–3 cm. long, 7–12 mm. wide, acuminate, rounded to shallowly cordate, somewhat cartilaginous on the margin, slightly clasping, 1-nerved; flowers few, solitary in axils, the pedicels 4–6 cm. long; sepals broadly lanceolate, acute, 5–7 mm. long, obsoletely 3-nerved; petals bifid, 1.5–2 times as long as the sepals; capsules as long as the sepals; seeds flat, pale brown, reniform-obicular, about 1 mm. across, scabrous, with rather prominent tubercles on margin.—July–Aug. Alpine regions of Hokkaido and Honshu (centr. distr.) and rocks near the sea in Hokkaido (e. distr.).—Ochotsk Sea region, inclusive of the Kuriles.

14. *Stellaria fenzlii* Regel. *S. yezoensis* Maxim.; *S. pilosula* Franch.; *S. sachalinensis* Takeda—SHIRAOI-HAKOBE. Pale green perennial herb; stems 15–30 cm. long, usually simple, nearly glabrous except for short hairs on nodes; leaves lanceolate to broadly so, 2–4 cm. long, 6–10 mm. wide, acuminate, rounded at base, often with few soft hairs at base and on midrib beneath; inflorescence terminal, loose, the bracts small, membranous on margin, the pedicels 1–4 cm. long; sepals broadly lanceolate, 2.5–4 mm. long, very acute, mostly 3-nerved; petals about half as long as the sepals, deeply 2-parted or sometimes absent; capsules 1½–2 times as long as the sepals, narrowly oblong, pale yellow; styles usually 3; seeds dark brown, obliquely elliptic, slightly flattened, about 0.7 mm. long, nearly smooth, dull.—June–Aug. Coniferous woods; Hokkaido, Honshu (centr. and n. distr.).—Kamchatka, Amur, Sakhalin, and Kuriles.

15. *Stellaria alsine* Grimm var. *undulata* (Thunb.)

Ohwi. *S. undulata* Thunb.; *S. uliginosa* sensu auct. Japon., non Murr.; *S. uliginosa* var. *undulata* (Thunb.) Fenzl; *S. japonica* Miq.; *S. alpine* var. *phaenopetala* Hand-Mazz.—NOMI-NO-FUSUMA.

Glabrous, usually glaucescent annual or biennial; stems tufted, 5–20 cm. long; leaves oblong to broadly lanceolate or elliptic, sometimes broadly oblanceolate, 8–13 mm. long, 2.5–4 mm. wide, obtuse and mucronate or acute, 1-nerved; inflorescence few-flowered, the bracts minute, white-membranous, the pedicels 5–25 mm. long, deflexed in fruit; sepals broadly lanceolate, acuminate, 3–4 mm. long, 1-ribbed, the lateral nerves obsolete; petals white, deeply 2-fid, slightly longer than the sepals in the earlier flowers, absent in the later ones; styles very short; capsules ellipsoidal, nearly as long as the sepals; seeds reniform-orbicular, dark brown, about 0.5 mm. long, the superficial cells convex on the body, sinuate on the margin.—Apr.–Oct. Wet waste grounds and sometimes woods in foothills; Hokkaido, Honshu, Shikoku; common.—China and Korea. The typical phase with smaller petals and longer styles occurs widely in temperate regions of the N. Hemisphere.

16. *Stellaria humifusa* Rottb. *S. humifusa* var. *oblongifolia* Fenzl.—EZO-HAKOBE. Glabrous perennial; stems decumbent and branched at base, 5–10 cm. long; leaves narrowly oblong to elliptic or broadly lanceolate, slightly fleshy, 10–15 mm. long, 2.5–4 mm. wide, acute to subobtusely, obsolete 1-nerved; flowers axillary, the pedicels 1–3 cm. long; sepals narrowly ovate to broadly lanceolate, 4–5 mm. long, acute, weakly 3-nerved; petals white, slightly longer than the sepals, deeply bifid; capsules slightly shorter than the sepals, ovoid; seeds about 0.8 mm. long, nearly smooth.—July–Aug. Wet sandy beaches; Hokkaido (e. distr.).—Cooler regions of the N. Hemisphere.

17. *Stellaria calycantha* (Ledeb.) Bong. *Arenaria calycantha* Ledeb.; *S. yezoalpina* Nakai.—KANCHI-YACHI-HAKOBE.

Tufted, essentially glabrous perennial herb; stems 5–15 cm. long, branched and decumbent at base; leaves narrowly oblong to broadly lanceolate, acute, 5–15 mm. long, 2–4 mm. wide; flowers solitary, axillary, the pedicels 1–2 cm. long; sepals broadly lanceolate, acute, weakly 3-nerved, 2–3 mm. long; petals absent; seeds nearly smooth.—Wet places in alpine regions; Hokkaido, Honshu (centr. distr.); rare.—Kamchatka, n. Kuriles, N. America, and N. Europe.

18. *Stellaria monosperma* Hamilt. var. *japonica* Maxim. *S. paniculigera* Makino.—O-YAMA-HAKOBE. Perennial; stems suberect, branched, 40–80 cm. long, with a longitudinal line of hairs; leaves oblong to broadly lanceolate or broadly oblanceolate, 4–12 cm. long, 1.5–3 cm. wide, glabrescent, short-petioled or subsessile, acuminate, acute at base; inflorescence loose, the pedicels 3–12 mm. long, short-glandular, the bracts small, foliaceous; sepals membranous, lanceolate, acuminate, short glandular-hairy, 3.5–5 mm. long; petals shorter than the sepals, bifid, white; capsules ovoid-globose, 2.5–3 mm. long, membranous, indichiscent; seeds solitary, about 2.5 mm. across, nearly smooth.—Aug.–Oct. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—The typical phase occurs from China to India.

19. *Stellaria radicans* L. EZO-Ō-YAMA-HAKOBE. Rather loosely appressed, silky-pubescent perennial; stems erect, 50–80 cm. long, mostly simple or sparsely branched; leaves lanceolate to oblanceolate, 6–12 cm. long, 1–2.5 cm. wide, short-acuminate, acute at base, subsessile, the lateral nerves rather distinct; cymes relatively large, loose, the pedicels 1–3 cm. long, deflexed in fruit, the bracts foliaceous; sepals ovate or narrowly so, subobtusely, 6–8 mm. long, 1-nerved; petals broadly ovate, 8–10 mm. long, lacinate.—July–Aug. Meadows in lowlands; Hokkaido.—Kuriles, Kamchatka, Sakhalin, Manchuria and e. Siberia.

12. DIANTHUS L. NADESHIKO ZOKU

Perennial herbs or rarely subshrubs; leaves flat, mostly linear; inflorescence cymose, paniculate or sometimes fasciculate; flowers solitary, red, rose, rarely white or yellowish; calyx tubular, 5-toothed, parallel-veined, subtended by 2 to many bracts; petals 5, the claw slender, the limb toothed or lacinate, rarely entire, hairy above or glabrous; stamens 10; gynophore often stipelike; ovary 1-locular, the styles 2; capsules cylindric or ovoid, 4-toothed or -valved; seeds discoid, flat, peltately attached.—About 100 species, in Europe, Asia, N. Africa, and n. N. America.

1A. Petals toothed on upper margin; inflorescence a dense many-flowered cyme; leaves deep green, elliptic to lanceolate or spatulate, the upper bracts often elongate.

2A. Innovation-shoots slightly elongate, with a tuft of leaves at top; cauline leaves spatulate to elliptic, usually obtuse; stems glabrous.

3A. Inflorescence dense, many-flowered; stems 20–50 cm. long, erect from the base. 1. *D. japonicus*

3B. Inflorescence loose, few-flowered; stems 15–30 cm. long, often decumbent at base. 2. *D. kiusianus*

2B. Innovation-shoots not elongate; cauline leaves lanceolate or narrowly so, acute to acuminate; stems often with short papillose hairs below the nodes. 3. *D. shinanensis*

1B. Petals finely lacinate on upper margin; inflorescence loosely 1- to 8-flowered; leaves glaucous, linear to narrowly lanceolate, the upper bracts short and broad. 4. *D. superbus*

1. *Dianthus japonicus* Thunb. *D. nipponicus* Makino; *D. ellipticus* Turcz.; *D. barbatus* var. *japonicus* (Thunb.) Yatabe.—FUJI-NADESHIKO, HAMA-NADESHIKO. Stout glabrous perennial; stems erect, ascending from the base, 20–50 cm. long, terete; radical leaves oblanceolate-oblong, papillose on margin, gradually narrowed below to a short petiole, the cauline leaves rather thick, sessile or nearly so, narrowly ovate to oblong or narrowly so, 4–8 cm. long, 1–2.5 cm. wide, obtuse to rounded or subacute, lustrous above; inflorescence densely many-flowered, rather flat-topped, the bracts elliptic, long-caudate; calyx-tube 1.5–2 cm. long; petal-limb obtusely deltoid,

6–7 mm. long, rose or rose-purple, toothed on upper margin; capsules slightly exserted beyond the calyx-tube; seeds about 2 mm. long, black, punctate-scarious.—July–Oct. Hokkaido (?), Honshu, Shikoku, Kyushu.—Ryukyus and China.

2. *Dianthus kiusianus* Makino. *D. hachijoensis* Nakai.—HIME-HAMA-NADESHIKO. Resembling the preceding species but smaller; stems often decumbent at the base, 15–30 cm. long; cauline leaves narrowly oblong to oblanceolate, 1–4 cm. long, 4–12 mm. wide, rounded to obtuse, mucronate; flowers few, loosely racemose, the bracts elliptic, subulate at apex; calyx-tube 15–20 mm. long, the teeth nearly awn-tipped; petals

rose-purple, about 10 mm. long, obtusely triangular, toothed on upper margin.—June-Oct. Near the sea; Kyushu.

3. *Dianthus shinanensis* (Yatabe) Makino. *D. barbatus* var. *shinanensis* Yatabe; *D. takenakae* Honda—SHINA-NADESHIKO, MIYAMA-NADESHIKO. Perennial herb; stems erect, 20–40 cm. long, rather stout, often with short papillose-like hairs below the nodes; cauline leaves linear-lanceolate to broadly lanceolate, 3–6 cm. long, 3–8 mm. wide, deep green, glabrous, papillose on margin, acuminate to acute, narrowed below to a short petiole; inflorescence densely flat-topped, the bracts oblong, long-linear to subulate-appendaged; calyx-tube 1.5–2 cm. long; petals rose-purple, obtusely triangular, 7–9 mm. long, scattered-pubescent on the inside near base; capsules slightly exceeding the calyx; seeds about 2 mm. long.—July-Aug. Valleys and ravines in mountains; Honshu (centr. distr.).

4. *Dianthus superbus* L. EZO-KAWARA-NADESHIKO. Stems 30–50 cm. long, erect, often branching at base, glabrous; leaves broadly linear, narrowly oblanceolate or linear-lanceolate, 4–7 cm. long, 2–10 mm. wide, papillose on margin, acuminate, glaucous, shortly clasping at base; flowers 3–8, pale rose or rarely white, the bracts 2-paired, the lower pair rarely be-

coming larger, concealing the upper ones; calyx-tube 2–3 cm. long, 2–3 times as long as the upper bracts; petal limb 2–2.5 cm. long, broadly obovate, deeply laciniate, hairy at base above.—June-Sept. Mountains; Hokkaido, Honshu (centr. and n. distr.).—Europe, Siberia, Manchuria, and Sakhalin.

Var. *speciosus* Reichenb. *D. superbus* var. *monticola* Makino—TAKANE-NADESHIKO. Dwarf alpine phase.—Honshu (centr. distr. and northw.), Hokkaido.

Var. *longicalycinus* (Maxim.) Williams. *D. superbus* forma *longicalycinus* Maxim.; *D. oreodum* Hance; *D. longicalyx* Miq.—KAWARA-NADESHIKO, NADESHIKO. Stems 30–80 cm. long; bracts 3- to 4-paired, the upper ones somewhat larger, short-cuspidate; calyx-tube 2.5–4 cm. long, rather slender, 3–4 times as long as the upper bracts.—July-Oct. Meadows, lowlands and mountains; Honshu, Shikoku, Kyushu.—Formosa, Korea, and China.

Dianthus chinensis L. SEKICHIKU. Plant with long-cuspidate bracts and white to deep red laciniate petals.—Cultivated.—China and Korea.

Dianthus barbatus L. AMERIKA-NADESHIKO. Frequently cultivated in our gardens.—Europe to Siberia, Manchuria, and China.

13. CUCUBALUS L. NAMBAN-HAKOBE ZOKU

Short-pilose perennials; stems elongate, branched; leaves ovate; inflorescence paniculate, loose, the flowers solitary, terminal; calyx at anthesis nearly cylindric, accrescent, cup-shaped in fruit with recurved upper margin, 10-nerved, 5-fid; petals 5, white, long-clawed, the limb bifid, with 2 small scales inside at base; stamens 10; receptacle stipelike; ovary 1-locular, many-ovuled; styles 3, slender; capsules globose, slightly fleshy and berrylike; seeds black, lustrous.—One variable species, in the temperate regions of the Old World.

1. *Cucubalus baccifer* L. var. *japonicus* Miq. NAMBAN-HAKOBE. Stems much elongate and branched, more than 1 m. long; leaves ovate to narrowly so, 2–5 cm. long, 7–20 mm. wide, acuminate, abruptly short-petiolate, nearly glabrous above, short-pilose beneath especially on the nerves, ciliolate, the petioles 1–4 mm. long; calyx 10–12 mm. long, green, accrescent, nearly glabrous, the lobes narrowly ovate, acute;

petals about 15 mm. long, the limb cuneate, bifid, as long as the claw; capsules globose, about 8 mm. across, the gynophore 2.5–3 mm. long; seeds about 1.3 mm. long.—July-Oct. Thickets in mountains and foothills; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea, Manchuria, s. Kuriles, and Sakhalin.

14. LYCHNIS L. SENNŌ ZOKU

Perennial herbs with flat leaves; calyx slightly inflated, clavate, ovoid or tubular, 5-toothed, 10-nerved; petals 5, clawed below, the limb variously toothed or lobed, rarely entire, with 2 small scales inside at base; stamens 10; styles 5, opposite the calyx-teeth, rarely 4 or 5; ovules many; capsules often short-stiped, with as many teeth or lobes as the styles; seeds often tubercled.—Thirty to forty species, in the temperate or cold regions of the N. Hemisphere.

- 1A. Flowers white; pedicels often longer than the calyx; calyx 7–12 mm. long. 1. *L. gracillima*
- 1B. Flowers vermillion or deep red, rarely white; pedicels short, nearly as long as the calyx or shorter, sometimes nearly absent; calyx 15–30 mm. long. 2. *L. miqueliana*
- 2A. Petals entire; flowers vermillion. 2. *L. miqueliana*
- 2B. Petals toothed or laciniate. 2. *L. miqueliana*
- 3A. Bracts ascending, linear to lanceolate, 5–10 mm. long, 1–2 mm. wide; limb of petals laciniate. 3. *L. kiusiana*
- 4A. Leaves lanceolate to linear-lanceolate, 5–10 mm. wide; flowers light red. 3. *L. kiusiana*
- 4B. Leaves ovate to narrowly so, 1–3 cm. wide; flowers deep red. 3. *L. kiusiana*
- 5A. Calyx 15–18 mm. long. 4. *L. wilfordii*
- 5B. Calyx 25–30 mm. long. 5. *L. sennō*
- 3B. Bracts appressed to the calyx, lanceolate to broadly so, 1–1.5 cm. long, 5–7 mm. wide; limb of petals toothed. 6. *L. fulgens*
- 6A. Petals deeply bifid, the lobes narrowly oblong; flowers deep red; calyx 15–17 mm. long. 6. *L. fulgens*
- 6B. Petals unlobed or very shallowly 2-lobed. 6. *L. fulgens*
- 7A. Plant glabrous; flowers yellowish red; claw of petals longer than the calyx. 7. *L. coronata*
- 7B. Plant pubescent; flowers deep red, rarely white; claw of petals not exceeding the calyx. 8. *L. sieboldii*

1. *Lychnis gracillima* (Rohrb.) Makino. *Silene gracillima* Rohrb.; *L. stellarioides* Maxim.; *L. ugoensis* Makino—SENTJU-GAMPI, SHIRANE-GAMPI. Caudex short; stems 40–100

cm. long, rather slender, scattered white-pubescent; leaves thin, lanceolate or broadly so, 5–13 cm. long, 1–3.5 cm. wide, sessile, nearly glabrous, long-acuminate, slightly narrowed below; in-

florescence rather loose, the pedicels 2-6 cm. long, glabrous; calyx campanulate-tubular in anthesis, clavate-campanulate in fruit, membranous, glabrous, 7-12 mm. long, the teeth short-ciliate; petals white, the limb 12-15 mm. long, bifid and toothed; capsules about 10 mm. long, short-stipitate, narrowly ovoid; seeds tuberculate.—July-Aug. Woods and thickets in mountains; Honshu (n. and centr. distr.).

2. *Lychnis miqueliana* Rohrb. FUSHIGURO-SENNŌ. Stems 50-80 cm. long, slightly branched below, scattered-pubescent or nearly glabrous, with dark thickened nodes; leaves ovate, obovate or oblong, 5-12 cm. long, 2.5-5 cm. wide, sessile, pubescent on nerves and on margin while young, short-acuminate to acute; bracts subulate-linear, 5-10 mm. long, 1-2 mm. wide, recurved above; pedicels 3-7 mm. long; calyx glabrous, 2.5-3 cm. long, narrowly clavate, the teeth short-ciliate; limb of petals 2.5-3 cm. long, vermilion, very rarely white, cuneate-obovate, nearly entire; seeds black, tuberculate.—July-Oct. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

3. *Lychnis kiusiana* Makino. OGURA-SENNŌ. Stems 60-80 cm. long, simple, glabrescent or slightly recurved-scarious; leaves lanceolate to linear-lanceolate, 5-10 cm. long, 6-12 mm. wide, gradually acuminate, subacute at base, loosely scarious; bracts linear, 3-8 mm. long, about 1 mm. wide, ascending; pedicels short-pilose, 3-12 mm. long; calyx membranous, narrowly tubular, slightly thickened above, nearly glabrous, 2-2.5 cm. long, the teeth short-ciliate; claw of petals slightly longer than the calyx, the limb red, lacinate.—July-Aug. Honshu (w. distr.), Kyushu; rare.

4. *Lychnis wilfordii* (Regel) Maxim. *L. laciniata* var. *japonica* Maxim.; *L. fulgens* var. *wilfordii* Regel; *L. laciniata* Maxim., non Lam.—EMBI-SENNŌ. Stems simple, 50-80 cm. long, glabrescent or scattered soft-pubescent; leaves narrowly ovate to oblong-ovate, 3-7 cm. long, 1-2 cm. wide, acuminate, rounded and slightly clasping at base, short-ciliate; bracts spreading, linear or linear-lanceolate, 3-5 mm. long; pedicels 3-10 mm. long, yellowish brown pubescent; calyx nearly glabrous, tubular at anthesis, short-clavate in fruit, 12-18 mm. long, membranous, the teeth short-ciliate; limb of petals deep red, about 2 cm. long, deeply and finely lacinate; capsules about 13 mm. long, narrowly oblong; seeds with elongate tubercles.—July-Aug. Hokkaido, Honshu (centr. distr.); rare.—Ussuri, Manchuria, and n. Korea.

5. *Lychnis senno* Sieb. & Zucc. SENNŌ. Plant short-pubescent; stems 50-70 cm. long; leaves ovate, 4-6 cm. long,

2-3 cm. wide, short-acuminate, acute at base; bracts lanceolate or narrowly so, 8-12 mm. long, 2-3 mm. wide, ascending; calyx 2.5-3 cm. long, clavate, membranous, long-pubescent; limb of petals usually deep red, rarely white, 15-20 mm. long, cleft with few lobes.—July-Aug. Chinese plant cultivated in old gardens.

6. *Lychnis fulgens* Fischer. EZO-SENNŌ. Roots slightly thickened at base; stems 50-70 cm. long, with scattered long white hairs; leaves narrowly ovate, 4-6 cm. long, 1.5-2.5 cm. wide, acuminate, rounded at base, sessile; bracts broadly lanceolate, 10-15 mm. long, 5-7 mm. wide, with long white hairs, erect; flowers deep red; calyx tubular, 15-17 mm. long, membranous; limb of petals broadly cuneate, about 2 cm. long, deeply bifid, the lobes narrowly oblong, obtuse, shallowly toothed on upper margin.—Honshu (Shinano Prov.), also reported to occur in Hokkaido.—n. Korea, Manchuria, and Ussuri.

7. *Lychnis coronata* Thunb. *L. grandiflora* Jacq.; *Agrostemma banksia* Meerb.—GAMPI. Plant nearly glabrous; stems green, 40-80 cm. long, thickened at the nodes; leaves ovate or elliptic, 5-8 cm. long, 2-4 cm. wide, slightly scarious on margin, rounded and narrowed toward the base, sessile; bracts erect, broadly lanceolate, 10-15 mm. long, 5-8 mm. wide, short-ciliate; calyx 2.5-3 cm. long, glabrous, rather thick, gradually broadened above, long-tubular, the teeth short, short-ciliate; claw of petals slightly longer than the calyx, the limb 2-2.5 cm. long, yellowish red, with rather deep irregular teeth on upper margin.—June-July. Chinese plant cultivated in our gardens.

8. *Lychnis sieboldii* Van Houtte. *L. coronata* var. *sieboldii* (Van Houtte) L. H. Bailey; *L. speciosa* Carr.—MATSUMOTO, MATSUMOTO-SENNŌ. Roots slightly thickened at base; stems long-pubescent, 40-70 cm. long; leaves narrowly to broadly ovate, 5-8 cm. long, 2.5-4.5 cm. wide, acuminate to short-acuminate, scattered scarious above, pilose beneath and on margin, rounded to abruptly narrowed at the sessile base; inflorescence rather dense, the bracts broadly lanceolate, 15-20 mm. long, 6-10 mm. wide, sometimes slightly recurved above, long-ciliate; calyx 2.5-3 cm. long, submembranous, long-pubescent on upper portion of ribs, the teeth rather short, acuminate, the tip subobtusely; limb of petals deep red, rarely white, 2-2.5 cm. long, broadly cuneate, shallowly 2-lobed, the lobes shallowly toothed.—June-July. Honshu (Shinano Prov.), Kyushu; very rare.

15. MELANDRIUM Fries FUSHIGURO ZOKU

Annual, biennial, or perennial herbs; leaves flat; inflorescence cymose; calyx tubular or tubular-campanulate, 10- or 20-nerved, often inflated, 5-toothed; petals clawed, the limb bifid, with 2 small scales inside at base; stamens 10; capsules 3- to 6-valved, often stipitate; styles 3-6.—Many species in the N. Hemisphere and in S. America.

- 1A. Styles 5 or 6; capsules 5- or 6-toothed. 1. *M. apetalum*
 1B. Styles 3; capsules 3-lobed or -toothed.
 2A. Biennial; limb of petals much shorter than the calyx-tube.
 3A. Leaves and calyx rather densely short-puberulent; seeds about 0.5 mm. across. 2. *M. apricum*
 3B. Leaves and calyx glabrous or scattered-pubescent; seeds about 0.7 mm. across. 3. *M. firmum*
 2B. Perennial; limb of petals as long as to longer than the calyx-tube.
 4A. Calyx tubular, subtruncate at base; flowers pale rose, rarely white; leaves lanceolate or narrowly so. 4. *M. keiskei*
 4B. Calyx campanulate, narrowed below; flowers white; leaves ovate to narrowly so. 5. *M. yanoi*

1. *Melandrium apetalum* (L.) Fenzl. *Lychnis apetalum* L.; *M. apetalum* forma *okadae* Makino—TAKANE-MANTEMATA. Tufted perennial with stout rhizomes; stems 10–20 cm. long, pubescent, with 2–4 pairs of leaves; radical and cauline leaves narrowly lanceolate, 3–8 cm. long, 2–10 mm. wide, short-pubescent especially on margin, acuminate, 1-nerved, gradually narrowed to the somewhat clasping base; flowers solitary, terminal; calyx narrowly tubular-ovoid in anthesis becoming ovoid in fruit, 12–15 mm. long, 5-toothed, 10-nerved, blackened on nerves, white-pubescent; limb of the petals about 2 mm. long, slightly retuse; capsules narrowly ovoid, 5- to 6-toothed, the teeth bidentate; seeds flat, red-brown, broadly winged, smooth, about 2 mm. across inclusive of the wing.—July–Aug. Alpine slopes; Honshu (centr. distr.); rare.—N. Europe and Siberia to the Kuriles and N. America.

2. *Melandrium apricum* (Turcz.) Rohrb. *Silene aprica* Turcz.—HIME-KE-FUSHIGURO. Densely gray-puberulent biennial; stems 20–50 cm. long; leaves linear-lanceolate to lanceolate or oblanceolate, sometimes narrowly ovate, 2–8 cm. long, 2–15 mm. wide, acute; inflorescence bracts herbaceous, the pedicels 5–30 mm. long; calyx narrowly ovoid in anthesis, ovoid in fruit, 8–10 mm. long, 5-toothed; limb of petals about 2 mm. long, retuse, pale rose; capsules ovoid, 6–8 mm. long, very short-stipitate, shallowly 6-lobed; styles 3; seeds reniform, about 0.5 mm. across, with rather small elongate tubercles on margin.—May–Aug. Honshu (w. distr.), Kyushu.—Korea, n. China, and e. Siberia.

3. *Melandrium firmum* (Sieb. & Zucc.) Rohrb. *Silene firma* Sieb. & Zucc.; *S. melandryiformis* Maxim.; *M. apricum* var. *firmum* (Sieb. & Zucc.) Rohrb.—FUSHIGURO. Erect biennial; stems glabrous, 30–80 cm. long; leaves oblong or ovate, sometimes broadly lanceolate, 3–10 cm. long, 1–3 cm. wide, short-acuminate, narrowed at base, ciliate, often loosely pubescent on both sides; cymes terminal and axillary, the bracts often membranous, the pedicels glabrous, 1–3 cm. long; flowers erect; calyx ovoid, glabrous or nearly so, 7–10 mm. long, 10-nerved; limb of the petals 2–3 mm. long, white, 2-

lobed; capsules ovoid, 7–8 mm. long, short-stipitate; seeds reniform, about 0.6 mm. long, small-tubercled.—June–Sept. Hokkaido, Honshu, Shikoku, Kyushu.—Forma *pubescens* (Makino) Makino. *M. firmum* var. *pubescens* (Makino) Makino; *M. apricum* var. *firmum* forma *pubescens* Makino—KE-FUSHIGURO. Plant pubescent.—e. Siberia, China, Korea, and Ryukyu.

4. *Melandrium keiskei* (Miq.) Ohwi. *Silene keiskei* Miq.; *S. maximowicziana* Rohrb.—Ô-BIRANJĪ. Perennial herb with short, stout, branched rhizomes; stems tufted, slender, mostly erect or ascending, sometimes decumbent, nearly glabrous or slightly short-pubescent; leaves lanceolate or narrowly so, acuminate, sessile, 1.5–6 cm. long, 3–10 mm. wide, glabrescent; cymes loosely few-flowered; calyx tubular, 10–13 mm. long, glabrous or nearly so, subtruncate at base; limb of petals 10–15 mm. long, obovate, bifid; capsules oblong; seeds flat, reniform, about 1 mm. across, with cylindrical hairlike tubercles.—July–Sept. Mountains; Honshu (centr. distr.).

Var. *minus* (Takeda) Takeda. *Silene keiskei* forma *minor* Takeda—BIRANJĪ. Soft hairy on leaves, pedicels, and calyx.—Honshu (Kantô and centr. distr.).

Var. *akaisialpinum* Yamazaki. TAKANE-BIRANJĪ. Tufted; stems low; flowers 1–2, rose-colored, large, 3–4 cm. across, the pedicels and calyx short-hairy.—Alpine; Honshu (centr. distr.).

5. *Melandrium yanoei* (Makino) Williams. *Silene yanoei* Makino—TEBAKO-MANTEMATA. Somewhat tufted perennial; stems erect, 20–40 cm. long, short-pubescent above; leaves ovate to narrowly so, 2–4 cm. long, 1–1.5 cm. wide, rather long-acuminate, nearly glabrous, slightly scabrous on margin, sessile or short-petioled; cymes 1- to few-flowered, loose, the pedicels slender, often with a pair of small linear bractlike leaves; calyx campanulate, glabrous, green, 6–7 mm. long, 5-lobed to the middle; limb of petals cuneate, 6–7 mm. long, white, bifid; capsules ovoid; styles 3; seeds reniform, about 1 mm. across, with diminutive tubercles.—Aug. Shikoku; rare.

16. *SILENE* L. MANTEMA ZOKU

Annuals, biennials, or perennials, rarely suffrutescent; leaves flat; inflorescence cymose; flowers white, rose or rose-purple; calyx tubular, ovoid or campanulate, 5-toothed, 10- or more-nerved; petals 5, the claw rather long, the limb usually bifid, with 2 small scales inside at base; stamens 10; styles 3(–5); ovary 1-locular, 3- to 5-septate at base; capsules ovoid or oblong, the teeth twice as many as the styles.—About 200 species.

1A. Biennial; petals white to rose-purple, the limb subintire; calyx ovoid in fruit. 1. *S. gallica*

1B. Perennial; petals pale rose or white, the limb bifid; calyx obovoid or clavate in fruit.

2A. Stems with tufts of short leaves at the nodes; calyx glabrous, 6–7 mm. long; limb of petals white, deeply bifid; stamens nearly as long as the petals, long-exserted. 2. *S. foliosa*

2B. Stems without tufts of leaves at the nodes; calyx pubescent, 12–15 mm. long; limb of petals pale rose to white, shallowly bifid; stamens shorter than the petals, only slightly exserted. 3. *S. repens*

1. *Silene gallica* L. *S. anglica* L.—SHIROBANA-MANTEMATA. Biennial with coarse spreading hairs; stems erect, 30–50 cm. long, often branched at base; leaves oblanceolate to broadly so, 2–4 cm. long, 5–10 mm. wide, acute to rounded, mucronate, sessile above, the radical ones subpetioled; flowers solitary in axils, forming a terminal bracteate spikelike raceme, the pedicels 1–8 mm. long; calyx toothed, inflated after anthesis, ovoid, 8–10 mm. long, puberulent and pilose; limb of petals 3–4 mm. long, white, with 2 small oblong obtuse scales inside at base; capsules ovoid; seeds reniform, black, about 0.8 mm. across, with slightly raised concentric lines and minute

tubercles.—May–July. Naturalized in Honshu.—Introduced from Europe.

Var. *quinquevulnera* (L.) Rohrb. *S. quinquevulnera* L.—MANTEMATA. Limb of petals with a large dark red-purple blotch, the scales lanceolate, acute.—Waste ground, along railroads and sandy beaches; naturalized in Honshu, Shikoku, Kyushu; common.—Introduced from Europe.

2. *Silene foliosa* Maxim. EZO-MANTEMATA. Perennial herb; stems tufted, erect, 20–40 cm. long, shortly recurved-hairy, thickened on nodes; leaves at base rosulate, petiolate, narrowly oblanceolate, 5–7 cm. long, 4–8 mm. wide, acute,

ciliolate, the cauline leaves narrowly oblanceolate, 2-5 cm. long, 2-6 mm. wide, gradually narrowed at base, subsessile; flowers few at a node, the pedicels short, glabrous, the bracts membranous; calyx tubular in anthesis, clavate-obovate in fruit, glabrous, 6-7 mm. long, the teeth deltoid or broadly ovate-deltoid; limb of petals white, cuneate, 5-6 mm. long, deeply bifid; styles and stamens long-exserted; capsules 4-5 mm. long, the teeth recurved; seeds about 1 mm. long, with raised superficial cells.—July–Aug. Hokkaido.—Korea, Amur, and Ussuri.

3. *Silene repens* Pers. KARAFUTO-MANTEMA. Perennial herb; stems erect, branched at base, 10-30 cm. long, with recurved short hairs; leaves lanceolate to narrowly so, 3-5 cm.

long, 3-8 mm. wide, sometimes oblanceolate, acute, sessile, glabrescent to short-pubescent, especially on margin; flowers few, terminal, the pedicels very short, puberulent; calyx tubular, 12-15 mm. long, puberulent; limb of petals cuneate-obovate, bifid, 6-7 mm. long, pale rose to white; stamens slightly exserted; gynophore 6-7 mm. long.—July–Aug. Meadows in lowlands, especially near the sea; Hokkaido.—Europe, Siberia, Korea, and Manchuria.

Var. *latifolia* Turcz. CHISHIMA-MANTEMA. More densely long-hairy; leaves broadly oblanceolate to narrowly oblong, 5-15 mm. wide.—Perhaps in Hokkaido (e. distr.).

Fam. 85. NYMPHAEACEAE SUIREN KA Waterlily Family

Aquatic herbs with creeping rhizomes; leaves long-petioled, involute in bud, often peltate, usually orbicular to cordate; flowers usually solitary from the axils of radical leaves, usually rather large; sepals 3-5; petals 3 to many; stamens 6 to many, free, the anthers erect, introrse or extrorse, longitudinally split, the locules adnate to the connective; carpels 3-8, free or united, sometimes embedded in the upper surface of an enlarged obconical receptacle; stigma distinct, often disc- or ring-shaped; ovules solitary in each locule, orthotropous, pendulous or many; carpels free and indehiscent or united to form a fleshy or spongy fruit; cotyledons fleshy.—About 8 genera, with about 60 species, cosmopolitan.

1A. Plant with a gelatinous sheath; flowers small, reddish purple; sepals and petals 3; stamens 12-18. 1. *Brasenia*

1B. Plants without a gelatinous sheath; flowers relatively large; sepals 4-6; petals 5 to many; stamens many.

2A. Leaves floating or slightly elevated above water level; carpels united; ovules many.

3A. Flowers yellow to orange-yellow; ovary inserted on the receptacle, superior; sepals, petals, and stamens inferior, free; sepals 5.

2. *Nuphar*

3B. Flowers white or rose-purple; ovary more or less adnate to the receptacle; sepals, petals, and stamens attached to the periphery of the ovary; sepals 4.

4A. Leaves prickly, 30-120 cm. across; stigma-disc depressed, adnate to the inner wall of an enlarged, cup-shaped receptacle.

3. *Euryale*

4B. Leaves unarmed, smaller; stigma-disc free from the receptacle; ovary semi-inferior. 4. *Nymphaea*

2B. Leaves elevated above water level often 1 m. or more on long petioles; flowers deep pink or rarely white; carpels free, embedded in the flat-topped spongy receptacle; ovules 1 or 2. 5. *Nelumbo*

1. BRASENIA Schreb. JUNSAI ZOKU

Aquatic herb with transparent gelatinous sheath; stems elongate, branched, leafy; leaves alternate, floating, peltate, elliptic, palmately nerved, entire; flowers small, reddish purple, axillary; sepals 3, resembling the 3 petals; stamens 12-18, the filaments subulate, the anthers laterally split; carpels 6-18, free; style short, the stigma lateral; ovules 2 or 3, pendulous, attached to the dorsal wall; mature carpels coriaceous, indehiscent, 1- to 2-seeded; seeds with endosperm.—One species.

1. *Brasenia schreberi* J. F. Gmel. *B. peltata* Pursh; *Hydroptilis purpurea* Michx.; *B. purpurea* (Michx.) Casp.

—JUNSAI. Perennial herb with branched creeping rhizomes; stems much elongated, slender, sparingly branched; leaves long-petioled, 6-10 cm. long, 4-6 cm. wide, purplish beneath; flowers long-peduncled, about 2 cm. across; sepals

broadly lanceolate, obtuse, about 10 mm. long; petals linear-oblong, obtuse, about 1.5 cm. long; anthers linear, about 4 mm. long; style about 8 mm. long.—May–Aug. Lakes and ponds; Hokkaido, Honshu, Shikoku, Kyushu.—e. Asia, India, Australia, w. Africa, and N. America.

2. NUPHAR Smith KŌ-HONE ZOKU

Perennial herbs with stout thickened creeping rhizomes; leaves long-petioled, radical, floating or briefly elevated above the water, rounded-cordate to narrowly ovate, entire, sagittate; peduncles 1-flowered; flowers yellow or orange-yellow; sepals 5 or 6, concave, petaloid, coriaceous, persistent, often becoming green in fruit; petals many, linear to spatulate or narrowly oblong; stamens many, shorter than the sepals, inferior, the filaments short, flat, the anthers introrse; carpels many, united into a compound ovary; stigma linear, the stigma-disc peltate; ovules many; fruit ovoid, berrylike; seeds with endosperm.—Ten or more species, in the Old World and N. America.

1A. Leaves narrowly ovate, raised above the water; stigma-disc dentate. 1. *N. japonicum*

1B. Leaves floating.

2A. Flowers broadly cup-shaped; filaments 1 or 2 times as long as the anthers; petioles terete. 2. *N. subintertextum*

2B. Flowers ellipsoidal; filaments 3-10 times as long as the anthers; petioles slightly flattened.

3A. Petioles hollow; stigma-disc without a raised center. 3. *N. oguraense*

3B. Petioles solid; stigma-disc with a raised center. 4. *N. pumilum*

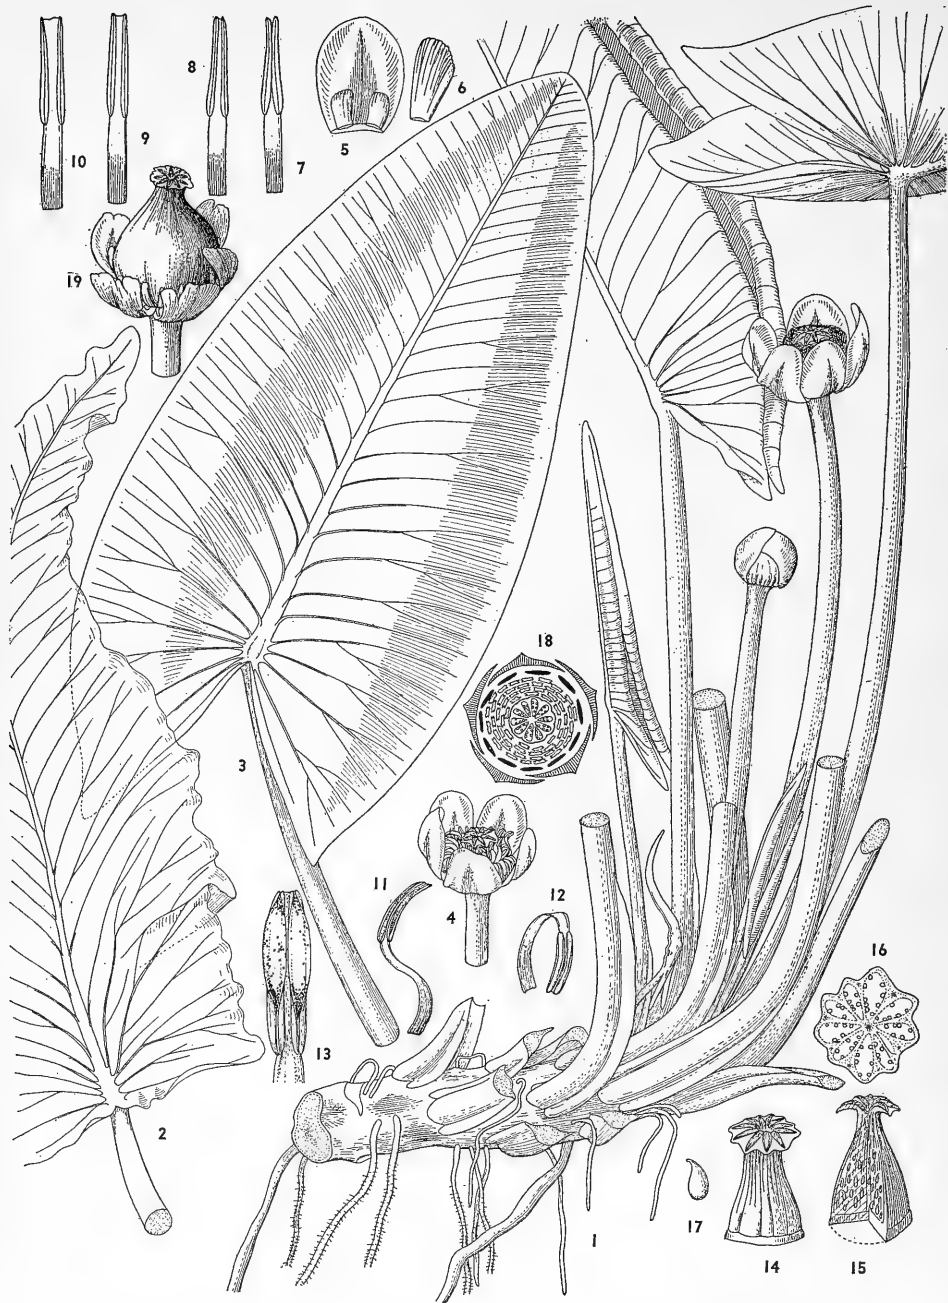

FIG. 5.—*Nuphar japonicum* DC. 1, Habit; 2, young submersed leaf; 3, aerial leaf; 4, flower; 5, sepal with 2 petals inside; 6, petal; 7, 8, 9, 10, 11, 12, stamens; 13, anther; 14, pistil; 15, the same, cut longitudinally; 16, ovary, cut transversely; 17, ovule; 18, floral diagram; 19, fruit.

1. *Nuphar japonicum* DC. Kō-hone. FIG. 5. Rhizomes stout, creeping; leaves radical, the submersed ones narrow, membranous, with undulate margin, the aerial ones subcoriaceous, narrowly ovate to oblong, 20–30 cm. long, 7–12 cm. wide, obtuse to rounded, sagittate, glabrous above, slightly pubescent beneath while young, entire; peduncles raised above the water; flowers yellow, 4–5 cm. across; sepals obovate-orbicular, about 2.5 cm. long, subcoriaceous, becoming green in fruit, rounded at apex; petals obovate-cuneate, about 8 mm. long; anthers 4–6 mm. long; stigma-disc 6–8 mm. across, dentate.—June–Sept. Ponds, lakes, and shallow streams; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.

Var. *rubrotinctum* (Casp.) Ohwi. *N. japonicum* var. *subintegerrimum* forma *rubrotinctum* Casp.; *N. subintegerrimum* forma *rubrotinctum* (Casp.) Makino.—BENT-KŌ-HONE. Flowers orange-red.—Known only in cultivation.

2. *Nuphar subintegerrimum* (Casp.) Makino. *N. japonicum* var. *subintegerrimum* Casp.—HIME-KŌ-HONE. Resembles the preceding; floating leaves broadly ovate, 4–8 cm. long, 5–8 cm. wide; flowers 3–4 cm. across; sepals 15–20 mm. long; anthers 3–5 mm. long; stigma-disc 4–5 mm. across, shallow-toothed; stigma broader, contiguous below.—June–Sept. Honshu, Shikoku.

3. *Nuphar oguraense* Miki. OGURA-KŌ-HONE. Rhi-

zomes stout; floating leaves broadly ovate to ovate-orbicular, 5–8 cm. long, 4–6 cm. wide, rounded, deeply cordate-sagittate at base, entire, the petioles flattened, slightly hollow; flowers yellow, 3–4 cm. across; sepals obovate, about 2 cm. long; petals broadly spatulate, about 6 mm. long, shallowly retuse; anthers 2–2.5 mm. long, oblong; stigma-disc 6–7 mm. across, shallowly dentate.—July. Ponds and shallow lakes; Honshu (w. distr. and westw.), Kyushu.

4. *Nuphar pumilum* (Timm) DC. *Nymphaea lutea* var. *pumila* Timm; *N. subpumilum* Miki.—NEMURO-KŌ-HONE. Rhizomes stout, creeping; floating leaves broadly ovate to ovate-orbicular, sometimes elliptic, 6–8 cm. long, 6–9 cm. wide, the petioles slightly flattened; flowers about 2.5 cm. across, yellow, floating; sepals broadly obovate or broadly elliptic, 12–20 mm. long, rounded at apex; petals spatulate-obovate, 5–7 mm. long, rounded at apex, often obsoletely toothed; anthers elliptic, 2.5–3 mm. long; stigma-disc 6–8 mm. across, pale yellow or partially reddish; stigma-disc 10–20 mm. across.—July–Aug. Ponds and shallow lakes; Hokkaido (e. distr.), Honshu (n. distr.).—Europe to Siberia.

Var. *ozeense* (Miki) Hara. *N. ozeense* Miki.—OZE-KŌ-HONE. With dark red stigma-disc.—Honshu (Oze in Kotsuke).

3. EURYALE Salisb. ONIBASU ZOKU

Large, prickly, acaulescent aquatic annual herb; leaves floating, orbicular, rugulose especially while young, prominently nerved and net-veined beneath; peduncles radical, 1-flowered; flowers rose-purple; sepals 4, united below into an ellipsoidal tube; petals many, smaller than the calyx-lobes; stamens many, inserted on the inner side of the petals, all fertile, the filaments short, the anthers oblong, the connective truncate; ovary inferior, the 8 carpels syncarpous; stigma discoid, depressed, the margin adnate to the inner wall of the receptacle; ovules few in each locule; fruit berrylike, spongy, densely prickly, irregularly dehiscent; seeds with endosperm.—One species.

1. *Euryale ferox* Salisb. ONIBASU. Leaves peltate, long-petioled, orbicular, lustrous above, purplish and short-pubescent beneath, 30–120 cm. across, flat, subterrene, slightly emarginate at base; calyx-lobes 15–20 mm. long, narrowly deltoid, subacute to obtuse, persistent, erect in fruit; petals broadly lanceolate or oblanceolate, 6–10 mm. long, obtuse;

anthers 3–3.5 mm. long, the filaments unequal in length; fruit ellipsoidal or subglobose, 5–7 cm. long, beaked; seeds subglobose, about 1 cm. across, with a fleshy aril.—Aug.–Oct. Ponds and lakes in lowlands; Honshu, Kyushu.—India, China, and Formosa.

4. NYMPHAEA L. SUIREN ZOKU

Perennial aquatic, acaulescent herbs with bulbous or stout short-creeping rhizomes; leaves orbicular, cordate-sagittate, basifixed or peltate; peduncles 1-flowered; flowers white, blue, rose or yellowish; sepals 4; petals many; stamens many, the outer filaments often petaloid, the anthers introrse; ovary syncarpous, the carpels many, adnate below to the receptacle; styles free, short, the stigma linear; fruit spongy, irregularly ruptured; seeds with endosperm.—Cosmopolitan, with about 50 species.

1. *Nymphaea tetragona* Georgi var. *tetragona*. *N. tetragona* var. *lata* Casp.; *N. pygmaea* (Salisb.) Aiton; *Castalia pygmaea* Salisb.—EZO-NO-HITSUJIGUSA. Rhizomes stout and fleshy; leaves long-petioled, ovate-orbicular to ovate-elliptic, 5–12 cm. long, 8–15 cm. wide, basifixed, entire, rounded, deeply cordate-sagittate; lobes of leaves shorter than the length from the attachment of petiole to apex, the inner margin often overlapping; petals usually 8, white; sepals green, broadly lanceolate to narrowly ovate, 3–3.5 cm. long, 10–15 mm. wide, subacute; outer filaments broadly oblanceolate, the inner ones

nearly linear, 3–5 mm. long, the connective not produced above; fruit ovoid-globose, covered by the persistent calyx.—July–Oct. Ponds and shallow lakes; Hokkaido, Honshu, Shikoku, Kyushu.—e. Siberia, Manchuria, China, Korea, India, and N. America.

Var. *angusta* Casp. *N. tetragona* var. *angusta* subvar. *orientalis* Casp.—HITSUJIGUSA. Lobes of leaves longer than the length from the attachment of petiole to apex, with more or less distant inner margin; petals usually 12–15.—Ponds and lakes at low elevations; Honshu, Shikoku, Kyushu.

5. NELUMBO Adans. HASU ZOKU

Coarse acaulescent, aquatic herbs; rhizomes long-creeping; leaves long-petiolate, raised 1 m. or more above water, orbicular, peltate, radiately nerved; peduncles radical, elongate, 1-flowered; flowers deep pink, white or yellowish; sepals 4 or 5, free, cadu-

cous petals many, inferior, early deciduous; stamens numerous, the anthers introrse, the connective with a clavate appendage; carpels many, free, embedded in the flat-topped spongy receptacle; style short, the stigma terminal; ovules 1 or 2, pendulous; nut ellipsoidal, the pericarp hard, without endosperm; cotyledons thickened.—Two species, one in N. America, another in Australia and e. Asia.

1. *Nelumbo nucifera* Gaertn. *Nymphaea nelumbo* L.; *Nelumbo nelumbo* (L.) Karst.; *Nelumbium speciosum* Willd.; *Nelumbium nelumbo* (L.) Druce—HASU. Large, glaucous, perennial herb; leaves depressed-orbicular, 20–50 cm. across, slightly retuse, the petioles and peduncles with short fleshy prickles; flowers 15–20 cm. across, deep pink or sometimes white; sepals caducous, green; petals obovate, obtuse,

nervulose, 8–12 cm. long, 3–7 cm. wide; anthers linear, yellow, 15–20 mm. long, the filaments linear, 7–25 mm. long; receptacle spongy, in fruit to 10 cm. high and as wide, flat, the seeds embedded within; nuts ellipsoidal, about 20 mm. long.—July–Aug. Much planted in ponds and shallow lakes, with several cultivated races.—India, China, Iran, and Australia.

Fam. 86. CERATOPHYLLACEAE MATSU-MO KA Hornwort Family

Slender submersed monoecious or dioecious aquatic herbs; stems slender, elongate, branching; leaves dichotomously forked into filiform, slightly and absolutely toothed segments; flowers unisexual, solitary in axils, sessile, the involucre bracts multifid, the segments entire or toothed, linear, the perianth absent; staminate flowers with 10–20 stamens, the anthers nearly sessile, extrorse, the connective ending in a thickened appendage; pistillate flowers with a single superior ovary, the ovules orthotropous, pendulous, the styles filiform, the stigma terminal; fruit an achene, the embryo of 4 verticillate cotyledons, without endosperm.—A single genus of 2 or 3 species, widely distributed in fresh waters of the world.

1. CERATOPHYLLUM L. MATSU-MO ZOKU

Characters of the family.

1. *Ceratophyllum demersum* L. MATSU-MO, KINGYO-MO. Dark green fragile aquatic herb; stems 20–100 cm. long, branched, slender; leaves verticillate, in 5's to 12's, sessile, 1.5–2.5 cm. long, much-divided, the ultimate segments filiform, with scattered minute spiny teeth; anthers oblong; achenes narrowly ovoid, sessile, 4–5 mm. long, with 2 spines near base; style persistent, spinelike, often longer than the body.—June–

July. Ponds, lakes, and shallow ditches; Hokkaido, Honshu, Shikoku, Kyushu; common.—Cosmopolitan.

Var. *quadrispinum* Makino. *C. oryzetorum* Komar.; *C. pentacanthum* Hayata, non Haynald; *C. demersum* var. *pentacorne* Kitag.—YOTSUBARI-KINGYO-MO. Achenes with 2 pairs of spines, one near base, the other on the shoulder.—Honshu, Kyushu.—Manchuria, Ussuri, China, and Formosa.

Fam. 87. TROCHODENDRACEAE YAMAGURUMA KA Trochodendron Family

Evergreen trees; leaves alternate, petiolate, rhombic-obovate to narrowly obovate, coriaceous, undulate toothed, penninerved; stipules absent; inflorescence racemose, terminal; flowers small, bisexual, the perianth absent; stamens many, the filaments filiform, the anthers elliptic; carpels 5–10, united at base, many-ovuled; styles short, recurved in fruit; stigma narrowly oblong; fruit partially sunken in the receptacle, dehiscent along the inner carpel margins; seeds linear.—A single genus and species.

1. TROCHODENDRON Sieb. & Zucc. YAMAGURUMA ZOKU

Characters of the family.

1. *Trochodendron aralioides* Sieb. & Zucc. YAMAGURUMA. Glabrous tree with rather stout branches, the branchlets greenish; leaves usually crowded at the ends of branchlets, broadly to narrowly obovate, rhombic-obovate, 6–12 cm. long, 2–7 cm. wide, obtuse, subcuneate at base, deep green and lustrous above, slightly paler beneath; inflorescence short-pedunculate, 7–12 cm. long; flowers 10–20, 10–12 mm. across, the pedicels 2–4 cm. long; anthers 1.2–1.7 mm. long;

styles persistent; fruit depressed-globose, 7–10 mm. across; seeds linear, 4–6 mm. long.—May–June. Mountains; Honshu, Shikoku, Kyushu.—Formosa and s. Korea.—Forma *longifolium* (Maxim.) Ohwi. *T. aralioides* var. *longifolium* Maxim.—NAGABA-NO-YAMAGURUMA. Phase with narrower, broadly oblanceolate leaves, often passing into the typical phase.—Occurs with the typical phase.

Fam. 88. EUPTLEACEAE FUSAZAKURA KA Euptelea Family

Large deciduous nearly glabrous tree; leaves petiolate, alternate, depressed-orbicular, penninerved, irregularly acute-toothed; stipules absent; flowers before the leaves, bisexual, short-pedicelled, the perianth absent; stamens many, pendulous on capillary filaments; carpels rather many, 1- to 4-ovuled; stigma sessile, broadly linear, decurrent inside; fruit stipitate, indehiscent, wing-margined; seeds 1–4, pendulous on the inner angle of the locule.—A single genus with perhaps 2 species, in e. Asia.

1. EUPTELEA Sieb. & Zucc. FUSAZAKURA ZOKU

Characters of the family.

1. *Euptelea polyandra* Sieb. & Zucc. FUSAZAKURA. Branches red-brown; petioles 3-7 cm. long, rather slender, hairy on upper side while young; leaves 6-12 cm. long and as wide, abruptly long-acuminate, subtruncate to rounded at base, irregularly coarse-toothed, pale green and sometimes slightly glaucous beneath, slightly pilose in axils; anthers linear, 6-7

mm. long, the connective long-mucronate; fruit usually 1-seeded, glabrous, obliquely obovate, 5-7 mm. long, the stipe as long as the body; stigma linear, slightly concave in fruit. —Mar.-May. Mountains; Honshu, Shikoku, Kyushu; rather common.

Fam. 89. CERCIDIPHYLLACEAE KATSURA KA Cercidiphyllum Family

Deciduous dioecious trees with dimorphic branches (short spurs and longer vegetative shoots); buds 2-scaled; leaves petiolate, simple, palmately nerved, the stipules connate inside the petiole; flowers appearing before the leaves, small-scaled, the perianth absent; stamens many, nearly sessile, the filaments filiform, the anthers linear, red, the connective extended at the apex; pistillate flowers short-pedicelled; carpels 3-5, follicular, free; style very slender, elongate, rose-purple; fruit a many-seeded follicle, dehiscent along the inner suture; seeds small, winged; embryo small. —A single genus of 2 or 3 species in e. Asia.

1. CERCIDIPHYLLUM Sieb. & Zucc. KATSURA ZOKU

Characters of the family. Two species in Japan.

1A. Seeds winged on one end; bark longitudinally fissured while still young; leaves of short spurs orbicular-cordate, slightly narrowed above and rounded at apex, shallowly cordate to nearly truncate at base; leaves of long shoots usually narrowed above.

1B. Seeds winged on both ends; bark not fissured until very old; leaves larger, those of short spur nearly orbicular, broadly rounded at apex, usually distinctly cordate at base, those of long shoots usually obtuse at apex. 1. *C. japonicum*

1. *Cercidiphyllum japonicum* Sieb. & Zucc. *C. ovale* Maxim. —KATSURA. Trunk often branched above the base; leaves vivid green on upper side, glaucous beneath, obtusely serrulate, 3-7 cm. long and as wide, the petioles reddish, 2-2.5 cm. long; staminate flowers very short-pedicelled, with few small bracts; stamens many, the anthers linear, red, 3-4 mm. long; pistillate flowers short-petioled; style very long; follicles nearly sessile, cylindric, slightly curved, about 15 mm. long; style very slender; seeds flat, small, winged on one end, 5-6.5 mm. long, inclusive of the wing. —Apr.-May. Hokkaido, Honshu, Shikoku, Kyushu. —China. —Forma *pendulum*

(Miyoshi) Ohwi. *C. japonicum* var. *pendulum* Miyoshi. —SHIDARE-KATSURA. Rare form with pendulous branches. —Honshu; sometimes cultivated.

2. *Cercidiphyllum magnificum* (Nakai) Nakai. *C. japonicum* var. *magnificum* Nakai. —HIRO-HA-KATSURA. Closely resembles the preceding, but the bark not fissured until the tree becomes very old; leaves larger, orbicular, 7-10 cm. long and as wide, deeply cordate; seeds 6-7 mm. long, inclusive of the wings. —Mountains at higher elevations than the preceding; Honshu (centr. and n. distr.).

Fam. 90. RANUNCULACEAE KIM-PŌGE KA Buttercup Family

Annuals or perennials, rarely shrubs, sometimes scandent; leaves often divided, alternate, sometimes opposite; flowers actinomorphic or zygomorphic, bisexual or sometimes unisexual, often large; sepals free, often petaloid, 3 to many, usually imbricate in bud; petals free, 3 to many, sometimes absent, well developed or sometimes reduced to nectaries; stamens many, free; anthers introrse, longitudinally split; carpels many or sometimes few, 1-locular, usually apocarpous, or sometimes united to form a compound ovary; styles distinct, the stigma terminal or oblique; ovules anatropous, ascending or pendulous; fruit usually a follicle or an achene, rarely berrylike and indehiscent, 1- to many-seeded; embryo small. —About 40 genera, with about 1,500 species, abundant in the temperate and frigid regions of both hemispheres, few in the Tropics.

1A. Sepals valvate in bud; leaves opposite, styles much elongate, taillike in fruit, often plumose-hairy. 1. *Clematis*

1B. Sepals imbricate in bud; leaves usually alternate or radical, rarely opposite.

2A. Fruit an achene.

3A. Flowers with involucrel leaves.

4A. Styles elongate and taillike in fruit. 2. *Pulsatilla*

4B. Styles not accrescent after anthesis, short. 3. *Anemone*

3B. Flowers not involucrel.

5A. Petals present.

6A. Petals with a nectary gland at the base.

7A. Ovules ascending, funicles ventral; terrestrial or aquatic herbs not glaucous in our species. 4. *Ranunculus*

7B. Ovules pendulous, funicles dorsal; terrestrial glaucous herbs. 5. *Callianthemum*

6B. Petals without glands. 6. *Adonis*

5B. Petals absent.

8A. Leaves ternately compound. 7. *Thalictrum*

8B. Leaves simple, palmately cleft to lobed. 8. *Troutvetteria*

2B. Fruit a follicle, rarely a berry.

- 9A. Petals spurred.
- 10A. Flowers actinomorphic; leaves ternately compound. 9. *Aquilegia*
- 10B. Flowers zygomorphic; leaves palmately lobed or divided. 10. *Aconitum*
- 9B. Petals, when present, not spurred.
- 11A. Petals smaller than the petaloid sepals, often reduced to a nectary or absent.
- 12A. Leaves ternately or pinnately compound.
- 13A. Sepals many. 11. *Anemonopsis*
- 13B. Sepals 3 to 5.
- 14A. Fruit a berry. 12. *Actaea*
- 14B. Fruit a follicle.
- 15A. Follicles and carpels stipitate, evergreen herbs. 13. *Coptis*
- 15B. Follicles and carpels usually sessile; summer-green herbs.
- 16A. Flowers in racemes or spikes. 14. *Cimicifuga*
- 16B. Flowers solitary, in umbels or panicles. 15. *Isopyrum*
- 12B. Leaves orbicular or palmately cleft.
- 17A. Petals present; leaves palmately cleft or dissected.
- 18A. Petals entire; carpels sessile; scapes not involucre. 16. *Trollius*
- 18B. Petals cleft; carpels stipitate; scapes involucre. 17. *Eranthis*
- 17B. Petals absent; leaves merely toothed. 18. *Caltha*
- 11B. Petals well developed; sepals 3 to 5, greenish, much shorter than the petals.
- 19A. Leaves palmately cleft; sepals caducous; seeds flat, winged; follicles 2, connate inside, flat. 19. *Glucidium*
- 19B. Leaves ternately compound; sepals persistent; seeds subglobose, not winged; follicles 3-5. 20. *Paeonia*

1. CLEMATIS L. SENNIN-SŌ ZOKU

Scandent or rarely erect bisexual or dioecious perennial herbs or shrubs; leaves opposite, petioled, pinnate or ternate, rarely simple, entire or toothed; flowers in panicles, corymbs, or solitary, white, purple or yellowish; sepals 4, sometimes 5 or more, petaloid, free, deciduous; petals absent or small, linear to spatulate, much smaller than the sepals; stamens many, the filaments glabrous or pubescent; carpels many; achenes 1-seeded; style elongate, often much so after anthesis, persistent, pilose.—About 250 species, widely distributed in the temperate zones, mainly in the N. Hemisphere.

- 1A. Sepals erect, usually recurved at the tip; flowers tubular or campanulate, nodding.
- 2A. Petals present; flowers solitary; stamens densely pubescent. 1. *C. ochotensis*
- 2B. Petals absent.
- 3A. Leaflets entire, often lobed or divided; flowers solitary, usually brown-villous; filaments densely pubescent. 2. *C. fusca*
- 3B. Leaflets toothed, often lobed to divided.
- 4A. Erect herbs slightly woody at base.
- 5A. Lateral leaflets broadly cuneate or subrounded on both halves at base; flowers 15-20 mm. long. 3. *C. stans*
- 5B. Lateral leaflets subcordate on outer half at base, broadly cuneate to subrounded on inner half; flowers 20-25 mm. long. 4. *C. speciosa*
- 4B. Scandent herbs with woody base.
- 6A. Filaments villous; flowers tubular-campanulate.
- 7A. Flowers in fascicles or solitary in axils of leaves of young branchlets.
- 8A. Sepals purplish, thick, ovate-lanceolate, scarcely dilated above, acute, densely short-tomentose near margin.
- 9A. Bracts remote from the flowers, small, green. 5. *C. japonica*
- 9B. Bracts subtending the flowers, often large and colored. 6. *C. obvallata*
- 8B. Sepals creamy white, membranous, spatulate-oblong, dilated above, obtuse, densely pubescent on back. 7. *C. tosaensis*
- 7B. Flowers solitary, terminal and axillary toward the top of young branchlets.
- 10A. Young branchlets glabrous or nearly so; leaves green; peduncles 2-8 cm. long, glabrous; sepals 12-18 mm. long, rather thick, narrowly oblong, white-tomentose near the margin, abruptly acute; achenes several, with a tail 2.5-3 cm. long. 8. *C. lasiantha*
- 10B. Young branchlets scattered pubescent; leaves glaucous; peduncles 10-14 cm. long, pubescent; sepals 2.5-3 cm. long, membranous, oblong-ovate, gradually long-acuminate, loosely pubescent on both sides; achenes many, the tail 4.5-5 cm. long. 9. *C. serratifolia*
- 6B. Filaments glabrous or nearly so; flowers broadly campanulate. 10. *C. williamsii*
- 1B. Sepals spreading from the base; flowers rotate, erect in anthesis, petals absent.
- 11A. Flowers large, solitary, 5-15 cm. across; spring.
- 12A. Peduncles with a pair of leaflike bracts; sepals 6 in the normal form. 11. *C. florida*
- 12B. Peduncles not bracteate; sepals 8 in the normal form. 12. *C. patens*
- 11B. Flowers small, 10-25 mm. across; summer to autumn.
- 13A. Flowers 1 to 3 in leaf-axils; anthers oblong, about 1 mm. long, blackened when dry. 13. *C. pierotii*
- 13B. Flowers 3 to many, in terminal and axillary panicles; anthers linear, 2-3 mm. long, yellow.
- 14A. Leaflets toothed. 14. *C. apiifolia*
- 14B. Leaflets entire or lobed to divided, not toothed.
- 15A. Petiolules ultimately jointed above; achenes lanceolate. 15. *C. uncinata* var. *ovatifolia*
- 15B. Petiolules not jointed; achenes lanceolate to broadly ovate.
- 16A. Leaves trifoliate or reduced to 1 or 2 leaflets, the petiolules of equal length.
- 17A. Leaflets broadly ovate to broadly elliptic, obtuse, cuneate to rounded at base; anthers about 1/10 as long as the filaments. 16. *C. crassifolia*

17B. Leaflets narrowed above, acuminate, rounded to shallowly cordate; anthers $\frac{1}{4}$ to $\frac{1}{2}$ as long as the filaments.

17. *C. meyeniana*

16B. Leaves pinnately compound, or if trifoliate, the petiolules of the terminal leaflet much longer than the others.

18A. Plant gray-green to sordid-green when dry; sepals oblanceolate; achenes 7–10 mm. long. 18. *C. maximowicziana*

18B. Plant purplish-brown when dry; sepals oblong-lanceolate; achenes oblong or rhombic-oblong, about 5 mm. long.

19. *C. fujisanensis*

1. *Clematis ochotensis* (Pall.) Poir. *Atragene ochotensis* Pall.; *C. alpina* var. *ochotensis* (Pall.) O. Kuntze; *A. alpina* var. *ochotensis* (Pall.) Regel & Tiling.—MIYAMA-HANSHÖZURU. Slender scandent herb, woody at base, the young shoots loosely pubescent, the flowering branches usually short, with a pair of leaves; leaves usually twice ternate, petioled, the leaflets broadly lanceolate to ovate-orbicular, 2.5–8 cm. long, 1.5–4 cm. wide, acuminate, petioluled, sometimes 2- to 3-parted, coarsely toothed, membranous; flowers solitary, terminal, pendulous, pubescent, campanulate, 2.5–3 cm. long, usually purplish, on ebracteate peduncles 7–15 cm. long; sepals 4, broadly lanceolate to narrowly ovate, narrowed above; petals few, spatulate-linear, about half as long as the sepals; stamens many, slightly shorter than the petals, the filaments pubescent, the anthers yellow, oblong; achenes broadly ovate, 3–4 mm. long, spreading-pilose; style 2.5–3 cm. long.—June–Aug. Alpine; Hokkaido, Honshu (centr. and n. distr.).—Kuriles, Sakhalin, Manchuria, Korea, e. Siberia, and Kamchatka.

Var. *fauriei* (H. Boiss.) Tamura. *C. alpina* var. *fauriei* H. Boiss.; *C. ochotensis* var. *ternata* Nakai.—KOMIYAMA-HANSHÖZURU. Phase with once-ternate leaves.—Honshu (n. distr.).

2. *Clematis fusca* Turcz. *C. kamschatcica* Bong.; *C. fusca* var. *kamschatcica* Regel & Tiling; *C. fusca* var. *ajanensis* Regel & Tiling; *C. fusca* var. *yezovensis* Miyabe.—KUROBANA-HANSHÖZURU. Rather firm perennial herb, woody at the base, sometimes scandent above, more or less brownish pubescent on young parts; leaves pinnate, 5- to 9-foliate, petioled, the leaflets firm-chartaceous, narrowly to broadly ovate, 2–7 cm. long, 1–4 cm. wide, entire, petioluled, those at the base often 2- to 3-lobed; flowers terminal and axillary, broadly campanulate, nodding, 15–20 mm. long, the terminal ones bractless, the peduncle 2–7 cm. long, the lateral flowers with a pair of minute bracts, the peduncles 5–15 cm. long; sepals relatively thick, narrowly ovate, dark purple, dark brown-villous, slightly recurved at apex; anthers linear, about 4 mm. long, the filaments villous; achenes broadly ovate, with obliquely spreading hairs; style about 2.5 cm. long, pale yellowish brown, feathery.—July–Aug. Grassy places; Hokkaido.—c. Siberia, Kamchatka, Sakhalin, and Kuriles.

Var. *glaberrima* Nakai. Phase with less hairy reddish purple sepals.

3. *Clematis stans* Sieb. & Zucc. *C. kousabotan* Decne.; *C. laualei* Decne. and var. *foliosa* Decne.; *C. savatieri* Decne.; *C. heracleifolia* var. *stans* (Sieb. & Zucc.) O. Kuntze.—KUSA-BOTAN. Erect dioecious short-pubescent herb often woody at the base; stems 50–100 cm. long, sometimes branched; leaves petiolate, ternate, the leaflets thick-chartaceous, ovate to depressed-orbicular, 5–10 cm. long, 4–10 cm. wide, often 2- to 3-cleft, short-acuminate, with coarse deltoid teeth, the lateral leaflets subsessile; cymes axillary, often forming a large terminal panicle, the pedicels short white-tomentose; flowers 15–20 mm. long, narrowly campanulate, nodding, pale purple-blue, short white-tomentose outside; sepals recurved on upper half, lanceolate; stamens of staminate flowers 10–12 mm. long,

the anthers linear, 4–5 mm. long, as long as to slightly shorter than the loosely pubescent filaments; achenes elliptic, about 3.5 mm. long, with short ascending hairs; style about 2 cm. long in fruit.—Aug.–Oct. Sunny places in mountains; Honshu.

Var. *austroriponensis* (Ohwi) Ohwi. *C. austroriponensis* Ohwi.—TSUKUSHI-KUSA-BOTAN. Anthers shorter, about 3 mm. long, the filaments 2–3 times as long as the anthers.—Shikoku, Kyushu.

Clematis urticifolia Kitag. TACHI-KUSA-BOTAN. Closely related to *C. stans*, but differs in the urceolate flowers. Reported from Honshu (Sado Isl.).—Korea.

4. *Clematis speciosa* (Makino) Makino. *C. heracleifolia* var. *speciosa* Makino; *C. heracleifolia* var. *hookeri* Makino, excl. syn.—Ō-KUSA-BOTAN. Closely resembles No. 3; stems stout; leaves chartaceous, petiolate, somewhat larger, ternate, the leaflets ovate to broadly so, 10–18 cm. long, 4–10 cm. wide, short-acuminate, sometimes 2- to 3-lobed, short-toothed, the lateral leaflets usually petioluled, prominently oblique at base; flowers 2–2.5 cm. long; sepals linear-lanceolate, dilated above; stamens about $\frac{1}{3}$ as long as the sepals, the anthers shorter than the filaments, about 3 mm. long.—Oct. Shikoku, Kyushu.

5. *Clematis japonica* Thunb. *C. ternata* Makino.—HANSHÖZURU. Scandent, sparsely pubescent subshrub; leaves petiolate, ternate, the leaflets ovate or elliptic, 5–8 cm. long, 2–4 cm. wide, subsessile, 3- to 5-nerved, acuminate to acute, cuneate to obtuse at base, with coarse teeth especially on upper half; flowers 1 to few, between the bud-scales at the base of young shoots, nodding, campanulate, 2.5–3 cm. long, purplish red or brownish red, the peduncles 5–10 cm. long, with a pair of small bracts above the middle; sepals 4, broadly lanceolate to narrowly ovate, slightly fleshy, nearly glabrous except the short white-tomentose margin; stamens about half as long as the sepals, the filaments flat, pubescent above; achenes broadly lanceolate, about 6 mm. long, glabrous or sparingly pilose; style 3–3.5 cm. long.—May–June. Thickets in mountains; Honshu, Kyushu.—Forma *purpureofusca* Hiseaichi. Peduncles shorter, bibracteate near base.—Forma *villosula* Ohwi. Sepals yellow-villous externally, sometimes divided.

6. *Clematis obvallata* (Ohwi) Tamura. *C. japonica* var. *obvallata* Ohwi; *C. japonica* forma *obvallata* (Ohwi) Ohwi.—KŌYA-HANSHÖZURU. Closely resembles the preceding; bracts at the top of the peduncles, larger, often colored and involucrelike.—Mountains; Honshu (s. Kinki Distr.), Shikoku.

Var. *shikokiana* Tamura. SHIKOKU-HANSHÖZURU. Bracts smaller.—Shikoku.

7. *Clematis tosaensis* Makino. *C. japonica* var. *brevipedicellata* Makino.—TORIGATA-HANSHÖZURU, AZUMA-HANSHÖZURU. Scandent subshrub closely resembling *C. japonica*; young shoots elongate, pubescent; leaflets 3; peduncles 1–8 cm. long, ebracteate; flowers creamy white, 2–3 cm. long; sepals membranous, spatulate-oblong, slightly dilated above, obtuse, white-pubescent outside, glabrous to scattered pubes-

cent inside; anthers much shorter than the filaments, the filaments linear, slightly pubescent; achenes 5-6 mm. long, broadly lanceolate.—Apr.-June. Thickets in mountains; Honshu, Shikoku.—Forma *cremea* (Makino) Tamura. *C. japonica* var. *cremea* Makino.—SHIRO-HANSHÖZURU. Peduncles longer, bracteate near the middle.—Honshu (Nikko in Shimotsuke).

8. *Clematis lasiandra* Maxim. TAKANE-HANSHÖZURU. Nearly glabrous scandent herb with slender woody branches; leaves petiolate, once to twice ternately compound, thin, the leaflets broadly lanceolate to broadly ovate, 4-8 cm. long, 1.5-4 cm. wide, acuminate, acute to shallowly cordate at base, with coarse denticulate, mucronate teeth, petiolate or subsessile; flowers solitary or 2 or 3, campanulate, 12-18 mm. long, the terminal peduncles naked, the lateral ones 2-8 cm. long, with a pair of small broadly linear bracts on lower part; sepals 4, rather thick, narrowly oblong to broadly lanceolate, nearly glabrous except the short white densely tomentose margin; stamens slightly shorter to nearly as long as the sepals, the filaments long-villous, the anthers broadly linear, about 2 mm. long; achenes many, ovate, about 3 mm. long, with spreading hairs; style slender, 2.5-3 cm. long, white.—Aug.-Oct. Honshu (Chügoku Distr.), Shikoku, Kyushu.

9. *Clematis serratifolia* Rehd. *C. orientalis* var. *serrata* Maxim.; *C. orientalis* var. *wilfordii* Maxim.; *C. sibiricoides* Nakai.—Ö-WAKU-NOTE. Scandent subshrub, the nodes and young parts short-pubescent; leaves pinnately biternate, the petioles 4-5 cm. long, the leaflets 3-5 cm. long, 1-3 cm. wide, petiolulate, often irregularly 2- to 3-fid, coarsely toothed, sparingly pubescent on both sides, glaucous, acuminate; peduncles erect, 10-14 cm. long, white-pubescent, with small bracts near base; flowers nodding, broadly campanulate; sepals 2-3 cm. long, about 1 cm. wide, narrowly ovate, gradually narrowed above and acuminate, membranous; stamens 5-7 mm. long, the filaments lanceolate-subulate, silky especially on margin, the anthers 2-2.5 mm. long, yellowish, obtuse; achenes ovate, about 2.5 mm. long, pilose, the tail 4.5-5 cm. long, slender, long white-pilose.—Hokkaido (near Wakkanai in Kitami Prov.).—Manchuria, n. Korea, and Ussuri.

10. *Clematis williamsii* A. Gray. *C. montana* var. *williamsii* (A. Gray) O. Kuntze; *C. montana* var. *bissetii* O. Kuntze.—SHIROBANA-NO-HANSHÖZURU. Scandent, gray-brown pubescent; leaves ternate, the leaflets short-petiolulate, rather thin, often nearly glabrous above, ovate to oblong, 3-8 cm. long, 1-3.5 cm. wide, few-toothed, cuneate to rounded at base, usually 3-fid, the median lobes acuminate; flowers white, cup-shaped or broadly campanulate, 1.5-5 cm. long, nodding, solitary, the peduncles axillary with a pair of minute bracts on lower half; sepals 4, broadly elliptic, membranous, about 2 cm. long, glabrous inside, appressed-pubescent outside; stamens shorter than the sepals, the filaments linear, glabrous, becoming black when dried, the anthers oblong, about 2 mm. long, yellow, the connective also blackened when dried; achenes ovate, about 5 mm. long, pilose; style about 2.5 cm. long, pilose, pale yellowish-brown.—May-June. Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu; rather rare.

Clematis eriopoda Maxim. HIME-BOTANZURU. Species attributed to Japan by Maximowicz, but obscure to us. Described as having ternate leaves, the leaflets ovate, 3-sected, incise-toothed, the median lobes linear, the lateral ones ovate, 2-2.5 cm. long, 1-2 cm. wide, the peduncles solitary, 1-

flowered, bracteate, villous above; sepals 4, nearly spreading, elliptic, densely silky outside, slightly longer than the stamens; filaments nearly glabrous, much longer than the anthers.

11. *Clematis florida* Thunb. *Anemone japonica* Houtt.; *C. hakonensis* Fr. & Sav.—TESSEN. Slightly pubescent, often glabrate woody herb; stems scandent, slender; leaves petiolate, 1 or 2 times ternate, the median primary petioles longer than the lateral, the ultimate leaflets ovate to narrowly so, usually entire, rather chartaceous, 2-4 cm. long, 1-2 cm. wide, acute; peduncles 1-flowered, solitary on the axils, about 10 cm. long, with a pair of leaflike simple bracts near middle; flowers white, large, 5-8 cm. across; sepals usually 6, spreading, ovate, acute, with a longitudinal band of soft short dense pubescence on each side externally; anthers linear, 3-5 mm. long, the filaments linear, about twice as long as the anthers, glabrous, blackened when dry; carpels silky.—May-June. Chinese plant long grown as an ornamental in our area; several cultivars are known.

12. *Clematis patens* Morr. & Decne. KAZAGURUMA. Resembles the preceding; leaves 3- to 5-foliolate, the leaflets ovate, chartaceous, often 3-fid, 3-10 cm. long, 2-5 cm. wide, acute, rounded to shallowly cordate; peduncles solitary and terminal on short young shoots, 1-flowered, bracteate, 10-15 cm. long; flowers white to pale blue-purple, 10-15 cm. across; sepals usually 8, caudate, narrowly ovate to narrowly oblong, with a broad band of short white hairs on each side externally; anthers linear, 6-10 mm. long, the filaments glabrous, as long as to slightly longer than the anthers; achenes ovate; style long yellowish-brown pilose.—May-June. Honshu, Shikoku, Kyushu. Several cultivars are grown in this country.—China.

13. *Clematis pierotii* Miq. KOBANO-BOTANZURU, YAMABOTANZURU. Slightly short-pubescent climber; leaves petiolate, twice ternate, the leaflets membranous, petiolule or sessile, ovate to broadly so, 1.5-5 cm. long, 8-20 mm. wide, usually 3-fid, with few irregular teeth, the midlobes of terminal leaflets often elongate, acuminate, the other lobes acute to subobtus, linear-lanceolate to narrowly ovate; peduncles axillary, solitary, 1- to 3-flowered, 5-10 cm. long, leafy-bracteate; flowers white, about 2.5 cm. across, erect; sepals oblong, white-pubescent outside especially toward the margin; stamens slightly shorter than the sepals, glabrous, the anthers narrowly oblong, 1-1.5 mm. long; achenes broadly lanceolate, about 5 mm. long, spreading-pilose; style yellowish, about 2 cm. long, feathery.—Aug.-Sept. Shikoku, Kyushu.—Ryukyus.

14. *Clematis apiifolia* DC. BOTANZURU. Slightly pubescent climber; stems rather thick below, woody, the shoots elongate, much branched, the inflorescence terminal; leaves petiolate, ternate, the leaflets nearly membranous, narrowly to broadly ovate, 4-8 cm. long, 2-5 cm. wide, acuminate, often 3-lobed, sparsely coarse-toothed, rounded to shallowly cordate at base; inflorescence pedunculate, 5-10 cm. long, rather many-flowered, cymose-paniculate; flowers white, 15-20 mm. across; sepals 4, broadly oblanceolate, spreading, short white-puberulent outside; stamens slightly shorter than the sepals, glabrous, the anthers linear, about 2 mm. long; achenes ovate, with spreading hairs, about 4 mm. long; style 1-1.2 cm. long.—Aug.-Sept. Thickets in lowlands and foothills; Honshu, Shikoku, Kyushu; common.—Korea and China.

Var. *bitermata* Makino. *C. brevicaudata* sensu auct. Japon., non DC.—ME-BOTANZURU, KO-BOTANZURU. Leaves

often partially twice ternate, the achenes often glabrous.—Honshu (centr. distr.).

Clematis × **takedana** Makino. MURASAKI-BOTANZURU. Hybrid of *C. apiifolia* × *C. stans*. Stems only slightly scandent, the leaflets firmer; flowers pale purple, the sepals spreading and recurved above; filaments often long-pubescent.—Honshu (n. and centr. distr.); rare.

15. Clematis uncinata Champ. var. **ovatifolia** (T. Ito) Ohwi. *C. ovatifolia* T. Ito; *C. longiloba* sensu Maxim., non DC.—KIL-SENNIN-SŌ. Glabrous, somewhat glaucous climber; leaves petiolate, somewhat coriaceous, twice ternate or the lower ones pinnately 5-foliolate, the lowest leaflets once again ternate, the ultimate leaflets ovate to ovate-oblong, 4–7 cm. long, 2–3 cm. wide, 3- or obsoletely 5-nerved, entire, acute to abruptly acuminate, rounded at base, the petiolules jointed below the top; panicles loosely many-flowered, 10–25 cm. long, the pedicels 2–2.5 cm. long, bracteate; flowers 2.5–3 cm. across; sepals 4, white, oblanceolate, subacuminate, the margin densely puberulent; anthers about 3 mm. long; achenes lanceolate, truncate, about 6 mm. long, glabrous; style 1.8–2.2 cm. long, feathery.—Aug. Honshu (s. Kinki Distr.), Kyushu (Higo Prov.). The typical phase occurs in s. China and Formosa.

16. Clematis crassifolia Benth. YAMA-HANSHŌZURU. Glabrous woody climber; stems prominently fissured and corky, the new shoots terete; leaves petiolate, ternate, the leaflets thick-coriaceous, elliptic or broadly ovate, 8–12 cm. long, 6–8 cm. wide, obtuse, broadly cuneate to rounded at base, entire, petiolules distinct, 3–4 cm. long, stout; inflorescence axillary, many-flowered, the bracts small; sepals 4, spreading, linear- to narrowly oblong, 15–18 mm. long, 3–5 mm. wide, white-woolly on margin and inside; anthers much shorter than the filaments.—Kyushu (s. distr. incl. Yakushima and Tanegashima).—s. China and Formosa.

17. Clematis meyeniana Walp. *C. lutchuensis* Koidz. —YAMABARU-SENNIN-SŌ, TERIHA-NO-SENNIN-SŌ. Glabrous woody climber, the young shoots often yellowish brown pubescent in leaf axils, changing to dark brown when dried; leaves petiolate, ternate, the leaflets rather coriaceous, petioluled, ovate to elongate-ovate, sometimes deltoid-ovate, 5-nerved, 4–10 cm. long, 2.5–5 cm. wide, acuminate, rounded to shallowly cordate at base; panicles axillary, pyramidal, 7–20 cm. long, peduncled, rather many-flowered, the bracts subulate, small, the pedicels rather short, the flowers white, 15–20 mm. across; sepals 4, spreading, with white tomentum on margin;

stamens about 2/3 as long as the sepals, glabrous, the anthers linear, yellow, 1/2–2/3 as long as the filaments; achenes yellowish brown villous; style feathery except at apex, yellowish brown.—July–Aug. Kyushu (Tanegashima and Yakushima).—Ryukyu, Formosa, s. China, and Philippines.

18. Clematis maximowicziana Fr. & Sav. *C. paniculata* Thunb., non J. F. Gmel.; *C. recta* var. *paniculata* (Thunb.) O. Kuntze; ? *C. terniflora* DC.; *C. dioscoreifolia* Lév. & Van't. *C. flammula* var. *robusta* Carr.; *C. dioscoreifolia* var. *robusta* (Carr.) Rehd.; *C. terniflora* var. *robusta* (Carr.) Tamura—SENNIN-SŌ. Branched suffrutescent woody climber, short-pubescent only while young, becoming grayish green when dry; leaves petiolate, pinnately 5-foliolate, the leaflets petiolulate, narrowly ovate to ovate-orbicular, sometimes broadly lanceolate or deltoid-ovate, 3–7 cm. long, (1–)2–4(–6) cm. wide, 3- to 5-nerved, usually entire, sometimes 2- to 3-lobed, obtuse, mucronate or acute, slightly cordate to rounded at base; inflorescence a rather many-flowered terminal panicle, 5–15 cm. long, the bracts subulate; flowers white, 2–2.8 cm. across, erect; sepals 4, spreading, oblanceolate, white-puberulent on margin; stamens 1/2–2/3 as long as the sepals, glabrous, the anthers linear, yellow, 2.5–3 mm. long; achenes rather few, ovate, 7–10 mm. long, slightly appressed-puberulent; style 2.5–3 cm. long, white, feathery.—Aug.–Oct. Hokkaido, Honshu, Shikoku, Kyushu; very common.—Korea and China.

19. Clematis fujisanensis Hisauchi & Hara. *C. kyu-shuensis* Tamura—FUJI-SENNIN-SŌ. Nearly glabrous climber, to 5 m. high; leaves 20–25 cm. long, 10–13 cm. wide, 3- to 5-foliolate, the petioles 5–7 cm. long, the leaflets deep green, chartaceous, petiolulate, ovate, ovate-lanceolate to lanceolate, 2–9 cm. long, very acute, entire, rarely unequally bifid, 5-nerved, white-pubescent while young, soon becoming glabrous, the petiolules 1–4 cm. long; panicles corymbose, few to many-flowered, nearly glabrous to sparsely pubescent, with minute subulate-deltoid bracts, the pedicels 2–3 cm. long; flowers 1.5–3 cm. across, white; sepals oblong-lanceolate, rounded, mucronate, sparingly pilose on outer side near tip, white-tomentulose on margin; stamens many, the anthers linear, 2–3 mm. long; achenes oblong or rhombic-oblong, about 5 mm. long, 3 mm. wide, appressed white-puberulent, the style 2.5–4 cm. long, with ascending-spreading white hairs.—Aug.–Sept. Honshu (Kantō Distr. and westw.), Kyushu; rare.

2. PULSATILLA Mill. OKINAGUSA ZOKU

Rhizomatous perennial herbs usually with long silky hairs at least while young; leaves radical, petiolate, palmately, ternately or pinnately compound, rarely simple; scapes erect, naked except for a whorl of involucrel leaves, 1-flowered, the involucrel leaves ternate; flowers nodding, campanulate, long-peduncled; sepals 5–12, deciduous, petaloid; petals absent; stamens many; carpels many, sessile, usually pilose; style elongate, becoming taillike after anthesis, feathery.—About 30 species, in temperate and arctic regions of the N. Hemisphere.

- 1A. Radical leaves pinnately 5-foliolate, the lateral leaflets subsessile; sepals dark reddish brown inside; tail of the achenes with hairs about 3–4 mm. long. 1. *P. cernua*
1B. Radical leaves ternately compound, the linear segments 1–2 mm. wide; sepals pale yellow inside; tail of the achenes with hairs 0.5–1 mm. long. 2. *P. nipponica*

1. Pulsatilla cernua (Thunb.) Spreng. *Anemone cernua* Thunb.—OKINAGUSA. Perennial silky-pubescent herb with thickened rhizomes; radical leaves petiolate, tufted, broadly ovate, 5-foliolate, 6–10 cm. long, the leaflets subcoriaceous, ovate or rhombic-orbicular, 2- to 5-parted, 3–5 cm. long,

acutely incised, often nearly glabrate above; scapes 10–40 cm. long; involucrel leaves sessile, palmately parted, 3–5 cm. long, sometimes again 3- to 5-leaf, the segments linear; peduncles 15–25 cm. long, the flowers nodding, solitary, tubular-campanulate, 2.5–3 cm. long; sepals 6, silky white-villous out-

side, glabrous and dark reddish brown to dark reddish purple inside, narrowly oblong; achenes narrowly ovate, about 3 mm. long, white-silky, the tail white, feathery, about 4 cm. long, the spreading hairs 3-4 mm. long; stigma punctate.—Apr.-May. Grassy slopes in foothills; Honshu, Shikoku, Kyushu; rather common.—Korea and China.

2. *Pulsatilla nipponica* (Takeda) Ohwi. *Anemone taraoi* var. *nipponica* Takeda—TSUKUMOGUSA. Silky-villose when young; rhizomes thickened, with a tuft of leaves at top; radical leaves long-petiolate, deltoid-orbicular, 2-6 cm. long and as wide, ternately compound, the leaflets petiolulate,

1.5-3 cm. long, finely dissected into linear acute segments 1-2 mm. wide; scapes 10-30 cm. long; involucre leaves sessile, 15-25 mm. long, deeply parted; peduncles elongate after anthesis, to 5-10 cm. long; flowers broadly campanulate or broadly tubular, one-sided, about 2.5 cm. long; sepals 6, oblong, white-silky outside, glabrous and pale yellow inside, membranous; achenes hairy, narrowly ovate, about 4 mm. long, the tail elongate, slightly thickened below, firm, 3-3.5 cm. long, densely pilose with brownish-yellow hairs 0.5-1 mm. long.—June-July. Alpine slopes; Hokkaido, Honshu (centr. distr.); rare.

3. ANEMONE L. ICHIRIN-SŌ ZOKU

Perennial herbs usually with creeping rhizomes; radical leaves petioled, the cauline usually involucrelike, commonly ternate, rarely opposite, all palmately to ternately divided or lobed; flowers 1 to many, usually on pedicels, usually large and showy; sepals 5 to many, petaloid, deciduous, imbricate in bud, rarely absent; petals absent; stamens many; carpels many or rather few, free, each with a pendulous ovule; achenes sessile or stiped, the style short, pilose or glabrous.—About 100 species, in temperate to cold regions of the world.

- 1A. Flowers sessile, the involucre leaves simple, entire; radical leaves 3-lobed, the lobes entire. 1. *A. hepatica*
- 1B. Flowers pedunculate, the involucre leaves variously lobed; radical leaves incised and toothed, usually compound. 2A. Achenes sessile; involucre leaves usually dissimilar in shape to the radical or cauline ones.
- 2A. Achenes sessile; involucre leaves usually dissimilar in shape to the radical or cauline ones.
- 3A. Achenes ovate or oblong, scarcely flattened.
- 4A. Involucre leaves petiolate.
- 5A. Flowers usually solitary; plants nonstoloniferous; rhizomes without persistent base of petioles; radical leaves absent or single at base of the solitary scape.
- 6A. Primary leaflets petiolulate; scapes 10-30 cm. long; flowers large; sepals 15-30 mm. long.
- 7A. Plants slightly glaucous, the long silky hairs deciduous; petioles of involucre leaves scarcely dilated. 2. *A. raddeana*
- 7B. Plants green, not glaucous, the hairs on the peduncle persistent; petioles of involucre leaves dilated and winged on the margin.
- 8A. Sepals 8-12, linear-oblong, 5-8 times as long as wide; anthers ellipsoidal, less than 1 mm. long. 3. *A. pseudoaltaica*
- 8B. Sepals 5-6, elliptic, 1.5-3 times as long as wide; anthers oblong, 1-1.5 mm. long. 4. *A. nikoenis*
- 6B. Primary leaflets sessile; scapes 5-15 cm. long; flowers small; sepals 5-12 mm. long.
- 9A. Sepals 5, 5-7 mm. long; leaflets of involucre leaves lanceolate or linear-lanceolate. 5. *A. debilis*
- 9B. Sepals 5-7, 10-12 mm. long; leaflets of involucre leaves ovate-oblong to oblong. 6. *A. yezoensis*
- 5B. Flowers 1 to 3 on a scape; plants often stoloniferous; rhizomes with persistent fibers disintegrated from the decayed petioles; radical leaves few; scapes 1-3. 7. *A. stolonifera*
- 4B. Involucre leaves sessile.
- 10A. Leaflets deltoid-ovate; involucre leaves rather narrow, pinnately incised; flowers solitary, pale purple, the peduncles 3-5 cm. long; sepals 12-15, linear-lanceolate, 5-10 times as long as wide. 8. *A. heiskeana*
- 10B. Leaflets rhombic-obovate, the lateral ones 2- to 3-parted; involucre leaves 3-parted; flowers 1-3, white, or slightly pinkish, the peduncles 5-10 cm. long; sepals 5, elliptic, 2-3 times as long as wide. 9. *A. flaccida*
- 3B. Achenes elliptic or ovate, prominently flattened, often with a thick wing on margin.
- 11A. Rhizomes slender, long-creeping, bearing scapiform stems at intervals with few pairs of opposite sessile leaves; stems dichotomously branched above, naked below, with few pairs of scales at base; flowers solitary in the dichotomous axils. 10. *A. dichotoma*
- 11B. Rhizomes thick and rather short, densely covered with decayed petiole-bases; scapes simple, rarely once-branched, with 1 or 2 pairs of sessile involucre leaves, surrounded at base with a tuft of radical petioled leaves; flowers in umbels. 11. *A. narcissiflora*
- 12A. Peduncles unbranched. 12. *A. sikokiana*
- 12B. Peduncles or some of them branched. 13. *A. hupehensis* var. *japonica*
- 2B. Achenes stipitate; involucre leaves few-paired, leaflike. 13. *A. hupehensis* var. *japonica*

1. *Anemone hepatica* L. var. *japonica* (Nakai) Ohwi. *Hepatica nobilis* var. *japonica* Nakai—MISUMI-SŌ. White-silky when young; rhizomes elongate; radical leaves long-petioled, depressed-deltoid, cordate, 2-3 cm. long, 3-5 cm. wide, 3-lobed, the lobes broadly ovate-deltoid, acute, rather coriaceous; stems 10-15 cm. long, the involucre leaves 3, narrowly ovate, subobtusely; sepals 6-9, white or slightly pinkish, 8-10 mm. long, slightly longer than the involucre, narrowly oblong, subobtusely at apex; carpels hairy, the stigma slightly thickened.—Feb.-May. Honshu.—Forma *variegata* (Makino) Hara. *Hepatica triloba* var. *obtusata* forma *variegata* Makino; *A. hepatica* var. *japonica* forma *nipponica* (Nakai) Ohwi; *H. nobilis* var. *nipponica* Nakai—SUHAMA-

sō. Leaves sometimes variegated, with obtuse lobes. Occurs with var. *japonica*. The typical form occurs in Eurasia.

Var. *pubescens* Hiroe. KE-SUHAMA-SŌ. Leaves often hairy on both sides, the lobes roundish.—Honshu (west. distr.), Shikoku.

2. *Anemone raddeana* Regel. AZUMA-ICHIGE. Rhizomes creeping, 1.5-3 cm. long, slenderly fusiform, with scattered, small, scarious scales at apex; leaves long-petiolate, 1 or 2 times ternate, the leaflets 3-parted; stems solitary, 15-20 cm. long, erect, scattered long-pilose, the involucre leaves 3, short-petiolate, once-ternate, the leaflets oblong, 15-35 mm. long, 5-15 mm. wide, obtuse, with irregularly toothed upper half; peduncles 2-3 cm. long; flowers white with a purple hue;

sepals about 2 cm. long; anthers elliptic, about 1 mm. long; ovary puberulous.—Mar.—May. Damp woods in mountains; Hokkaido, Honshu, Shikoku.—Amur, Ussuri, Korea, and Sakhalin.

3. *Anemone pseudoaltaica* Hara. *A. altaica* sensu auct. Japon., non Fisch.—KIKUZAKI-ICHIGE. Rhizomes slender, 2–10 cm. long, long-creeping; radical leaves twice-ternate, long-petiolate, the leaflets ovate, 3- to 5-parted, irregularly toothed; stems solitary, 10–30 cm. long, glabrous, the involucre leaves 3, petiolate, ternate, the peduncles pubescent; sepals pale purple or white, linear-elliptic, about 20 mm. long; anthers elliptic; achenes broadly lanceolate, about 4 mm. long, densely short, spreading, white-pubescent; styles slender, rather short.—Apr.—June. Woods in mountains; Hokkaido, Honshu (n. and centr. distr.).

4. *Anemone nikoensis* Maxim. ICHIRIN-SŌ. Rhizomes slender, creeping, 1–6 cm. long, slightly thickened at intervals; radical leaves 1–2 times ternate, long-petiolate, the leaflets ovate, subacute, pinnately parted; stems 20–30 cm. long, solitary, the involucre leaves 3, petiolate, once-ternate, the leaflets ovate, subacute, 2–5 cm. long, pinnately parted, irregularly toothed, the peduncles solitary, pubescent; sepals 5, white, usually with a pinkish hue, elliptic, 2–3 cm. long; anthers oblong; style short; carpels densely short-pilose.—Apr.—May. Woods in foothills; Honshu, Shikoku, Kyushu.

5. *Anemone debilis* Fisch. *A. ranunculoides* var. *gracilis* Schldt.; *A. gracilis* (Schldt.) F. Schmidt.—HIME-ICHIGE. Delicate herb, 5–15 cm. high, sparsely pubescent; rhizomes short-creeping, 7–15 mm. long; involucre leaves ternate, petiolate, sometimes only 3-parted, with the leaflets linear-lanceolate or lanceolate, 2–5 cm. long, 3–12 mm. wide, usually coarsely toothed, sessile; peduncles solitary; flowers white; sepals 5, oblong, 5–7 mm. long; anthers elliptic, about 0.4 mm. long; achenes narrowly ovate, about 3 mm. long, rather densely grayish white-pubescent; style narrow, rather short.—June–July. Damp coniferous woods in mountains; Hokkaido, Honshu (n. and centr. distr. and Yamato Prov.).—Kuriles, Sakhalin, Kamchatka, Manchuria, and e. Siberia.

6. *Anemone yezoensis* (Miyabe) Koidz. *A. umbrosa* var. *yezoensis* Miyabe; *A. debilis* var. *soyensis* Makino, excl. syn.—EZO-ICHIGE. Resembles the preceding; rhizomes slender; leaflets of involucre leaves ovate-oblong or oblong, 2–3 cm. long, 7–15 mm. wide, coarsely toothed; sepals 5–7, narrowly ovate, 10–12 mm. long; anthers elliptic, about 0.7 mm. long.—May–July. Hokkaido.—Sakhalin.

7. *Anemone stolonifera* Maxim. *A. sinzevii* Komar.—SANRIN-SŌ. Sparsely pubescent stoloniferous herb 15–30 cm. high; radical leaves long-petiolate, 3-foliate, the lateral leaflets 2-parted, the terminal one rhombic-obovate, 2.5–4 cm. long, 3-parted, incised and toothed, short-petiolate or subsessile; scapes 1 to 3, the involucre leaves ternate, short-petiolate, 3-parted, the segments cuneate to broadly oblanceolate, 3-cleft and coarsely toothed, 2–3 cm. long; flowers 1–3, white, on erect peduncles 3–10 cm. long; sepals 5, elliptic, 7–8 mm. long; achenes rather few, broadly ovate, puberulous, about 3 mm. long; style slender and rather short.—May–July. Woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—Formosa, Manchuria, Korea, and (?) China.

8. *Anemone keiskeana* T. Ito. YUKI-WARI-ICHIGE, RURI-ICHIGE. Rhizomes rather slender, creeping, to 10 cm. long; radical leaves long-petiolate, nearly glabrous, deltoid, 3-foliate, the leaflets 3–5 cm. long, sessile, deltoid-ovate, acuminate,

obtusely toothed or incised, the involucre leaves narrowly ovate or narrowly oblong, sessile, 10–35 mm. long, toothed or pinnately lobulate, the peduncles 3–5 cm. long, solitary, loosely ascending-pubescent; sepals 12–15, linear-oblong, 15–20 mm. long, white to purplish toward the base; anthers elliptic, 1–2 mm. long.—Feb.–Apr. Honshu (w. distr.), Shikoku, Kyushu.

9. *Anemone flaccida* F. Schmidt. *A. baicalensis* var. *laevigata* A. Gray; *A. laevigata* (A. Gray) Koidz.; *A. soyensis* H. Boiss.; *A. tagawa* Ohwi; *A. amagisanensis* Honda.—NIRIN-SŌ. Slightly pubescent perennial with stout creeping rhizomes; radical leaves long-petiolate, 3-parted, the lateral segments 2-parted, the terminal one rhombic-obovate, 2–4 cm. long, 1.5–3.5 cm. wide, 3-fid and coarsely toothed; stems 1 or 2, 20–30 cm. long, the involucre leaves sessile, rather unequal, cuneate-ovate or oblong, 3-fid, coarsely toothed, 2–5 cm. long; peduncles 1–3, 5–10 cm. long; flowers white; sepals 5, elliptic, 8–15 mm. long; anthers elliptic, about 1 mm. long; achenes ovate, about 2.5 mm. long, short white-pubescent; style very short.—Moist shaded places along streams and ravines in foothills; very common.—Sakhalin, Amur, and n. China.

10. *Anemone dichotoma* L. FUTAMATA-ICHIGE. Rather stout, white-pubescent herb with slender, elongate rhizomes; stems erect, rather firm, 40–80 cm. long, naked on lower half, with few scales at base, dichotomously branching above, with a single flower on each branch; leaves opposite, sessile, 3-parted, the segments cuneate-oblanceolate, 4–8 cm. long, 1–2 cm. wide, acute, coarsely toothed on upper half and sometimes again 3-lobed, nearly glabrous above; peduncles 3–7 cm. long; flowers white; sepals 5, broadly elliptic, 8–15 mm. long, appressed-puberulent externally; anthers elliptic, about 0.8 mm. long; achenes glabrous, ovate, flat, 4–5 mm. long, the style about 1.5 mm. long.—June–July. Grassy places in lowlands, especially near the sea; Hokkaido.—Europe, Siberia, Manchuria, and Korea.

11. *Anemone narcissiflora* L. HAKUSAN-ICHIGE. Perennial herb, usually densely white-pilose; rhizomes stout, covered with old leaf bases; radical leaves long-petiolate, orbicular-cordate, 3-parted, the lateral segments deeply 2-lobed, each segment further dissected into linear subacute ultimate lobes; stems 1 to 4, 15–40 cm. long, the involucre leaves 2–4 cm. long, dissected into linear lobes, the peduncles 1–7 cm. long; flowers white; sepals 5–7, ovate or elliptic, 12–15 mm. long; anthers oblong, about 1 mm. long; achenes flat, glabrous, with a rather thick wing on the margin, broadly elliptic, 6–7 mm. long, about 5 mm. wide, the style short and slightly incurved.—July–Aug. Wet alpine slopes; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin, Kuriles, n. Korea to Himalayas, Siberia to Europe, and N. America.

Var. *sachalinensis* Miyabe & Miyake. KARAFUTO-SENKA-SŌ. Plants more densely pubescent.—Honshu (n. distr.), Hokkaido.—Sakhalin and s. Kuriles.

12. *Anemone sikokiana* Makino. *A. narcissiflora* var. *sikokiana* Makino.—SHIKOKU-ICHIGE. Resembles the preceding; radical leaves 5-angled, cordate-orbicular, 3-parted, the lateral segments 2-parted, 3–5 cm. long, each segment 2 to 3-fid, coarsely incised and lobed; some of the peduncles branched, bearing smaller involucre leaves and few flowers.—Alpine slopes; Shikoku (Mount Ishizuchi in Iyo Prov.); rare.

13. *Anemone hupehensis* Lemoine var. *japonica* (Thunb.) Bowles & Stearn. *Atragene japonica* Thunb.; *Anemone japonica* (Thunb.) Sieb. & Zucc., non Houtt.; *A. vitiifolia* var. *japonica* (Thunb.) Finet & Gagnep.; *A. hybrida* var. *japonica* (Thunb.) Ohwi; *A. nipponica* Merr.; *A. sieboldii* Honda; *Eriocapitella japonica* (Thunb.) Nakai—SHŪMEIGIKU, KIBUNGIKU. Rather tall, appressed-pubescent perennial herb 50–80 cm. high, with erect dichotomously forked stems; radical leaves petiolate, ternate, the leaflets petiolulate,

ovate, 5–12 cm. long, 3–7 cm. wide, often 3-fid, irregularly toothed, acute, rounded to cordate, the cauline of few pairs, sessile or short-petioled, ternate or 3-fid, the upper ones gradually reduced; flowers long-pedunculate, 5–7 cm. across; sepals about 30, slightly unequal, spreading, some of the outer ones green and small, the inner ones petaloid, oblanceolate, pale rose-purple, silky-pubescent outside; carpels very numerous, forming a rather large head.—Sept–Oct. Cultivated and often naturalized in our area.—China.

4. RANUNCULUS L. KIMPŌGE ZOKU

Annual or perennial sometimes aquatic herbs; leaves entire, palmate or ternate, sometimes finely dissected, the cauline alternate; flowers yellow, white or sometimes orange-red, solitary or in terminal panicles; sepals 3–5 or more, caducous or deciduous, greenish; petals larger than the sepals, normally 5, sometimes few or many, flat, petaloid, with a nectariferous spot often covered by a small scale near base inside; stamens usually many, sometimes rather few; ovules solitary, ascending; achenes many, glabrous or puberulous, forming a globose to ellipsoidal head, on a short or slightly elongate receptacle, smooth or striate, sometimes spiny, terminated by a short beaklike style.—About 400 species, in the temperate and cold regions of both hemispheres and in high mountains of the Tropics.

1A. Achenes not transversely nerved; terrestrial herbs with yellow flowers.

2A. Achenes longitudinally striate; plants stoloniferous, growing near seashores; leaves elliptic to oblong, 3–5 toothed on upper margin; flowers small, yellow, the petals 2.5–3 mm. long. 1. *R. kawakamii*

2B. Achenes not striate.

3A. Achenes not spiny, smooth, glabrous or puberulent.

4A. Achenes plump or lenticular, without a flat face on each side, 1.2–2.5 mm. long; radical leaves simple to 3-foliate.

5A. Radical leaves linear or linear-lanceolate, simple, entire, 1–1.5 mm. wide; flowers small, 5–7 mm. across; plant long-stoloniferous. 2. *R. reptans*

5B. Radical leaves cordate-orbicular or depressed-orbicular, usually palmately lobed or toothed.

6A. Sepals villous with dark brown woolly hairs; plant of alpine regions. 3. *R. shinanoalpinus*

6B. Sepals glabrous or with pale hairs.

7A. Annual or biennial herbs; achenes in an oblong, cylindric head on an elongate receptacle. 4. *R. sceleratus*

7B. Perennial herbs; achenes in a globose to ellipsoidal head, on a short receptacle.

8A. Flowers small, 4–8 mm. across; low alpine plants with small, palmately 5- to 9-parted radical leaves.

9A. Stems 3–7 cm. long; leaves 5- to 7-cleft. 5. *R. pygmaeus*

9B. Stems 8–20 cm. long; leaves 5- to 9-parted.

10A. Anthers narrowly oblong; plant deep green, slightly pubescent; petals narrowly oblong, scarcely longer than the sepals. 6. *R. kitadakeanus*

10B. Anthers ellipsoidal; plants vivid green, pubescent; petals broadly obovate, longer than the sepals. 7. *R. yatsugataensis*

8B. Flowers rather large, 12–25 mm. across.

11A. Radical leaves at least partially ternately divided; stems 5–25 cm. long; plant of grassy places along rivers, with partially fusiform roots. 8. *R. ternatus*

11B. Radical leaves palmately parted to cleft; plants of mountains and hills with slender or slightly thickened roots.

12A. Achenes lenticular, glabrous.

13A. Stems 3–8 cm. long, solid. 9. *R. yakushimensis*

13B. Stems 15–80 cm. long, hollow.

14A. Plants not stoloniferous; radical leaves usually rather many.

15A. Hairs spreading. 10. *R. japonicus*

15B. Hairs appressed. 11. *R. acris*

14B. Plants stoloniferous; radical leaves rather few. 12. *R. grandis*

12B. Achenes very plump, puberulent. 13. *R. franchetii*

4B. Achenes rather flat, 3–4 mm. long, often with an indistinct ridge near margin on face; radical leaves ternate.

16A. Plants stoloniferous; flowers 15–22 mm. across; petals obovate-orbicular; sepals not reflexed in anthesis. 14. *R. repens*

16B. Plants without stolons; flowers 6–12 mm. across; petals narrowly obovate; sepals reflexed in anthesis.

17A. Receptacle elongate, 6–10 mm. long in fruit; heads ellipsoidal to oblong; leaf-segments narrow. 15. *R. chinensis*

17B. Receptacle scarcely elongate, 1–5 mm. long; heads globose.

18A. Stems decumbent; flowers solitary, cauline, the pedicels 1–5 cm. long. 16. *R. sieboldii*

18B. Stems erect or decumbent only at base; flowers in a terminal corymbose panicle.

19A. Style rather slender, distinctly recurved; achenes without or with an indistinct ridge along upper margin; leaf-segments broadly ovate.

20A. Achenes somewhat ridged near margin; style strongly recurved; stems erect or rarely decumbent. 17. *R. quelpaertensis*

20B. Achenes without a ridge near margin; style slightly recurved; stems prostrate. 18. *R. hakkoensis*

19B. Style rather thick and short, scarcely recurved; achenes with an indistinct ridge all around the margin; leaf-segments ovate to cuneate-lanceolate, coarsely hirsute.

21A. Leaves once ternate, the ultimate leaf segments ovate or oblong. 19. *R. cantoniensis*

21B. Leaves twice ternate; ultimate leaf segments cuneate-oblongate. 20. *R. tachiroei*

- 3B. Achenes spiny on both sides.
 22A. Leaves 3- to 5-fid, the segments obtuse. 21. *R. muricatus*
 22B. Leaves ternate, the segments subacute. 22. *R. arvensis*
 1B. Achenes transversely nerved; aquatic herbs with white flowers; submerged leaves finely dissected; nectary of the petal naked.
 23A. Receptacle hairy.
 24A. Pedicels 3-10 cm. long; flowers about 15 mm. across. 23. *R. nipponicus*
 24B. Pedicels 1-3 cm. long; flowers about 5 mm. across. 24. *R. kazusensis*
 23B. Receptacle glabrous; pedicels usually slightly elongate; plant rather small. 25. *R. yezoensis*

1. *Ranunculus kawakamii* Makino. *Halerpestes kawakamii* (Makino) Tamura—HIME-KIMPOGE, TSURU-HIKI-NO-KASA. Small glabrous leafy stoloniferous herb; leaves ovate-oblong to ovate-orbicular, 8-20 mm. long, 7-12 mm. wide, rounded at apex, rounded to subcuneate at base, 3(-5) short-toothed on upper margin; petioles of radical leaves 3-10 cm. long, rather shorter in those of the stolons; stems erect, 5-12 cm. long, 1- to 3-flowered, slender, the bracts 1-2 mm. long, usually lanceolate, entire, the pedicels erect, 2-5 cm. long; flowers yellow, about 6 mm. across; sepals broadly ovate, spreading, glabrous, concave, about 2.5 mm. long; petals narrowly ovate or narrowly oblong, 1.5-2 times as long as the sepals; anthers reniform-orbicular, very short; heads of carpels globose, about 4 mm. across, the receptacles sparsely short-hairy; achenes 1-1.2 mm. long, glabrous, longitudinally nerved; style short, slightly curved.—Aug. Wet sandy places near seashore; Honshu (Kantō Distr. and northw.); rare.

2. *Ranunculus reptans* L. *R. repens* var. *flagellifolius* (Nakai) Ohwi; *R. flagellifolius* Nakai—Ito-KIMPOGE. Delicate nearly glabrous perennial stoloniferous herb; radical leaves linear to filiform, 3-10 cm. long, about 1 mm. wide, sometimes slightly broader above, often with a callose point at apex; leaves of stolons 1-5 cm. long; flowers solitary, 5-6 mm. across, the pedicels 2-5 cm. long, radical or from the nodes of stolons, slightly pubescent above while young; sepals ovate or broadly so, glabrous, spreading, concave; petals 5, sometimes 4 or 6, obovate, slightly longer than the sepals; anthers very short, ellipsoidal.—Aug.-Sept. Wet places along streams and around ponds; Hokkaido, Honshu (Oze in Shimotsuke Prov. and Nozori Lake in Kotsuke, Nikko and elsewhere); rare.—s. Kuriles, Sakhalin and throughout the cooler regions of the N. Hemisphere.

3. *Ranunculus shinanoalpinus* Ohwi. *R. altaicus* var. *minor* Nakai, pro parte—TAKANE-KIMPOGE. Rhizomes short; stems 8-12 cm. long, erect, unbranched, 1- to 2-leaved, usually 1-flowered; radical leaves obovate-orbicular to broadly cuneate, sometimes depressed-orbicular, relatively thick, 5- to 7-toothed on upper margin, rounded at apex, rounded to broadly cuneate, rarely truncate at base, nearly glabrous on both sides, slightly long-pubescent on margin, the petioles 1-3 cm. long, the cauline leaves sessile, with 2-stipulelike membranes at base, 3-parted, the segments lanceolate, entire, obtuse; pedicels 2-5 cm. long, brown-pubescent; sepals 5, 5-7 mm. long, spreading, concave, oblong, brown woolly-villous; petals 5, yellow, 6-8 mm. long, broadly obovate; anthers narrowly oblong; heads of carpels globose, the receptacle glabrous; achenes ovate, glabrous.—July-Aug. Alpine regions; Honshu (Mount Shirouma in Shinano); rare.

4. *Ranunculus sceleratus* L. TAGARASHI. Nearly glabrous annual or biennial herb; stems 10-50 cm. long, often branched, erect; leaves lustrous, the lower cauline petiolate, reniform-orbicular, 1.2-4 cm. long, 1.5-5 cm. wide, 3-parted to

cleft, cordate, the lateral segments 2-cleft, the median segments cuneate, obtuse, both slightly lobed and with coarse obtuse teeth, the upper ones subsessile, dilated and with a membrane on each side at base, 3-sected, the segments lanceolate, obtuse; flowers rather numerous, 6-8 mm. across; sepals somewhat reflexed, slightly pubescent, elliptic; petals as long as the sepals, obovate; anthers oblong; heads of carpels ellipsoidal to oblong-cylindrical, the receptacle 7-12 mm. long, glabrous or with scattered short white hairs; achenes many, broadly obovate, glabrous, 1-1.2 mm. long, with a very short style.—Apr.-June. Wet places in lowlands, especially abundant in paddy fields; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Eurasia, N. America, and n. Africa.

5. *Ranunculus pygmaeus* Wahlenb. KUMOMA-KIMPOGE. Small, glabrous or scattered pubescent perennial herb with short rhizomes; stems 3-7 cm. long, 1- to 2-flowered; radical leaves petiolate, reniform-orbicular, 5-7 mm. long, 7-12 mm. wide, truncate to broadly cordate, 5- to 7-cleft, the segments ovate, obtuse, the cauline leaves 1-2, subsessile, 3-parted, the segments narrowly ovate, obtuse; flowers about 5 mm. across, pedicellate, elongate after anthesis; sepals elliptic, scattered-pubescent, concave; petals nearly as long as the sepals, yellow, obovate; heads of carpels ellipsoid-globose, about 3 mm. long, the receptacle glabrous; achenes broadly obovate, glabrous, about 1 mm. long.—July. Alpine regions; Honshu (Mount Shirouma in Shinano); rare.—Northern regions and high mountains of Eurasia and N. America.

6. *Ranunculus kitadakeanus* Ohwi. KITADAKE-KIMPOGE. Glabrescent to sparingly pubescent perennial; rhizomes short, sparsely fibrous at neck; scapes 2- to 4-leaved, 1- to 2-flowered; radical and lower cauline leaves petiolate, 12-20 mm. wide, 3- to 5-parted, the median segments obovate to cuneate, often 3-fid, the middle and upper cauline leaves subsessile or sessile, 3- to 5-sected into linear, subacute segments, the pedicels much elongate after anthesis; flowers about 7 mm. across, yellow; sepals spreading, slightly pubescent, concave, elliptic; petals 5, only slightly longer than the sepals, narrowly spatulate-oblong; heads of carpels globose, 5-6 mm. across, the receptacle short-pilose, about 4 mm. long; achenes obovate, glabrous, about 2 mm. long, the styles slender, short, suberect.—July-Aug. Alpine regions; Honshu (Mount Kitadake in Kai Prov.); rare.

7. *Ranunculus yatsugataensis* Honda & Kumazawa. YATSUGATAKE-KIMPOGE. Loosely appressed-pubescent perennial with short rhizomes; stems 10-30 cm. long, erect, usually simple, 2- to 3-leaved; radical leaves 1-3, petiolate, orbicular-cordate, 8-15 mm. long and as wide, palmately 5- to 9-parted, the segments subobtusely, incised, the median ones obovate, the cauline leaves sessile or short-petiolate, 3-sected, the lateral segments 3-parted, linear-lanceolate, subobtusely, 0.7-1.2 mm. wide; flowers usually 1, long-pedicellate, 8-10 mm. across; sepals broadly elliptic, white-pubescent, slightly concave;

petals 5, broadly obovate, 1.5 times as long as the sepal; anthers small, elliptic; achenes glabrous.—Aug. Alpine regions; Honshu (Mount Yatsugatake in Shinano Prov.); rare.

8. *Ranunculus ternatus* Thunb. *R. zuccarinii* Miq.; *R. extorris* Hance—HIKI-NO-KASA. Scattered pubescent to glabrescent perennial herb, often with the roots thickened, narrowly fusiform; stems 10–30 cm. long, few-flowered, few-leaved; radical leaves petiolate, simple, 3-parted or 3-sected, the segments reniform-orbicular to cuneate-obovate, often petiolulate, 1–2 cm. long, 5–15 mm. wide, sometimes again 3-lobed, with few obtuse teeth or incised, the cauline leaves 1–4, sessile, 3-sected, the segments nearly linear, obtuse; flowers long-pedicellate, yellow, 12–17 mm. across; sepals 5, spreading, broadly elliptic, sparsely pubescent, concave; petals 5, obovate-orbicular, 2–2.5 times as long as the sepals; anthers oblong; heads of carpels ellipsoidal to globose, 5–7 mm. long, the receptacles glabrous; achenes obovate-orbicular, about 1.2 mm. long, glabrous, the style slender, rather short, scarcely recurved.—Apr. Grassy places along rivers in lowlands; Honshu, Shikoku, Kyushu; rather common.—Ryukyus, Formosa, and China.

9. *Ranunculus yakushimensis* (Makino) Masam. *R. acris* var. *japonicus* subvar. *yakushimensis* Makino—HIME-UMA-NO-ASHIGATA. Glabrous or pubescent perennial herb; rhizomes short; stems ascending, rooting from the lower nodes, 3–8 cm. long, 1- to 2-flowered, few-leaved; radical leaves cordate-orbicular or depressed-cordate, 4–8 mm. long, 5–10 mm. wide, 3-parted, the segments often 3-lobed, subacute, the petioles 1–4 cm. long, the cauline leaves petiolate or sessile, lanceolate, simple or 3-parted into lanceolate segments; flowers long-pedicellate, 12–15 mm. across; sepals oblong or elliptic, slightly concave, glabrous to slightly pubescent; petals obovate, about twice as long as the sepals; anthers oblong.—July–Aug. Kyushu (Yakushima); rare.

10. *Ranunculus japonicus* Thunb. *R. acris* var. *japonicus* (Thunb.) Maxim.; *R. acris* sensu auct. Japon., saltem pro parte, non L.; *R. propinquus* var. *hirsutus* A. Gray—UMA-NO-ASHIGATA, KIMPŌGE. Spreading-pubescent perennial herb; rhizomes short, slightly tufted; radical leaves long-petiolate, orbicular-cordate, obtusely 5-angled, 2.5–7 cm. long, 3–10 cm. wide, 3-parted, coarsely toothed and then shallowly incised, the median segments cuneate-obovate, the lateral ones 2-fid, the cauline leaves few, similar to the radical but short-petiolate or sessile, the segments slightly narrower, the uppermost ones 3-parted to simple and bractlike; flowers 12–20 mm. across, rather long-pedicellate; sepals 5, elliptic, pubescent, spreading, concave; petals 5, 2–2.5 times as long as the sepals, obovate-orbicular; anthers oblong; heads of carpels globose, the receptacle globose, glabrous; achenes obovate-orbicular, rather flat, glabrous, 2–2.5 mm. long, the style very short, slightly recurved.—Apr.–June. Grassy places in lowlands and mountains; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common and rather variable.—Korea, China, Ryukyus, and Formosa.

11. *Ranunculus acris* L. var. *nipponicus* Hara. ? *R. novus* Lév. & Van't.—MIYAMA-KIMPŌGE. Resembles the preceding, the hairs appressed to ascending, sparse; rhizomes rather tufted; radical leaves much divided, the segments narrower, acute; scapes 1–2; flowers few, 20–25 mm. across; style very shortly recurved.—June–Aug. Alpine regions; Hokkaido, Honshu (n. and centr. distr.); rather common.—? n. Korea.

Var. *subcorymbosus* (Komar.) Tawet. *R. subcorymbosus*

Komar.—KENASHI-MIYAMA-KIMPŌGE. Stems sparsely pilose.—Alpine areas; Hokkaido, Honshu (n. distr.).—Sakhalin and Kamchatka.

12. *Ranunculus grandis* Honda. Ō-UMA-NO-ASHIGATA. Closely resembles *R. japonicus*; stems 30–100 cm. long, with spreading or somewhat reflexed hairs; rhizomes short; plants short-stoloniferous; leaf-segments slightly narrower, subacute; flowers long-pedicellate, about 20 mm. across, yellow; sepals ovate-orbicular, concave; petals broadly obovate, about twice as long as the sepals; flower heads globose.—Mountains; Honshu (Rikuchū Prov.).

Var. *mirissimus* (Hisauchi) Hara. *R. mirissimus* Hisauchi—GUNNAI-KIMPŌGE. Stems 20–30 cm. long, the stolons elongate, the hairs spreading, denser; leaves rather deeply cordate.—May–July. Mountains; Honshu (Kai Prov.).

Var. *austrokurilensis* (Tatew.) Hara. *R. acris* var. *austrokurilensis* Tatew.; *R. transochotensis* Hara; *R. grandis* var. *transochotensis* (Hara) Hara; *R. grandis* var. *ozensis* Hara—SHIKOTAN-KIMPŌGE. Plant rather slender, 25–50 cm. high, the hairs appressed, the pedicels elongate, the style short, recurved.—June–Aug. Lowlands to the mountains; Hokkaido, Honshu (Ozegahara in Shimotsuke).—A variable species, occurring also in the Kuriles, Kamchatka, n. Korea, and Manchuria.

13. *Ranunculus franchetii* H. Boiss. EZO-KIMPŌGE. Nearly glabrous perennial, 15–20 cm. high, with numerous horizontally spreading roots; radical leaves few, long-petiolate, orbicular-cordate, 2–2.5 cm. long, 2.5–4 cm. wide, palmately parted, the median segments cuneate, the lateral ones again 2- to 3-lobed, these deeply incised or sometimes coarsely toothed, the ultimate lobes subobtuse; stems 1- to 3-flowered, the cauline leaves sessile, 3-sected, the lateral segments 2-parted, all the segments broadly linear to lanceolate, entire or few-toothed, subobtuse; flowers yellow, about 20 mm. across; sepals 5, narrowly ovate, concave, glabrous or scattered-pubescent; petals obovate, about twice as long as the sepals; anthers narrowly oblong; achenes plump, puberulent.—May. Hokkaido.—Manchuria, n. Korea, Amur, and Sakhalin.

14. *Ranunculus repens* L. HAI-KIMPŌGE. Stoloniferous perennial herb, scattered-pubescent; rhizomes short; radical leaves long-petiolate, ternate, the leaflets petiolulate, broadly ovate, 4–8 cm. long and as wide, 3- to 5-parted, the segments acute, again 2- to 3-fid, incised and coarsely toothed; stems 20–50 cm. long; cauline leaves short-petiolate or sessile, with a stipulelike membrane at base of the petiole on each side; flowers yellow, 15–22 mm. across; sepals ovate, spreading, slightly concave, nearly glabrous to appressed-pubescent; petals 5, about twice as long as the sepals, broadly obovate; heads of carpels globose, the receptacle short, scattered short-pilose; achenes obovate, about 3 mm. long, with an indistinct ridge along the margin, the style rather thick, short, slightly recurved.—May–June. Wet places in lowlands, especially near seashores; Hokkaido, Honshu (centr. and n. distr.).—Cold regions of Eurasia and N. America.

15. *Ranunculus chinensis* Bunge. KO-KITSUNE-NO-BOTAN. Perennial herb with spreading coarse hairs; rhizomes short; stems rather stout, erect, branched, 40–80 cm. long; radical leaves few, long-petiolate, 2- to 3-parted, the segments cuneate, subacute, 2–4 cm. long, 5–10 mm. wide, again 2- to 3-fid, incised and coarsely toothed; flowers 6–8 mm. across, several to rather many, the pedicels appressed-pubescent; sepals narrowly ovate, reflexed; petals 5, nearly as long as the sepals, narrowly obovate; heads of carpels oblong or narrowly

so, 10–15 mm. long, 8–10 mm. across, the receptacle elongate, 6–10 mm. long, short-pilose; achenes elliptic, 3–3.5 mm. long, with an indistinct ridge along both margins, the style very short, scarcely recurved.—May–June. Wet places; Honshu. —Korea, China, and c. Siberia.

16. *Ranunculus sieboldii* Miq. *R. asiaticus* sensu Thunb., pro parte; *R. ternatus* sensu DC., non Thunb.—SHIMA-KITSUNE-NO-BOTAN. Perennial with coarse spreading

hairs; rhizomes short; stems ascending or procumbent, 30–50 cm. long, rather stout; radical and lower cauline leaves petiolate, ternate, the leaflets ovate-orbicular to elliptic, petiolulate, 3–5 cm. long, 2- to 3-fid, toothed and incised, the segments obovate; pedicels 1-flowered, 1–5 cm. long, ebracteate; flowers yellow, 8–12 mm. across; sepals reflexed, ovate, slightly concave, thinly hirsute; petals 5, obovate, slightly larger than the sepals; heads of carpels globose, 10–12 mm. across, the receptacle short, loosely pilose; achenes broadly obovate, about 4 mm. long, flat, with an indistinct ridge along the margin on both sides, the style prominent, slightly recurved.—Mar.–June. Honshu (Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus and Formosa.

17. *Ranunculus quelpaertensis* (Lév.) Nakai var. *glaber* (H. Boiss.) Hara. *R. hakkodensis* var. *glaber* (H. Boiss.) Ohwi & Okuyama; *R. ternatus* var. *glaber* H. Boiss.; *R. vernyi* var. *glaber* Nakai; *R. glaber* Makino.—KITSUNE-NO-BOTAN. Nearly glabrate or sparsely hairy perennial herb; stems suberect to ascending, 15–80 cm. long, rather stout, branched; radical and lower cauline leaves petiolate, ternate, the leaflets petiolulate, broadly ovate to ovate-orbicular, 2–6 cm. long, 1.5–4 cm. wide, acute to subobtusely 2- to 3-cleft, incised and acutely toothed, the upper ones parted, incised and toothed, sessile; flowers 8–12 mm. across; sepals reflexed, ovate, concave; petals 5, obovate-oblong, slightly longer than the sepals; heads of carpels globose, 8–10 mm. across, the receptacle short, short-pilose; achenes obovate, flat, glabrous, about 3.5 mm. long, with an indistinct ridge along the upper margin, the style prominent, distinctly recurved.—Apr.–July. Wet places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Korea, China, and Ryukyus.

Var. *quelpaertensis*. *R. hakkodensis* var. *quelpaertensis* (Lév.) Ohwi and Okuyama; *R. repens* var. *quelpaertensis* Lév.; *R. quelpaertensis* (Lév.) Nakai; *R. vernyi* var. *quelpaertensis* (Lév.) Nakai; *R. ternatus* var. *quelpaertensis* (Lév.) Ohwi.—YAMA-KITSUNE-NO-BOTAN. Plants short, densely hirsute, growing in mountains.

Var. *yaegatakensis* (Masam.) Ohwi & Okuyama. *R. yaegatakensis* Masam.; *R. ternatus* var. *yaegatakensis* (Masam.) Ohwi.—HIME-KITSUNE-NO-BOTAN. A dwarf variant.—Kyushu (Yakushima).

18. *Ranunculus hakkodensis* Nakai. TSURU-KITSUNE-NO-BOTAN. Sparsely hairy perennial; leaves prostrate, 40–60 cm. long, glabrescent; radical leaves petiolate, 4–5.5 cm. wide, 3-parted, the segments obovate, irregularly incised and obtusely toothed, the petiolules 3–8 mm. long; petals 5, elliptic, 3.5–4 mm. long; achenes rather few, broadly obovate, about 3 mm. long.—July–Aug. Wet places in mountains; Honshu (n. distr.).

19. *Ranunculus cantoniensis* DC. *Hecatonia pilosa* Lour.; *R. polycephalus* Makino; *R. siliifolius* Lév.—KE-KITSUNE-NO-BOTAN. Perennial herb; stems 30–80 cm. long, erect, branched, with coarse spreading long hairs at base, appressed-strigose above; radical and lower cauline leaves once

ternate, petiolate, the leaflets ovate to broadly so, 2.5–5 cm. long, 2–3.5 cm. wide, petiolulate, subacute to acute, 2- to 3-fid, the lobes oblong, incised and acutely coarse-toothed; flowers about 10 mm. across; sepals reflexed, ovate, slightly concave, sparingly pilose outside; petals elliptic or oblong, slightly longer than the sepals; heads of carpels globose, 8–10 mm. across, the receptacle ellipsoidal, short white-hairy; achenes obovate-orbicular, about 3 mm. long, glabrous, with an indistinct ridge along both margins, the style rather short, scarcely recurved.—May–July. Wet places in lowlands; Honshu, Shikoku, Kyushu.—Korea, Formosa, and s. China.

20. *Ranunculus tachiroei* Fr. & Sav. OTOKOZERI. Perennial herb; stems erect, rather stout, branched above, 50–100 cm. long, with spreading coarse long hairs toward the base, appressed-hairy above; radical and lower cauline leaves rather long-petiolate, twice ternate, the leaflets petiolulate or subsessile, 2- to 3-parted, the segments cuneate to oblanceolate or broadly linear, 3–6 cm. long, 7–12 mm. wide, acute, entire and subsuccinate at base, coarsely acute-toothed or incised above; flowers rather numerous, long-pedicellate, 10–12 mm. across; sepals reflexed, ovate, slightly pubescent outside; petals oblong, yellow, slightly longer than the sepals; heads of carpels globose, about 8 mm. across, the receptacle short, ellipsoidal, white-pilose; achenes about 3 mm. long, obovate-orbicular, glabrous, with an indistinct ridge along both margins; style rather prominent, scarcely recurved.—July–Aug. Wet places; Honshu.

21. *Ranunculus muricatus* L. TOGEMI-NO-KITSUNE-NO-BOTAN. Biennial, nearly glabrous; stems branched from the base, ascending, 15–40 cm. long; radical and lower cauline leaves long-petiolate, orbicular-cordate, 4–10 cm. long, 3(–5)-fid, coarsely toothed and often incised, the median lobes broadly cuneate; flowers 8–12 mm. across; sepals slightly reflexed, shorter than the petals; petals 5–8 mm. long, narrowly obovate; heads of carpels globose, 12–15 mm. across; achenes elliptic, obscurely ridged near the margin and spiny, about 5 mm. long, the style slightly recurved.—Mar.–Apr. Naturalized in our area.—Introduced from Europe.

22. *Ranunculus arvensis* L. ITO-KITSUNE-NO-BOTAN. Biennial, sparingly pubescent herb; stems erect, 20–40 cm. long; lower leaves petiolate, the upper ones sessile or short-petiolate, both 3-foliolate and again trisected, the segments 2- to 3-parted, 1.5–3 cm. long, the ultimate segments linear, 1–3 mm. wide, subacute; flowers 10–12 mm. across, relatively long-pedicellate; sepals narrowly ovate, shorter than the petals; heads of carpels globose, 10–12 mm. wide, achenes broadly obovate, obsoletely ridged along the margin, mammillate-spinose on both sides, about 5 mm. long; style prominent, scarcely recurved.—Apr. Rarely naturalized in our area.—Introduced from Europe.

23. *Ranunculus nipponicus* (Makino) Nakai. *R. aquatilis* var. *nipponicus* Makino, nom. seminud.—ICHŌBA-BAIKAMO. Aquatic herb; stems elongate; submerged leaves several times dissected into filiform segments, short-petiolate, 3–4 cm. long, the sheath usually dilated above, thinly membranous, appressed-puberulent; floating leaves (when present) palmately cleft or lobed; flowers about 15 mm. across, white with a yellow center; heads of carpels globose, the receptacle hairy; achenes glabrous or with sparse stiff hairs.—July–Aug. Mountains; Honshu (centr. distr.).

Var. *major* Hara. *R. aquatilis* var. *flaccidus* forma *drouetii* sensu auct., Japon., non Hiern; *R. pantothrix* var. *submersus* Nakai, excl. syn.—BAIKAMO, UMEBACHI-MO. Floating

leaves absent; flowers 15–20 mm. across, the peduncles 3–10 cm. long; common.—Ponds and streams; Hokkaido, Honshu.

Var. *japonicus* (Nakai) Hara. *R. aquatilis* var. *japonicus* Nakai—MISHIMA-BAIKA-MO. Resembles the typical phase but with palmately parted floating leaves.—Ponds and streams; Honshu (Mishima in Izu Prov.).—Korea.

24. *Ranunculus kazusensis* Makino. HIME-BAIKA-MO. Slender, glabrous, aquatic, perennial herb; stems slender, glabrous, elongate, loosely leafy; leaves short-petiolate, the upper ones sessile, 3–4.5 cm. long, finely dissected, the stipules thinly membranous, appressed-puberulent on the outside; pedicels slender, glabrous, 1–3 cm. long; flowers white with a yellow center, about 6 mm. across; sepals elliptic, glabrous;

petals obovate, 1.2–4 mm. long, 1.5–2 times as long as the sepals; receptacle short-pilose; heads of carpels globose, 3–3.5 mm. across; achenes about 1.2 mm. long, glabrous or with few appressed hairs on the back.—June–Aug. Honshu (Kazusa Prov.), Kyushu (Higo Prov.).—Korea.

25. *Ranunculus yessoensis* Nakai. CHITOSE-BAIKA-MO. Leaves petiolate or sessile in the upper ones, several times dissected into filiform segments, glabrous, the stipules oblong, thinly membranous, 5–6 mm. long, glabrous; pedicels 3–6.5 cm. long, slender; flowers 6–7 mm. across, white with a yellow center; sepals 5, greenish, about 3 mm. long, oblong; petals obovate, about 4 mm. long, spreading; stamens about 15; achenes obovate, about 1 mm. long, glabrous, the receptacles glabrous.—Hokkaido.

5. CALLIANTHEMUM C. A. Mey. UMEZAKI-SABA-NO-O ZOKU

Low, glaucescent, glabrous perennial herbs with short, stout rhizomes; radical leaves long-petiolate, ternately or pinnately compound, the cauline leaves few, reduced in size; stems usually simple; flowers 1 to 3, white or creamy white with a dark orange-red center; sepals 5, deciduous, greenish, smaller than the petals; petals 5–15, with a depressed nectary near base inside; carpels many, sessile, free, each with a pendulous ovule; achenes ovate, capitate; style short, persistent.—Few species, in the alpine regions and far northern areas of the Old World.

- 1A. Terminal primary petiolules 1–2 times as long as the lateral ones; cauline leaves dilated at base; flowers opening before the leaves; petals 8–10, linear- to narrowly oblong; sepals ovate to broadly elliptic 1. *C. miyabeum*
 1B. Terminal primary petiolules 1.5–4 times as long as the lateral ones; cauline leaves not dilated at base; flowers opening after the leaves; petals 6 or 7, oblong, elliptic, or obovate. 2. *C. insigne* var. *hondoense*

1. *Callianthemum miyabeum* Tatew. HIDAKA-SŌ. Glauous perennial herb, 10–25 cm. high; radical leaves petiolate, ternate, the leaflets ovate-deltoid, 2–4 cm. long, 3-sected or 3-foliolate, deeply parted; stems few-leaved; flowers 1 or 2, long-pedunculate, creamy white, about 2 cm. across; sepals ovate to broadly elliptic, 4–5 mm. long; petals linear- to narrowly oblong, obtuse or subrounded, retuse, creamy white, dark orange-red near base; styles prominently recurved.—May–June. Alpine regions; Hokkaido (Mount Apoi in Hidaka Prov.); rare.

2. *Callianthemum insigne* (Nakai) Nakai var. *hondoense* (Nakai & Hara) Ohwi. *C. hondoense* Nakai & Hara—KITADAKE-SŌ. Closely resembling the preceding species; petiolules of the primary terminal division of the radical leaves much longer than the lateral ones; stems usually 1-flowered; flowers 2–2.5 cm. across; sepals ovate to oblong, 7–8 mm. long; petals obovate to elliptic, often retuse.—June. Alpine regions; Honshu (Mount Kitadake in Kai); rare.

6. ADONIS L. FUKUJU-SŌ ZOKU

Perennial or sometimes annual herbs with branched stems; leaves alternate, pinnately dissected, the lower often reduced to a sheath or scale; flowers terminal, rather large, yellow, sometimes red; sepals several, green, deciduous; petals 5–40, petaloid, deciduous, without a nectariferous gland; stamens many; carpels many, free, each with a pendulous ovule; fruiting heads globose to cylindric; achenes with a short style.—Few species, in the N. Hemisphere.

1. *Adonis amurensis* Regel & Radde. FUKUJU-SŌ. Rhizomes short and thick, with numerous stout fibrous roots; stems 10–30 cm. long, often branched, usually papillose-puberulent above, sometimes pubescent; lower leaves membranous, sheathlike, the normal cauline leaves alternate, deltoid-ovate, 3–10 cm. long, petiolate, pinnately dissected, the ultimate segments lanceolate, glabrous or pubescent underneath; stipules

small, lobed, green; flowers yellow, 3–4 cm. across; sepals several, ovate; petals longer than the sepals, 20–30, spreading, broadly oblanceolate; anthers 1–2 mm. long; achenes puberulent, 3–3.5 mm. long, on receptacles about 1 cm. long, the heads ovoid-globose; style short and recurved.—Mar.–May. Hokkaido, Honshu, Kyushu.—Korea, Manchuria, and e. Siberia.

7. THALICTRUM L. KARAMATSU-SŌ ZOKU

Perennial herbs; leaves ternately compound, radical and cauline, usually alternate, often stipulate and stipellate; inflorescence paniculate, corymbose or racemose; flowers small, bisexual or unisexual (plants dioecious), rarely polygamous, greenish, white, sometimes rose-colored; sepals 3–5, greenish and inconspicuous or sometimes white or rose-colored and more or less petaloid, caducous or deciduous; petals absent; stamens many, prominent, the filaments capillary or clavate, the anthers small; carpels few to many, the ovules solitary, pendulous, the receptacle minute; achenes often stipitate, commonly laterally flattened, sometimes narrowly winged, usually nerved; style beaklike, elongate, sometimes circinnate, or short, with a deltoid to linear stigma on inner side.—About 100 species, in the cooler regions of the N. Hemisphere, few in S. America and S. Africa.

- 1A. Inflorescence paniculate or racemose, more or less pyramidal; flowers usually green or yellow-green, rarely purplish; anther-connexive mucronate; filaments filiform, narrower than the anthers.
- 2A. Inflorescence racemose, loosely about 10-flowered; stems 10–15 cm. long, naked or with a single cauline leaf.
- 2B. Inflorescence paniculate, many-flowered; stems 20–150 cm. long, more or less distinctly leafy.
- 3A. Achenes 2–6, sessile; sepals small, caducous; flowers greenish yellow to pale yellow.
- 4A. Stems usually prominently ridged, simple, erect, scarcely branched; leaves once to twice pinnately ternate, rather longer than broad.
- 4B. Stems striate or nearly terete, often flexuous; leaves 2- to 3-ternate, nearly as broad as long.
- 5A. Stems rather flexuous; nerves and veinlets of leaflets prominently impressed above, raised beneath; stigma lanceolate-deltoid, acute; stipels absent.
- 5B. Stems nearly erect; nerves and veinlets of leaflets not prominently raised beneath, nearly flat above; stigma ovate-deltoid; stipels often present.
- 3B. Achenes 8–20, short-stipitate; sepals rather prominent, deciduous after anthesis; flowers purplish.
- 1B. Inflorescence corymbose, with a flat or only slightly convex top; flowers white or rose-colored; anther-connexives not mucronate; filaments broadened above and clavate, as broad as or broader than the anther.
- 6A. Achenes 3- to 4-winged, distinctly stipitate.
- 6B. Achenes laterally flattened or scarcely so, not winged.
- 7A. Achenes sessile or very short-stipitate, not flattened; stems 30–100 cm. long, many-leaved.
- 8A. Achenes sessile; stems 30–60 cm. long, rather firm, slightly flexuous below.
- 8B. Achenes very short-stipitate; stems 50–100 cm. long.
- 9A. Stipules prominently lacerate on margin; stipels absent; achenes with 3 or 4 longitudinal nerves on each side; styles scarcely hooked at apex.
- 9B. Stipules obsoletely toothed or subentire; stipels present at base of primary division of leaves; achenes with 3 or 4 raised ribs on each side; style slender, prominently hooked at apex.
- 7B. Achenes distinctly stipitate, flattened laterally, with 1–4 slender longitudinal nerves on each side; stems 10–70 cm. long, slender or delicate, 1–2(–3)-leaved.
- 10A. Style including the stigma thick, beaklike, 0.3–1.5 mm. long, straight or slightly recurved, not flexuous, much shorter than the body of the achene.
- 11A. Beak of achene very short, about 0.5 mm. long; filaments usually much-dilated above.
- 12A. Achenes about 3 mm. long; radical leaves usually much shorter than the stem; leaflets ovate to oblong, rarely rhombic, shallowly cordate to rounded at base; stipels rather short.
- 12B. Achenes about 2 mm. long; radical leaves nearly as long as the stem; leaflets rhombic-elliptic, usually cuneate at base; stipels elongate.
- 11B. Beak of achene rather elongate, about 1 mm. long; filaments usually gradually and slightly dilated above.
- 13A. Leaflets linear-lanceolate to linear-oblong, usually entire or sometimes few-toothed.
- 13B. Leaflets orbicular to rhombic-elliptic, few-toothed on upper margin.
- 14A. Leaflets rhombic-elliptic to orbicular-rhombic, broadly cuneate to truncate at base; flowers few to many; achenes oblong-lanceolate, with a straight beak 1–1.2 mm. long.
- 14B. Leaflets orbicular to orbicular-elliptic, shallowly cordate to rounded at base; flowers few; achenes broadly oblong-lanceolate, with a slightly recurved beak 0.7–1 mm. long.
- 10B. Style including the stigma slender, flexuous, about 2 mm. long, as long as the body of the achene.
15. *T. toyamae*

1. *Thalictrum alpinum* L. var. *stipitatum* Yabe. *T. nipponoalpinum* Honda—HIME-KARAMATSU. Small glabrous perennial herb with short-branched, creeping rhizomes; radical leaves petiolate, 2–3 times ternate-pinnate, 3–5 cm. long, deltoid in outline, exstipellate, the leaflets 2- to 3-lobed, petiolulate or sessile, orbicular to cuneate-obovate, 2–3 mm. long and as wide, slightly recurved on margin, the lobes rounded to very obtuse, entire or 2- to 3-lobulate; stems 10–15 cm. long, 1-leaved or leafless, erect, nodding above; racemes occupying 1/2–2/3 of the entire stem, loosely about 10-flowered, the bracts small, the pedicels recurved, 1–4 cm. long; flowers small, pale greenish yellow; sepals 4, narrowly oblong, 2.5–3 mm. long, 3-nerved; anthers linear, about 2 mm. long, mucronate; achenes 3–5, subobovate, about 3 mm. long, short-stipitate; style very short, the stigma deltoid, puberulous.—July–Aug. Rather dry alpine slopes; Honshu (centr. distr.); very rare.—China (?) and Himalayas (?). The species is widely distributed throughout northern regions and mountainous areas of the N. Hemisphere.

2. *Thalictrum simplex* L. var. *brevipes* Hara. *T. simplex* auct. Japon., non L.; *T. affine* auct. Japon., non Ledeb. *T. simplex* var. *affine* auct. Japon., non Regel.—NO-KARAMATSU. Erect, glabrous perennial herb 60–100 cm. high; stems prominently acute-angled; lower leaves twice, the upper

ones once to twice ternate-pinnate, short-petiolate or sessile, the stipules minutely toothed, the stipels sometimes developed on the lower portion, the leaflets cuneate to narrowly obovate or lanceolate, 2–4 cm. long, 4–5 mm. wide, acute to acuminate, sometimes 2- to 3-lobed; panicle large, narrowly ovoid, the pedicels short; flowers pale greenish yellow or pale yellow; sepals about 3 mm. long, about 3-nerved; anthers 1.5–2 mm. long, mucronate; achenes 2–6, sessile, scarcely compressed, ellipsoidal, about 3 mm. long, with 8–10 raised longitudinal ribs; style very short, the stigma ovate.—June–Aug. Grassy places in lowlands along rivers; Honshu, Kyushu.—Korea, Manchuria, China, and e. Asia. The species occurs across northern Asia to Europe.

3. *Thalictrum foetidum* L. var. *glabrescens* Takeda. *T. foetidum* sensu auct. Japon., non L.; *T. yesoense* Nakai—CHABO-KARAMATSU. Minutely glandular-puberulent to nearly glabrous perennial; stems 15–40 cm. long, slightly flexuous toward base, branched above; lower leaves petiolate, 3–6 times ternate, 5–15 cm. long and as wide, the stipules undulately toothed or subentire, exstipellate, the leaflets broadly obovate-cuneate, ovate or depressed-ovate, 3–7(–10) mm. long, 3–8 mm. wide, green above, glaucous beneath, 2- to 3-lobed, often 2- to 3-toothed, the nerves and veinlets prominently impressed above, elevated beneath, the upper leaves smaller and sessile;

inflorescence loose, the pedicels 2-5 cm. long; anthers broadly linear, 2-2.5 mm. long, mucronate; achenes 2-4, sessile, about 3 mm. long, few-ribbed on each side, slightly compressed laterally, the style very short, the stigma lanceolate-deltoid. —May-July. Rocky cliffs near the sea and in mountains; Hokkaido, Honshu (Rikukyu Prov.).—The species occurs across northern Asia to Europe.

4. *Thalictrum minus* L. var. *stipellatum* (C. A. Mey.) Tamura. *T. kemense* Fries; *T. kemense* var. *stipellatum* C. A. Mey. ex Maxim.; *T. minus* sensu auct. Japon., non L.; *T. minus* var. *pseudosimplex* H. Boiss.; *T. simplex* var. *divaricatum* Huth; *T. chionophyllum* Nakai. —*ÖKARAMATSU*. Mostly glabrous perennial 30-100 cm. high; stems usually striate, leafy; lower leaves rather large, short-petiole or sessile, 2-4 times ternate, the stipules undulately toothed, usually stipellate, the leaflets oblong, obovate or flabellate-obovate, 1-3 cm. long, 8-20 mm. wide, rounded to sometimes cordate, 2- to 3-lobed, green above, glaucous beneath; panicles rather large; flowers yellowish green, the pedicels usually rather long; sepals caducous, 3-nerved, oblong; anthers broadly linear, about 3 mm. long, mucronate; achenes 2-6, narrowly obovate, about 3 mm. long, sessile, few-nerved on each side, the style very short, the stigma ovate-deltoid. —July-Sept. Hills and mountains; Hokkaido, Honshu; very variable. —Kuriles, Sakhalin, Korea, Manchuria, China, Siberia to Europe, and N. America.

Var. *hypoleucum* (Sieb. & Zucc.) Miq. *T. hypoleucum* Sieb. & Zucc.; *T. thunbergii* DC.; *T. thunbergii* var. *hypoleucum* (Sieb. & Zucc.) Nakai; *T. minus* var. *elatum* sensu auct. Japon., non Lecoyer; *T. minus* var. *majus* Miq.; *T. yamamotoi* Honda. —*AKI-KARAMATSU*. Panicles looser and larger; pedicels short; anthers slightly shorter and the stigma narrower. —A more southern variety occurring widely in Hokkaido, Honshu, Shikoku, Kyushu. —s. Kuriles, Sakhalin, Korea, Manchuria, Amami-oshima, and China.

5. *Thalictrum rochebrunianum* Fr. & Sav. *SHIKIN-KARAMATSU*. Glabrous perennial; stems erect, slightly branched above, 70-100 cm. long, striate; leaves deltoid in outline, petiolate, 3-4 times ternate, the upper ones sessile, the stipules subentire, the stipels absent, the leaflets obovate to elliptic, obtuse, mucronate, 2-3 cm. long, 1.5-2.5 cm. wide, rounded to cordate at base, often 2- to 3-lobed; panicles sometimes branched below, large, the pedicels 1-2 cm. long, nodding above, the bracts obcordate, small; flowers pale purple, the sepals rather large, elliptic, deciduous after anthesis, 6-8 mm. long; anthers lanceolate, yellow, about 1.2 mm. long, short-mucronate; achenes about 4 mm. long, 8-20, narrowly oblong, with several prominent longitudinal ribs, the style 1-1.5 mm. long; style very short, the stigma small, ovate. —July-Aug. Grassy places in highlands; Honshu (centr. distr.); rather rare.

6. *Thalictrum aquilegifolium* L. *T. contortum* L.; *T. rubellum* Sieb. & Zucc.; *T. aquilegifolium* var. *sibiricum* Regel & Tiling; *T. aquilegifolium* var. *asiaticum* Nakai, var. *intermedium* Nakai, and var. *japonicum* Nakai; *T. mitsinokuense* Koidz.; *T. daisenense* Nakai; *T. nipponense* Huth; *T. anomalum* Lévl. & Van't.; *T. taquetii* Lévl. —*KARAMATSU-SŌ*. Glabrous, more or less glaucescent perennial herb; stems erect, rather stout, 50-120 cm. high, slightly striate, leafy; leaves 3-4 times ternate, the lower petiolate, the upper sessile; stipules membranous, nearly entire, reflexed, the stipels smaller, the leaflets obovate to cordate-orbicular, 1.5-3.5 cm. long, 1-3 cm. wide, often 3-lobed, obtuse; panicles densely rather many-

flowered, flat-topped; flowers white or sometimes slightly reddish; sepals elliptic, about 3-4 mm. long, 5- to 7-nerved, caducous; stamens many, about 10 mm. long, the filaments dilated above, white, the anthers whitish yellow, broadly linear, 1-1.2 mm. long; achenes 5-10, pendulous, 6-8 mm. long, 3- to 4-winged, broadly obovate to elliptic, the style 4-5 mm. long; style and stigma short. —July-Sept. Grassy places in highlands and alpine meadows; Hokkaido, Honshu, Shikoku, Kyushu; more common northward. —Cooler regions of the N. Hemisphere.

7. *Thalictrum actaeae-folium* Sieb. & Zucc. *SHIGIN-KARAMATSU*. Glabrous perennial with thick fibrous roots; stems 30-70 cm. long, striate, somewhat flexuous; leaves deltoid in outline, 2 or 3 times ternate, often aggregated toward the lower portion of stem, petiolate, the upper ones smaller and sessile, the stipules narrow, undulate on margin, the stipels usually absent, the leaflets thinly cartaceous, slightly unequal, broadly ovate, rhombic-elliptic or ovate-orbicular, glaucescent beneath, 1-4 cm. long, 1-3 cm. wide, rather acute, cuneate to truncate at base, irregularly coarse-toothed; flowers white; sepals elliptic, 3-4 mm. long; stamens many, the filaments white, very slightly dilated above, the anthers linear, 1.5-1.8 mm. long; achenes 3-5, sessile, few-ribbed, narrowly ovate; style slender, rather short, about 1.5 mm. long, strongly recurved above, the stigma on inner side of the style above. —July-Oct. Woods in hills and mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

8. *Thalictrum baicalense* Turcz. *T. franchetii* Huth; *T. baicalense* var. *japonicum* H. Boiss. —*HARU-KARAMATSU*. Glabrous herb; stems 50-100 cm. long, striate, erect; leaves 2 to 3 times ternate, petiolate in lower ones, sessile in upper ones, deltoid in outline, glaucescent, exstipellate, the stipules membranous, lacerate, the leaflets broadly obovate to orbicular, membranous, 2-3.5 cm. long and as wide, rounded to obtuse, often shallowly 3-lobed and with few rounded teeth, truncate, to cuneate at base; inflorescence corymbose, densely rather many-flowered, with the flowers creamy white; sepals ovate, 3- to 5-nerved, 3-4 mm. long; stamens many, the filaments slightly dilated above, the anthers 0.8-1 mm. long, narrowly oblong, sometimes slightly mucronate; achenes 4-10, 2.5-3 mm. long, ellipsoidal or broadly obovoid, rather plump, with 3-5 weak nerves on each side, the style about 0.3 mm. long; style rather thick, 0.3-0.5 mm. long, the stigma obovate. —June-July. Mountains; Hokkaido, Honshu (centr. distr. and northw.). —Korea, Manchuria, and e. Siberia.

9. *Thalictrum sachalinense* Lecoyer. *T. akanense* Huth. —*ÉZO-KARAMATSU*, *MIYAMA-AKI-KARAMATSU*. Glabrous perennial herb; stems erect, 50-80 cm. long, striate, leafy; leaves deltoid in outline, 2-3 times ternate, the upper sessile, the lower ones petiolate, the stipules rather broad, membranous, undulate-toothed or subentire, the stipels membranous, broadly cuneate-obovate or rhombic-orbicular, rounded at apex, shallowly cordate to broadly cuneate at base, shallowly 2- to 3-lobed on upper margin, the lobes rounded, often with few small rounded teeth; inflorescence flat-topped, rather densely flowered; flowers white; sepals ovate, 3- to 7-nerved; stamens white, many, the filaments slightly dilated above, the anthers broadly linear, about 1 mm. long; achenes 8-15, about 3 mm. long, ovoid, longitudinally ridged, the style about 0.5 mm. long; styles slender, about 1.2 mm. long, prominently hooked, the stigma oblongate, about half as long as the style. —June-July. Hokkaido. —n. Korea.

10. *Thalictrum filamentosum* Maxim. var. *tenerum* (Huth) Ohwi. *T. tenerum* Huth; *T. tuberiferum* var. *tenerum* (Huth) H. Boiss.; *T. tuberiferum* Maxim.; *T. clavatum* sensu auct. Japon., non DC.; *T. tuberiferum* var. *glabrescens* Honda; *T. tuberiferum* var. *pubescens* Honda—MIYAMA-KARAMATSU.

Rather slender, sometimes pubescent, rhizomatous, perennial herb; stems erect, 20–70 cm. long; radical leaves usually solitary, long-petiolate, 2- to 3-ternate, thinly membranous, the stipels absent, the leaflets ovate to ovate-oblong or ovate-orbicular, glaucescent beneath, 1.5–8 cm. long, 1–5 cm. wide, usually gradually narrowed above, obtuse, cuneate to shallowly cordate at base, often 2- to 3-lobulate and toothed, the cauline leaves 1–3, smaller, sessile, the stipules nearly absent; inflorescence densely flowered, rather flat-topped; flowers many, white; sepals elliptic; stamens rather many, the filaments much dilated above, the anthers oblong, about 1 mm. long; achenes 2–6, oblanceolate to narrowly obovate, 3–5 mm. long, flattened laterally, 1- to 4-nerved on each side, the style 3–4 mm. long; style rather thick and short, about 0.5 mm. long, nearly straight, the stigma narrowly oblong.—May–Aug. Woods and thickets in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and s. Kuriles.

Var. *yakusimensense* (Koidz.) Tamura. *T. yakusimensense* Koidz.—YAKUSHIMA-KARAMATSU. Plant small with the leaflets cuneate to rounded at base, the stipels on the achenes shorter.—Kyushu (Yakushima).—Korea, Manchuria, and s. Kuriles. The typical phase occurs in Amur, Manchuria, and Korea.

11. *Thalictrum microsperrum* Ohwi. *T. microsperrum* var. *sikokianum* Honda; *T. filamentosum* var. *sikokianum* (Honda) Ohwi, excl. syn. nonnul.—KOGOME-KARAMATSU. Slender glabrous perennial herb; stems to 20 cm. long, very slender, few-leaved, erect, simple; radical leaves 3-ternate, the petioles 3–5 cm. long, the stipules entire (stipels absent), the leaflets petiolulate, rhombic to deltoid-elliptic, 1–3.5 cm. long, glaucous beneath, thinly membranous, very obtuse, cuneate to subtruncate at base, coarsely toothed on upper margin; inflorescence corymbose-paniculate, about 10 cm. long and as wide, loosely many-flowered, the branches spreading; flowers white, on long pedicels, the bracts linear, about 1 mm. long; achenes 6–12, oblong-lanceolate, about 2 mm. long inclusive of the style, flattened laterally, straight, few-nerved on each side, the style 3–4 mm. long, very slender, straight, the style straight, very short.—Apr.–May. Shikoku, Kyushu.

12. *Thalictrum integrilobum* Maxim. *T. filamentosum* var. *integrilobum* (Maxim.) Ohwi—NAGABA-KARAMATSU. Slender glabrous rhizomatous perennial herb; radical leaves solitary, sometimes nearly as long as the stem, 3- to 4-ternate, the leaflets petiolulate, linear-lanceolate or linear-

oblong, 1.5–3 cm. long, 3–5 mm. wide, obtuse, entire to obsoletely few-toothed; corymbs few- to rather many-flowered, somewhat convex, loose; flowers white, the pedicels 5–15 mm. long; filaments linear-oblanceolate, slightly dilated above, often twice as broad as the anther; achenes few, oblanceolate, 3–4 mm. long, the style 1.5–2 mm. long, the beak (style and stigma) 0.8–1 mm. long, straight or nearly so, linear, with a linear stigma inside.—Hokkaido (Mount Apoi in Hidaka Prov.); rare.

13. *Thalictrum watanabei* Yatabe. *T. capillipes* Nakai—TAMA-KARAMATSU. Slender glabrous rhizomatous perennial herb, some of the roots thickened near middle; stems 20–30 cm. long; radical leaves solitary, petiolate, 3- to 4-ternate, the leaflets petiolulate, elliptic to orbicular-rhombic, thinly membranous, 1–2 cm. long, 7–15 mm. wide, obtuse to broadly cuneate at base, sparsely coarse-toothed on the upper half; cauline leaves 1–2, much reduced and sessile, ternate or bi-ternate; corymbs loosely few to rather many-flowered, very loose; flowers white, the pedicels 5–20 mm. long, obliquely spreading, the filaments linear-oblanceolate, usually broader than the anthers; achenes 3–6, lanceolate to oblanceolate, 3–3.5 mm. long, the style 1.5–2 mm. long, the beak 1–1.5 mm. long, linear, straight, the stigma linear on inner side.—June–Sept. Honshu (Totomi and Yamato Prov.), Shikoku, Kyushu.

14. *Thalictrum nakamurae* Koidz. HIME-MIYAMA-KARAMATSU. Closely resembles the preceding; roots short, thickened near base; stems 20–30 cm. long, very slender; leaflets orbicular to elliptic-orbicular, very rarely rhombic-orbicular, rounded to shallowly cordate; corymbs loosely few-flowered; flowers white; filaments slightly broadened above; young achenes oblanceolate to narrowly obovate, on slender styles; style about 1 mm. long or less, slightly recurved at apex.—July–Aug. Wet rocks in mountains; Honshu (Mount Komagatake in Echigo and Mount Tanigawa in Kotsuke Prov.); rare.

15. *Thalictrum toyamae* Ohwi. HIRE-FURI-KARAMATSU. Glabrous, slender perennial herb (sometimes stoloniferous), some of the roots thickened; stems solitary, slender, 10–20 cm. long, loosely 1- to 3-leaved, with few divaricate branches above; leaves without stipules and stipels, the radical ones solitary, as long as the stems, 3-ternate, deltoid in outline, 7–15 cm. long and wide, the petioles 3–6 cm. long, the leaflets thinly membranous, ovate to orbicular-rhombic, 12–30 mm. long and as wide, usually cuneate or rarely subcordate at base, few-lobed, glaucescent beneath; cauline leaves ternate or simple, short-petiolate or sessile; achenes 5–10, oblong-fusiform, 1.7–2 mm. long, flattened laterally, weakly 2- to 3-nerved on each side, the style 1–1.2 mm. long; style about 2 mm. long, slender and slightly flexuous, stigmatic on inner side.—June. Kyushu (Mount Kurokami in Hizen); rare.

8. TRAUTVETTERIA Fisch. & Mey. MOMIJI-KARAMATSU ZOKU

Rather tall perennial herbs; leaves alternate, petiolate, palmately cleft, irregularly toothed; inflorescence paniculate-corymbose; flowers small, white; sepals 3–5, caducous; petals absent; stamens many, the filaments slightly dilated above; carpels many, 1-ovuled, glabrous, sessile; achenes ovate, rhombic in transverse section, ridged, slightly flattened laterally, rather inflated, terminated by a short style.—Two species, one in N. America and one in e. Asia.

1. *Trautvetteria japonica* Sieb. & Zucc. *T. palmata* var. *japonica* (Sieb. & Zucc.) Huth—MOMIJI-KARAMATSU. Rhizomes short-creeping, the plants sometimes stoloniferous;

stems erect, 25–60 cm. long, 2- to 3-leaved, short appressed-pubescent above; radical and lower cauline leaves long-petiolate, glabrous, cordate-orbicular or reniform-orbicular, 5–12

cm. long, 6-15 cm. wide, 7- to 9-parted to -cleft, the segments rhombic-ovate, acute to acuminate, often 1- to 2-lobed, coarsely acute-toothed and incised, the upper leaves smaller, sessile; inflorescence flat-topped, densely many-flowered, often lobed; anthers elliptic, 0.5-0.7 mm. long; achenes rather many, forming a globose head on a short small receptacle, broadly ovate, sometimes with few appressed hairs, 2.5-3.5 mm. long; style slender, short, slightly hooked at apex.—July-Aug.

Wet places in mountains; Hokkaido, Honshu (n. and centr. distr.).—s. Kuriles.

Var. *borealis* Hara. *T. palmata* Fisch. & Mey.; *Ranunculus pleurocarpus* Maxim.—OKU-MOMIJI-KARAMATSU. Leaves pubescent beneath; style shorter.—Hokkaido (Kitami Prov.).—s. Kuriles, Sakhalin, Amur, and Ochotsk Sea region.

9. AQUILEGIA L. ODAMAKI ZOKU

Perennial herbs; stems erect, sometimes branched; leaves radical and cauline, alternate, petiolate, 2- to 3-ternate; flowers actinomorphic, usually rather large; sepals 5, petallike, colored, flat; petals slightly smaller than the sepals, spurred at base; stamens many, the inner ones reduced to membranous staminodes; carpels 5, sessile, free; ovules many; fruit of 5 dehiscent follicles; seeds black, usually smooth and shining, sometimes rugulose.—About 50 species, in the temperate regions of the N. Hemisphere.

1A. Stamens many; flowers large; spur much exerted in normal forms.

2A. Carpels glabrous; spur incurved above; flowers blue, white or bluish purple. 1. *A. flabellata*

2B. Carpels pubescent; spur erect, sometimes incurved above; flowers usually yellowish brown to purplish brown. 2. *A. buergeriana*

1B. Stamens 9-14; flowers small; spur very short, scarcely exerted. 3. *A. adoxoides*

1. *Aquilegia flabellata* Sieb. & Zucc. *A. akitsensis* Huth; *A. sibirica* var. *flabellata* (Sieb. & Zucc.) Finet & Gagnep.

—ODAMAKI. Glaucous perennial herb with short, stout, branched rhizomes; stems erect, 20-50 cm. long, few-leaved, often slightly puberulent above; radical leaves few, petiolate, ternate, the petioles sometimes slightly pubescent, the leaflets 3-parted, the segments flabellate, 1.5-4 cm. long and as wide, 3-lobulate, obtusely incised on upper margin, glaucous beneath; flowers few, large, 3-4 cm. across; sepals about 2.5 cm. long, usually bluish purple, rarely white, ovate to elliptic, obtuse to rounded; petals about 1.5 cm. long, erect, pale yellow, sometimes white, the spur nearly as long as the body of the petal, incurved above, rarely absent in some cultivated forms; carpels glabrous; style rather long.—Apr.—May. Frequently cultivated as a pot plant, believed to have originated from the wild phase var. *pumila*; the plant was first described on the basis of the cultivated phase.

Var. *pumila* Kudo. *A. buergeriana* var. *pumila* Huth; *A. akitsensis* sensu auct. Japon, non Huth; *A. fauriei* Lév. & Van't., non Lév.; *A. japonica* Nakai & Hara; *A. flabellata* var. *prototypica* Takeda—MIYAMA-ODAMAKI. Plants smaller than in the cultivated phase; stems to 30 cm. high, 1- to 2(-3)-flowered, the leaves less prominently glaucous.—Alpine regions in Honshu (centr. and n. distr.), Hokkaido.—s. Kuriles, Sakhalin, and n. Korea.

2. *Aquilegia buergeriana* Sieb. & Zucc. YAMA-ODAMAKI. Stems 30-60 cm. long, branched, scattered soft-pubescent; leaves twice ternate, long-petiolate, the leaflets rather thin, broadly rhombic to broadly obovate-cuneate, 1.5-4

cm. long, 2- to 3-cleft, obtusely incised, sparingly soft-pubescent beneath, glaucescent especially below; flowers few, 3-3.5 cm. across, the pedicels spreading-puberulent often with glandular hairs; sepals narrowly ovate, acute, 2-2.5 cm. long, brownish purple to yellowish, ascending to obliquely spreading; petals 12-15 mm. long, yellowish, the spur erect, slender, 17-20 mm. long, often very slightly inflated at the end; carpels soft-pubescent; seeds black, punctulate.—June-Aug. Honshu, Shikoku, Kyushu.

Var. *oxysepala* (Trautv. & Mey.) Kitam. *A. oxysepala* Trautv. & Mey.; *A. vulgaris* var. *oxysepala* (Trautv. & Mey.) Regel—EZO-YAMA-ODAMAKI. Spurs incurved.—Hokkaido and Honshu (n. and Hokuriku Distr.).—Korea, Manchuria, e. Siberia, and n. China.

3. *Aquilegia adoxoides* (DC.) Ohwi. *Isopyrum adoxoides* DC.; *I. japonicum* Sieb. & Zucc.; *I. tuberosum* Lév.; *Semiaquilegia adoxoides* (DC.) Makino—HIME-UZU. Slender perennial herb, the rhizomes globose, tuberous; scapes sparingly branched, scattered-puberulent, few-leaved; radical leaves few, 2-5 cm. long and as wide, long-petiolate, sparingly puberulent, slightly glaucescent and somewhat purplish beneath, ternate, the leaflets 1-2.5 cm. long, 2- to 3-cleft or parted, obtusely incised, the cauline ones smaller; flowers nodding, pale rose; sepals narrowly oblong, 5-6 mm. long; petals 2.5-3 mm. long, tubular below and with a very short spur at base; stamens 9-14, some of the inner ones reduced to flat staminodes; carpels 3-4(-5), sessile, 5-6 mm. long in fruit; seeds slightly roughened.—Mar.—May. Mountains; Honshu (Kantō and westw.), Shikoku, Kyushu; common.—s. Korea and China.

10. ACONITUM L. TORI-KABUTO ZOKU

Erect or sometimes scandent perennial herbs with thickened roots; leaves petiolate, alternate, palmately 3- to 7-cleft or divided; flowers racemose or paniculate, zygomorphic, blue, pale purple, white or yellow; sepals 5, petallike, the upper or median one clearly hooded or galeate, the others flat, the lower 2 narrower than the others; petals 2, small, hidden under the helmet, nectariferous, stipitate; stamens many; follicles 3-5, the seeds many, often winged or rugose.—About 200 species, in temperate and northern regions of the N. Hemisphere. Common in our area.

1A. Upper sepals with elongate-conic suberect to recurved tip; roots perennial, often branched; flowers pale purple or pale yellow.

2A. Flowers pale yellow; upper sepals slightly narrowed toward the tip and rounded, suberect; leaves deeply parted to divided, the segments and teeth acute. 1. *A. gigas*

- 2B. Flowers pale purple to nearly white; upper sepals distinctly narrowed and slightly recurved; leaves palmately cleft to shallowly parted, the segments and teeth acute to obtuse. 2. *A. loczyanum*
- 1B. Upper sepals erect or slightly incurved; roots yearly renovated, obconical or elongate-conical, undivided; flowers blue or bluish purple, rarely white. 3. *A. volubile*
- 3A. Stems scandent; carpels glabrous. 3. *A. volubile*
- 3B. Stems erect or ascending, not scandent. 4. *A. japonicum*
- 4A. Stems ascending to arcuate. 4. *A. japonicum*
- 4B. Stems erect or nearly so, sometimes flexuous above. 4. *A. japonicum*
- 5A. Inflorescence relatively loose, usually few-flowered, the pedicels relatively elongate; plant of alpine regions. 5. *A. senanense*
- 6A. Carpels and follicles glabrous or sparsely hairy. 5. *A. senanense*
- 6B. Carpels and follicles uniformly and rather densely puberulent. 6. *A. yuparense*
- 5B. Inflorescence relatively dense, usually many-flowered, the pedicels relatively short; plants of mountains and hills. 6. *A. yuparense*
- 7A. Leaves palmately divided, the median segments petioluled. 7. *A. sachalinense*
- 8A. Ultimate lobes of leaves linear. 7. *A. sachalinense*
- 8B. Ultimate lobes of leaves lanceolate. 8. *A. yezoense*
- 7B. Leaves palmately parted. 9. *A. chinense*

1. *Aconitum gigas* Lév. & Van't. *Lycocotnum gigas* (Lév. & Van't.) Nakai; *A. pallidum* sensu auct. Japon., non Reichenb.—ÖREIJIN-SŌ. Vivid green perennial herb; stems 50–100 cm. long, rather stout, slightly angled, with short incurved hairs on upper portion; radical and lower cauline leaves long-petiolate, reniform-orbicular, 10–20 cm. wide, 7- to 9-parted or nearly divided, usually again 3-cleft and incised, acutely toothed, thinly pilose on both sides especially on the nerves beneath, sometimes nearly glabrous on both sides; racemes terminal and axillary, to 30 cm. long, the flowers many, pedicellate, about 2.5 cm. long, pale yellow; carpels 3, glabrous.—July–Aug. Wet shaded places in high mountains; Hokkaido, Honshu (n. and centr. distr.).—Sakhalin.

2. *Aconitum loczyanum* R. Raymond. REIJIN-SŌ. Short-pubescent perennial herb; stems often angled below, to 70 cm. long, sparsely branched; radical and lower cauline leaves long-petiolate, reniform-orbicular or orbicular-cordate, 6–15 cm. wide, deeply to shallowly 5–(7)-cleft, incised and toothed; racemes terminal and axillary, 5–15 cm. long, the pedicels about 1 cm. long, pilose; flowers 2–2.5 cm. long; upper sepals pilose outside; carpels 3, with spreading hairs, becoming glabrescent.—Aug.–Oct. Wet shaded places in woods and along streams in mountains; Honshu, Shikoku, Kyushu.

Var. *pterocale* (Koidz.) Ohwi. *A. pterocale* Koidz. —AZUMA-REIJIN-SŌ. Stems narrowly winged on lower parts; carpels with incurved hairs or glabrous; pedicels and outer side of sepals with incurved hairs.—Honshu (centr. and n. distr.).

3. *Aconitum volubile* Pall. HANA-KAZURU, HANA-ZURU, TSURUBUSHI. Stems scandent above, with short curved hairs on upper part; leaves 3-cted, the segments sessile or very short-petiolate, narrow, 4–8 cm. long, 2- or 3-parted, sometimes with few incisions on margin; inflorescence terminal and lateral, rather loosely few-flowered, the flowers about 3 cm. long, bluish purple; carpels usually 5, glabrous.—Sept.–Oct. Kyushu (Kirishima Mts.).—Korea, Manchuria, and e. Siberia.

4. *Aconitum japonicum* Thunb. YAMA-TORI-KABUTO. Stems 30–100 cm. long, erect, more or less arcuate above, rarely slightly scandent on upper portion, puberulent above; leaves 5–10 cm. wide, 3–(5)-cleft or -divided, glabrous, the segments obovate-rhombic or rhombic-ovate, more or less incised and coarsely toothed, the median segment often petiolulate; inflorescence corymbose, terminal and lateral, rather small, usually few-flowered, the axillary branches usually not

elongate, the pedicels puberulent, spreading-hairy or sometimes glabrous; flowers bluish purple, about 3 cm. long; carpels usually 3, sometimes 4 or 5, glabrous or loosely few-haired.—Sept.–Nov. Hills and mountains; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common and very variable.

5. *Aconitum senanense* Nakai. ?*A. zigzag* Lév. & Van't.; *A. matsumurae* Nakai—HOSOKA-TORI-KABUTO, TAKANE-TORI-KABUTO. Erect perennial herb often flexuous and short-pubescent above, usually unbranched; leaves 6–10 cm. wide, 3–(5)-parted or -divided, the segments deeply cleft and narrowly lobulate; inflorescence usually a terminal corymbose panicle, rather loosely few-flowered, the lateral branches when present few and rather elongate; flowers bluish purple, 2.5–3 cm. long; carpels 3–5, glabrous.—July–Sept. Alpine regions; Honshu (south-centr. distr.).

Var. *incisum* (Nakai) Ohwi. *A. hakusanense* Nakai; *A. metajaponicum* Nakai; *A. zigzag* forma *incisum* Nakai—HAKUSAN-TORI-KABUTO. Stems slightly taller, 40–80 cm. long; leaves cleft to parted, the segments shallowly lobed; lateral inflorescence often ascending, rather many, the terminal branches nearly pyramidal, rather many-flowered.—Mountain regions of Honshu (Japan Sea side of centr. and n. distr.).

6. *Aconitum yuparense* Takeda. EZO-HOSOKA-TORI-KABUTO. Stems 40–50 cm. long, erect, with incurved short hairs on upper portion; leaves 5–11 cm. wide, 5- to 7-parted, the segments deeply lobed, narrowly caudate; inflorescence few-flowered, terminal and lateral, the lateral branches few and erect; flowers bluish purple, about 2.5 cm. long; carpels 3–5, densely white-puberulent.—Aug. Alpine slopes; Hokkaido (Mount Yubaidake); rare. Closely allied to *Aconitum kurilense* Takeda of the s. Kuriles.

Aconitum ito-seiyanum Miyabe & Tatew. SEIYA-BUSHI. Allied to *A. yuparense* but differs in the 5-cted leaves.—Reported to occur in Hokkaido (Teshio Prov.).

7. *Aconitum sachalinense* F. Schmidt. KARAFUTO-BUSHI. Erect perennial herb, puberulent on upper portion; stems 50–100 cm. long, rather stout; leaves rather dense, palmately 5-cted, the median segments 6–8 cm. long, deeply cut, short-petioluled, the ultimate lobes 2–4 mm. wide, broadly linear; inflorescence a dense rather many-flowered terminal panicle, the lateral branches mostly erect; flowers bluish purple, about 2.5 cm. long; carpels 3, glabrous.—Hokkaido.—Sakhalin.

8. *Aconitum yezoense* Nakai. EZO-TORI-KABUTO. Stems erect, slightly flexuous above, short recurved-pubescent; leaves 3-cted, the median segments petiolate, 7–10 cm. long,

the lateral ones 2-parted, both cut into narrow lobes; inflorescence terminal and axillary, rather densely flowered, the axillary ones on elongate peduncles; flowers bluish purple, about 3 cm. long; carpels glabrous, usually 3.—Aug.—Oct. Hokkaido.

9. *Aconitum chinense* Sieb. & Zucc. TORI-KABUTO. Stems 80–120 cm. long, firm, recurved short-hairy on upper portion; leaves rather dense, somewhat thick, 3-parted, the segments 10–15 cm. long, deeply incised and coarsely toothed,

the lateral segments deeply 2-cleft; branches of inflorescence rather many-flowered, erect; flowers deep bluish purple, large, 3–4 cm. long; carpels usually 5, glabrous.—Sept.—Oct. Cultivated for cut flowers and planted in gardens.

Aconitum zuccarinii Nakai. AIZU-TORI-KABUTO. Closely allied to and doubtfully distinct from *A. chinense*, differing usually in having 3 carpels.—Honshu (Iwashiro and Shimotsuke Prov.). Poorly known.

11. ANEMONOPSIS Sieb. & Zucc. RENGE-SHŌMA ZOKU

Erect perennial rhizomatous herbs; leaves alternate, mostly basal and on lower portion of stems, 2- to 3-ternate, petiolate; flowers in loose racemiform panicles, long-pedicelled, rather large, nodding, pale purple; sepals 7–10, flat, petaloid, oblong, deciduous; petals about 10, much smaller than the sepals, nectariferous at base; stamens many; carpels 2–4, sessile, free, rather many-ovuled; style elongate, slender; fruit of 2–4 follicles; seeds scaly.—A single species, in Japan.

1. *Anemonopsis macrophylla* Sieb. & Zucc. *Xaveria macrophylla* (Sieb. & Zucc.) Endl.—RENGE-SHŌMA. Plant glabrous; stems 40–80 cm. long; leaves large, the petioles dilated and membranous on both sides at base, the leaflets rhombic-ovate to broadly ovate or oblong, 4–8 cm. long, 2–5 cm. wide, acuminate, often 3-lobed, incised and acutely

toothed; inflorescence 15–30 cm. long, more than 10-flowered; flowers 3–3.5 cm. across; sepals oblong, about 2 cm. long; petals 10–12 mm. long, obovate, rather thick; stamens many; style elongate, filiform, the stigma punctate; follicles about 15 mm. long.—July–Sept. Woods in mountains; Honshu (centr. distr.); rare.

12. ACTAEA L. RUIYŌ-SHŌMA ZOKU

Rhizomatous perennials; leaves radical and cauline, alternate, ternately compound; inflorescence racemose, terminal, the bracts small, linear to lanceolate, persistent; flowers small, white, pedicellate; sepals 3–5, petaloid or sepallike, caducous; petals 4–10, unguiculate, flat, caducous; stamens many, the filaments filiform, longer than the sepals; carpels solitary, ellipsoidal, several-ovuled; stigma sessile, shallowly 2-lobed, discoid; fruit a berry.—Few species, in the temperate regions of the N. Hemisphere.

- 1A. Pedicels rather thickened in fruit; fruit black; inflorescence relatively short. 1. *A. asiatica*
1B. Pedicels slender and not thickened in fruit; fruit red; inflorescence rather elongate. 2. *A. erythrocarpa*

1. *Actaea asiatica* Hara. *A. spicata* var. *nigra* sensu auct. Japon., non Willd. *A. acuminata* sensu Komar., non Wall.—RUIYŌ-SHŌMA. Stems 40–70 cm. long, 2- to 3-leaved, few-scaled at base, puberulent above; leaves radical and lower cauline, 2- to 4-ternate, the leaflets membranous, ovate to narrowly so, 4–10 cm. long, 2–6 cm. wide, acuminate, incised and acutely toothed, sometimes 3-lobed, scattered short-pubescent when young; racemes densely flowered, 3–5 cm. long, the pedicels 10–15 mm. long in fruit, dark red, horizontally spreading; sepals about 3 mm. long; petals broadly ovate, 2–2.5 mm. long; fruit globose, black, about 6

mm. across.—May. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—China, Manchuria, Ussuri, and Korea.

2. *Actaea erythrocarpa* Fisch. *A. spicata* var. *erythrocarpa* (Fisch.) Ledeb.—AKAMI-NO-RUIYŌ-SHŌMA. Closely resembling the preceding species; inflorescence dense in anthesis, 5–10 cm. long in fruit, the pedicels often deflexed in fruit, much slenderer than the axis; fruit red.—June. Woods in mountains; Hokkaido, Honshu (n. distr.).—Europe, Siberia, Manchuria, Korea, Sakhalin, and s. Kuriles.

13. COPTIS Salisb. Ō-REN ZOKU

Small evergreen perennial herbs with creeping rhizomes; leaves radical, ternate or palmately 5-parted, sometimes 2- to 4-ternate, petiolate; scapes 1- to few-flowered; flowers white, rather small, bisexual or unisexual (plants often dioecious); sepals 5–6, petaloid, deciduous; petals 5–6, small, nectariferous; stamens many; carpels few to many, stipitate, free, several-ovuled; follicles verticillately arranged on a receptacle, chartaceous; seeds shining.—About 10 species, in temperate regions of the N. Hemisphere.

- 1A. Follicles without nerves on each side, obovate in cross section; style slender, rather elongate, the stigma narrow, decurrent on inner side of the style; leaves always 3-foliate. 1. *C. trifolia*
1B. Follicles with 1 longitudinal nerve on each side, obtriangular in cross section; style short, the stigma essentially punctate; leaves 3 or more foliate.
2A. Flowers solitary, rarely 2; sepals obovate or elliptic; petals obovate; leaflets 3 or 5, sessile, ternately or palmately arranged.
3A. Leaves 3-foliate, rather firm, with rather prominent veinlets beneath. 2. *C. trifoliolata*
3B. Leaves 5-foliate, firmly chartaceous, with faintly raised veinlets beneath. 3. *C. quinquefolia*
2B. Flowers 1 to 3; sepals lanceolate; petals spatulate; leaves once to thrice ternately compound, if simply ternate the leaflets distinctly petiolulate. 4. *C. japonica*

1. *Coptis trifolia* (L.) Salisb. *Helleborus trifolius* L.—MITSUBA-Ö-REN, MITSUBA-WÖ-REN. Slender nearly glabrous perennial with very slender creeping rhizomes; leaves long-petiolate, the leaflets 3, sessile, obovate or obovate-orbicular, 1-2.5 cm. long, 1-2 cm. wide, obtuse, shallowly incised and irregularly mucronate-toothed, sometimes shallowly lobulate; scapes 5-10 cm. long; flowers white, 7-10 mm. across, the limb of petals elliptic, yellow; follicles ovoid, 3-5 mm. long, on a stipe 5-7 mm. long; style recurved above.—June-July. Coniferous woods and sphagnum-moors; Hokkaido, Honshu (centr. and n. distr.).—Cooler regions of the N. Hemisphere.

2. *Coptis trifoliolata* (Makino) Makino. *C. quinquefolia* var. *trifoliolata* Makino; *C. trifoliolata* var. *oligodonta* F. Maekawa; *C. oligodonta* (F. Maekawa) Satake.—MITSUBA-NO-BAIKA-Ö-REN. Closely resembles the preceding in habit but slightly coarser and the rhizomes less elongate; leaflets firmer and thicker, the petioles grooved above; scapes 7-15 cm. long, sometimes with a small scale; flowers 12-15 mm. across; sepals broader, 6-8 mm. long; petals about half as long as the stamens, the limb slightly shorter or as long as the claw; follicles 6-8 mm. long, with a longitudinal nerve on each side, the stipe about 5 mm. long; style short, the stigma nearly punctate.—June-Aug. Wet alpine slopes and high mountains; Honshu (Japan Sea side of centr. and n. distr.).

3. *Coptis quinquefolia* Miq. *C. quinquefolia* var. *stolonifera* Makino.—BAIKA-Ö-REN, BAIKA-WÖ-REN, GOKAYÖ-Ö-REN. Rhizomes short-creeping (plants often stoloniferous); leaflets 5, evergreen, irregularly mucronate-toothed, 1-2.5 cm. long, 7-20 mm. wide, the lateral ones smaller; scapes 7-15 cm. long, often 1-scaled; flowers white, 12-18 mm. across;

sepals obovate; petals nearly as long as the stamens, the limb much shorter than the claw; follicles similar to those of the preceding.—Apr.-May. Woods in mountains; Honshu (centr. distr. and westw.), Shikoku.

Var. *ramosa* (Makino) Ohwi. *C. quinquefolia* forma *ramosa* Makino; *C. ramosa* (Makino) Tamura; *C. quinquefolia* var. *pedatoquinquefolia* Koidz.—Ö-COKAYÖ-Ö-REN. Plant without stolons; leaflets pinnately incised; scapes often 2-flowered.—Kyushu (Yakushima).

4. *Coptis japonica* (Thunb.) Makino. *Thalictrum japonicum* Thunb.; *C. orientalis* Maxim.; *C. anemonefolia* Sieb. & Zucc.; *C. occidentalis* var. *japonica* Huth.—Ö-REN, WÖ-REN. Perennial herb with short, rather thick rhizomes; radical leaves ternate, the leaflets simple or shallowly lobulate, 2-5 cm. long, broadly ovate, acute, petiolulate, irregularly acute-toothed; scapes 10-25 cm. long, 1- to 3-flowered, nearly glabrous or short-pubescent above; flowers about 10 mm. across, white, bisexual or polygamous; sepals lanceolate; follicles about 10 mm. long, the stipe 6-8 mm. long; style short.—Mar.-Apr. Woods in mountains; Hokkaido, Honshu, Shikoku.

Var. *japonica*. KIKUBA-Ö-REN, KIKUBA-WÖ-REN. Leaves once ternate, the leaflets pinnately cleft to parted or sometimes nearly divided.

Var. *dissecta* (Yatabe) Nakai. *C. anemonefolia* var. *dissecta* Yatabe.—SERIBA-Ö-REN, SERIBA-WÖ-REN. Leaves twice ternate.—Occurs with the typical phase.

Var. *major* (Miq.) Satake. *C. brachypetala* Sieb. & Zucc.; *C. brachypetala* var. *major* Miq.—KO-SERIBA-Ö-REN, HOSOBASERIBA-Ö-REN, KO-SERIBA-WÖ-REN. Leaves thrice ternate.—Occurs with the typical phase.

14. CIMICIFUGA L.

SARASHINA-SHÖMA ZOKU

Erect perennial herbs; leaves radical and cauline, the lower ones long-petiolate, ternately compound; inflorescence racemose or spicate, terminal, often loosely branched, the flowers small, white, pedicelled or sessile; sepals 2-5, petaloid, caducous; petals 0-8, unguiculate, often 2-fid; stamens many, the filaments filiform or slightly flattened above; carpels 1-8, sessile or stipitate, many-ovuled; styles very short or slender; follicles 1-8; seeds smooth or scaly.—About 10 species, in the temperate regions of the N. Hemisphere.

1A. Flowers distinctly pedicelled; carpels 2-7, stipitate; style circinnate, with a narrow oblique stigma inside; plant of mountains and alpine meadows. 1. *C. simplex*

1B. Flowers nearly sessile; carpels solitary, very rarely 2, scarcely stipitate; style very short, the stigma short, terminal.

2A. Leaflets acute to obtuse or short-acuminate, with short callose hairs on nerves above. 2. *C. japonica*

2B. Leaflets acuminate to long-acuminate, glabrous above except for short hairs sometimes near margin. 3. *C. acerina*

1. *Cimicifuga simplex* Wormsk. *C. foetida* var. *simplex* (Wormsk.) Regel; *C. yesoensis* (Nakai) Kudo; *C. simplex* var. *yesoensis* Nakai.—SARASHINA-SHÖMA. Perennial herb with short-creeping rhizomes; stems white-puberulent above, 40-100 cm. long, few-leaved; radical and lower cauline leaves long-petiolate, 2- to 3-ternate, the leaflets ovate to narrowly so, 3-8 cm. long, 1.5-5 cm. wide, acuminate, sometimes 3-lobed, irregularly incised and toothed; spikes elongate, 20-30 cm. long, often branched below, densely many-flowered, the pedicels 5-10 mm. long; sepals white, about 4 mm. long; petals slightly smaller, shallowly 2-lobed; stamens about 10 mm. long, white; carpels 2-7, the stipe elongate after anthesis, slightly puberulent to glabrous.—Aug.-Oct. Mountain meadows and alpine regions; Hokkaido, Honshu, Shikoku, Kyushu.—Sakhalin, Kuriles, and Kamchatka.

2. *Cimicifuga japonica* (Thunb.) Spreng. *Actaea japonica* Thunb.; *Pityroperma obtusilobum* Sieb. & Zucc. var.

biternatum Sieb. & Zucc.; *C. obtusiloba* (Sieb. & Zucc.) Miq.; *C. biternata* (Sieb. & Zucc.) Miq.—INU-SHÖMA. Perennial herb 60-80 cm. high; radical leaves long-petiolate, 1- to 2-ternate, the leaflets chartaceous, broadly ovate to orbicular-cordate, 6-10 cm. long, 5-10 cm. wide, subobtusely to acuminate, palmately lobulate and irregularly toothed, shallowly cordate, with short callose hairs on nerves above, and more or less spreading hairs on nerves beneath; stems scapellike, usually leafless; inflorescence 20-35 cm. long, short-pubescent, often branched below; flowers many, white, sessile or nearly so; sepals about 5 mm. long; petals 2-cleft; stamens about 8 mm. long, the filaments filiform, the anthers broadly elliptic; carpels solitary, rarely 2.—Aug.-Oct. Honshu (centr. distr. and westw.).

3. *Cimicifuga acerina* (Sieb. & Zucc.) T. Tanaka. *Pityroperma acerina* Sieb. & Zucc.; *C. japonica* var. *acerina* (Sieb. & Zucc.) Huth; *C. acerina* var. *typica* Hara, var. *macro-*

phylla (Koidz.) Hara, and var. *intermedia* Hara; *C. macrophylla* Koidz.—ŌBA-SHŌMA. Rhizomatous perennial herb; radical leaves 1- to 2-ternate, the leaflets deep green above, orbicular-cordate, 7-20 cm. long, 6-18 cm. wide, acuminate to long-acuminate, glabrous above except short-pilose near margin, short-hairy on nerves beneath, palmately cleft to lobulate, irregularly acute-toothed; scapes 80-120 cm. long, usually leafless; inflorescence often branched below, 15-30 cm. long,

puberulent, many-flowered; flowers white; sepals 4-5 mm. long; stamens about 8 mm. long, the filaments filiform, the anthers oblong; carpels solitary, glabrous.—Sept.-Oct. Honshu, Shikoku, Kyushu.

Var. *peltata* (Makino) Hara. *C. japonica* forma *peltata* Makino; *C. peltata* (Makino) Koidz.—KIKEN-SHŌMA. Leaflets peltate.—Honshu (centr. distr.).

15. ISOPYRUM L. SHIRO-KANE-SŌ ZOKU

Slender rather soft perennial herbs; leaves ternately compound, the cauline alternate; inflorescence cymose-paniculate or the flowers solitary, yellowish or white; sepals 5-6, petaloid, deciduous; petals 5, small, nectariferous or absent; stamens many, sometimes 5 or 10; carpels 2-10, free, several-ovuled; follicles 2-10; seeds smooth or granular-roughened.—About 20 species, in the temperate regions of the N. Hemisphere.

- 1A. Petals absent; carpels more than 2, ascending in fruit, the receptacle not thickened; leaves 1- to 2-ternate, the leaflets all alike.
 1. *I. raddeanum*
- 1B. Petals present, small; carpels 2, horizontally spreading in fruit, the receptacle thickened and recurved on margin; leaves ternate, the terminal leaflets simple, the lateral ones 2-nate, 3-nate or pedately compound.
 - 2A. Stems and lower leaf surface soft-pubescent. 2. *I. dicarpon*
 - 2B. Stems and leaves glabrous.
 - 3A. Seeds granular-roughened; rhizomes and stolons absent. 3. *I. trachyspermum*
 - 3B. Seeds smooth; rhizomes or stolons present.
 - 4A. Flowers 1.2-1.5 cm. across; rhizomes long-creeping; leaflets rhombic-ovate to broadly so. 4. *I. stoloniferum*
 - 4B. Flowers 7-8 mm. across; rhizomes short-creeping.
 - 5A. Lower 2 cauline leaves not closely contiguous; leaflets broadly ovate. 5. *I. numajirianum*
 - 5B. Lower 2 cauline leaves closely contiguous.
 - 6A. Rhizomes densely scaly, the plants rarely stoloniferous; Japan Sea side. 6. *I. nipponicum*
 - 6B. Rhizomes loosely scaly, the plants sometimes stoloniferous; Hakone and Izu in Honshu. 7. *I. hakonense*

1. *Isopyrum raddeanum* (Regel) Maxim. *Enemion raddeanum* Regel; *E. raddeanum* var. *japonicum* Fr. & Sav.—CHICHIBU-SHIRO-KANE-SŌ. Perennial herb with short rhizomes; stems 20-30 cm. long, with few scaly leaves at base; cauline leaves 2-3, alternate, on upper part of the stem, short-petiolate or sessile, 1- to 2-ternate, the leaflets broadly cuneate-ovate, 2-4 cm. long, 1-3 cm. wide, often 2- to 3-lobed and irregularly toothed, glaucous and soft short-pubescent beneath or glabrous on both sides; flowers few, terminal, umbellate, about 12 mm. across, white, the pedicels to 3 cm. long, erect; petals absent; filaments slightly broadened above; carpels 3-5, glabrous, 4-5 mm. long in fruit, slightly ascending, broadly ovate; seeds granular-roughened.—May. Woods in mountains; Honshu (n. and centr. distr.); rare.—Korea, Manchuria, and Ussuri.

2. *Isopyrum dicarpon* Miq. *I. stipulaceum* Fr. & Sav.—SABA-NO-O. Scattered soft-pubescent perennial; rhizomes much abbreviated; radical leaves ternate, petiolate, the petioles prominently dilated at base, the terminal leaflets simple, ovate, 1-3 cm. long, 7-20 mm. wide, subacute with an obtuse tip, often lobed, toothed, the lateral leaflets again dissected with 2-5 smaller leaflets, the lower cauline leaves subopposite; flowers to 10, white with purple striations, about 8 mm. across, the petals stipitate, nectariferous, the limb 2-lobed, the outer lobe larger, inflexed; carpels 2; seeds smooth.—Mar.-Apr. Shikoku, Kyushu.

Var. *univalve* Ohwi. SAIKOKU-SABA-NO-O. Petals without the inner lobe.—Mar.-Apr. Honshu (Kinki Distr.).

3. *Isopyrum trachyspermum* Maxim. TŌGOKU-SABA-NO-O. Resembling the preceding but quite glabrous; stems rather tufted, 5-20 cm. long; terminal leaflets broadly ovate to broadly obovate, 5-15 mm. long, 4-15 mm. wide, obtuse to

subrounded; flowers 5-8 mm. across, pale yellowish-green; sepals obliquely ascending; limb of petals divided into an inner and outer lobe; carpels 2; seeds granular-roughened.—Mar.-May. Woods in foothills and mountains; Honshu (Rikuzen Prov. and southw.), Shikoku, Kyushu; rather common.

4. *Isopyrum stoloniferum* Maxim. TSURU-SHIRO-KANE-SŌ, SHIRO-KANE-SŌ. Resembles *I. dicarpon*, but quite glabrous, 10-20 cm. high; rhizomes slender, elongate; petioles slightly dilated at base, the terminal leaflets rhombic-ovate or broadly so, 1-2 cm. long, subacute with an obtuse tip; flowers creamy yellow, 12-15 mm. across, expanded; sepals spreading; limb of petals bilabiate; carpels 2; seeds smooth.—May-June. Woods in mountains; Honshu (Tōkaidō to s. Kinki Distr.).

5. *Isopyrum numajirianum* Makino. KŌYA-SHIRO-KANE-SŌ. Resembles species Nos. 4 and 6; rhizomes short, stems about 20 cm. long, without radical leaves; lower 2 cauline leaves distant, the terminal leaflets broadly ovate, retuse, 10-25 mm. long, 7-20 mm. wide; flowers yellowish white, broadly campanulate; seeds smooth.—May. Woods in mountains; Honshu (s. Kinki Distr.), Shikoku; rare.

6. *Isopyrum nipponicum* Franch. *I. makinoi* Nakai; *I. pterigonocaudatum* Koidz.—AZUMA-SHIRO-KANE-SŌ. Rhizomes short, branched, creeping, with broad fleshy scales; stems without radical leaves, 10-25 cm. long, the cauline leaves few, the terminal leaflets usually cuneate-obovate or cuneate-oblong, obtuse to subrounded, 2-4 cm. long, 10-25 mm. wide, glaucous beneath; flowers 7-10 mm. across, few to more than 10, pale greenish yellow, sometimes with a purple hue, not fully expanded; limb of petals simple, inflexed; seeds smooth.—May-July. Wet places in mountains; Honshu (Japan Sea side, Uzen Prov. to Echizen and Tajima Prov.).

Var. *sarmentosum* Ohwi. *I. ohwianum* Koidz.—SAN'IN-SHIRO-KANE-SŌ. Plants sarmentose.—Honshu (Japan Sea side, Echizen Prov. to Chigoku Distr.).

7. *Isopyrum hakonense* F. Maekawa & Tuyama. HAKONE-SHIRO-KANE-SŌ. Glabrous perennial; rhizomes branched, short-creeping, loosely scaly; stems 10–20 cm. long, rather slender, the cauline leaves 1 pair, subsessile, the radical leaves

long-petiolate, the terminal leaflets broadly ovate or broadly rhombic-ovate, 1.5–2 cm. long, subobtusely, slightly narrower, broadly cuneate to abruptly narrowed below, 3-lobulate; flowers few, 6–8 mm. across, white, not fully expanded; sepals about 4 mm. long; seeds smooth.—May. Honshu (Izu and Sagami Prov.).

16. TROLLIUS L. KIMBAI-SŌ ZOKU

Erect glabrous perennial herbs with thick short rhizomes; leaves radical and cauline, alternate, palmately divided to lobed; flowers solitary or few, yellow, bisexual, erect, pedicelled; sepals 5 to rather numerous, petaloid, deciduous; petals 5–10, linear, short-clawed and with a nectariferous pit at base; stamens many; carpels 3 to many, free, sessile; fruit of few to rather many follicles; seeds many, usually angled, smooth.—More than 10 species, in temperate and northern regions of the N. Hemisphere.

- 1A. Petals longer than the stamens. 1. *T. hondoensis*
 1B. Petals shorter than to as long as the stamens.
 2A. Sepals 5–7, spreading; anthers usually 2.5–5 mm. long. 2. *T. riederianus*
 2B. Sepals 10–16, ascending and connivent above; anthers usually 1.5–2 mm. long. 3. *T. pulcher*

1. *Trollius hondoensis* Nakai. *T. asiaticus* var. *ledebourii* Maxim.; *T. ledebourii* var. *macropetalus* sensu auct. Japon., non Regel.—KIMBAI-SŌ. Stems erect, few-leaved; radical and lower cauline leaves long-petiolate, 6–12 cm. long and as wide, 3-sected, the terminal segments rhombic-elliptic to rhombic-obovate, pinnately cleft on the upper half, irregularly acute-toothed, the lateral segments 2- to 3-parted, green above, paler beneath, firmly chartaceous; upper cauline leaves sessile or short-petiolate, rather small; flowers 2.5–4 cm. across; sepals elliptic, spreading; petals subacute or obtuse; anthers 3–5 mm. long; styles 2.5–3.5 mm. long.—June–Aug. Wet meadows in mountains especially along streams; Honshu (Uzen to Oomi Prov.).

2. *Trollius riederianus* Fisch. & Mey. *T. patulus* var. *brevistylis* Regel; *T. membranostylis* sensu Miyabe, non Hult.—CHISHIMA-KIMBAI-SŌ. Erect perennial herb with short rhizomes; radical and lower cauline leaves long-petiolate, cordate-orbicular, 4–12 cm. long and as wide, 3-sected, the segments obovate to rhombic-elliptic, the lateral divisions 2- to 3-parted, pale and dull beneath, pinnately parted or cleft, incised and toothed; upper cauline leaves small, sessile; flowers yellow, 3–4 cm. across; sepals 5–7, broadly elliptic; petals linear, rather thick, obtuse to rounded; anthers 2.5–5 mm. long; style 1.5–2.5 mm. long.—July–Aug. Alpine meadows; Hokkaido.—Kuriles, Sakhalin, and Kamchatka.

Var. *japonicus* (Miq.) Ohwi. *T. japonicus* Miq.; *T. nishidaei* Miyabe; *T. patulus* sensu auct. Japon., non Salisb.—SHINANO-KIMBAI-SŌ. Leaves more deeply cut; styles rather slender, 2.4–4 mm. long.—July–Aug. Alpine meadows; Hokkaido, Honshu (n. and centr. distr.).

Trollius citrinus Miyabe, with lemon-colored flowers and spreading petals, is reported as growing with *T. riederianus* var. *japonicus* in Hidaka Prov., Hokkaido. Possibly it is just a variant, but its proper status can not now be determined with certainty.

3. *Trollius pulcher* Makino. BOTAN-KIMBAI-SŌ. Glabrous rather stout perennial herb; stems 20–60 cm. long, tufted, usually 3-leaved, 1- to 2-flowered; radical leaves long-petiolate, reniform, to 12 cm. long, 19 cm. wide, 3-sected, the segments cuneate, incised-toothed, the lateral segments broader, deeply 2-parted, the terminal segment elliptic, 3-cleft; cauline leaves gradually becoming smaller above, the petioles dilated below; flowers orange-yellow, hemispheric, 3–5.5 cm. across, erect; sepals many, concave, connivent above, imbricate, orbicular, about 2.5 cm. long and as wide in the outer ones, narrower in inner ones, minutely toothed on upper margin, rounded; petals 5–7, 8.5–10 mm. long, shorter than the stamens, erect, linear-spathulate, obtuse, short-clawed, entire; anthers short; carpels many; style erect, straight.—Hokkaido (Rishiri Isl.).

17. ERANTHIS Salisb. SETSUBUN-SŌ ZOKU

Small tuberous-rooted perennials; radical leaves palmately dissected, the involucral leaves sessile; flowers solitary and terminal, short-peduncled, yellow or white; sepals 5–8, petalike, deciduous; petals reduced to small 2- to 4-fid nectaries; stamens numerous; carpels follicular, few, free, short-stiped.—Few species in the Old World.

1. *Eranthis pinnatifida* Maxim. *E. keiskei* Fr. & Sav.; *Shibateranthus pinnatifida* (Maxim.) Satake & Okuyama; *S. keiskei* (Fr. & Sav.) Nakai.—SETSUBUN-SŌ. Small perennial herb 5–15 cm. high, nearly glabrous, the peduncle minutely puberulous; radical leaves long-petioled, reniform-orbicular, 3–4 cm. wide, somewhat 5-angled in outline, 3-parted, the lateral divisions deeply bifid, the lobes and cen-

tral division rhombic-ovate, obtuse, pinnatifid; involucral leaves sessile; flowers white, about 2 cm. across; sepals 5, ovate, 10–15 mm. long; petals yellow, 2- to 4-fid, shorter than the stamens; carpels 1–5, about 10 mm. long, glabrous, short-stiped, the style about 2–3 mm. long; seeds brownish, rounded, smooth.—Mar.–Apr. Woods in mountains; Honshu (Kantō and westw.); rather rare.

18. *CALTHA* L. RYŪ-KINKA ZOKU

Glabrous, often stoloniferous perennial herbs with short rhizomes; radical leaves simple, palmately nerved, entire or toothed, petiolate, cordate, the cauline ones few or absent; flowers yellow or creamy yellow, few to rather numerous; sepals 5 to rather many, yellow, petaloid, large, deciduous; petals absent; stamens many or sometimes few; carpels sessile; style short; fruit of few to several follicles; seeds many, smooth.—More than 10 species, in temperate and northern regions of the N. Hemisphere.

1. *Caltha palustris* L. var. *membranacea* Turcz. *C. palustris* var. *sibirica* Regel; *C. membranacea* (Turcz.) Schipcz.; *C. sibirica* (Regel) Makino; *C. palustris* var. *nipponica* Hara—RYŪ-KINKA. Rhizomes short, thick-rooted; radical leaves long-petiolate; reniform-orbicular or ovate-cordate, 5–10 cm. long and as wide, undulate-toothed; scapes 15–50 cm. long, erect, few-leaved; flowers golden-yellow, 2–3 cm. across; follicles about 1 cm. long.—Apr.–July. Wet places in mountains; Honshu, Kyushu.—c. Siberia, China, and Korea.—Forma *decumbens* Makino. *C. palustris* var. *en-ko-so* Hara—ENKŌ-SŌ. Stems decumbent.—Wet places; Honshu.

Var. *pygmaea* Makino. KOBANO-RYŪ-KINKA. Dwarf-growing phase, recently found wild.—Honshu (Hirugano in Hida).—Long cultivated.

Var. *barthei* Hance. *C. barthei* (Hance) Koidz.; *C. fistulosa* Schipcz.; *C. palustris* forma *gigas* Lév.—EZO-NO-RYŪ-KINKA. Plant 50–80 cm. high; radical leaves 10–25 cm. wide, often deltoid-toothed; flowers large, rather many; style short.—May–July. Wet places; Hokkaido, Honshu (n. distr.).—Sakhalin and Kuriles.

19. *GLAUCIDIUM* Sieb. & Zucc. SHIRANE-AOI ZOKU

Perennial herbs, white-pubescent while young; rhizomes stout; cauline leaves 2, palmately lobed, the basal leaves long-petiolate; flowers solitary, terminal, pale blue-purple; sepals 4, petaloid, spreading, deciduous; petals absent; stamens many; carpels 2, sometimes solitary, sessile, slightly connate below, many-ovuled; follicles flattened laterally, somewhat 4-angled; seeds obovate, flat, many, broadly winged on margin.—A single species, in Japan.

1. *Glaucidium palmatum* Sieb. & Zucc. *G. paradoxum* Makino—SHIRANE-AOI. Stems rather stout, naked below, 2-leaved above; radical (sterile) leaves membranous, long-petiolate, the cauline reniform or cordate-orbicular, 8–20 cm. long and as wide, palmately 7- to 11-lobed, soft-pubescent while young, the lobes acuminate, irregularly acute-toothed, often incised, the petioles 10–15 cm. long; flowers terminal,

solitary, 5–8 cm. across, pedunculate; sepals 4, broadly ovate, thin, pale blue-purple, rarely white; stamens many; carpels usually 2; follicles flattened, about 15 mm. long; seeds narrowly oblong, about 10 mm. long inclusive of the wing.—May–July. Woods in high mountains; Hokkaido, Honshu (n. and centr. distr.).

20. *PAEONIA* L. BOTAN ZOKU

Perennial herbs or suffrutescent subshrubs; leaves ternately or pinnately compound; flowers large, terminal and axillary, pale pink, yellow or purple-red; sepals 3–5, herbaceous, greenish; petals 5–20, petaloid, without nectary glands, deciduous; stamens many; carpels 2–5, free; follicles rather large, several to many-seeded; seeds black.—About 30 species in the Old World, mainly in Asia, 2 in N. America.

1A. Plants herbaceous, the flowers with a low disc below the carpels.

2A. Leaflets rather thin, not shining, oblong, usually not decurrent below, abruptly acute to subobtusely, whitish beneath; flowers not fully expanded; filaments pale red; stigma purplish; plant of mountains.

3A. Flowers white; stigma short, slightly recurved; follicles reflexed. 1. *P. japonica*

3B. Flowers rose; stigma rather elongate, prominently circinnate; follicles spreading. 2. *P. obovata*

2B. Leaflets firm, chartaceous, shining above, narrowly obovate to lanceolate, often decurrent on the petioles, usually acuminate, pale green beneath; flowers fully expanded; cultivated. 3. *P. lactiflora*

1B. Plant shrubby, the flowers with the disc dilated and enveloping the carpels; cultivated. 4. *P. suffruticosa*

1. *Paeonia japonica* (Makino) Miyabe & Takeda. *P. obovata* var. *japonica* Makino—YAMA-SHAKUYAKU. Stems 40–50 cm. long, with few scalelike leaves at base; rhizomes stout, short; cauline leaves 3–4, petiolate, large, usually twice ternate, the leaflets oblong to obovate, 4–12 cm. long, 3–7 cm. wide, abruptly acute to obtuse, acuminate at base, often petiolulate, glaucous beneath; flowers white, 4–5 cm. across, solitary and terminal; sepals ovate; petals 5–7, ascending, connivent above, obovate, 3–4 cm. long; anthers 5–7 mm. long; stigma short, slightly recurved.—Apr.–June. Thickets and open woods in mountains; Honshu, Shikoku, Kyushu.—Korea and Manchuria.

Var. *pilosa* Nakai. KE-YAMA-SHAKUYAKU. Leaves pubescent beneath.—Occurs with the typical phase.

2. *Paeonia obovata* Maxim. BENIBANA-YAMA-SHAKUYAKU. Closely allied to the preceding; leaves scattered soft-pubescent beneath; flowers pale rose; stigma elongate, circinnate.—Apr.–June. Woods and thickets in mountains; Hokkaido, Honshu, Shikoku.—Korea, Manchuria, China, Amur, and Sakhalin.

Var. *glabra* Makino. KE-NASHI-BENIBANA-YAMA-SHAKUYAKU. Leaflets glabrous beneath.—Occurs with the typical phase.

3. *Paeonia lactiflora* Pall. *P. albiflora* Pall.—SHAKUYAKU. Erect perennial herb, 50–80 cm. high, the roots thickened, narrowly fusiform; leaves once to twice pinnately ternate, the leaflets often 3-parted, the segments lanceolate to narrowly obovate, shining above, pale green beneath; flowers large, white to rose or red-purple, often double.—May.

Long cultivated in our area for ornament and medical purposes.—c. Siberia, Manchuria, Korea, China, and Tibet.

4. *Paeonia suffruticosa* Andr. *P. moutan* Sims.—BOTAN. Sparsely branched small shrub 1-1.5 m. high; leaflets usually 3- to 5-cleft, often whitish beneath; flowers large

and showy, the disc thick-membranous, enveloping the carpels; carpels densely brown-pubescent.—Long cultivated in our area and many cultivars of it are grown.—nw. China, Tibet, and Bhutan.

Fam. 91. LARDIZABALACEAE AKEBI KA Lardizabala Family

Usually scandent woody climbers; leaves alternate, palmately or ternately compound, exstipulate; flowers polygamous or unisexual, actinomorphic, usually racemose; sepals 6, rarely 3, petallike; petals absent or small, reduced to a nectary; stamens 6; ovary superior; carpels 3 to many, free, dehiscent or indehiscent; ovules many; fruit berrylike; seeds with copious endosperm.—About 8 genera with about 20 species, in e. Asia, India, and S. America.

- 1A. Sepals 3; leaves deciduous; stamens free. 1. *Akebia*
1B. Sepals 6; leaves evergreen; stamens monadelphous. 2. *Stauntonia*

1. AKEBIA Decne. AKEBI ZOKU

Deciduous woody climbers; leaves palmately 3- to 5-foliolate, petiolate; racemes axillary; flowers unisexual (plants monoecious), the pistillate larger, on the lower part of the raceme, purplish; sepals 3, free; petals absent; stamens in staminate flowers 6, free; carpels 3-9, many-ovuled; ovules on parietal placentae; berry large, oblong.—Few species, in e. Asia.

- 1A. Leaflets 5, entire, oblong; pistillate pedicels declined. 1. *A. quinata*
1B. Leaflets 3(-5), undulate-toothed or subentire, ovate or broadly so; pistillate pedicels horizontally spreading. 2. *A. trifoliata*

1. *Akebia quinata* (Thunb.) Decne. *A. sempervirens* Nakai; *Rajania quinata* Thunb.—AKEBI. Glabrous climber; leaflets 5, oblong or oblong-obovate, 3-5 cm. long, 1-2 cm. wide, somewhat retuse, obtuse to rounded at base, entire, slightly glaucescent beneath; flowers pale purple, the pistillate 2.5-3 cm. across, long-pedicellate; sepals broadly elliptic, 15-20 mm. long, the staminate 12-16 mm. across, on upper part of raceme, the pedicels slender; sepals 7-8 mm. long; fruit 5-8 cm. long, oblong, becoming dark purplish when mature.—Apr.-May. Thickets in hills and mountains; Honshu, Shikoku, Kyushu; common.—Korea and China.

2. *Akebia trifoliata* (Thunb.) Koidz. *Clematis trifoliata* Thunb.; *A. lobata* Decne.; *A. quercifolia* Sieb. & Zucc.; *A. clematifolia* Sieb. & Zucc.—MITSUBA-AKEBI. Glabrous woody climber; leaves trifoliolate, the leaflets ovate to broadly

so, 3-6 cm. long, 1-2.5 cm. wide, shallowly retuse, rounded at base, usually undulate-toothed; sepals of the pistillate flowers 7-10 mm. long; staminate flowers rather numerous, 4-5 mm. across, short-pedicelled; sepals about 2 mm. long; fruit oblong, becoming dark purplish.—Apr.-May. Thickets in hills and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—China.

Akebia pentaphylla Makino. GOYŌ-AKEBI. An alleged hybrid of the two native species, having 5 leaflets and the flower characters of No. 2.

Akebia pentaphylla var. *integrifolia* Y. Kimura. KUWA-ZOME-AKEBI. An alleged hybrid having the leaves of No. 1, but paler flowers rather larger than in those of *A. pentaphylla*.—Known from Honshu (Shinano Prov.).

2. STAUNTONIA DC. MUBE ZOKU

Evergreen woody climber; leaves palmately 5- to 7-foliolate; racemes axillary, short, few-flowered; flowers unisexual (plants monoecious); sepals 6, the outer 3 somewhat broader; stamens 6, connate; pistillate flowers with 6 staminodia; carpels 3, free; stigma capitate; ovules many; berry ovoid-globose, usually indehiscent; seeds many, ovoid or oblong, embedded in edible fleshy pulp.—Few species, in e. Asia.

1. *Stauntonia hexaphylla* (Thunb.) Decne. *Rajania hexaphylla* Thunb.—MUBE. Glabrous climber; leaflets (3-)5-7, coriaceous, oblong, ovate or obovate, 6-10 cm. long, 2-4 cm. wide, entire, pale green and prominently net-veined beneath; flowers few, pale yellow with dark red-purple striations, the outer sepals lanceolate, obliquely ascending, about 20

mm. long, gradually narrowed above, subacute, the inner sepals linear; berry purplish, ovate-globose, about 5 cm. long.—Apr.-May. Thickets in lowlands and foothills in warmer regions; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus and S. Korea.

Fam. 92. BERBERIDACEAE MEGI KA Barberry Family

Herbs or shrubs; leaves alternate, simple, ternately or sometimes pinnately compound, the stipules absent or present; flowers bisexual, in cymes, racemes, or panicles or solitary; sepals and petals imbricate, biseriate or the latter sometimes reduced to nectaries; stamens as many as the petals and opposite them, the anthers usually opening by 2 valves hinged at top; ovary superior, 1-locular, few- to many-ovuled; style short or absent, the stigma usually petlate; fruit a berry or capsule; seeds with endosperm.—About 10 genera with more than 250 species, mainly in temperate regions of the N. Hemisphere, few in S. America.

- 1A. Woody plants; petals reduced to nectaries; fruit a berry.
 2A. Leaves simple, often reduced to spines, deciduous (in ours); anthers opening by valves; sepals 6. 1. *Berberis*
 2B. Leaves pinnate or ternate, evergreen.
 3A. Leaves tripinnate; leaflets entire; flowers white; anthers longitudinally split. 2. *Nandina*
 3B. Leaves simply pinnate; leaflets spiny on margins; flowers yellow; anthers opening by valves. 3. *Mahonia*
 1B. Herbs.
 4A. Sepals and petals present.
 5A. Petals with a nectary gland; leaves ternate, rarely binate.
 6A. Carpels soon deciduous after anthesis, exposing 2 seeds. 4. *Caulophyllum*
 6B. Carpels persistent and enveloping the seeds.
 7A. Fruit a dehiscent follicle. 5. *Epimedium*
 7B. Fruit an indehiscent berry. 6. *Ranzania*
 5B. Petals without a nectary gland; leaves simple, often peltate; fruit a berry. 7. *Diphylleia*
 4B. Sepals and petals absent; leaves ternate; fruit a follicle. 8. *Achlys*

1. BERBERIS MEGI ZOKU

Deciduous or rarely evergreen shrubs with yellowish wood; leaves simple, entire or spine-toothed, penni-nerved, the leaves of the shoots reduced usually to 3-parted spines; flowers in axillary racemes, solitary, or fasciculate in axils, rather small, yellow; sepals 6, subtended by 2 or 3 bracteoles; petals 6, in 2 series, usually with 2 nectariferous glands at base; stamens 6, free, the anthers opening by 2 small terminal valves; carpels solitary; stigma peltate; ovules few; berry indehiscent, 1- to several-seeded. —About 200 species, abundant in c. Asia, S. America, and e. Asia, few in N. America, Europe, and n. Africa.

- 1A. Leaves spiny-toothed.
 2A. Branches angled; leaves oblanceolate, 1–2 cm. wide, acute or obtuse; flowers 3–7, in umbels or short racemes. 1. *B. sieboldii*
 2B. Branches obsoletely striate; leaves obovate or oblong, 1.5–3 cm. wide, very obtuse or nearly rounded; flowers more than 10, in racemes. 2. *B. amurensis* var. *japonica*
 1B. Leaves entire.
 3A. Branches terete or nearly so; leaves 3–8 cm. long; flowers 3–5, often in short racemes. 3. *B. tschonoskyana*
 3B. Branches prominently grooved; leaves 1–3.5 cm. long; flowers 2–4, fasciculate in axils. 4. *B. thunbergii*

1. *Berberis sieboldii* Miq. HEBI-NORABAZU. Glabrous, spiny, deciduous shrub; leaves oblanceolate to broadly so, 4–8 cm. long, 1–2 cm. wide, acute, sometimes obtuse, narrowed below, pale beneath, densely spiny-toothed; racemes much shorter than the leaves, 2–4 cm. long; flowers yellow, about 6 mm. across; fruit globose, dark red.—May. Honshu (sw. part of centr. distr. and Kinki Distr.).

2. *Berberis amurensis* Rupr. var. *japonica* (Regel) Rehd. *B. vulgaris* var. *japonica* Regel; *B. japonica* (Regel) C. K. Schn., non R. Br.; *B. regeliana* Koehne; *B. amurensis* sensu auct. Japon., non Rupr.—HIRO-HA-NO-HEBI-NORABAZU. Glabrous spiny shrub, branches longitudinally grooved, the spines spreading; leaves obovate to oblong, usually narrowly obovate, 3–10 cm. long, 1.5–3 cm. wide, not lustrous, very obtuse to rounded, narrowed below, pale beneath, the veinlets rather prominent; racemes nodding, as long as to slightly longer than the leaves, usually more than 10-flowered; flowers yellow, about 6 mm. across; berry oblong, red, about 10 mm. across.—June. Hokkaido, Honshu (centr. and n. distr.), Kyushu.—Korea, Manchuria, and Amur.—Forma ***bretschneideri*** (Rehd.) Ohwi. *B. bretschneideri* Rehd.; *B. amur-*

ensis var. *bretschneideri* (Rehd.) Hara—AKA-JIKU-HEBI-NORABAZU. Branches and petioles red-brown.—Forma ***brevifolia*** (Nakai) Ohwi. *B. amurensis* var. *brevifolia* Nakai—MARUBA-HEBI-NORABAZU. Leaves obovate-orbicular to broadly obovate.—Honshu (n. Kantō Distr.).

3. *Berberis tschonoskyana* Regel. *B. sikokiana* Yatabe—ŌBA-MEGI, MIYAMA-MEGI. Shrub with branches sometimes obsoletely grooved, often spiny; leaves elliptic to oblong, 3–8 cm. long, 1–2 cm. wide, obtuse, narrowed below, whitish or paler beneath; flowers 3–8, axillary, often on a short axis slightly longer than the leaves, yellow, about 6 mm. across; fruit oblong, 8–10 mm. long, red.—June. Mountains; Honshu (Kantō to Kinki Distr.), Shikoku, Kyushu.

4. *Berberis thunbergii* DC. MEGI. Spiny shrub with branches prominently grooved, the spines rarely 3-parted; leaves obovate, elliptic or oblong, 1–3.5 cm. long, obtuse, mucronate or rounded, narrowed below, whitish beneath; flowers 2–4, umbellate, yellow, about 6 mm. across; the peduncles short or wanting; fruit ellipsoidal, 7–10 mm. across, red.—Apr. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.

2. NANDINA Thunb. NANTEN ZOKU

Evergreen unarmed shrub; leaves alternate, short-petiolate, 2- to 3-pinnately compound, the axis jointed at base, the leaflets entire, the petioles dilated at base; stipules absent; panicles terminal, many-flowered; flowers white, rather small; sepals many, 3-seriate, the inner ones gradually larger, becoming petallike, the nectaries 3 or 6; anther-locules longitudinally split; ovary 1, 2-ovuled; fruit a globose, 2-seeded berry.—A single species, India to e. Asia.

1. *Nandina domestica* Thunb. NANTEN. Erect, glabrous, simple to sparingly branched shrub; leaves rather densely arranged especially toward the top of stems and branchlets, the leaflets narrowly ovate to broadly lanceolate, 3–7 cm. long, 1–2.5 cm. wide, subcoriaceous, acuminate, lustrous above, entire; panicles large, pedunculate, erect;

flowers white, about 6 mm. long; fruit red, sometimes white, rarely pale purple, 6–7 mm. across.—June. Ravines and valleys in mountains in warmer parts; Honshu (Tōkaidō to Kinki Distr. and westw.), Shikoku, Kyushu; long cultivated, with many cultivars.—Centr. China and India.

3. MAHONIA Nutt. HIIRAGI-NANTEN ZOKU

Evergreen spineless shrubs or rarely small trees with yellow wood; leaves alternate, pinnately compound, the leaflets coriaceous, spinose-dentate; stipules minute; flowers in many-flowered racemes or panicles, yellow; sepals 9; petals 6; filaments dilated, usually with 2 toothlike appendages at the apex; stigma peltate; fruit a berry, dark blue, bloomy; seeds solitary or few.—About 50 species in N. America and E. Asia.

1. *Mahonia japonica* (Thunb.) DC. *Ilex japonica* Thunb.; *Berberis japonica* (Thunb.) R. Br.—HIIRAGI-NANTEN. Shrub to small tree; leaves 30–50 cm. long, the leaflets 9–15, coriaceous, rigid, usually ovate-oblong, 4–10 cm. long, with 1–3 teeth on inner side and 5–6 teeth on outer side,

dark bluish green above, yellowish green beneath, the lateral ones very oblique, the terminal leaflet stalked, truncate or subcordate at the base, larger; flowers yellow, in fascicled, long-drooping racemes; fruit bluish black.—Introduced and long cultivated in our area,—China and Formosa.

4. CAULOPHYLLUM Michx. RUIYŌ-BOTAN ZOKU

Glabrous perennial rhizomatous herbs; leaves 1–2, membranous, pinnately 2- to 3-ternate, the leaflets sometimes 3-lobed; inflorescence cymose, terminal and axillary; flowers yellow, 3- to 6-bracteate at base; sepals 6; petals 6, very short, reduced to nectaries, opposite the sepals; stamens 6, the anthers opening by a valve on each side; ovary solitary, 1-carpellate; stigma lateral; ovules 2, orthotropous; fruits berrylike, globose, blue-black, often bloomy.—Two species, one in N. America and one in E. Asia.

1. *Caulophyllum robustum* Maxim. *C. thalicroides* var. *robustum* (Maxim.) Regel; *Leontice robusta* (Maxim.) Diels.—RUIYŌ-BOTAN. Glaucous perennial herb, 40–80 cm. high, with stout rhizomes; stems solitary, erect, simple, few-scaled at base, 1- to 2-leaved on upper half; leaves petiolate or sessile, 2- to 3-ternate, the leaflets membranous, ovate-oblong, 4–8 cm. long, 2–4 cm. wide, subacuminate to

acute, often 2- to 3-lobed to -divided, glaucous beneath; flowers yellow, 10–12 mm. across, pedicellate; sepals obovate, narrowed below, 6–8 mm. long; fruits berrylike, 6–7 mm. across, globose, the stipe 4–6 mm. long, thickened.—May–July. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

5. EPIMEDIUM L. IKARI-SŌ ZOKU

Perennial herbs with short-creeping rhizomes and much-branched roots; leaves binate or ternate, the leaflets entire or spine-margined, the cauline ones 1 or 2; racemes simple or slightly branched, terminal; flowers white, purplish, or yellowish; sepals 8, 2-seriate, the outer ones smaller, the inner ones petalike; petals 4, often spurred at base; stamens 4, the anthers opening by a valve on each side; ovary 1, the ovules in 2 series along the ventral suture; capsules slender, 2-valved, the valves unequal, the smaller one deciduous, the larger one persistent; seeds few, the raphe arillate.—More than 20 species, in Asia and Europe.

1A. Petals scarcely spurred.

2A. Stamens longer than the perianth; filaments about 2 mm. long, slightly shorter than the anthers; leaves 1- or 2-ternate, evergreen; pedicels nearly as long as the flowers. 1. *E. sagittatum*

2B. Stamens shorter than the perianth; filaments 0.5 mm. long, much shorter than the anthers; leaves binate; pedicels 1–3 times as long as the flowers.

3A. Racemes many-flowered, subpaniculate; leaves summer-green; leaflets ovate-oblong, 6–10 cm. long, acute. 2. *E. setosum*

3B. Racemes 4- to 15-flowered; leaves evergreen; leaflets ovate to broadly so, 2.5–5 cm. long, obtuse. 3. *E. diphyllum*

1B. Petals long-spurred.

4A. Primary division of cauline leaves paired; leaflets obtuse to subobtus. 4. *E. trifoliolobinatum*

4B. Primary division of cauline leaves in 3's; leaflets usually acute to acuminate.

5A. Leaves evergreen, rather firm; leaflets prominently glaucous beneath. 5. *E. sempervirens*

5B. Leaves usually summer-green, thinly chartaceous; leaflets pale to slightly glaucous beneath.

6A. Leaflets 3–6 cm. long; flowers white, rose, or pale purple. 6. *E. grandiflorum*

6B. Leaflets 5–12 cm. long; flowers creamy yellow. 7. *E. koreanum*

1. *Epimedium sagittatum* (Sieb. & Zucc.) Maxim. *Aceranthus sagittatus* Sieb. & Zucc.; *E. ikariso* Sieb. ex Regel; *E. sinense* Sieb.—HOZAKI-NO-IKARI-SŌ. Evergreen perennial herb; cauline leaves solitary, 3- to 9-foliolate, the leaflets ovate-oblong, 6–10 cm. long, 3–4 cm. wide, spine-margined; flowers white, about 6 mm. across; inner sepals about 4 mm. long, ovate.—A Chinese plant long cultivated for medical use, now becoming rare.

2. *Epimedium setosum* Koizd. Ō-BAIKA-IKARI-SŌ. Summer-green herb, 25–40 cm. high; cauline leaves solitary, binately 2- to 4-foliolate, the leaflets narrowly ovate to nar-

rowly ovate-oblong, 6–10 cm. long, 3–4 cm. wide, acute, sagittate, more or less spine-margined, brownish long-pubescent beneath while young; inflorescence rather many-flowered; flowers white, 10–12 mm. across, the inner sepals 6–7 mm. long.—Apr.–May. Honshu (Chūgoku Distr.); rare.

3. *Epimedium diphyllum* (Morr. & Decne.) Lodd. *Aceranthus diphyllum* Morr. & Decne.; *E. japonicum* Sieb.—BAIKA-IKARI-SŌ. Evergreen perennial herb, 20–30 cm. high; leaves 1 or 2 times binate or sometimes ternate in the last division, the cauline solitary, the leaflets rather coriaceous, ovate to broadly so, 2.5–5 cm. long, 2–3.5 cm. wide, entire or

slightly spine-margined, obtuse, cordate, scattered-puberulent beneath; flowers white, 10–12 mm. across.—Apr.–May. Shikoku, Kyushu.

Epidemium × **youngianum** Fisch. & Mey. UMEZAKI-
IKARI-SŌ. A hybrid of *E. diphyllum* × *E. grandiflorum*
Garden origin.

4. **Epidemium trifoliatobinatum** Koidz. HIME-
IKARI-SŌ. Perennial, 30–50 cm. high; leaves binate, the primary
ternate, the leaflets broadly ovate to narrowly so, 4–7 cm. long,
3–4 cm. wide, obtuse or abruptly acute, obliquely sagittate to
cordate, somewhat coriaceous, usually glaucous and thinly
brownish puberulent beneath, entire or scarcely spine-toothed;
flowers about 10, white, rather large.—Honshu (Chūgoku
Distr.), Shikoku, Kyushu.

Epidemium longifolium Decne. KO-
IKARI-SŌ. This may be a hybrid of No. 4 and No. 5.

5. **Epidemium sempervirens** Nakai. *E. macranthum*
var. *hypoleucum* Makino; *E. hypoleucum* (Makino) F. Mae-
kawa; *E. sempervirens* var. *hypoleucum* (Makino) Ohwi—
TOKIWA-
IKARI-SŌ. Evergreen herb, 40–60 cm. high, with
rather thick rhizomes; leaflets coriaceous, spine-margined,
broadly ovate to ovate-elliptic, 6–10 cm. long, 3–5 cm. wide,
abruptly acuminate, deeply cordate, glaucous beneath, and
with fine appressed hairs beneath, flowers white or purplish,
rather large, the pedicels often forked.—Apr.–May. Hon-
shu (Japan Sea side from Kinki Distr. to n. distr.).

Var. **hypoglaucum** (Makino) Ohwi. *E. macranthum* var.
hypoglaucum Makino; *E. hypoglaucum* (Makino) F. Mae-
kawa—URAJIRO-
IKARI-SŌ. Leaflets persistent, with fine

hairs beneath; flowers purplish to white.—Often found
growing with the typical phase in Honshu (Japan Sea side
from centr. distr. to Kinki).

6. **Epidemium grandiflorum** Morr. *E. macranthum*
Morr. & Decne.; *E. grandiflorum* var. *violaceum* (Morr.)
Stearn; *E. violaceum* Morr.; *E. macranthum* var. *thunbergi-*
anum Miq.; *E. macranthum* var. *violaceum* (Morr.) Franch.
—IKARI-SŌ. Summer-green perennial herb, 20–40 cm.
high; stems few-scaled at base; leaves 2- to 4-ternate, the leaf-
lets ovate to deltoid-ovate, 3–6 cm. long, 2–4 cm. wide, sub-
acute, spinulose-margined, cordate, glabrous above, glaucescent
and glabrate beneath; flowers white to pale purple, with an
elongated exerted spur.—Mar.–May. Honshu, Shikoku,
Kyushu.

Var. **higoense** Shimizu. *E. multifoliolatum* Koidz.—
YACHIMATA-
IKARI-SŌ, SOHAYAKI-
IKARI-SŌ. Adult leaflets with
scattered minute spreading hairs above.—Calcareous rocks;
Kyushu (Higo Prov.); rare.

7. **Epidemium koreanum** Nakai. *E. cremeum* Nakai;
E. sulphurellum Nakai; *E. coelestis* Nakai—KIBANA-
IKARI-SŌ, SHIROBANA-
IKARI-SŌ. Rhizomes short, loosely tufted,
sparingly branched; leaves usually 2-ternate, the leaflets ovate
to broadly so, 5–12 cm. long, 3–9 cm. wide, oblique, spinulose-
toothed, green and glabrous above, abruptly short-acuminate;
stems brown-pubescent above when young, 1-leaved; sepals
5–7 mm. long; petals 7–8 mm. long, the spur spreading, about
15 mm. long.—Apr. Hokkaido (sw. distr.), Honshu (Ja-
pan Sea side of centr. and n. distr.).—Korea.

6. RANZANIA T. Itō TOGAKUSHI-SHŌMA ZOKU

Soft glabrous glaucescent perennial herb with creeping branched rhizomes; stems simple, 2-leaved at the summit, naked
below; leaves ternate, petiolate, petiolulate; stipules absent; flowers in a terminal fascicle, pale purple, nodding, with 3 caducous
sepallike bracts outside; sepals 6, petallike; petals 6, small, bearing 2 nectariferous glands at base; stamens 6; anthers dehiscing
from a small valve on each side; ovary solitary, many-ovuled, the placenta parietal; fruit a berry.—A single species, in
Japan.

1. **Ranzania japonica** (T. Itō) T. Itō. *Podophyllum japa-*
onicum T. Itō; *Yatabea japonica* (T. Itō) Maxim.—TOGA-
KUSHI-SHŌMA. Stems 30–50 cm. long, terete, erect; leaflets 3,
petiolulate, orbicular to ovate-orbicular, 3-lobed or -incised,
subacute, 8–12 cm. long and as wide, thinly membranous,
cordate, glaucous beneath; pedicels fasciculate at the summit

of the stem, 4–8 cm. long, nodding in anthesis, to 15 cm. long
and erect in fruit; flowers about 2.5 cm. across; sepals ovate,
obliquely spreading, obtuse, about 15 mm. long; fruit el-
lipsoidal.—June–July. Woods in mountains; Honshu (Ja-
pan Sea side of centr. and n. distr.); rare.

7. DIPHYLLEIA Michx. SANKA-YŌ ZOKU

Soft perennial herbs with stout creeping rhizomes; stems simple, 2-leaved above, terete; leaves petiolate or sessile, orbicular or
sometimes peltate; inflorescence cymose or umbellate, the flowers white; sepals 6, caducous; petals 6, flat, white; stamens 6; ovary
solitary, the ovules in 2 series on one side within the ovary; berry indehiscent, ellipsoidal; seeds oblong, curved.—About 3
species, in N. America and e. Asia.

1. **Diphylleia grayi** F. Schmidt. *D. cymosa* sensu auct.
Japan, non Michx.; *D. cymosa* var. *grayi* (F. Schmidt) Maxim.
—SANKA-YŌ. Rhizomes stout, knotty; stems 30–60 cm.
long, terete, rather stout, scattered curled white-pubescent,
remotely 2(–3)-leaved on upper half, with few membranous
scales at base; leaves petiolate, orbicular or reniform-orbicular,
the lower one peltate, to 25 cm. long, 30 cm. wide, the upper

one sessile with a deep sinus at each end, basifixed, toothed and
incised, white-pubescent beneath; flowers 3–10, pedicelled,
about 2 cm. across; petals white, spreading, obovate, about 10
mm. long; berry ellipsoidal, blue, bloomy, 10–13 mm. long,
several-seeded.—June–July. Woods in high mountains;
Hokkaido, Honshu (centr. and n. distr., and the mountains
in Yamato Prov.).—Sakhalin.

8. ACHLYS DC. NAMBU-SŌ ZOKU

Glabrous herbs with creeping rhizomes; leaves radical, palmately nerved, 3-sected to -parted, long-petiolate, the segments sessile, entire, sometimes obtusely lobulate; scapes erect, simple; inflorescence terminal, spicate, the flowers minute, bractless, the perianth absent; stamens 9-15, the filaments filiform, dilated above, the outer ones longer; anthers short, 2-locular, opening by a small valve on each side; ovary solitary, the carpels 1; stigma broad, sessile; ovules solitary, erect from the base of ovary; follicles small, oblique, slightly laterally compressed.—Two species, one in western N. America and one in e. Asia.

1. *Achlys japonica* Maxim. *A. triphylla* var. *japonica* (Maxim.) T. Itô—NAMBU-SŌ. Slender, glabrous, rather firm perennial herb with slender, creeping rhizomes; leaves radical, usually solitary, 3-sected, the petioles 15-20 cm. long, the segments sessile, with the median one cuneate-obovate or

flabellate, 5-8 cm. long, 3-6 cm. wide, 3-lobed or undulately incised on upper margin, obtuse, the lateral segments subcordate; flowers rather many, white, small; stamens unequal, to about 5 mm. long; fruit 3-4 mm. long, subobcordate, ascending.—Hokkaido, Honshu (n. distr.).

Fam. 93. MENISPERMACEAE TSUZURA-FUJI KA Moonseed Family

Diocious herbs or scandent woody vines, rarely erect; leaves alternate, often peltate, entire or palmately cleft; stipules absent; inflorescence paniculate or cymose; sepals free or rarely connate, 1 to several; petals free or connate; stamens many or few, free or connate; carpels 3 to 6, usually 3, free, the ovules 2, 1 ovule soon aborting; stigma entire or lobed; fruit a drupe, the stones usually incurved, sometimes reniform; endosperm present or absent.—About 70 genera, with about 400 species, mainly in the Tropics.

KEY TO FLOWERING MATERIAL

- 1A. Carpels 2-6.
 - 2A. Sepals and petals spirally arranged; stamens 12-24. 1. *Menispermum*
 - 2B. Sepals and petals verticillate; stamens 3-12.
 - 3A. Stamens 9-12. 2. *Sinomenium*
 - 3B. Stamens 3-6. 3. *Cocculus*
- 1B. Carpels 1.
 - 4A. Perianth of pistillate flowers actinomorphic. 4. *Stephania*
 - 4B. Perianth of pistillate flowers not regular. 5. *Cissampelos*

KEY TO STERILE MATERIAL

- 1A. Erect shrub; leaves evergreen, oblong-obovate, 3-nerved. *Cocculus laurifolius*
- 1B. Scandent shrubs or herbs; leaves ovate to orbicular.
 - 2A. Leaves peltate.
 - 3A. Leaves scattered-pubescent on upper side, more densely so beneath. *Cissampelos insularis*
 - 3B. Leaves glabrous above, glabrous or rarely pubescent beneath.
 - 4A. Leaves broadly ovate, not angled, rounded at base. *Stephania japonica*
 - 4B. Leaves orbicular, 5- to 9-angled or shallowly lobed, barely cordate or truncate at base. *Menispermum dauricum*
 - 2B. Leaves basifixed.
 - 5A. Branches and upper side of leaves glabrous; inflorescence large. *Sinomenium acutum*
 - 5B. Branches and leaves soft-pubescent; inflorescence rather short. *Cocculus trilobus*

1. MENISPERMUM L. KŌMORI-KAZURA ZOKU

Scandent, dioecious, herbaceous or woody perennials; leaves orbicular-angulate or palmately lobed, peltate; inflorescence racemose or paniculate; staminate sepals 4-10, 2-seriate, the inner whorl larger; petals 6-9, suborbicular, shorter than the sepals, inflexed on margin; stamens 12-24, free, the anthers 4-locular; perianth of the pistillate flowers similar to the staminate, the stamens reduced to staminodes; carpels 2-4; stigma dilated; drupes 2-3, subglobose, oblique, the stones orbicular-reniform, substrate on back, concave on the sides.—Two species, one in N. America and one in e. Asia.

1. *Menispermum dauricum* DC. KŌMORI-KAZURA. Suffrutescent climber, the young branches elongate, glabrous or slightly pilose on upper part; leaves reniform to cordate-orbicular, 7-13 cm. long and as wide, shallowly 5- to 9-lobulate or angled, membranous, glaucous beneath, usually glabrous,

the petioles 5-15 cm. long; inflorescence racemose, glabrous, pedunculate; flowers green-yellow; drupe reniform-globose, 8-10 mm. long, black.—May-June. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, n. China, and e. Siberia.

2. SINOMENIUM Diels TSUZURA-FUJI ZOKU

Deciduous woody dioecious climbers with simple, sometimes palmately lobed leaves; panicles rather large; sepals and petals 6, the latter inflexed and embracing the filaments; stamens 9-12, the anthers 4-locular; pistillate flowers with 9 staminodia; carpels 3; the style recurved, the stigma lobulate; drupe flat, oblique, the stone curved, with a tuberculate dorsal rib and numerous transverse ribs; seeds lunate.—A single species, in e. Asia.

1. *Sinomenium acutum* (Thunb.) Rehd. & Wils. *Menispermum acutum* Thunb.; *Cocculus diversifolius* Miq., non DC.; *Cebatha miqueliana* O. Kuntze; *S. diversifolium* (Miq.) Diels; *Cocculus heterophyllus* Hemsl. & Wils.—TSUZURA-FUJI, Ô-TSUZURA-FUJI. Scandent shrub, the branches nearly glabrous; leaves orbicular to ovate-orbicular, 6–10 cm. long, 3–12 cm. wide, 5- to 7-angled, lobed or cleft, subcordate to truncate at base, with 2 or 3 pairs of nerves, glaucescent and

pubescent beneath while young, glabrous and green above; petioles 5–10 cm. long; inflorescence 10–20 cm. long, many-flowered, more or less short-pilose, the branches nearly racemose; flowers pale green, the perianth short-pubescent; drupe oblique, black, 6–7 mm. long, 4–5 mm. wide, flattened, orbicular.—July. Honshu (s. Kantô Distr. and westw.), Shikoku, Kyushu.—China.

3. COCCULUS DC. AO-TSUZURA-FUJI ZOKU

Scandent or erect shrubs; leaves simple, or sometimes lobed; cymes or panicles axillary; sepals 6, often pilose, the outer 3 smaller; petals 6, often bifid, auriculate and inflexed at base; stamens 6–9, free; carpels 3 or 6; style cylindric, the stigma lateral; drupes obovoid or subglobose, the stones muricate on back, compressed laterally with shallowly concave sides; cotyledons linear, flat.—More than 10 species, in e. and s. Asia, Africa, and N. America.

- 1A. Erect glabrous evergreen shrub; leaves oblong-obovate, deep green and lustrous above. 1. *C. laurifolius*
 1B. More or less pubescent deciduous scandent shrub; leaves broadly ovate to ovate-cordate, sometimes shallowly 3-lobed. .. 2. *C. trilobus*

1. *Cocculus laurifolius* DC. KÔSHÛ-YUAKU, ISOYAMA-AOKI. Glabrous evergreen erect shrub, the branches slightly flattened, green, multistriate; leaves coriaceous-chartaceous, deep green, lustrous, oblong-obovate or obovate, sometimes elliptic, 5–12 cm. long, 2–4.5 cm. wide, acuminate, entire, 3-ribbed and with transverse parallel veinlets; petioles 5–10 mm. long, 1-ribbed beneath and obtriangular in cross section; inflorescence axillary and terminal, the flowers small, yellow; drupes depressed-globose, black, about 6 mm. across, slightly compressed.—July. Kyushu (s. distr.).—Ryukyus, Formosa, China, and se. Asia.

2. *Cocculus trilobus* (Thunb.) DC. *Menispermum trilobum* Thunb.; *C. thunbergii* DC.; *Cebatha orbiculata* O.

Kuntze—AO-TSUZURA-FUJI. Deciduous scandent pubescent shrub; branches elongate, terete, obsolete striate; leaves firmly membranous to chartaceous, broadly ovate to ovate-cordate, 2–12 cm. long, 2–10 cm. wide, obtuse, mucronulate, sometimes shallowly 3-lobed, with 1 or 2 pairs of lateral nerves, the petioles 1–3 cm. long; inflorescence axillary and terminal, narrowly panicate; flowers small, glabrous, yellow-white; drupe black, bloomy, 6–7 mm. across, the stones U-shaped, with small tubercles on back, finely rugulose.—July–Aug. Thickets in lowlands and foothills; Hokkaido, Honshu, Shikoku, Kyushu; common.—China, Formosa, Malaysia, Philippines, Indochina to the Himalayas.

4. STEPHANIA Lour. HASU-NO-HA-KAZURA ZOKU

Plants scandent, herbaceous or woody, dioecious; leaves simple, deciduous or evergreen, often peltate; inflorescence a simple or compound umbel, or sometimes panicate; staminate sepals 6–10, usually equal, 2-seriate; petals 3–4, shorter than the sepals, suborbicular or obovate, thickened, rarely absent; stamens connate into a column, peltate, the anthers marginal at the top of the column, confluent and forming a marginal ring; pistillate sepals 3–5; petals 2–4, similar to the staminate ones; carpels solitary, with a parted style; drupe compressed, oblique, the stones compressed laterally, tuberculate on back, excavated on both sides; embryo linear.—About 35 species, in the Tropics.

1. *Stephania japonica* (Thunb.) Miers. *Menispermum japonicum* Thunb.; *Cocculus japonicus* (Thunb.) DC.—HASU-NO-HA-KAZURA. Glabrous scandent herb with elongate-striate branches; leaves peltate, thinly chartaceous or membranous, often glaucous beneath, broadly ovate to ovate-orbicular, 6–12 cm. long, 5–10 cm. wide, obtuse, rounded to slightly

cordate; inflorescence an axillary, pedunculate, compound umbel or cyme; flowers pale green; style several-parted; drupe globose, red, about 6 mm. across; seeds U-shaped, coarsely rugose on back.—July–Sept. Warmer parts; Honshu (Tôkaidô to Chûgoku Distr.), Shikoku, Kyushu.—India, Malaysia, and China.

5. CISSAMPELOS L. MIYAKOJIMA-TSUZURA-FUJI ZOKU

Woody climbers; leaves often peltate, glabrous or pubescent; staminate inflorescence corymbiform, panicate or cymose, axillary, the pistillate cymose, racemose, or rarely in axillary fascicles or similar to the staminate; staminate sepals 4–5, the petals 2–5, free or connate; stamens united into a column, the anthers 2–4, marginal; carpels solitary; style 3-fid or dentate, the lobes entire or bilobed; drupe subglobose, oblique, the stones compressed laterally, tuberculate on back, excavated on each side; seeds U-shaped.—About 20 species, in the Tropics.

1. *Cissampelos insularis* Makino. *Paracylea insularis* (Makino) Kudo & Yamamoto—MIYAKOJIMA-TSUZURA-FUJI. Scandent shrubs with striate branches, pubescent while young; leaves ovate-cordate or broadly ovate, 3–10 cm. long and as wide, subobtusely, pubescent on both sides especially beneath, green above, paler beneath; inflorescence panicate or

racemose, sessile in the pistillate, the staminate short-pedunculate, 3–8 cm. long; staminate petals 4–5, free; fruit subglobose, about 5 mm. long, thinly long-pilose.—Aug.–Oct. Warmer parts; Honshu (s. Kinki and w. Chûgoku Distr.), Shikoku, Kyushu; rare.—Ryukyus.

Fam. 94. MAGNOLIACEAE MOKUREN KA Magnolia Family

Evergreen or deciduous, often aromatic trees or shrubs or sometimes scandent woody vines; leaves entire, simple, rarely lobed or toothed, the stipules large, rarely absent; flowers usually bisexual, sometimes unisexual, actinomorphic: sepals 3, often petaloid; petals 6 to many; stamens many, rarely connate; carpels usually spirally arranged on an elongate often woody torus, rarely verticillate, each with 1 to few usually anatropous ovules, dehiscent along dorsal or ventral sutures or berrylike and indehiscent; endosperm oily.—About 10 genera, with about 100 species, in temperate and subtropical regions of Asia and America.

- 1A. Erect woody plants; mature fruit a woody, dehiscent follicle; flowers bisexual.
 2A. Stipules prominent, deciduous; carpels spirally arranged, the seeds dorsally dehiscent at maturity.
 3A. Fruit stipitate. 1. *Michelia*
 3B. Fruit sessile. 2. *Magnolia*
 2B. Stipules absent; carpels in a single simple verticil, the seeds dehiscent on inner side when mature. 3. *Illicium*
 1B. Woody climbers; mature carpels fleshy, indehiscent, berrylike; flowers unisexual; plants dioecious or monoecious.
 4A. Receptacles much elongate after anthesis, the carpels spicate. 4. *Schisandra*
 4B. Receptacles not elongate, the carpels capitate. 5. *Kadsura*

1. MICHELIA L. OGATAMA-NO-KI ZOKU

Trees; leaves simple, penninerved, stipulate; flowers solitary, axillary, rather small; sepals and petals (tepals) similar, 9 to many, 3- to many-seriate, imbricate; anthers linear, the locules introrse; carpels many, 2- to many-ovuled, loosely arranged on an elongate conelike axis, coriaceous, persistent; seeds at first suspended by a filiform funicle.—More than 10 species, in mountains of tropical and subtropical regions of Asia.

1. *Michelia compressa* (Maxim.) Sarg. *Magnolia compressa* Maxim.—OGATAMA-NO-KI. Erect evergreen tree, brownish appressed-pubescent on young branches, buds, and young leaves beneath; leaves oblong-ovate or oblong, 5–10 cm. long, 2–4 cm. wide, coriaceous, lustrous and deep green above, paler beneath, acute with an obtuse tip; petioles 2–3 cm.

long, appressed-pubescent; flowers solitary in upper axils, about 3 cm. across, white, with a purplish red center; perianth-segments 12, oblanceolate, 15–25 mm. long; carpels short-pubescent while young, 2- to 3-seeded, the fruit 5–10 cm. long.—Feb.–Apr. Warmer regions; Honshu (s. Kantō, Tōkaidō, and s. Kinki Distr.), Shikoku, Kyushu.—Ryukyus and Formosa.

2. MAGNOLIA L. MOKUREN ZOKU

Evergreen or deciduous trees or shrubs with rather stout branches, the winter buds large, enveloped by a single outer scale; leaves usually entire, simple, petiolate; stipules membranous, adnate to the base of petiole and enclosing the young successive leaves, the scar encircling the stem; flowers large, solitary, terminal, sessile or short-pedunculate, bisexual, the bud enclosed in a stipular spathe; sepals 3, often petaloid; petals 6–12, in 2–4 series; stamens many, the anthers linear, the locules introrse; carpels many, 2-ovuled, on a conelike, woody receptacle; seeds with an aril.—About 35 species, in temperate to warmer regions of eastern N. America, Mexico, West Indies, e. Asia, and the Himalayas.

- 1A. Flowers after or with the leaves; fruit conelike, usually symmetrical, subglobose to oblong.
 2A. Evergreen tree; leaves thick-coriaceous; cultivated. 1. *M. grandiflora*
 2B. Deciduous trees and shrubs.
 3A. Leaves 20–40 cm. long, mostly at the tip of the branches; branches and winter buds glabrous; flowers erect on a short stout peduncle. 2. *M. obovata*
 3B. Leaves 6–18 cm. long, alternate on the branches.
 4A. Flowers erect, 12–15 cm. across, on a short stout peduncle. 3. *M. × watsonii*
 4B. Flowers nodding, 8–10 cm. across, on a rather long slender peduncle. 4. *M. sieboldii*
 1B. Flowers appearing before the leaves, subsessile; fruit cylindric, usually curved and unsymmetric.
 5A. Sepals 3, much shorter and narrower than the petals.
 6A. Flowers expanding, white or partially reddish; indigenous trees and shrubs.
 7A. Leaves broadly lanceolate to ovate-oblong, acute, glaucous and white-puberulent beneath; branches rather slender; flowers without a small leaf at base of the peduncle. 5. *M. salicifolia*
 7B. Leaves obovate, abruptly acuminate, pale green beneath; branches rather stout; flowers usually with a small leaf at base of the peduncle. 6. *M. kobus*
 6B. Flowers not expanding, purplish, with ascending sepals and petals; leaves broadly obovate, 6–12 cm. wide; cultivated. 7. *M. liliflora*
 5B. Perianth segments similar in shape and color.
 8A. Perianth-segments 9, obovate; leaves broadly obovate, 8–15 cm. long. 8. *M. denudata*
 8B. Perianth-segments 12–18, oblanceolate; leaves narrowly obovate or broadly oblanceolate, 5–8 cm. long. 9. *M. stellata*

1. *Magnolia grandiflora* L. TAISAN-BOKU. Evergreen tree, the buds and young branches densely soft brown-tomentose; leaves coriaceous, oblong to narrowly so, or ovate, sometimes ovate-oblong, 12–23 cm. long, 5–10 cm. wide, subobtusely to subacute, lustrous and deep green above, brown-tomentose

beneath, the petioles about 2 cm. long; flowers cup-shaped, erect, 15–20 cm. across, white, fragrant, on a short stout peduncle; fruit ovoid, 7–10 cm. long, brown-hairy.—May–July. Commonly planted in parks and gardens.—se. United States.

2. *Magnolia obovata* Thunb. *M. hypoleuca* Sieb. & Zucc.; *M. glauca* sensu Thunb., non L.—HŌ-NO-KI. Deciduous tree; branches stout, glabrous, purplish; winter buds glabrous; leaves obovate to narrowly cuneate-obovate, 20–40 cm. long, 13–25 cm. wide, usually rounded and broadly mucronate, obtuse to narrowly rounded at base, glabrous above, glaucous and pubescent beneath, the petioles glabrous or slightly pubescent on upper side, 2–3 cm. long; flowers cup-shaped, white, about 15 cm. across, erect, fragrant; sepals 3, similar to the petals but smaller; petals 6–9, obovate, slightly fleshy; anthers 16–18 mm. long; fruit narrowly oblong.—May–June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—China.

3. *Magnolia* × *watsonii* Hook. f. UKEZAKI-ŌYAMARENGE. Small tree with glabrous rather stout branches; leaves obovate or oblong-obovate, 10–18 cm. long, 6–13 cm. wide, obtuse, nearly glabrous above, glaucous and pubescent beneath, the petioles 1.5–2 cm. long; flowers erect, cup-shaped, 12–15 cm. across, the peduncles 2–3 cm. long.—Reported to be a hybrid of No. 2 and No. 4.

4. *Magnolia sieboldii* C. Koch. *M. parviflora* Sieb. & Zucc., non Bl.; *M. oyama* Kort; *M. verecunda* Koidz.—ŌYAMARENGE. Large shrub with glabrous, rather stout branches, the buds scattered brown-hairy; leaves obovate or broadly so, 7–15 cm. long, 5–10 cm. wide, green and scattered-pubescent on nerves above, whitish to glaucous and sparsely long-pubescent beneath, the petioles pubescent, 2–3.5 cm. long; flowers nodding, 8–10 cm. across, fragrant, white, cup-shaped, the peduncle rather long and pubescent; sepals ovate, pale rose, 1/2–2/3 as long as the petals; petals white, obovate, usually 6; fruit ellipsoidal, 2.5–3.5 cm. long, glabrous.—May–July. Woods in mountains; Honshu (Kantō to Kinki Distr.), Shikoku, Kyushu; rare.—Korea.

5. *Magnolia salicifolia* (Sieb. & Zucc.) Maxim. *Buergeria salicifolia* Sieb. & Zucc.—TAMU-SHIBA. Small deciduous tree with rather slender glabrous branches; leaves broadly lanceolate to ovate-oblong, 6–12 cm. long, 2–5 cm. wide, thinly chartaceous, acute, glabrous above, glaucous and white-puberulent beneath, acute at base, the petioles glabrous, 1–1.5 cm. long; flowers white, 7–10 cm. across; sepals 3, lanceolate, 20–30 mm. long, 4–7 mm. wide, about half as long as the petals; petals 6(–12), narrowly obovate, to broadly oblanceolate, 17–25 mm. wide, spreading; fruit cylindric, 5–7 cm. long, glabrous.—Apr.–May. Mountains; Honshu (mainly Japan Sea side), Kyushu.

6. *Magnolia kobus* DC. *M. thurberi* Hort.; *M. praecoccima* Koidz.—KOBUSHI. Deciduous tree with rather stout glabrous branches; leaves thinly chartaceous, obovate to broadly so, 6–13 cm. long, 3–6 cm. wide, abruptly acuminate, the tip subobtusely, glabrous above, paler green and slightly pubescent on nerves beneath; flowers white, sometimes with a rose-purple center, about 10 cm. across, usually with a small leaf at base of the very short peduncle; sepals 3, linear, 15–18

mm. long, 3–4 mm. wide; petals narrowly obovate, 2–3.5 cm. broad, spreading, usually reddish near the base; fruit short-cylindric, 7–10 cm. long.—Apr.–May. Hills and base of mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

Var. *borealis* Sarg. *M. praecoccima* var. *borealis* (Sarg.) Koidz.—KITA-KOBUSHI. Leaves larger, 10–17 cm. long, 6–8 cm. wide; flowers slightly larger, often pink tinged.—Hokkaido and Honshu (Japan Sea side of n. and centr. distr.).—S. Korea.

7. *Magnolia liliflora* Desr. *M. discolor* Vent.; *M. purpurea* Curt.; *Yulania japonica* Spach; *M. obovata* sensu Willd., non Thunb.—MOKUREN, SHI-MOKUREN. Large deciduous shrub with rather stout erect nearly glabrous branches; leaves obovate or broadly so, 8–18 cm. long, 6–12 cm. wide, abruptly short-acuminate, narrowed below, scattered short-pilose above, pale green and short-pilose on nerves beneath, the petioles 10–15 cm. long; flowers tubular-campanulate, not expanding, 8–10 cm. long; sepals lanceolate, about 3 cm. long, 7–8 mm. wide, recurved below, with incurved margin above; petals 6, dark purple, usually whitish inside, 3–4 cm. wide.—Apr.–May. Widely cultivated in our area.—centr. China.

Var. *gracilis* (Salisb.) Rehd. *M. gracilis* Salisb.—TŌ-MOKUREN. Shrub with rather slender, erect branches, the leaves narrower; sepals linear-lanceolate, incurved on margin, rather straight, about 4 mm. wide; petals slightly smaller, narrower, dark red-purple, with whitish inner side.—Chinese shrub cultivated in gardens.

8. *Magnolia denudata* Desr. *M. conspicua* Salisb.; *M. yulan* Desf.—HAKU-MOKUREN. Deciduous tree, resembling the preceding, but the flowers white and open-campanulate; leaves broadly ovate, 8–15 cm. long; perianth-segments (tepals) 9, narrowly obovate, 7–8 cm. long, 3–4 cm. wide; fruit glabrous.—Apr. Ornamental tree from centr. China, cultivated in our area.

Var. *purpurascens* (Maxim.) Rehd. & Wils. *M. purpurascens* (Maxim.) Makino; *M. conspicua* var. *purpurascens* Maxim.—SARASA-RENGE. Perianth-segments pale red-purple outside and white inside.—Cultivated in our area; flowering slightly later than the typical phase.—centr. China.

9. *Magnolia stellata* (Sieb. & Zucc.) Maxim. *Buergeria stellata* Sieb. & Zucc.—SHIDE-KOBUSHI. Small tree or large shrub with densely pubescent young branches; leaves thinly chartaceous, narrowly obovate or broadly oblanceolate, 5–8 cm. long, 1–3 cm. wide, obtuse to rounded, cuneate at base, glabrous above, pale green and glabrous or slightly short-pubescent only on nerves beneath, the petioles 2–5 mm. long, usually appressed short-pubescent; flowers white to rose, about 8 cm. across; perianth-segments (tepals), 12–18, oblanceolate, 8–12 mm. wide, spreading, subrecurved before withering; carpels glabrous.—Apr. Mountains; Honshu (western Tōkaidō Distr.); often planted in gardens.

3. ILLICIMUM L. SHIKIMI ZOKU

Glabrous, often aromatic, evergreen trees and shrubs; leaves simple, alternate, glandular-dotted, usually entire, petiolate; flowers solitary, pedicelled, white, yellowish or purplish; sepals 3 or 6, free, membranous, in 1 or 2 series, imbricate; petals many, spreading, usually linear-oblong; stamens many, the filaments thickened, the anther-locules introrse; carpels many, verticillate, 1-ovuled; follicles coriaceous or ligneous.—About 20 species, in e. Asia and N. America.

1. *Illicium religiosum* Sieb. & Zucc. *I. anisatum* L. pro parte; *I. japonicum* Sieb.—SHIKIMI. Small evergreen tree; leaves coriaceous, lustrous, narrowly obovate or oblong, 4–10

cm. long, 1.5–3.5 cm. wide, abruptly short-acuminate, the tip obtuse, entire, the lateral nerves and veinlets not prominent; petioles 10–15 mm. long; flowers pale yellow-white, fragrant,

Betula platyphylla var. *japonica* Hara (Betulaceae). Okuyukusu in Nemuro Prov., Hokkaido. (Photo M. Tatewaki.)

Callianthemum miyabeianum Tatew. (Ranunculaceae). Mount Appi, Hidaka, Hokkaido. (Photo M. Tatewaki.)

Machilus thunbergii Sieb. & Zucc. (Lauraceae). Enoshima Island, Sagami Prov., Honshu. (Photo J. Ohwi.)

Stauntonia hexaphylla (Thunb.) Decne. (Lardizabalaceae). Near Kobe, Honshu. (Photo J. Ohwi.)

2.5-3 cm. across, the peduncles about 2 cm. long, the bracts caducous; petals broadly linear or lanceolate; seeds yellow-brown.—Mar.-May. Thickets and woods in foothills; Hon-

shu (Kantō Distr. and westw.), Shikoku, Kyushu; common and much planted in temples and used as a decoration in Buddhist cemeteries.—Ryukyus, Formosa, and China.

4. SCHISANDRA Michx. MATSUBUSA ZOKU

Scandent dioecious woody climbers; leaves alternate, membranous, deciduous, exstipulate; flowers solitary, from the lower axils of young shoots, small, nodding, long-pedunculate, pale yellow or rose, the perianth-segments 6-12, petalike; stamens 5-15, connate; carpels many, indehiscent, 2-ovuled, loosely arranged in a spike on a much-elongate receptacle, berrylike, red or black; seeds reniform.—More than 10 species, 1 in N. America, the others in e. and s. Asia.

- 1A. Leaves narrowly obovate to obovate-orbicular, with 5-10 short teeth, the midrib impressed on upper side; petioles half or less than half as long as the blade; fruit red; seeds smooth. 1. *S. chinensis*
 1B. Leaves ovate-orbicular, with 3-5 short teeth, the midrib not impressed on upper side; petioles about as long as to half as long as the blade; fruit blue-black; seeds tubercled. 2. *S. repanda*

1. *Schisandra chinensis* (Turcz.) H. Baill. *Kadsura chinensis* Turcz.; *Sphaerostemma japonica* Sieb. & Zucc.; *Maximowiczia chinensis* (Turcz.) Rupr.—CHŌSEN-GOMISHI. Small scandent shrub; leaves membranous, narrowly obovate to obovate-orbicular, rarely elliptic, 4-7 cm. long, 3-5 cm. wide, glabrous or sometimes papillose on nerves beneath, the petioles 2-2.5 cm. long, pale green; flowers creamy white, pendulous on slender peduncles; petals oblong, about 10 mm. long, ascending; fruit globose, red; seeds smooth.—May-June. Mountains; Hokkaido, Honshu (n. and centr. distr.).—Korea, China, Amur, and Sakhalin.

2. *Schisandra repanda* (Sieb. & Zucc.) Radlk. *Tro-*

chostigma repanda Sieb. & Zucc.; *S. nigra* Maxim.—MATSUBUSA. Closely resembles the preceding; leaves slightly thicker, broader, flat above, glabrous, 2-6 cm. long, 3.5-5 cm. wide, rounded and abruptly petiolate at base, paler beneath, the nerves not impressed, the petioles 2-5 cm. long, often reddish, the petals creamy white; fruit globose, blue-black; seeds tubercled.—May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—s. Korea.—Forma *hypoleuca* (Makino) Ohwi. *S. nigra* var. *hypoleuca* Makino; *S. discolor* Nakai.—URAJIRO-MATSUBUSA. Leaves whitish beneath.—Occurs with the typical phase.

5. KADSURA Juss. SANE-KAZURA ZOKU

Evergreen scandent dioecious shrubs; leaves alternate, petiolate, simple, rather thick, lustrous, scattered-toothed; stipules absent; flowers axillary, solitary, creamy white; perianth-segments 9-15, the outer gradually smaller, the inner petaloid; stamens in the staminate flowers many, free or connate in a head, the connective broad; carpels many, in heads, 2- to 3-ovuled, the fruiting ones berrylike, red, on a globose incrassate fleshy receptacle; seeds reniform.—About 10 species, in the tropical and temperate regions of Asia.

1. *Kadsura japonica* (Thunb.) Dunal. *Uvaria japonica* Thunb.—SANE-KAZURA, BINAN-KAZURA. Leaves elliptic, oblong or ovate, 5-10 cm. long, 3-5 cm. wide, rather thick and soft, deep green and lustrous above, paler and often purplish beneath, the lateral nerves and veinlets very weak and obso-

lete; peduncles with few small scalelike bracts on lower part; flowers about 1.5 cm. across, pendulous, the inner petals elliptic, about 10 mm. long; seeds about 5 mm. across.—Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China and Formosa.

Fam. 95. LAURACEAE * KUSU-NO-KI KA Laurel Family

Usually aromatic, sometimes dioecious erect trees or shrubs, rarely twining epiphytic parasites; leaves alternate, simple or palmately cleft, pinninerved, sometimes 3-nerved at base; stipules absent; flowers bisexual or unisexual, actinomorphic, rather small, in axillary umbels, racemes, or panicles, the perianth-segments 4 or 6, often connate at base; stamens 6-12, the anthers 2- to 4-locular, the locules opening upward by a flaplike valve; ovary 1-locular, with a solitary pendulous ovule; fruit a berry or drupe, often enclosed by the persistent perianth base; seeds without endosperm.—About 40 genera, with about 1,500 species, mainly in the Tropics, relatively few in temperate regions.

- 1A. Flowers bisexual; inflorescence without involucre bracts.
 2A. Twining parasitic herbs; leaves scalelike, small; anthers 2-locular. 1. *Cassytha*
 2B. Trees with large leaves.
 3A. Fruit entirely enclosed within the perianth-tube; anthers 2-locular. 2. *Cryptocarya*
 3B. Fruit naked; anthers 4-locular.
 4A. Perianth-segments deciduous; leaves usually 3-nerved. 3. *Cinnamomum*
 4B. Perianth-segments persistent, reflexed in fruit; leaves usually pinninerved. 4. *Machilus*
 1B. Flowers unisexual (plants dioecious); inflorescence involucre bracts.
 5A. Anthers (except in *Lindera citriodora*) 2-locular; perfect stamens 9; leaves mostly deciduous (evergreen in *Lindera strychnifolia*).
 6A. Fruit an indehiscent berry. 5. *Lindera*
 6B. Fruit dry, irregularly splitting, 5- to 6-lobed, the seed exposed. 6. *Parabenzoïn*
 5B. Anthers 4-locular; leaves evergreen.
 7A. Perianth-segments 4; stamens 6(-8); leaves usually 3-nerved. 7. *Neolitsea*

7B. Perianth-segments 6; stamens 9(-12); leaves usually penninerved.

8A. Lower surface of leaves tomentose; perianth-tube developed into a cup enclosing the base of the fruit. 8. *Litsea*

8B. Lower surface of leaves glabrous or nearly so; perianth-tube not developed into a cup enclosing the base of fruit.

9. *Actinodaphne*

1. CASSYTHA L. SUNAZURU ZOKU

Epiphytic twining parasitic herbs; stems filiform, much-branched, adhering to the host by holdfasts; leaves small, scalelike, alternate; inflorescence spicate, racemose, or in heads, in axils of scalelike leaves; flowers sessile or short-pedicelled, bisexual, sometimes dimorphic, the bracteoles 2, minute; perianth-segments 6, persistent, the inner 3 connate below into an ovoid tube; perfect stamens 9, the 6 outer ones introrse, without glands, the inner 3 extrorse, each with a gland on each side; staminodes subsessile or stipitate; fruit enclosed in a fleshy perianth-tube.—About 30 species, in the tropics.

1. *Cassytha filiformis* L. SUNAZURU. Glabrous, slender, herbaceous, much branched; scales, bracts, bracteoles and 3 outer perianth-segments ovate-cordate, about 0.5 mm. long, ciliolate; flowers sessile, in rather loose axillary spikes; inner

perianth-segments elliptic or ovate-deltoid, 1.5-2 mm. long; fruit globose, 6-7 mm. long and as wide, enclosed by the perianth-tube.—Oct.-Nov. Near seashores; Kyushu (Yakushima). Widely distributed in the Tropics.

2. CRYPTOCARYA R. Br. SHINA-KUSU-MODOKI ZOKU

Trees or shrubs; leaves alternate or rarely subopposite, 3-nerved or penninerved; inflorescence a panicle; flowers small, bisexual; perianth-segments 6, nearly equal, the tube nearly ovoid, contracted at apex after anthesis; perfect stamens 9, in 3 series, those of outer 2 series not glanduliferous, introrse, the inner with a gland on each side, extrorse; staminodes ovate; ovary sessile; berry entirely enclosed in the perianth-tube, globose or ellipsoidal, the perianth-segments deciduous.—More than 100 species, in the Tropics.

1. *Cryptocarya chinensis* (Hance) Hemsl. *Beilschmiedia chinensis* Hance—SHINA-KUSU-MODOKI. Tree; leaves narrowly elliptic, 7-10 cm. long, 3-5 cm. wide, acuminate, 3-nerved, the petioles 7-12 mm. long; panicles axillary and ter-

minial, 2-3 cm. long; flowers 2-3 mm. long; fruit about 10 mm. across, 13-15 mm. long.—Kyushu (Hyuga Prov. and Tanegashima).—Formosa and s. China.

3. CINNAMOMUM Bl. KUSU-NO-KI ZOKU

Aromatic trees; leaves evergreen, coriaceous, subopposite or alternate, 3-nerved; inflorescence an axillary or terminal panicle, sometimes a raceme or umbel; flowers bisexual, the perianth-segments 6, equal, the tube short; perfect stamens 9 or fewer, in 3 series, the outer 2 series without glands, the anthers introrse, 4-locular, the innermost series with 2 glands on each filament, the anthers extrorse; staminodes capitate and stipitate; ovary sessile; berry with a persistent perianth-tube below.—About 100 species, in tropical Asia, few in Australia.

1A. Leaves with impressed axillary glands beneath. 1. *C. camphora*

1B. Leaves without axillary glands beneath.

2A. Leaves obovate-oblong, 3-6 cm. long, rounded to very obtuse, with pale yellowish silky appressed-hairs beneath. . . . 2. *C. daphnoides*

2B. Leaves lanceolate to ovate-orbicular, 6-15 cm. long, acute to obtuse, glabrous or scattered-hairy.

3A. Inflorescence glabrous; leaves acute. 3. *C. japonicum*

3B. Inflorescence appressed-pubescent; leaves short-caudate. 4. *C. sieboldii*

1. *Cinnamomum camphora* (L.) Sieb. *Laurus camphora* L.—KUSU-NO-KI. Glabrous evergreen tree with yellow-brown branches; buds many-scaled; leaves subcoriaceous, ovate or broadly so or elliptic, 6-10 cm. long, 3-6 cm. wide, abruptly acuminate, lustrous above, often glaucescent beneath, 3-nerved or subpenninerved, with 2 impressed glands in the lower nerve axils beneath, the petioles 15-25 mm. long; inflorescence axillary, paniculate, glabrous, pedunculate, shorter than the leaves, the bracts caducous, membranous, linear, soft-pubescent, the perianth-segments about 1.5 mm. long, yellow-green, soft-pubescent inside, elliptic; fruit globose, 7-8 mm. across, black.—May-June. Warmer parts; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; widely planted.—Ryukyus, Formosa, and China.

2. *Cinnamomum daphnoides* Sieb. & Zucc. *C. sericeum* Sieb. ex Miq.—KŌCHI-NIKKEI. Evergreen tree, the young branchlets pale yellowish and densely appressed silky-pubescent; leaves coriaceous, obovate to oblong, 3-6 cm. long, 1.2-3 cm. wide, rounded at apex, obtuse at base, appressed-pubescent

above while young, densely yellowish silky appressed-tomentose beneath, deep green above, the margin slightly recurved, the midrib 3-parted from the base, the petioles 5-8 mm. long, silky-pubescent; inflorescence densely appressed silky-pubescent; perianth-segments 3-3.5 mm. long, appressed-pubescent on both sides, broadly ovate-elliptic; fruit ellipsoidal, about 10 mm. long.—Kyushu (s. distr.); common near the sea.—Ryukyus.

3. *Cinnamomum japonicum* Sieb. ex Nakai. *C. pedunculatum* Nees, excl. syn. Thunb.—YABU-NIKKEI. Glabrous evergreen tree; leaves subcoriaceous, narrowly ovate or oblong, 6-12(-15) cm. long, 2-5 cm. wide, obtuse, glaucous beneath, the midrib 3-parted near base, the petioles 8-18 mm. long; inflorescence shorter than the leaves, glabrous; peduncles prominent, the pedicels rather short; perianth-segments about 2.5 mm. long, broadly ovate, puberulent inside; fruit ellipsoidal, 10-12 mm. long, black.—June. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea, China, Ryukyus, and Formosa.

Cinnamomum brevifolium Miq. *C. maruba* Jungh.—**MARUBA-YABU-NIKKEI**. Leaves nearly orbicular, 3-nerved from the base.—This may be a variant of No. 3.

4. **Cinnamomum sieboldii** Meissn. *C. loureiri* sensu auct. Japon., non Nees—**NIKKEI**. Evergreen tree; branches with scattered short appressed hairs while young; leaves coriaceous, narrowly ovate-oblong, rarely broadly lanceolate, 8–15

cm. long, (2–)2.5–5 cm. wide, glabrous (young leaves appressed white-pubescent), caudate, glaucous beneath, the midrib 3-parted near base, the petioles 15–20 mm. long; inflorescence much shorter than the leaves, rather densely appressed white-hairy; perianth-segments about 5 mm. long, oblong, appressed-puberulent on both sides.—May–June. Planted in warmer districts.—**Ryukyus** (?).

4. MACHILUS Nees TABU-NO-KI ZOKU

Evergreen trees with alternate, pinninerved, petiolate leaves; panicles axillary; flowers bisexual, small, the perianth-segments 6, equal or the outer 3 slightly smaller, persistent, the tube short; perfect stamens 9, in 3 series, the anthers 4-locular, the outer 6 without glands, introrse, the inner 3 each with 2 glands at base, extrorse; staminodes 3, capitate, stipitate; ovary sessile; berry ellipsoidal or globose, with persistent reflexed perianth-segments at base.—About 60 species, in s. and e. Asia.

- 1A. Leaves obovate to broadly oblanceolate, sometimes oblong, glabrous, abruptly obtuse. 1. *M. thunbergii*
1B. Leaves obovate-oblong to lanceolate or oblanceolate, usually tapered and sometimes caudate. 2. *M. japonicus*

1. **Machilus thunbergii** Sieb. & Zucc. **TABU-NO-KI, INUGUSU**. Large evergreen tree with stout, terete, glabrous branches, the bud-scales many, the inner ones yellow-brown, woolly; leaves coriaceous, obovate, elliptic or broadly oblanceolate, 8–15 cm. long, 3–7 cm. wide, abruptly obtuse, usually acute at base, lustrous and deep green above, pinninerved, pale green and with slightly raised veinlets beneath, the petioles 2–3 cm. long, stout; inflorescence glabrous; flowers pedicelled, the perianth-segments 5–7 mm. long, narrowly oblong, brown-pubescent inside; fruit globose, about 10 mm. across, black-purple.—Mar.–May. Hills, lowlands, and foothills; Honshu, Shikoku, Kyushu; common.—s. Korea, Ryukyus, Formosa, and China.

2. **Machilus japonicus** Sieb. & Zucc. *M. thunbergii* var. *japonicus* (Sieb. & Zucc.) Yatabe—**HOSOGA-TABU, AOGASHI**. Evergreen tree with glabrous branches, the bud-scales many, ciliate; leaves lanceolate or obovate-oblong, 8–20 cm. long, 2–4 cm. wide, sometimes oblanceolate, somewhat lustrous, whitish with slightly raised veinlets beneath, gradually acuminate or caudate, acute at base, the petioles 15–20 mm. long; inflorescence glabrous; flowers pedicelled, the perianth-segments 4–5 mm. long, narrowly oblong, puberulent inside and on margin; fruit globose, about 10 mm. long.—May–June. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—s. Korea and Ryukyus (?).

5. LINDERA Thunb. KURO-MOJI ZOKU

Diocious trees and shrubs; bud-scales few to many or absent; leaves alternate or subopposite, deciduous, sometimes evergreen, pinninerved, sometimes 3-nerved; inflorescence umbellate, sessile or peduncled, with usually 4(2–5) involucre bracts in bud; flowers unisexual, the perianth-segments 6, deciduous, nearly equal, the tube short; stamens usually 9, in 3 series, the outer 6 without glands, the inner each with 2 glands, the anthers introrse, 2-locular (4-locular in No. 5); staminodes absent; berry globose or ovoid.—About 100 species, in warmer and tropical regions of the N. Hemisphere, few in N. America, abundant in Asia.

- 1A. Leaves 3-nerved from the base.
2A. Leaves often 3-cleft, deciduous, ovate-orbicular. 1. *L. obtusiloba*
2B. Leaves unlobed, evergreen, elliptic or broadly so. 2. *L. strychnifolia*
1B. Leaves pinninerved.
3A. Branchlets yellowish brown; winter-buds sessile.
4A. Petioles 3–4 mm. long; leaves oblong to elliptic; fruit black, 6–7 mm. across. 3. *L. glauca*
4B. Petioles 7–20 mm. long; leaves oblanceolate; fruit red, 5–6 mm. across. 4. *L. erythrocarpa*
3B. Branchlets dark green; flowers opening before or with the leaves; fruit black.
5A. Leaves glabrous; pedicels 4–6 mm. long, glabrous; winter-buds sessile. 5. *L. citriodora*
5B. Leaves long-pubescent at least while young; pedicels 15–20 mm. long, pubescent; winter-buds stipitate.
6A. Petioles 10–15 (–20) mm. long; leaves without prominently raised veinlets beneath. 6. *L. umbellata*
6B. Petioles 5–10 (–15) mm. long; leaves with prominently raised veinlets beneath. 7. *L. sericea*

1. **Lindera obtusiloba** Bl. *Benzoïn obtusilobum* (Bl.) O. Kuntze—**DAN-KŌBAI**. Large shrub; leaves alternate, ovate-orbicular or broadly so, 5–15 cm. long, 4–13 cm. wide, usually 3-lobed, green and slightly pubescent above while young, whitish and often long-pubescent becoming glabrate beneath, subobtusely to subacute, truncate to shallowly cordate at base, the lobes ovate-deltoid, the lateral ones erect, obtuse, the petioles 1.5–3 cm. long; flowers opening before the leaves, the peduncles absent, the pedicels 12–15 mm. long, pubescent, slightly thickened at apex; fruit globose, about 8 mm. across,

red.—Apr.–May. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea and China.

2. **Lindera strychnifolia** (Sieb. & Zucc.) F. Vill. *Daphnidium strychnifolium* Sieb. & Zucc.; *Benzoïn strychnifolium* (Sieb. & Zucc.) O. Kuntze—**TENDAI-UYAKU**. Evergreen shrub; leaves subcoriaceous, elliptic to broadly obovate, 4–6 cm. long, 2.5–4 cm. wide, caudate, with an obtuse tip, glaucous beneath, densely pale brown-pubescent while young, glabrescent, except the midrib, the veinlets rather prominent, the petioles 5–10 mm. long; peduncles absent, the pedicels 3–4

mm. long at anthesis, pubescent.—Apr. Chinese shrub often planted in warmer parts and sometimes naturalized.

3. *Lindera glauca* (Sieb. & Zucc.) Bl. *Benzoïn glaucum* Sieb. & Zucc.—YAMA-KOBASHI. Large deciduous shrub; leaves oblong to elliptic, often ovate or obovate-oblong, acute to subacute at both ends, whitish, with deciduous hairs beneath, green, glabrous, the midrib puberulous above, the petioles short, 3–4 mm. long; peduncles very short, the pedicels 13–15 mm. long, thickened at apex; fruit globose, black, 6–7 mm. across.—Apr. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea, China, and Formosa.

4. *Lindera erythrocarpa* Makino. *Benzoïn erythrocarpa* (Makino) Rehd.; *L. thunbergii* Makino, excl. syn.—KANAKUGI-NO-KI. Large deciduous shrub; leaves oblanceolate to oblong, 6–13 cm. long, 1.5–2.5 cm. wide, acute or slightly obtuse, glabrous above, glaucescent and with sparse deciduous hairs beneath, the petioles 6–10 mm. long; peduncles 3–5 mm. long, the pedicels pubescent, 10–12 mm. long in fruit; fruit globose, 5–6 mm. across, red.—May. Honshu (s. part of centr. distr. and westw.), Shikoku, Kyushu.—Korea and China.

5. *Lindera citriodora* (Sieb. & Zucc.) Hemsl. *Aperula citriodora* (Sieb. & Zucc.) Bl.; *Benzoïn citriodorum* Sieb. & Zucc.; *L. citrata* Koidz., excl. syn.; *Litsea citriodora* (Sieb. & Zucc.) Hatusima—AO-MOJI. Small deciduous glabrous tree; branches dark green; leaves alternate, thinly chartaceous, broadly lanceolate to narrowly oblong-ovate, 7–15 cm. long, 2–4.5 cm. wide, long-acuminate, glaucous beneath, the veinlets slightly raised above, the petioles 12–25 mm. long; peduncles 10–12 mm. long, the pedicels 4–6 mm. long, slightly thickened at apex; anthers 4-locular; fruit about 5 mm. across, globose, black.—Mar. Low elevations; Kyushu.—Ryukyus and Formosa.

6. *Lindera umbellata* Thunb. *Benzoïn umbellatum* (Thunb.) O. Kuntze; *L. hypoglauca* Maxim.; *Benzoïn hypoglauca* (Maxim.) O. Kuntze; *L. umbellata* var. *hypoglauca* (Maxim.) Makino; *Benzoïn thunbergii* Sieb. & Zucc.; *L. ob-tusa* Fr. & Sav.—KURO-MOJI. Erect deciduous shrub;

leaves thinly chartaceous, narrowly oblong to ovate-oblong, 5–9 cm. long, 1.5–3.5 cm. wide, whitish hairy beneath, glabrescent, the lateral nerves 4 to 6 pairs, the veinlets weak and not raised beneath, the petioles slender, 10–15 mm. long; inflorescence pubescent, the peduncles 4–8 mm. long, the pedicels 15–22 mm. long; perianth-segments elliptic, 3–4 mm. long; fruit about 6 mm. across, black.—Honshu, Shikoku, Kyushu; rather common.—China.

Var. *membranacea* (Maxim.) Momiyama. *L. membranacea* Maxim.; *Benzoïn membranaceum* (Maxim.) O. Kuntze —ŌBA-KURO-MOJI. Plant larger than in the typical phase, the leaves narrowly oblong to obovate, 6–12 cm. long, 3–5 cm. wide, the lateral nerves 5 to 8 pairs.—Hokkaido, Honshu (n. distr.).

Var. *lancea* Momiyama. HIME-KURO-MOJI. Leaves lanceolate-oblong to oblanceolate, acuminate, the silky hairs beneath persistent, the petioles shorter, pubescent, the peduncles shorter, with yellowish velvety persistent hairs.—Honshu (Suruga Prov. to Kii and Kawachi Prov.), Shikoku, Kyushu.

7. *Lindera sericea* (Sieb. & Zucc.) Bl. *Benzoïn sericeum* Sieb. & Zucc.; *L. umbellata* var. *sericea* (Sieb. & Zucc.) Makino; *Benzoïn umbellatum* var. *sericeum* (Sieb. & Zucc.) Rehd.—KE-KURO-MOJI. Shrub; leaves chartaceous, narrowly obovate, 6–15 cm. long, 2–6 cm. wide, acuminate to very acute, cuneate, short-pubescent on both sides and with scattered long hairs beneath especially on nerves and on midrib above, whitish beneath, the lateral nerves 6 to 9 pairs, the veinlets prominent and raised beneath; inflorescence few-flowered, the pedicels slightly thickened above in fruit, 15–18 mm. long; fruit globose, about 7 mm. across, black.—Honshu (Kii Prov.), Shikoku, Kyushu.

Var. *glabrata* Bl. *L. sericea* var. *tenuis* (Nakai) Momiyama; *L. subsericea* Makino; *Benzoïn sericeum* var. *tenuis* Nakai—USUGE-KURO-MOJI, MIYAMA-KURO-MOJI. Leaves somewhat smaller and thinner, not short-pubescent on both surfaces but scattered long-hairy beneath.—Honshu (Kantō to centr. distr. and westw.), Shikoku, Kyushu.

6. PARABENZOIN Nakai SHIRO-MOJI ZOKU

Deciduous dioecious shrubs; leaves alternate, petiolate, simple or 3-fid, pinninerved or 3-nerved; inflorescence umbellate, short-pedunculate, with 4 involucre bracts when young; flowers similar to those of *Lindera*, the pedicels thickened; fruit large, globose, irregularly splitting into 5–6 segments and exposing the single yellow-brown seed.—Japan and China.

- 1A. Leaves usually 3-cleft, 3-nerved from the base. 1. *P. trilobum*
 1B. Leaves simple, undivided, not 3-nerved from the base. 2. *P. praecox*

1. *Parabenzoïn trilobum* (Sieb. & Zucc.) Nakai. *Benzoïn trilobum* Sieb. & Zucc.; *Lindera triloba* (Sieb. & Zucc.) Bl.—SHIRO-MOJI. Deciduous shrub; leaves thinly chartaceous, broadly deltoid-obovate, often 3-lobed, 8–12 cm. long, 7–10 cm. wide in the divided ones, 3–5 cm. wide in the simple ones, glaucescent and glabrous beneath except for spreading hairs on the nerves, 3-nerved from the base, the lobes ovate, acuminate, the petioles 10–20 mm. long; inflorescence short-peduncled, the pedicels thickened in fruit, 8–12 mm. long; fruit globose, about 12 mm. across.—Apr. Honshu (centr. distr. and westw.), Shikoku, Kyushu; rather common in mountains.—China.

2. *Parabenzoïn praecox* (Sieb. & Zucc.) Nakai. *Benzoïn praecox* Sieb. & Zucc.; *Lindera praecox* (Sieb. & Zucc.) Bl.—ABURA-CHAN. Deciduous shrub to small tree; leaves chartaceous, ovate to narrowly so or elliptic, 5–7 cm. long, 2–4 cm. wide, acuminate, glabrous, whitish and often soft-pubescent on the nerves beneath, the petioles slender, 10–20 mm. long; flowers opening before the leaves, the pedicels thickened, 8–10 mm. long, slightly ligneous; fruit globose, brownish yellow, about 15 mm. across.—Mar.–Apr. Mountains; Honshu, Shikoku, Kyushu; rather common.

7. NEOLITSEA Merr. SHIRO-DAMO ZOKU

Evergreen dioecious trees; leaves alternate, petiolate, entire, usually 3-nerved from above the base or rarely penninerved, often silky-pubescent while young; inflorescence umbellate, subsessile, enclosed while young by involucre bracts; flowers unisexual, the perianth-segments 4, deciduous, the tube very short; stamens in the staminate flowers 6(–8), all fertile, in 3 series, the outer 4 without glands, the inner 2 each with a gland on each side, the anthers introrse, 4-locular; fruit a berry, red or black.—About 60 species, in e. Asia, Malaysia, and India.

- 1A. Leaves 8–18 cm. long; petioles 2–3 cm. long; flowers yellow, in autumn; fruit red. 1. *N. sericea*
 1B. Leaves 5–12 cm. long; petioles 8–15 mm. long; flowers reddish, in spring; fruit black. 2. *N. aciculata*

1. *Neolitsea sericea* (Bl.) Koidz. *Laurus sericea* Bl.; *Litsea glauca* Sieb.; *Malapoenna sieboldii* O. Kuntze; *N. glauca* (Sieb.) Koidz.; *N. sieboldii* (O. Kuntze) Nakai; *N. latifolia* Koidz., non S. Moore.—SHIRO-DAMO. Evergreen tree with greenish branchlets; leaves coriaceous, oblong or ovate-oblong, 8–18 cm. long, 4–7 cm. wide, obtuse, 3-nerved from above the base, white beneath, densely yellow-brown silky while young, glabrescent or the hairs becoming scattered, the petioles 2–3 cm. long; inflorescence umbellate, sessile, yellow-brown villous, the pedicels 7–10 mm. long in fruit, slightly thickened above; fruit ellipsoidal, 12–15 mm. long, red.—Sept.–Oct. Honshu, Shikoku, Kyushu.—Korea, Formosa, and China.

2. *Neolitsea aciculata* (Bl.) Koidz. *Litsea foliosa* Sieb. & Zucc., non Nees; *Litsea aciculata* Bl.; *Malapoenna aciculata* (Bl.) O. Kuntze.—INUGASHI, MATSURA-NIKKEI. Evergreen tree; leaves coriaceous, oblong to obovate-oblong, 5–12 cm. long, 2–4 cm. wide, obtuse, 3-nerved from above the base, white, glabrous or slightly appressed-pubescent beneath, the petioles 8–15 mm. long; flowers reddish, the pedicels hairy, 7–8 mm. long; fruit ellipsoidal, slightly longer than the pedicel, with a small cup-shaped perianth-tube at base, black.—Mar.–Apr. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus and Korea.

8. LITSEA Lam. HAMA-BIWA ZOKU

Evergreen dioecious trees; leaves alternate, rarely subopposite, usually penninerved; inflorescence umbellate, sessile or pedunculate, subtended by 4–6 involucre bracts; perianth-segments 6, the tube short or ovoid; stamens 9–12, the first and second series without glands, the anthers introrse, 4-locular; fruit a berry often surrounded by an inflated perianth-tube at base.—About 150 species, abundant in tropical Asia and Australia, few in Africa and America.

1. *Litsea japonica* (Thunb.) Juss. *Tomex japonica* Thunb.; *Fiwa japonica* (Thunb.) J. F. Gmel.; *Tetranthera japonica* (Thunb.) Spreng.—HAMA-BIWA. Evergreen tree; branches yellowish velvety; leaves coriaceous, oblong to narrowly so, 7–15 cm. long, 2–5 cm. wide, slightly recurved on margin, obtuse, glabrous above, yellowish velvety beneath, the lateral nerves 8 to 12 pairs, prominently raised beneath, the

petioles 15–40 mm. long, densely woolly; inflorescence short-pedunculate, often branched; flowers very short-pedicelled, the perianth-segments deciduous; stamens 9; fruit ellipsoidal, blue-purple, 15–18 mm. long, about 12 mm. across, with a cup-shaped perianth-tube at base.—Oct.–Nov. Thickets and woods near the sea; Honshu (Nagato Prov.), Shikoku, Kyushu.—Ryukyus and s. Korea.

9. ACTINODAPHNE Nees KAGO-NO-KI ZOKU

Evergreen dioecious trees; leaves alternate, sometimes subverticillate, coriaceous, penninerved; inflorescence umbellate, enveloped by deciduous imbricate bracts while young, pedunculate or sessile; flowers small, the perianth-segments 6, sometimes persistent, the tube short; perfect stamens 9, in 3 series, the outer 6 without glands, the anthers introrse, 4-locular; fruit a berry with a persistent perianth at base.—About 100 species, in the Tropics of Asia and Malaysia.

- 1A. Leaves broadly oblanceolate to obovate-oblong, 5–10 cm. long, glabrous, obtuse; inflorescence subsessile; fruit globose, red. 1. *A. lancifolia*
 1B. Leaves lanceolate, sometimes oblanceolate, 10–25 cm. long, scattered puberulous beneath, long-acuminate; inflorescence a compound umbel, short pedunculate; fruit ellipsoidal, black. 2. *A. longifolia*

1. *Actinodaphne lancifolia* (Sieb. & Zucc.) Meissn. *Daphnidium lancifolium* Sieb. & Zucc.; *lozoste lancifolia* (Sieb. & Zucc.) Bl.; *Litsea lancifolia* (Sieb. & Zucc.) F. Vill.—KAGO-NO-KI. Evergreen tree; leaves coriaceous, obovate-oblong to broadly oblanceolate, 5–10 cm. long, obtuse, glabrous, whitish beneath, the lateral nerves 7 to 10 pairs, the petioles 8–15 mm. long, scattered-pubescent; inflorescence subsessile, the pedicels 5–10 mm. long in fruit, thickened; fruit obovoid-globose, 7–8 mm. long, 6–7 mm. across, with a 6-parted persistent perianth at base.—Sept. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—s. Korea and Ryukyus.

2. *Actinodaphne longifolia* (Bl.) Nakai. *Machilus* (?)

longifolia Bl.; *lozoste acuminata* Bl.; *A. acuminata* (Bl.) Meissn.; *Fiwa longifolia* (Bl.) Nakai.—BARIBARI-NO-KI, AOKAGO-NO-KI. Evergreen tree with stout glabrous branches; leaves thinly coriaceous, lanceolate to narrowly so, sometimes oblanceolate, 10–25 cm. long, 15–30 mm. wide, long-acuminate, glaucous and slightly puberulous beneath, the lateral nerves 10 to 15 pairs, the petioles 10–30 mm. long; inflorescence on a peduncle 5–10 mm. long, the perianth-segments deciduous; fruit ellipsoidal, about 15 mm. long, black.—Aug. Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus.

Fam. 96. PAPAVERACEAE KESHI KA Poppy Family

Usually herbs, glabrous or coarsely hairy, often glaucescent, usually with colored juice; leaves alternate, simple or pinnate, stipules absent; flowers solitary, subumbellate or racemose, actinomorphic or zygomorphic; sepals 2(-4), free, usually caducous; petals 4(-12); stamens many and indefinite or few and definite, sometimes with partially connate filaments; ovary superior, 1- to 8-locular, the placentae parietal, navelike or inflexed and septalike; style short, the stigma various, often discoid; fruit a capsule, dehiscent by valves or opening by pores, rarely indehiscent; seeds sometimes arillate.—About 30 genera, with about 500 species, mostly in the subtropics and cooler regions of the N. Hemisphere.

- 1A. Stamens many; petals if present not spurred; carpels 2-8; sepals usually large.
 2A. Placentae 4-8; stigma discoid; capsules globose to obovoid, opening by pores; flowers usually large and showy. 1. *Papaver*
 2B. Placentae 2; stigma 2-fid; capsules compressed or linear, valves dehiscent to base. 2. *Chelidonium*
 3A. Petals 4; capsules linear; ovules rather numerous. 3. *Macleania*
 3B. Petals absent; capsules cuneate-oblancoleate, flattened; ovules few. 3. *Macleania*
 1B. Stamens 4-6; carpels 2; sepals minute.
 4A. Stamens 6; filaments usually connate below; flowers spurred. 4. *Dicentra*
 5A. Outer 2 petals spurred or saccate at base. 5. *Corydalis*
 5B. Upper petal only spurred or saccate at base. 5. *Corydalis*
 4B. Stamens 4; filaments free; petals not spurred nor saccate at base; leaves radical, pectinately pinnate. 6. *Pteridophyllum*

1. PAPAVER L. KESHI ZOKU

Annuals, biennials, or perennials often with coarse hairs, usually glaucous, with milky juice; leaves usually pinnately lobed; flowers large, showy, yellow, white, or red, long-pedunculate, nodding in bud, erect at anthesis; sepals 2, green, caducous; petals large, 4; stamens many; ovary ovoid to globose or obovoid, 1- to many-locular, many-ovuled; stigma broadly discoid, radiately striate; capsules globose to obovoid, opening by apical pores; seeds minutely impressed-punctate.—About 50 species, mostly in Eurasia, few in N. America.

- 1A. Acaulescent; leaves and peduncles radical; flowers yellow; capsules hispid. 1. *P. jauriei*
 1B. Caulescent, the stems leafy; peduncles cauline, axillary.
 2A. Perennial herb with long coarse hairs on stems and leaves; capsules glabrous. 2. *P. orientale*
 2B. Annuals or biennials.
 3A. Hairy; leaves pinnatisect, not clasping. 3. *P. rhoeas*
 3B. Glabrous; leaves pinnately cleft to incised, clasping. 4. *P. somniferum*

1. *Papaver jauriei* Fedde. *P. nudicaule* var. *jauriei* Fedde; *P. nudicaule* sensu auct. Japon., non L.—RISHIRI-HINAGESHI. Hispid perennial herb, 10-20 cm. high with short-tufted rhizomes; leaves radical, long-petiolate, ovate to narrowly so, pinnately divided, the segments often 2- to 4-lobed, the ultimate lobes oblong, acute; scapes 10-20 cm. high, erect, with spreading hairs below, the hairs appressed above; sepals about 10 mm. long, ovate, densely rusty-brown hairy; petals greenish yellow, about 2 cm. long; capsules broadly ellipsoidal, coarsely appressed-hairy, 7-11 mm. long, 6-10 mm. across.—July-Aug. Alpine gravelly slopes; Hokkaido (Rishiri Isl.); very rare.

2. *Papaver orientale* L. ONIGESHI. Coarsely long-hairy perennial herb, 60-100 cm. high; stems simple, erect, 1-flowered; leaves pinnately divided, the segments broadly lanceolate, coarsely incised; calyx densely coarse-hairy, to 3 cm. long; petals deep red, 5-6 cm. long, with a rather large black spot at base; capsules broadly obovoid.—May-June. A Mediterranean plant often cultivated.

Papaver bracteatum Lindl. *P. orientale* var. *bracteatum* (Lindl.) Ledeb.—BOTANGESHI. Flowers subtended by 2 rather large bracts.—Cultivated in our area.

3. *Papaver rhoeas* L. HINAGESHI. Biennial 30-80 cm. high, with coarse spreading hairs; stems erect, loosely branched, slender; leaves pinnately divided, toothed; peduncles with coarse spreading hairs; sepals about 2 cm. long, hairy; petals white to deep red, 3-4 cm. long; capsules glabrous, broadly obovoid, about 10 mm. long.—May-July. European plant commonly cultivated as an ornamental.

4. *Papaver somniferum* L. KESHI. Large, coarse, glabrous, slightly branched, erect biennial, 50-150 cm. high; leaves glaucous, narrowly ovate to narrowly oblong, clasping, irregularly incised and toothed, the lower ones pinnatifid; sepals glabrous, 1.5-2 cm. long; petals 4(-8), white or red-purple, 5-7 cm. long; capsules ovoid-globose, glabrous, 4-6 cm. long, 3.5-4 cm. across.—May-June. European plant cultivated as a medicinal herb.

2. CHELIDONIUM L. KUSA-NO-Ō ZOKU

Soft sometimes glaucescent annuals, biennials, or perennials with orange juice; stems leafy or acaulescent; leaves pinnately divided; flowers solitary in leaf-axils or few in axillary umbels, rather large, yellow, pedicelled; sepals 2, green, caducous; petals 4; stamens many; placentae 2, parietal; style short, the stigma 2-lobed; capsules linear, glabrous, erect, dehiscent; seeds lustrous, small, arillate.—Few species, in Eurasia.

- 1A. Biennial; stems leafy, 30-80 cm. long; umbels several-flowered, axillary, pedunculate; petals 10-12 mm. long. 1. *C. majus* var. *asiaticum*
 1B. Perennial, rhizomatous; stems few-leaved above, 30-40 cm. long; flowers solitary or paired in axils; petals 2-2.5 cm. long. 2. *C. japonicum*

1. *Chelidonium majus* L. var. *asiaticum* (Hara) Ohwi. *C. majus* var. *hirsutum* Trautv. & Mey., excl. syn.; *C. majus* sensu auct. Japon., non L.; *C. majus* subsp. *asiaticum* Hara—KUSA-NO-Ō. Erect, branched glaucescent biennial herb with multicellular curled hairs at first, later becoming glabrescent; stems 30–80 cm. long; leaves 1- to 2-pinnately parted or divided, 7–15 cm. long, 5–10 cm. wide, obtuse, glabrous to pubescent beneath, obtusely toothed and incised, the lower leaves petiolate; umbels pedunculate, axillary, few-flowered; flowers pedicelled; sepals 6–8 mm. long; petals 10–12 mm. long.—May–July. Meadows and thickets in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—The temperate regions of e. Asia. The typical phase occurs in Europe and Siberia.

2. *Chelidonium japonicum* Thunb. *Hylomecon japonicum* (Thunb.) Prantl; *C. uniflorum* Sieb. & Zucc.; *Stylophorum japonicum* (Thunb.) Miq.—YAMABUKI-SŌ. Soft perennial herb with short rhizomes, with scattered multicellu-

lar curled hairs; radical leaves long-petioled, pinnate, the leaflets 5–7, broadly ovate to elliptic, 1.5–5 cm. long, 1.2–3 cm. wide, short-petiolulate, acute, incised and irregularly toothed; scapes 30–40 cm. long, with few, small, dissected leaves above; flowers 1 to few, axillary, the pedicels 4–6 cm. long; sepals narrowly ovate, acute, 15–17 mm. long; petals 2–2.5 cm. long; capsules linear, 3–5 cm. long, about 3 mm. across, many-seeded; stigma 2-lobed.—Apr.–June. Woods in lowlands and hills; Honshu.—Forma *lanceolatum* (Yatabe) Ohwi. *Stylophorum lanceolatum* Yatabe; *Hylomecon japonicum* var. *lanceolatum* (Yatabe) Makino—HOSOGA-YAMABUKI-SŌ. Leaflets of cauline leaves minutely toothed, broadly lanceolate.—Forma *dissectum* (Fr. & Sav.) Ohwi. *Stylophorum japonicum* var. *dissectum* Fr. & Sav.; *Hylomecon japonicum* var. *dissectum* (Fr. & Sav.) Makino—SERIBA-YAMABUKI-SŌ. Leaflets of cauline leaves linearly rhombic-ovate, deeply pinnatifid and incised.

3. MACLEAYA R. Br. TAKENIGUSA ZOKU

Large erect perennial more or less glaucous herbs with yellow juice; stems stout, hollow, leafy; leaves petiolate, large, pinnatifid; flowers white, small, pedicelled, in large erect panicles; sepals 2, white, caducous; petals absent; stamens many; ovary 1; style short, the stigma thickened, 2-lobed; ovules few; capsules broadly oblanceolate, pendulous, flat, the valves membranous, glabrous; seeds few.—Two species, in Japan and China.

1. *Macleaya cordata* (Willd.) R. Br. *Bocconia cordata* Willd.; *B. jedoensis* Carr.; *B. japonica* André; *M. yedoensis* André; *M. cordata* var. *yedoensis* (André) Fedde—TAKENIGUSA, CHAMPAGIKU. Stems stout, 1–2 m. high, erect, usually simple, branched above, terete; leaves radical and cauline, broadly ovate, 12–25 cm. long, obtuse, subcordate, pinnately incised, white and rather densely short-pubescent beneath; sepals oblanceolate, about 10 mm. long; stamens many, the

anthers linear, yellow, 3–4 mm. long; capsules flat, glabrous, obtuse, cuneate, about 20 mm. long, about 5 mm. wide, gray-brown.—June–Aug. Waste grounds and open meadows in lowlands and foothills; Honshu, Shikoku, Kyushu; common.—China and Formosa.

Var. *thunbergii* (Miq.) Miq. *Bocconia cordata* var. *thunbergii* Miq.—KE-NASHI-CHAMPAGIKU. Leaves glabrous beneath.—Occurs with the typical phase.

4. DICENTRA Bernh. KOMA-KUSA ZOKU

Glabrous, glaucous perennial herbs with pinnately or ternately dissected leaves; inflorescence racemose; flowers rose or yellowish, nodding, the pedicels bracteate; sepals 2, scalelike; petals 4, the outer 2 boat-shaped, reflexed above in anthesis, saccate or short-spurred at base, the inner 2 rather small, clawed, connate at apex, ridged on back; stamens 6; ovary 1, the placenta 2; style slender, the stigma flat, 2- to 4-lobed; capsules lanceolate, dehiscent, 2-valved; seeds usually arillate.—More than 10 species, in N. America and Asia.

1A. Tall leafy-stemmed perennial herb; racemes relatively long, many-flowered; flowers about 30 mm. long; sepals caducous.

1B. Small scapose perennial herb; racemes very short, few-flowered; flowers about 20 mm. long; sepals persistent. 2. *D. peregrina*

1. *Dicentra spectabilis* (L.) Lem. *Fumaria spectabilis* L.; *Dielytra spectabilis* (L.) G. Don; *Eucapnos spectabilis* (L.) Sieb. & Zucc.—KEMAN-SŌ. Rhizomes rather stout, elongate, tufted; stems leafy, 40–80 cm. long, angled, juicy, reddish; leaves long-petiolate, twice ternate, the leaflets 3- to 5-parted to divided, 3–6 cm. long, the segments broadly oblanceolate, usually incised on upper margin, slightly glaucescent; racemes solitary, axillary, pedunculate, 20–30 cm. long, many-flowered; flowers nodding, flattened, deeply cordate, 27–32 mm. long, 18–20 mm. wide, rose, the inner petals white; sepals thinly membranous, lanceolate, caducous, 6–7 mm. long.—Apr.–June. Cultivated in gardens.—Korea, Manchuria, and China.

2. *Dicentra peregrina* (Rudolph) Makino. *Fumaria*

peregrina Rudolph; *D. pusilla* Sieb. & Zucc.; *D. peregrina* var. *pusilla* (Sieb. & Zucc.) Makino—KOMA-KUSA. Glaucous, glabrous perennial herb with short erect rhizomes; leaves radical, petiolate, finely dissected, the lobes linear-oblong, the segments obtuse, 2–6 mm. long, about 1 mm. wide, glaucous; scapes 5–15 cm. long, the raceme very short, few-flowered; flowers rose, flat, slightly cordate, about 20 mm. long, 10–12 mm. wide; sepals broadly ovate, persistent, about 3 mm. long, green; capsules narrowly oblong, 8–10 mm. long, about 4 mm. wide, enveloped by the persistent withered perianth; style slender, as long as the capsule, the stigma transversely oblong, flat; seeds black, shining.—July–Aug. Gravelly to sandy slopes mainly in volcanoes; Hokkaido, Honshu (centr. and n. distr.); rare.—Sakhalin, Kuriles, Kamchatka, and e. Siberia.

5. CORYDALIS DC. KI-KEMAN ZOKU

Usually glabrous and glaucous, sometimes sparingly papillose biennial or perennial herbs; leaves ternately or pinnately divided, alternate or radical; inflorescence racemose, terminal or axillary, bracteate; flowers pedicelled, rose-purple, white or yellow; sepals 2, small or absent; petals 4, free or partially connate, the outer 2 larger, the upper one spurred at base, the inner 2 connate at apex, rigid on the back; stamens 6, united in pairs; ovary 1-locular, with 2 nervelike placentae, 1- to many-ovuled; styles slender, the stigma flat, often dentate on margin; capsules linear to ovoid, sometimes torulose; seeds usually arillate.—About 200 species, in Africa, Eurasia, and America, especially abundant in centr. Asia and China.

- 1A. Plants with tubers; cauline leaves few; flowers rose-purple or blue, rarely white.
 - 2A. Tubers usually 1-stemmed; radical leaves present only when the tuber not scapose; lowest cauline leaf reduced to a scale.
 - 3A. Capsules linear or oblong-linear; tuber with more or less yellow flesh; bracts usually entire. 1. *C. ambigua*
 - 3B. Capsules lanceolate to narrowly ovate; tuber with white flesh; bracts often incised.
 - 4A. Flowers 15–25 mm. long. 2. *C. lineariloba*
 - 4B. Flowers 10–13 mm. long. 3. *C. capillipes*
 - 2B. Tubers with few radical leaves and scapes; lowest cauline leaf not reduced to a scale.
 - 5A. Stems slender, 5–10 cm. long; capsules linear, 17–20 mm. long. 4. *C. decumbens*
 - 5B. Stems stout, up to 1 m. long; capsules broadly oblanceolate, about 25 mm. long. 5. *C. curvicalcarata*
- 1B. Plants without tubers; cauline leaves often rather numerous; flowers yellow, rarely rose-purple or whitish.
 - 6A. Upper petals connate to the claw of the inner petals; seeds smooth.
 - 7A. Stems much elongate, sometimes more than 1 m. long; flowers pale yellow, in loose racemes, with a spur about as long as the body at base; sepals subentire. 6. *C. ochotensis*
 - 7B. Stems erect, 20–50 cm. long; flowers rose-purple, rarely rose-white, in dense racemes, with a spur shorter than the body at base; sepals finely dissected into capillary segments. 7. *C. incisa*
 - 6B. Upper petals free; seeds muricate, papillose or impressed-punctate.
 - 8A. Flowers 6–13 mm. long; stigma with 4 distinct lobes on upper margin; aril clavate, not appressed to the seed.
 - 9A. Flowers green-yellow, 6–13 mm. long, sometimes with a purple hue; capsules strongly flexuous; seeds with impressed dots. 8. *C. ophiocarpa*
 - 9B. Flowers pale yellow, 6–7 mm. long; capsules straight; seeds with conical papillae. 9. *C. racemosa*
 - 8B. Flowers 15–23 mm. long (12–18 mm. long in *C. tashiroi*); stigma with small teeth on margin; aril appressed to the seed.
 - 10A. Leaves pinnate.
 - 11A. Capsules straight; flowers 12–18 mm. long, with a spur 1–4 mm. long at base. 10. *C. tashiroi*
 - 11B. Capsules more or less curved, slightly torulose; flowers 15–23 mm. long, with a longer spur at base.
 - 12A. Racemes 3–10 cm. long, densely many-flowered, the flowers 20–23 mm. long; seeds with impressed dots. 11. *C. speciosa*
 - 12B. Racemes 2–5 cm. long, 2- to 8-flowered, the flowers 18–20 mm. long; seeds tuberculate. 12. *C. pallida*
 - 10B. Leaves ternate. 13. *C. heterocarpa*

1. *Corydalis ambigua* Cham. & Schltdl. EZO-ENGO-SAKU. Glabrous, glaucescent, smooth or slightly papillose perennial herb, the tuber globose, 1–2 cm. across; stems solitary, 10–30 cm. long, 2-leaved above, the scalelike leaf near the base sometimes bearing a branch from the axil; leaves petiolate, 1- to 2(-3)-ternate, the ultimate segments thin, linear to ovate-orbicular, 10–30 mm. long, 2–25 mm. wide, entire or variously lobed to parted, obtuse to rounded; racemes terminal, densely many-flowered, erect, the bracts broadly lanceolate to ovate-orbicular, usually entire, the pedicels 7–12 mm. long; flowers blue-purple, rarely white, 17–25 mm. long; capsules linear or oblong-linear, 15–23 mm. long, 2.5–3 mm. across; seeds dark brown, shining, smooth.—Apr.–May. Woods and meadows in lowlands to mountains; Hokkaido, Honshu (n. distr.); very variable in leaf-shape and in the papillosity of leaf-margins and racemes.—Sakhalin, Kuriles, and Ochotsk Sea region.

2. *Corydalis lineariloba* Sieb. & Zucc. *C. orthoceras* Sieb. & Zucc.; *C. senanensis* Fr. & Sav.; *C. vernyi* Fr. & Sav.; *C. laxa* Fr. & Sav.; *C. hallaisanensis* Lév.; *C. remota* sensu auct. Japon., non Fisch.—YAMA-ENGO-SAKU, SASABA-ENGO-SAKU. Glabrous, smooth or slightly papillose perennial herb, the tuber globose, 7–15 mm. across; stems 10–20 cm. long, 2-leaved, the scalelike leaf at the base often with a small axillary bulblet; leaves 2- to 3-ternate, the leaflets or ultimate segments thin, linear to ovate-orbicular, often deeply 3-cleft to -parted, 15–25 mm. long, 3–15 mm. wide; flowers in a dense terminal raceme, the bracts lanceolate to flabellate-cuneate, usually toothed to in-

cised, the pedicels 5–15 mm. long; flowers 15–25 mm. long, blue-purple; capsules lanceolate to ovate-oblong, 7–13 mm. long, 2.5–4 mm. wide; seeds smooth, shining.—Apr.–May. Woods and meadows in hills and mountains; Honshu, Kyushu; rather common.—Korea and Manchuria.

Var. *capillaris* (Makino) Ohwi. *C. bulbosa* var. *capillaris* Makino; *C. capillaris* (Makino) Takeda—HIME-ENGO-SAKU. Differs from the typical phase in being very delicate; leaves 3(-4)-ternate, the leaflets or ultimate segments ovate-orbicular to oblong, 5–8 mm. long, 3–5 mm. wide, thinner; flowers rather few.—Shikoku, Kyushu.

Var. *papilligera* (Ohwi) Ohwi. *C. papilligera* Ohwi—KINKI-ENGO-SAKU. Differs from the preceding variety in the ovate-oblong capsules, 5–10 mm. long, 4–5 mm. wide, and the seeds with minute papillose-tubercles toward the margin.—Honshu.

3. *Corydalis capillipes* Franch. MICHINOKU-ENGO-SAKU, HIME-YAMA-ENGO-SAKU. Glabrous slender perennial herb, the tuber globose, 5–10 mm. across; scapes 10–20 cm. long, 2-leaved, with a single subterranean scale and axillary bulblet; leaves petiolate, 2- to 3-ternate, the leaflets or ultimate segments linear to oblong, thin, 1–3 cm. long, 2–10 mm. wide, often deeply parted, sometimes entire; racemes many- or rather few-flowered, the bracts narrowly ovate to flabellate-cuneate, entire to incised; flowers 10–13 mm. long; capsules ovate-oblong, about 3 mm. long, 2 mm. wide.—Apr.–May. Woods and meadows in mountains; Honshu (Japan Sea side of n. and centr. distr.).

4. *Corydalis decumbens* (Thunb.) Pers. *Fumaria decumbens* Thunb.—JIROBŌ-ENGO-SAKU. Slender glabrous glaucous perennial herb, the globose tuber renewed each season; radical leaves few, 2- to 3-ternate, long-petiolate, the leaflets usually 2- to 3-parted to -cleft, the segments oblanceolate to obovate, 1-2 cm. long, 3-7 mm. wide, thin, glaucous; scapes decumbent, erect above, 10-30 cm. long, without a scalelike leaf below ground; cauline leaves 2, petiolate, 2-ternate; racemes rather few-flowered, the bracts ovate, entire, subacute, the pedicels 5-10 mm. long; flowers rose to blue-purple, 15-22 mm. long; capsules linear, 15-22 mm. long, about 1.5 mm. wide, slightly torulose when dried; seeds dark brown, about 1.2 mm. across, minutely mammillate.—Apr.-May. Meadows along rivers in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Formosa and China.—*Forma albescens* (Takeda) Ohwi. *C. decumbens* lusus *albescens* Takeda. Flowers whitish.—Occurs with the typical phase.

5. *Corydalis curvicalcarata* Miyabe & Kudo. *Ezo-ō-keman*. Stems erect, stout, glabrous, about 1 m. long; cauline leaves 2- to 3-ternate-pinnate, the ultimate segments pinnate, the lobes broadly lanceolate to elliptic, acute, glaucous beneath; racemes short, nearly simple, about 4.5 cm. long, the pedicels about 1 cm. long, the bracts linear; flowers white, about 16 mm. long, the upper petals slightly longer than the upwardly curved rounded spur; capsules clavate, about 2 cm. long, 6-7 mm. wide; seeds 3-3.5 mm. across.—June. Hokkaido.

6. *Corydalis ochotensis* Turcz. *Tsuru-keman*. FIG. 6. Glabrous glaucous biennial herb; stems branched, elongate, soft and juicy, decumbent or ascending, acutely angled, sometimes more than 1 m. long; leaves petiolate, nearly deltoid in outline, 7-12 cm. long and as wide, 2- to 3-ternate, the leaflets often 3-cleft, the segments oblong or obovate, 10-15 mm. long, 5-10 mm. wide, subrounded, the petiole winged; racemes terminal, loose, the bracts ovate to broadly so, usually entire, 3-10 mm. wide, weakly veined, the pedicels 4-7 mm. long; flowers pale yellow, 15-20 mm. long; sepals subentire; capsules obovate-cuneate to elongate-obovate, 12-15 mm. long, 3.5-4.5 mm. wide; seeds in 2 series, smooth.—Aug.-Sept. Mountains; Honshu (Kantō and centr. distr.).—e. Siberia and Ochotsk Sea region.

Var. raddeana (Regel) Nakai. *C. raddeana* Regel; *C. ochotensis* forma *raddeana* (Regel) Nakai.—NAGAMI-NOTSURU-KEMAN. Bracts ovate to lanceolate, 2-5 mm. wide; capsules linear-oblongate, 2-2.5 mm. wide; seeds in one series.—Aug.-Oct. Mountains; Hokkaido, Honshu, Kyushu.—Manchuria, Korea, and e. Siberia.

7. *Corydalis incisa* (Thunb.) Pers. *Fumaria incisa* Thunb.—MURASAKI-KEMAN. Soft glabrous slightly glaucous biennial; tap-root somewhat fusiform in winter; stems 20-50 cm. long, tufted, angular, slightly branched, leafy; radical leaves long-petiolate, ovate-orbicular, 3-8 cm. long, more or less triangular in outline, 2-ternate, the leaflets ternately or pinnately lobed, the lobes cuneate, incised, 1-2 cm. long, the cauline petiolate; racemes erect, 4-12 cm. long, the bracts flabellate-cuneate to oblanceolate, incised, the pedicels 10-15 mm. long; flowers rose-purple, 12-18 mm. long; sepals finely dissected into capillary segments; capsules linear-oblong, nodding, about 15 mm. long, 3-3.5 mm. wide, straight.—Apr.-June. Thickets and bamboo forests in lowlands and foothills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Forma

pallescens Makino. *SHIRO-YABU-KEMAN*. Flowers nearly white.—Occurs with the typical phase.

8. *Corydalis ophiocarpa* Hook. f. & Thoms. *C. japonica* Makino; *C. makinoana* Matsum.—YAMA-KI-KEMAN. Glabrous, glaucous, perennial herb; stems somewhat tufted, nearly erect, 40-80 cm. long, angled, greenish; leaves petiolate, ovate, 8-15 cm. long, 4-8 cm. wide, pinnately compound, the leaflets pinnately divided or parted, the segments ovate or narrowly so, often incised, the petioles winged; racemes terminal, short-pedunculate, rather densely many-flowered, the bracts lanceolate, with a filiform point, the pedicels 2-6 mm. long, curved, much shorter than the bracts; flowers greenish yellow, sometimes with a dark purple hue, 8-13 mm. long, the spur short; capsules linear, strongly flexuous, about 3 cm. long; seeds impressed-punctate.—May-July. Mountains; Honshu (Kantō Distr. and westw.), Shikoku.—Formosa, China, and India.

9. *Corydalis racemosa* (Thunb.) Pers. *Fumaria racemosa* Thunb.—HOZAKI-KI-KEMAN. Glabrous biennial herb; stems spreading, 20-60 cm. long; leaves petiolate, ovate, 5-10 cm. long, 3-5 cm. wide, 2-ternate, the leaflets broadly ovate; racemes 5-10 cm. long, the bracts linear; flowers 6-7 mm. long; capsules linear, straight, 17-30 mm. long, 2-2.5 mm. wide; seeds about 1 mm. across, with conical tubercles.—Apr.-May. Kyushu, Shikoku.—China.

10. *Corydalis tashiroi* Makino. *C. formosana* Hayata.—SHIMA-KI-KEMAN. Glabrous glaucous biennial; stems 15-40 cm. long; leaves petiolate, broadly ovate, 8-20 cm. long, bipinnate, the leaflets pinnately parted to divided, the segments broadly ovate, incised; racemes bracteate; flowers 12-18 mm. long, the spur very short; capsules linear, straight, 3.5-4.5 cm. long, 2.5-3 mm. wide; seeds with impressed dots.—Mar.-Apr. Kyushu.—Ryukyus, Formosa, and s. China.

11. *Corydalis speciosa* Maxim. *C. pallida* var. *speciosa* (Maxim.) Komar.; *C. maximowicziana* Nakai; *C. pterophora* Ohwi.—KŌZAKI-KEMAN. Glabrous glaucous biennial herb; stems 20-40 cm. long, terete, erect, often ascending at base; leaves petiolate or subsessile, narrowly ovate, 10-15 cm. long, 4-6 cm. wide, the leaflets pinnate or pinnatifid, incised; racemes densely many-flowered, elongate in fruit, 3-10 cm. long; flowers 20-23 mm. long; capsules linear, 2-3 cm. long, torulose, gently curved; seeds with impressed dots.—May-June. Hokkaido, Honshu (Mount Hayachine in Rikuchu).—e. Siberia, Manchuria, n. China, and Sakhalin.

12. *Corydalis pallida* (Thunb.) Pers. *Fumaria pallida* Thunb.; *C. satsumensis* T. Ito; *C. triflora* Ohwi; *C. triflora* var. *arakiana* Ohwi.—FŪRO-KEMAN. Glabrous, glaucous, biennial herb; stems 15-50 cm. long, terete, several-leaved, erect or ascending; leaves petiolate or subsessile, ovate, 1- to 2-pinnate, the leaflets broadly ovate, incised; racemes 2-5 cm. long, 2- to 8-flowered; flowers 18-20 mm. long; capsules linear, 1-2 cm. long, slightly torulose; seeds with conical tubercles.—Mar.-May. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

Var. tenuis Yatabe. *C. pallida* sensu auct. Japon., pro parte Maxim., non Pers.; *C. hondoensis* Ohwi.—MIYAMA-KI-KEMAN. Plant slightly larger; racemes longer, 3-10 cm. long, rather many-flowered; flowers 20-23 mm. long; capsules 2-3 cm. long, prominently torulose.—Honshu (Kinki Distr. and eastw.); common.

13. *Corydalis heterocarpa* Sieb. & Zucc. *C. wilfordii* Regel.—TSUKUSHI-KI-KEMAN. Glabrous glaucous herb;

FIG. 6.—*Corydalis ochotensis* Turcz. 1, 2, 3, Habit; 4, portion of stem; 5, part of a leaf; 6, bract; 7, flower; 8, 9, sepals; 10, flower; 11, lower petal; 12, 13, 14, 15, apical part of inner petal; 16, 17, stamens; 18, stamens enlarged; 19, pollen; 20, pistil; 21, stigma; 22, longitudinal section of ovary; 23, ovule; 24, 25, capsules; 26, the same at dehiscence; 27, 28, seeds; 29, the same, cut longitudinally.

stems rather stout, often reddish, terete, 40–60 cm. long; leaves usually petiolate, broadly ovate-deltoid, 10–25 cm. long and as wide, 2- to 3-ternate, the leaflets incised to parted; racemes 5–10 cm. long, many-flowered; flowers 15–25 mm. long, the spur short; capsules broadly linear, 25–35 mm. long, 3–4 mm. wide, torulose; seeds in one series, densely papillose with short-cylindric tubercles.—Mar.–June. Honshu (Chūgoku Distr.), Shikoku, Kyushu.—s. Korea.

Var. *japonica* (Fr. & Sav.) Ohwi. *C. wilfordii* var. *japonica* Fr. & Sav.; *C. pallida* var. *platycarpa* Maxim. ex Palib., pro parte; *C. platycarpa* (Maxim.) Makino.—KI-KEMAN.

Capsules narrowly lanceolate, scarcely torulose; seeds in two series or nearly two series.—Apr.–May. Thickets and thin woods in lowlands, especially near the sea; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather common.—Ryukyus.

Var. *brachystyla* (Koidz.) Ohwi. *C. brachystyla* Koidz.—MUNIN-KI-KEMAN. Closely resembles the preceding variety; capsules lanceolate, 2–3 cm. long, 4–5 mm. wide, not torulose; seeds with short conical tubercles.—Honshu (Izu Isls.).—Bonins and Ryukyus.

6. PTERIDOPHYLLUM Sieb. & Zucc. OSABAGUSA ZOKU

Stemless perennial herbs with short rather thick rhizomes; leaves radical, pectinate, deep green, petiolate; scapes simple, naked, erect; racemes solitary, terminal; flowers nodding, rather small, the pedicels solitary or ternate; sepals 2, deciduous, small; petals 4, white, deciduous, equal, obliquely ascending, oblong; stamens 4, free, the filaments short, erect, the anthers linear; ovary 1-locular; styles slender, the stigma bifid; capsules obovate-globose, 2-valved, 2-seeded.—A single species, in Japan.

1. *Pteridophyllum racemosum* Sieb. & Zucc. OSABAGUSA. Nearly glabrous perennial herb; leaves pectinate, broadly oblanceolate in outline, 10–20 cm. long, 2.5–3 cm. wide, obtuse, gradually narrowed below, the segments many, spreading, linear-oblong, about 3 mm. wide, short-toothed, sparsely hispid above, slightly auriculate on upper side near base; scapes erect, 15–25 cm. long; racemes loose, 5–15 cm.

long, the pedicels slender, solitary to ternate, 10–15 mm. long, spreading; sepals 2, broadly ovate, 1–1.2 mm. long; petals about 5 mm. long; anthers linear, 2–2.2 mm. long; capsules obovoid, about 3.5 mm. across and as long; style 2.5–3 mm. long; seeds ellipsoidal, 1.5 mm. long.—June–Aug. Coniferous woods; Honshu (centr. and n. distr.); rare.

Fam. 97. CAPPARIDACEAE FŪCHŌ-SŌ KA Caper Family

Herbs or woody plants; leaves simple or palmately compound, 3- to 9-foliolate, alternate, rarely opposite; stipules 2 or absent, often becoming spiny; inflorescence racemose or corymbose; flowers actinomorphic, usually bisexual; sepals 4, sometimes connate; petals 4, 2, or absent; stamens 4 or more, the disc often much elongate; ovary stipitate or sessile, usually 1-locular, the placentae parietal; carpels 2 or more; fruit a capsule or berry.—About 35 genera, with about 500 species, mainly tropical and warm-temperate.

1. CRATAEVA L. GYŌBOKU ZOKU

Glabrous trees or shrubs with lenticellate branches; leaves 3-foliolate, petiolate; flowers in corymbs, showy, often polygamous; calyx 4-parted, the segments imbricate in bud, deciduous; petals 4, long-clawed, not overlapped in bud; receptacle hemispherical, lobed; stamens 8–20, inserted on the margin of receptacle, the filaments filiform, elongate; ovary ovoid, long-stipitate, 1- to 2-locular, the placentae 2, parietal; ovules many; stigma sessile, discoid; fruit a globose or ovoid berry; seeds few or many.—Few species, in the Tropics.

1. *Crataeva religiosa* Forst. *C. falcata* DC.—GYŌBOKU. Small tree with pale lenticellate gray-brown branches; leaves long-petiolate, the leaflets rather thin, ovate to narrowly so, 6–10 cm. long, 2–5 cm. wide, usually acuminate, entire, glaucescent beneath; inflorescence a terminal corymb, the flowers large, pale yellow, the pedicels about 3 cm. long; petals

ovate, clawed, 15–20 mm. long; stamens exserted, about 4 cm. long; ovary narrowly ovoid, 4–5 mm. long, the stipe nearly as long as the pedicel; berry fleshy, nodding, about 2.5 cm. long.—June–July. Near the sea; Kyushu (s. distr.).—s. China, India, Malaysia to Australia, and Africa.

Fam. 98. CRUCIFERAE ABURA-NA KA (JŪJI KA) Mustard Family

Mostly herbs; leaves cauline or radical, alternate, simple to pinnate; stipules absent; flowers in racemes, sometimes solitary in leaf-axils, rarely bracteate; sepals 4, deciduous; petals 4 or absent, clawed, deciduous; stamens 6 (rarely 4), tetradynamous, in 2 series; disc with 2, 4, or 6 glands; ovary 2-locular, with parietal placentae; style usually persistent, simple, the stigma discoid, sometimes bifid; fruit a silique or siliqua, rarely indehiscent and jointed; seeds without endosperm; cotyledons large, incumbent or accumbent.—About 200 genera, with about 2,000 species, mostly in temperate regions and high latitudes of both hemispheres.

1A. Hairs simple, not branched, without glands, or hairs absent.

2A. Capsule a flattened long-stipitate silique; stamens longer than the petals. 1. *Macropodium*

2B. Capsules sessile or nearly so, not distinctly stipitate at the base; stamens not longer than the petals.

3A. Capsules indehiscent.

4A. Capsules 1-seeded, flat; flowers yellow. 2. *Isatis*

4B. Capsules few-seeded, torulose; flowers white or rose-purple. 3. *Raphanus*

- 3B. Capsules dehiscent.
- 5A. Capsules laterally flattened; septa narrow; valves navicular, sometimes winged on the keel.
- 6A. Seeds solitary in each locule of capsule; cotyledons incumbent. 4. *Lepidium*
- 6B. Seeds 2 to several in each locule; cotyledons accumbent. 5. *Thlaspi*
- 5B. Capsules terete or dorsally flattened.
- 7A. Flowers white.
- 8A. Valves elastic and coiled at maturity. 6. *Cardamine*
- 8B. Valves not elastic or coiled at maturity.
- 9A. Flowers bracteate; seeds rather large, few; cotyledons incumbent. 7. *Wasabia*
- 9B. Flowers not bracteate; seeds small, many; cotyledons accumbent.
- 10A. Capsule a silique. 8. *Nasturtium*
- 10B. Capsule an inflated silicle. 9. *Cochlearia*
- 7B. Flowers yellow.
- 11A. Cotyledons incumbent; fruit terete or flattened; valves often 3-nerved; plants hairy. 10. *Sisymbrium*
- 11B. Cotyledons accumbent; valves costate or keeled or 1-nerved; plants glabrous.
- 12A. Siliques 3-4 cm. long, costate or keeled. 11. *Barbarea*
- 12B. Siliques shorter, weakly 1-nerved or nerveless. 12. *Rorippa*
- 1B. Hairs bifid or stellate, rarely simple and gland-tipped.
- 13A. Capsules flattened laterally, a silicle; valves navicular. 13. *Capsella*
- 13B. Capsules dorsally flattened or terete, a silicle, rarely a silique; valves not navicular.
- 14A. Capsules a silicle; cotyledons accumbent. 14. *Draba*
- 14B. Capsule a silique.
- 15A. Cotyledons accumbent; flowers white, rarely purple. 15. *Arabis*
- 15B. Cotyledons incumbent.
- 16A. Flowers white or rose-purple.
- 17A. Siliques narrowly linear.
- 18A. Valves thinly membranous; stamens free. 16. *Arabidopsis*
- 18B. Valves firmly membranous; longer stamens connate in pairs. 17. *Dontostemon*
- 17B. Siliques gradually narrowed above. 18. *Berteroella*
- 16B. Flowers yellow to yellowish.
- 19A. Stigma entire; leaves pinnately dissected; valves thinly membranous. 19. *Descurainia*
- 19B. Stigma bifid; leaves simple, toothed or incised; valves firmly membranous. 20. *Erysimum*

1. MACROPODIUM R. Br. HAKUSEN-NAZUNA ZOKU

Nearly glabrous perennial herbs; leaves alternate, toothed, the lower petiolate; inflorescence a densely flowered spikelike raceme, elongate, ebracteate; flowers many, white, rather large; sepals narrow, loose, equal; petals narrow, longer than the sepals; stamens exerted, the anthers elongate, contorted; siliques elongate, flattened, long-stipitate, the valves flat, with a weak nerve; style very short, the stigma punctiform; seeds in 1 or 2 series, flat, winged.—Two species, in the Altai Mountains and e. Asia.

1. *Macropodium pterospermum* F. Schmidt. HAKUSEN-NAZUNA. Rhizomes creeping, short; stems erect, 40-100 cm. long, usually simple, leafy, with simple minute hairs above; leaves narrowly ovate to broadly lanceolate, 7-12 cm. long, 1.5-5 cm. wide, acuminate, glabrous on both sides or often minutely hairy on nerves beneath, toothed, the lower ones petiolate, the upper ones subsessile; inflorescence elongate,

many-flowered, often to 40 cm. long in fruit, the pedicels spreading, 7-13 mm. long; petals slightly longer than the sepals, linear, 6-7 mm. long; stamens 13-15 mm. long; siliques 4-6 cm. long, about 4 mm. wide, the stipe 15-30 mm. long; seeds about 10, winged on margin.—July-Aug. Wet grassy places in alpine regions; Hokkaido, Honshu (n. and centr. distr.); rare.—Sakhalin.

2. ISATIS L. TAISEI ZOKU

Usually glabrous, sometimes pubescent or tomentose, often glaucescent, branched annual or biennial herbs; leaves entire or obsoletely toothed, the cauline sagittate; flowers in loose ebracteate racemes, small, usually yellow; silique oblong to linear, indehiscent, 1-seeded, flat, woody or bony on the center, coriaceous and thickened or foliaceous on margin; stigma sessile; seed solitary; cotyledons incumbent.—About 20 to 30 species, in Europe, N. Africa, and Asia.

1. *Isatis tinctoria* L. var. *yezoensis* (Ohwi) Ohwi. *I. oblongata* sensu auct. Japon., non DC.; *I. japonica* sensu auct. Japon., non Miq.; *I. yezoensis* Ohwi—HAMA-TAISEI, EZO-TAISEI. Glauous, glabrous; stems erect, 30-40 cm. long; lower cauline leaves narrowly ovate, 10-12 cm. long, 2-3 cm.

wide, obtuse, shallowly toothed, sagittate; petals small, yellow; siliques cuneate-obovate, about 15 mm. long, 4-5 mm. wide, subacute.—June-July. Seashores; Hokkaido.—Korea and Ussuri.

3. RAPHANUS L. DAIKON ZOKU

Glabrous or hispidulous branched annuals or biennials; tap-root often thickened; lower leaves lyrate; racemes elongate, bractless; flowers white or purplish rose, rather large, pedicelled; sepals erect, the lateral ones subsaccate at base; stamens free; siliques elongate, terete, torulose, coriaceous or spongy, the locellus 1-seeded; style elongate, the stigma emarginate; seeds globose; cotyledons conduplicate.—Few species, in the Old World, especially in the Mediterranean region.

1. **Raphanus sativus** L. forma **raphanistroides** Makino. *R. raphanistroides* (Makino) Nakai; *R. macropodus* var. *spon-taneus* Nakai; *R. acanthiiformis* Morel; *R. macropodus* Lév.; *R. sativus* var. *raphanistroides* (Makino) Makino.—HAMADAIKON. Annual or biennial with a slenderly thickened tap-root; stems 40–80 cm. long, branched, terete; leaves lyrate, slightly glaucescent; flowers pale rose-purple; petals about 2

cm. long, obovate, clawed; siliques erect, 5–8 cm. long, 5–6 mm. across, the pedicels 1–2 cm. long, ascending, glabrous, somewhat coriaceous, torulose, not dehiscent, terete, 2- to 5-seeded.—Apr.–June.—A degenerated phase of cv. **Hortensis**. *R. sativus* var. *hortensis* Backer, the "Daikon" or Japanese radish.

4. LEPIDIUM L. MAME-GUMBAI-NAZUNA ZOKU

Glabrous or pubescent erect or diffuse often branched herbs or shrubs; flowers in racemes, ebracteate, small, white; sepals short, equal; petals short or absent; stamens 2–4; siliques flat, oblong, ovate, obovate or obcordate, rarely subglobose, often laterally flattened, keeled, emarginate, sometimes winged, with a narrow membranous septum; style absent or filiform, the stigmas emarginate; cotyledons accumbent or incumbent.—About 60 species, in temperate to warmer regions of the world.

- 1A. Cauline leaves cordate, entire, strongly clasping. 1. *L. perfoliatum*
 1B. Cauline leaves petiolate or sessile, not clasping.
 2A. Siliques orbicular, 2.5–3 mm. long and as wide. 2. *L. virginicum*
 2B. Siliques elliptic, about 5 mm. long, 3 mm. wide. 3. *L. sativum*

1. **Lepidium perfoliatum** L. KOSHIMINO-NAZUNA. Erect biennial; lower cauline and radical leaves twice pinnately divided, the upper leaves cordate, entire, acute; flowers small.—Apr. (–Oct.). Naturalized in our area.—s. Europe and w. Asia.

toothed or entire, racemes elongate after anthesis; flowers many, small, white; siliques orbicular, with a narrow wing on upper margin, the seeds narrowly winged on upper margin.—May–June. Naturalized in our area.—N. America.

2. **Lepidium virginicum** L. MAME-GUMBAI-NAZUNA. Erect biennial herb; stems branched, 20–50 cm. long, minutely puberulent; cauline leaves cuneate-oblancoate to linear, 1.5–5 cm. long, 2–10 mm. wide, acute, narrowed at base, deeply

3. **Lepidium sativum** L. KOSHÔ-SÔ. Nearly glabrous annual or biennial; cauline leaves pinnately parted, the upper ones entire and linear; flowers rather small, white; siliques elliptic, entire, narrowly winged on upper margin.—May–Aug. Very rarely cultivated.—Europe.

5. THLASPI L. GUMBAI-NAZUNA ZOKU

Usually glabrous, often glaucescent annuals, biennials, or perennials; stems erect, sometimes scapose; radical leaves rosulate, entire or toothed, the cauline oblong or narrowly ovate, auriculate; flowers in ebracteate racemes, white, rose, or pale purple; sepals erect, equal; petals obovate; stamens free; siliques short, laterally flattened, oblong, obcordate or obcuneate, emarginate or rarely acute, the valves keeled or winged, the septum narrow, membranous; style short or elongate, the stigma emarginate; seeds 2 to several in each locule; cotyledons accumbent.—About 30 species, in temperate to Arctic regions and mountains of the N. Hemisphere, rare in the S. Hemisphere.

- 1A. Biennial; siliques obcordate-orbicular, prominently wing-margined, retuse; style very short. 1. *T. arvense*
 1B. Perennial; siliques cuneate-oblong, wingless, subtruncate; style slender, about 1.5 mm. long. 2. *T. japonicum*

1. **Thlaspi arvense** L. GUMBAI-NAZUNA. Glabrous glaucous biennial; stems erect, 20–40 cm. long, often branched; leaves broadly lanceolate to narrowly ovate, 3–6 cm. long, 1–2.5 cm. wide, subobtusely, short-toothed, clasping; racemes elongate, 10–20 cm. long; flowers white; petals about 3.5 mm. long; siliques retuse to obcordate-orbicular, 1.5 cm. long, 1–1.2 cm. wide, including the winged margin, slightly shorter than the pedicel; seeds about 1.2 mm. long, wrinkled.—Apr.–June. Waste grounds and cultivated fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; naturalized and rather common.—Europe to n. Africa, n. and w. Asia to India.

2. **Thlaspi japonicum** H. Boiss. TAKANE-GUMBAI. Tufted glaucescent glabrous perennial with short much-branched caudex; stems 8–15 cm. long, firm, terete, erect, few-leaved; radical leaves spatulate-elliptic, entire, obtuse to rounded at apex, the cauline narrowly ovate to elliptic, 1–2 cm. long, 7–12 mm. wide, clasping, auriculate, subacute; racemes elongate after flowering, 2–3 cm. long, 10- to 30-flowered, the pedicels spreading, rather stout, as long as to slightly longer than the silicle; siliques cuneate-oblong, wingless, about 8 mm. long, subtruncate; style slender, about 1.5 mm. long, the valves folded, wingless; seeds wingless, smooth.—Hokkaido; rare.

6. CARDAMINE L. TANETSUKE-BANA ZOKU

Glabrous or pubescent perennials or biennials, sometimes rhizomatous or stoloniferous; leaves simple or pinnately divided; inflorescence racemose or corymbose; flowers white or rose-purple, ebracteate; sepals equal; petals clawed; siliques elongate, linear, the valves flat, coiled, the septum membranous, hyaline; style short or elongate; stigma simple or shallowly 2-lobed; seeds in 1 series, flat, winged or wingless; cotyledons accumbent.—About 100 species in temperate to frigid regions of the world and in mountains, especially abundant in Europe and Asia.

- 1A. Rhizomes scarcely thickened; scapes or stems leafy.
- 2A. Stolons if present short; sparsely pubescent biennials or perennials; flowers 2.5–6(–7) mm. long.
- 3A. Cauline leaves 10–20, usually distinctly auriculate; petals oblanceolate or absent. 1. *C. impatiens*
- 3B. Cauline leaves few, not or scarcely auriculate; petals cuneate-ovate to obovate.
- 4A. Rhizomes scarcely developed or branched; leaflets 3–20 mm. long.
- 5A. Siliques and pedicels pilose; terminal leaflets or radical leaves reniform or cordate; petals about 5 mm. long.
- 6A. Stems 7–20 cm. long; racemes few-flowered, not elongate. 2. *C. tanakae*
- 6B. Stems 20–40 cm. long; racemes rather many-flowered, elongate after anthesis. 3. *C. dentipetala*
- 5B. Siliques and pedicels glabrous; petals 3–4 mm. long.
- 7A. Siliques 17–22 mm. long, about 1 mm. wide, the stigma only slightly thickened.
- 8A. Leaflets of radical leaves 7–17, the terminal one slightly larger than the others; leaflets of upper leaves usually linear to narrowly oblanceolate. 4. *C. flexuosa*
- 8B. Leaflets of radical leaves (3–)5–11, the terminal one much larger than the others; leaflets of upper leaves oblanceolate to oblong. 5. *C. scutata*
- 7B. Siliques 25–30 mm. long, 1.2–1.5 mm. wide, the stigma distinctly thickened. 6. *C. longifructus*
- 4B. Rhizomes much branched; leaflets not more than 10 mm. long; alpine plant with stems 5–10 cm. long. 7. *C. nipponica*
- 2B. Stolons elongate after anthesis, leafy; glabrous perennials; flowers 6–10 mm. long.
- 9A. Stems erect from the base, sometimes decumbent after anthesis; plants stoloniferous; rhizomes not prominent. 8. *C. lyrata*
- 9B. Stems usually ascending from the creeping rhizomes; stolons elongate after anthesis.
- 10A. Leaflets 5–11.
- 11A. Leaflets of cauline leaves sessile. 9. *C. schinziana*
- 12A. Leaflets of upper leaves linear, acute. 10. *C. yezoensis*
- 12B. Leaflets elliptic to lanceolate, usually obtuse. 11. *C. torrentis*
- 13A. Siliques gradually narrowed above to the stigma. 12. *C. kusiana*
- 13B. Siliques abruptly and shortly narrowed above to the stigma. 13. *C. fauriei*
- 11B. Leaflets of cauline leaves petiolulate. 14. *C. anemonoides*
- 10B. Leaflets 3(–5). 15. *C. arakiana*
- 1B. Rhizomes more or less thickened.
- 14A. Plants short-rhizomatous; stems 10–20(–30) cm. long; leaves 3-foliolate or if 5-foliolate, the leaflets of the lowest pair very small; racemes short, rather few-flowered.
- 15A. Radical leaves absent; leaflets of cauline leaves rhombic-lanceolate to linear-lanceolate; petals 8–10 mm. long. 16. *C. appendiculata*
- 15B. Radical leaves present; leaflets orbicular-reniform or ovate; petals 4–5 mm. long. 17. *C. leucantha*
- 14B. Plants stoloniferous; stems 30–70 cm. long; leaflets 5–7; racemes rather elongate.
- 16A. Cauline leaves auriculate; leaflets obtuse or subobtusate, rather thick, 3–5 cm. long, short-pilose on upper side; racemes glabrous.
- 16B. Cauline leaves not auriculate; leaflets acuminate to long-acute, thin and membranous, 4–10 cm. long, puberulent beneath, scattered short-hairy above; racemes usually puberulent. 18. *C. leucantha*

1. *Cardamine impatiens* L. JA-NINJIN. Slender, sparsely short-pubescent annual or biennial; stems erect, often branched above; leaves pinnately divided, the radical petiolate, the cauline short-petiolate or sessile, usually auriculate, the pinnae 7–20, thinly membranous, pinnately lobed or deeply incised; racemes many-flowered, 10–15 cm. long, erect, the pedicels 3–6 mm. long, slender; flowers greenish white; sepals oblanceolate, slightly pilose; petals white, broadly oblanceolate, 3–3.5 mm. long, 1.5–2 times as long as the sepals, sometimes smaller or absent; siliques glabrous or scattered-pilose. —Wet shaded places in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common. —The temperate regions of Eurasia.

2. *Cardamine tanakae* Fr. & Sav. *C. tenuis* Koidz., excl. basionym; *C. chelidonioides* S. Moore —MARUBA-NOKONRON-SŌ. Biennial or perennial (?), usually rather densely white-pilose; stems 7–20 cm. long; radical leaves petiolate, 1- to 7-foliolate, the leaflets petiolulate, orbicular-cordate or ovate-orbicular, coarsely toothed, rounded at apex, the terminal leaflet 1–3 cm. long and as wide, the lateral leaflets smaller, the cauline 1–5, petiolate, 3- to 7-foliolate, sometimes auriculate; racemes rather few-flowered, densely white-pilose, the pedicels 7–15 mm. long; petals cuneate-obovate, white, 5–7 mm. long; siliques ascending, 2–2.5 cm. long, 1–1.2 mm. wide, scattered-pilose; stigma slightly thickened; seeds about 1.2 mm. long. —Wet places; Honshu, Shikoku, Kyushu.

3. *Cardamine dentipetala* Matsum. *C. drakeana* H.

Boiss. —Ö-KE-TANETSUKE-BANA. Resembles No. 5, but scattered-pilose on all parts; siliques pilose. —June. Wet woods in mountains; Honshu (Japan Sea side of n. and centr. distr.); rather rare.

4. *Cardamine flexuosa* With. *C. scutata* subsp. *flexuosa* (With.) Hara —TANETSUKE-BANA. Annual or biennial herb; stems 10–30 cm. long, usually spreading-pilose on lower part, sometimes branched above; lower leaves 7- to 17-foliolate, often very thinly pilose, the leaflets ovate to broadly so, petiolulate, sometimes 3- to 5-lobed, the terminal lobe slightly larger, 3–15 mm. long, 6–15 mm. wide, the leaflets of the upper leaves 3–11, lanceolate, sometimes denticulate or incised, sessile or subsessile; racemes 10- to 20-flowered; flowers white; petals cuneate-obovate, 3–4 mm. long; siliques glabrous, about 2 cm. long, 1 mm. wide; seeds about 1 mm. wide. —Mar.–June. Wet places in lowlands and paddy fields; Hokkaido, Honshu, Shikoku, Kyushu; common. —Temperate regions of the N. Hemisphere.

Var. *fallax* O. E. Schulz. *C. fallax* (O. E. Schulz) Nakai; *C. brachycarpa* Franch.; *C. parviflora* sensu auct. Japon., non L.; *C. koshiensis* Koidz. —TACHI-TANETSUKE-BANA. More densely pubescent; stems slender and erect; growing in dryer places than the typical phase.

5. *Cardamine scutata* Thunb. *C. regeliana* Miq.; *C. angulata* var. *kamtschatica* Regel; *C. flexuosa* var. *kamtschatica* (Regel) Matsum.; *C. autumnalis* Koidz.; *C. scutata* subsp. *regeliana* (Miq.) Hara —ŌBA-TANETSUKE-BANA. Resembles

the preceding, but slightly larger, softer and nearly glabrous; leaflets 3-11, the terminal leaflets much larger than the lateral; petals about 4 mm. long; siliques about 2-2.5 cm. long.—Wet places in lowlands and in the mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—c. Siberia, Kamchatka, Sakhalin, Korea, and Manchuria.

6. *Cardamine longifructus* Ohwi. *C. flexuosa* var. *latifolia* Makino.—MIZU-TANETSUKE-BANA. Glabrous perennial herb with short branched rhizomes; stems tufted, striate, green, sparsely branched, few-leaved; radical leaves pinnately 3- to 7-foliolate, with petioles 4-6 cm. long, the terminal leaflets reniform, few-toothed, 1.5-2 cm. long, 2-2.5 cm. wide, truncate to shallowly cordate at base, the lateral leaflets much smaller, the lower cauline leaves simulating the radical, the median and upper leaflets sessile, the terminal rhombic-orbicular to obovate-cuneate, obtusely and irregularly toothed, 2-2.5 cm. long, 1.5-2 cm. wide, the lateral leaflets narrowly oblong; racemes erect; flowers several to rather many, about 6 mm. long; sepals 2 mm. long; petals obovate-cuneate; siliques suberect to ascending, nearly straight, 2.5-3 cm. long; style very short; stigma slightly thickened; seeds rather many, wingless.—Apr.-May. Wet places in hills and low mountains; Honshu (Chūgoku Distr.), Shikoku, Kyushu (?).

7. *Cardamine nipponica* Fr. & Sav. MIYAMA-TANETSUKE-BANA. Glabrous perennial herb, the stem much branched; stems or scapes tufted, 5-10 cm. long; radical leaves few, 1.5-3 cm. long, 3- to 5(-7)-foliolate, the leaflets elliptic, obovate or oblong, subsessile, 2-6 mm. long, 1.5-5 mm. wide, entire, the terminal leaflets slightly larger to nearly as large as the lateral ones, the cauline leaves few, short-auriculate, clasping; inflorescence densely few-flowered; petals 5-6 mm. long, cuneate-obovate; siliques erect, 2-3 cm. long, 1-1.2 mm. wide, gradually narrowed above.—July-Aug. Alpine slopes; Hokkaido, Honshu (centr. and n. distr.).

8. *Cardamine lyrata* Bunge. MIZU-TAGARASHI. Glabrous perennial stoloniferous herb; stems 30-50 cm. long, leafy, erect in anthesis, decumbent in fruit; lower cauline leaves 11- to 13-foliolate, sessile, the terminal leaflets 1-2 cm. long and as wide, orbicular-cordate, the lateral ones smaller, subsessile, ovate, obtuse, 3-10 mm. long, the upper ones 5- to 7-foliolate; leaves of the stolons often reduced to a simple terminal leaflet; racemes many-flowered; petals white, 8-10 mm. long, obovate; siliques 2-3 cm. long, about 1 mm. wide, nearly erect, the pedicels 1-2 cm. long, obliquely spreading; seeds winged.—May. Wet places and paddy fields in lowlands and foothills; Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Korea, n. China, and e. Siberia.

9. *Cardamine schinziana* O. E. Schulz. *C. nasturtii-folia* H. Boiss., non Steud.—EZO-NO-JA-NIN-JIN. Glabrous perennial; stems 20-30 cm. long, leafy, often short-creeping below; leaflets 5-11, oblong to lanceolate, often slightly incised, the terminal one 15-25 mm. long, 8-15 mm. wide, the lateral ones sessile, 5-20 mm. long, 3-8 mm. wide; flowers white; petals 7-8 mm. long.—June. Wet places; Hokkaido (Hidaka Prov.).

10. *Cardamine yezoensis* Maxim. *C. prorepens* Fisch. forma *valida* Takeda; *C. valida* (Takeda) Nakai.—AINU-WASABI. Perennial stoloniferous herb, mostly glabrous or thinly pilose on the stems near base; stems 30-50 cm. long, often sparsely branched above; leaves petiolate, 5-12 cm. long, without auricles at base, the leaflets 5-9, ovate to ovate-oblong, 1-3 cm. long, 7-15 mm. wide, glabrous, sessile, scattered

short-toothed; racemes elongate, many-flowered; petals 8-10 mm. long.—July-Sept. Hokkaido.—Sakhalin.

11. *Cardamine torrentis* Nakai. *C. nipponica* Nakai, non Fr. & Sav.—OKUYAMA-GARASHI. Closely resembling the preceding species; stems rather stout, branched, often decumbent; leaflets usually ovate to suborbicular, 1.5-4 cm. long,

1-3.5 cm. wide; racemes rather short; petals 5-6 mm. long; siliques 25-35 mm. long, about 1.5 mm. wide; seeds wingless, about 1.5 mm. long.—May-July. Wet places along streams and ravines in mountains; Honshu (centr. distr.).

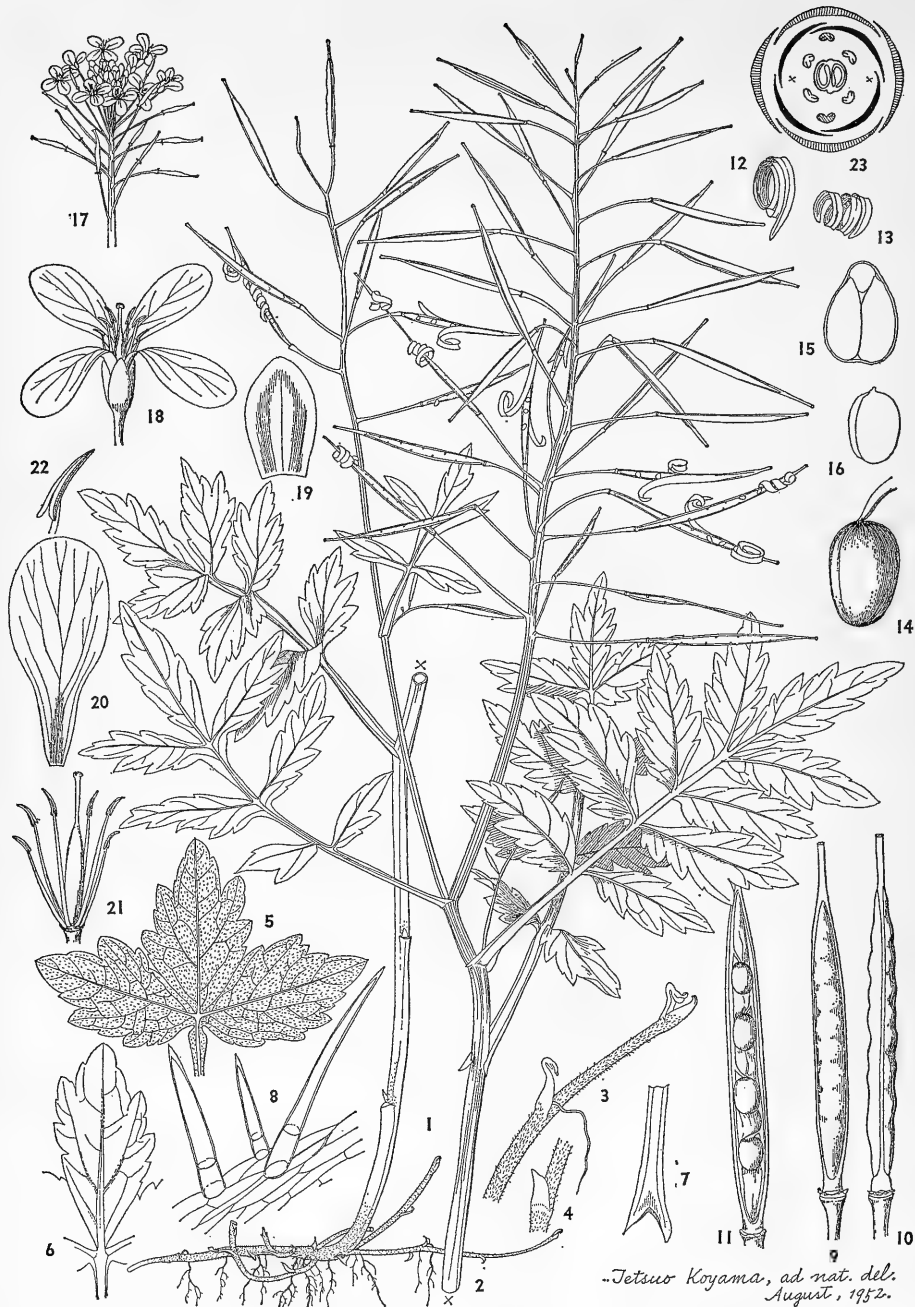

12. *Cardamine kiusiana* Hara. TAKACHIHO-GARASHI. Closely resembles the two preceding species; stems to 60 cm. long; lateral leaflets of the cauline leaves petiolulate, ovate to oblong, the uppermost leaves lanceolate to oblong; petals 8-10 mm. long; siliques 15-25 mm. long.—Shikoku (Mount Tsurugi ?), Kyushu (Hyuga Prov.).

13. *Cardamine fauriei* Franch. *C. geifolia* Koidz.—EZO-WASABI. Glabrous stoloniferous perennial; stems 30-40 cm. long, few-leaved; leaves petiolate, the lower ones 3(-5)-foliolate, the terminal leaflet ovate-orbicular or orbicular-cordate, obtusely toothed, 2.5-4 cm. long and as wide, the lateral lobes cordate-orbicular to oblong, petiolulate or sessile, entire or toothed, 1-3 cm. long, 7-15 mm. wide, each of the upper leaves of the stolons reduced to a terminal leaflet only, often incised-toothed; racemes elongate after anthesis, on long pedicels; petals 7-9 mm. long; siliques 15-20 mm. long, 1-1.2 mm. wide.—May-July. Streams and ravines in mountains; Hokkaido, Honshu (?).

14. *Cardamine anemonoides* O. E. Schulz. *Dentaria corymbosa* Matsum.; *C. matsumurana* Nemoto.—MITSUBA-KONRON-SŌ. Perennial herb, scattered short-pubescent on the leaves above and on margin; stems 10-20 cm. long, 4- to 5-leaved above, with 1-2 reduced leaves at base; rhizomes slightly thickened, fusiform, scaly; radical leaves absent, the cauline leaves petiolate, 1- to 3-foliolate, the leaflets broadly rhombic-lanceolate to linear-lanceolate, toothed or incised, often connate below and forming a 3-parted leaf, 1-8 cm. long, 8-20 mm. wide, the petioles to 20 mm. long; flowers 2-7, in subcorymbose racemes; petals ascending, 8-10 mm. long, white, sometimes reddish, cuneate-obovate; siliques erect, 3-4 cm. long, 1-1.2 mm. wide, the pedicels about 20 mm. long; seeds wingless, about 1.5 mm. long.—Apr.-May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

15. *Cardamine arakiana* Koidz. *Dentaria arakiana* Koidz.—Ō-MARUBA-KONRON-SŌ. Allied to species No. 2; rhizomes short, thickened, scaly; stems 10-30 cm. long, simple, few-leaved, with spreading hairs; radical leaves ternate or simple, thin, the terminal leaflets orbicular-reniform, or reniform-cordate, 15-30 mm. long, 15-40 mm. wide, short-pilose above, undulate-toothed, the lateral leaflets very small, short-petiolulate, obliquely cordate; cauline leaves smaller, the leaflets slightly narrower; racemes several-flowered, short, glabrous; sepals glabrous; petals narrowly cuneate-oblong, 6-7 mm. long, slightly shorter than the pedicels in anthesis; siliques 2-3 cm. long, about 1.8 mm. wide, gradually narrowed above to the stigma, the style about 2 mm. long; seeds about 1.5 mm. long, wingless.—Apr.-May. Honshu (Tanba Prov.).

16. *Cardamine appendiculata* Fr. & Sav. *Dentaria appendiculata* (Fr. & Sav.) Matsum.; *C. macrophylla* var. *appendiculata* (Fr. & Sav.) Yatabe.—HIRO-ITA-KONRON-SŌ, TADENO-UMI-KONRON-SŌ. FIG. 7. Rhizomes slender, creeping, slightly

..Jetsuo Koyama, ad nat. del.
August, 1952.

FIG. 7—*Cardamine appendiculata* Fr. & Sav. 1, 2, Fruiting plant; 3, 4, portion of rhizome; 5, leaflets, upper surface; 6, the same, lower surface; 7, base of petiole; 8, hairs on upper surface of leaf; 9, 10, siliques; 11, the same, with valve taken off; 12, 13, valves; 14, 15, 16, seeds; 17, raceme; 18, flower; 19, sepal; 20, petal; 21, flower, with sepals and petals removed; 22, anther; 23, floral diagram. Specimen from Lake Tadenoumi in Shimotsuke, Honshu.

thickened at apex; stems 30–50 cm. long, several-leaved; leaves petiolate, the radical and lower cauline long-petiolate, the leaflets 5–7, nearly equal, ovate-oblong to oblong, 3–5 cm. long, 1–3 cm. wide, obtuse, short-pubescent above, incised and obtusely toothed, the petioles of the cauline leaves slightly auriculate; racemes solitary or few, about 10-flowered, the pedicels 1–2 cm. long; petals about 8 mm. long, white, cuneate-obovate; siliques 2–3 cm. long, 1.5–1.8 mm. wide, gradually narrowed above; seeds about 2 mm. long, wingless.—May–July. Wet places along streams and ravines in mountains; Honshu (centr. and n. distr.).

17. *Cardamine leucantha* (Tausch) O. E. Schulz.

7. WASABIA Matsum. WASABI ZOKU

Glabrous perennial herbs; radical leaves long-petiolate, simple, cordate-obovate, undulate-toothed; stems leafy, simple; flowers bracteate, in racemes, white; sepals ascending; petals clawed, obovate; siliques linear-oblong, rather short, torulose, cylindric, the valves membranous, without a midrib, the septum perfect; style rather elongate, the stigma simple; seeds few in 1 series, rather large, plump; cotyledons incumbent.—Two species, in Japan.

- 1A. Rhizomes stout, 1–2 cm. across; style about 2 mm. long; petals 8–9 mm. long; leaves to 15 cm. across. 1. *W. japonica*
1B. Rhizomes short and narrow, 1–2 mm. across; style 0.5–0.7 mm. long; petals 5–7 mm. long; leaves to 5 cm. across. 2. *W. tenuis*

1. *Wasabia japonica* (Miq.) Matsum. (?) *Cochlearia wasabi* Sieb.; *Eutrema wasabi* (Sieb.) Maxim.; *Alliaria wasabi* (Sieb.) Prantl; *W. wasabi* (Sieb.) Makino; *W. pungens* Matsum.; (?) *Lunaria japonica* Miq.; *E. japonica* (Miq.) Koidz.; (?) *E. okinosimensis* Takenouchi—WASABI. Rhizomes creeping, stout; stems ascending, 20–40 cm. long, several-leaved; radical leaves long-petiolate, cordate-reniform, 8–15 cm. long and as wide, rounded at apex, undulate-toothed, the petioles dilated at base; cauline leaves petiolate, broadly ovate, 2–4 cm. long, shallowly cordate; inflorescence simple, solitary, many-flowered, the bracts similar to the cauline leaves but small, the pedicels slender, 1–3(–5) cm. long; sepals and stamens about 4 mm. long; petals cuneate-obovate; siliques on stipes 3–5 mm. long; style slender.—Mar.–May. Wet places along streams in mountains and often cultivated in such places for the pungent rhizomes; Honshu, Shikoku, Kyushu.—Sakhalin.

Dentaria leucantha Tausch; *C. dasyloba* (Turcz.) Komar.; *D. dasyloba* Turcz.; *D. macrophylla* var. *dasyloba* (Turcz.) Makino—KONRON-SŌ. Rhizomatous; stems 40–60 cm. long, erect, short-pubescent; cauline leaves few, petiolate, short-pubescent beneath, the leaflets 5–7, thinly membranous, broadly lanceolate to ovate-oblong, 4–8 cm. long, 1–2.5(–3) cm. wide, acuminate, toothed; racemes many-flowered, elongate after anthesis, short-pubescent; sepals usually pilose; petals 8–10 mm. long; siliques slightly pilose while young, long-pedicelled.—Apr.–June. Wet places along streams and ponds in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, n. China, and e. Siberia.

2. *Wasabia tenuis* (Miq.) Matsum. *Nasturtium tenue* Miq.; *Cardamine tenuis* (Miq.) Koidz.; *C. bracteata* S. Moore; *Eutrema bracteata* (S. Moore) Koidz.; *W. bracteata* (S. Moore) Hiseuchi; *E. hederacfolia* Fr. & Sav.; *W. hederacfolia* (Fr. & Sav.) Matsum.—YURI-WASABI. Slender glabrous perennial herb with narrow short rhizomes and slender fibrous roots; stems ascending, 10–30 cm. long, few-leaved; radical leaves long-petiolate, reniform-obovate, cordate, 2–5 cm. long and as wide, undulate-toothed, mucronate, the nerves palmate; cauline leaves petiolate, ovate, cordate, 1–2.5 cm. long, 0.8–2.5 cm. wide; flowers in loose racemes, few, the bracts similar to the cauline leaves but small, the pedicels 5–15(–40) mm. long, slender, spreading to deflexed; siliques nodding, broadly linear, torulose, 8–12 mm. long, about 2 mm. across, sessile or nearly so; seeds 4–8, in 1 series, 2–2.5 mm. long, obsoletely punctulate.—Apr.–May. Streams in mountain woods; Honshu, Shikoku, Kyushu.

8. NASTURTIIUM R. Br. ORANDA-GARASHI ZOKU

Perennial herbs of wet places; leaves pinnate; racemes elongate, many-flowered, without bracts; flowers white; siliques linear; style stout, short; valves membranous, nerveless; seeds in 2 series, many, small; cotyledons accumbent.—A single species.

1. *Nasturtium officinale* R. Br. *N. nasturtium-aquaticum* (L.) Karst.; *Sisymbrium nasturtium-aquaticum* L.; *Rorippa nasturtium-aquaticum* (L.) Schinz & Thell.; *Radícula nasturtium-aquaticum* (L.) Britten & Rendle—ORANDA-GARASHI. Glabrous perennial rhizomatous herb; stems 30–40 cm. long, rather stout; leaves petiolate, pinnate, the leaflets

3–7(–9), ovate or broadly so, undulately few toothed, the terminal leaflet larger than the lateral, 2–3 cm. long, 15–25 mm. wide; racemes rather elongate, the pedicels often deflexed; siliques 1–2 cm. long, 1.5–2 mm. wide, with a short, stout style; seeds in 2 series.—Widely naturalized in our area, growing in water or in very wet places; common.—Eurasia.

9. COCHLEARIA L. TOMOSHIRI-SŌ ZOKU

Glabrous annuals or perennials; leaves alternate, sometimes rosulate, entire or pinnately parted; flowers white, rarely purple or yellow, ebracteate, in racemes or rarely solitary on naked scapes; petals shortly clawed; stamens straight or geniculate; siliques sometimes short-stiped, oblong or globose, the valves usually ventricose, loosely reticulate or veiny; style short or elongate, the stigma simple or capitate; seeds many to few, usually in 2 series, small; cotyledons accumbent or rarely incumbent.—About 25 species, in the temperate and far northern regions of the N. Hemisphere, especially along the sea and in high mountains.

1. *Cochlearia oblongifolia* DC. *C. officinalis* subsp. *oblongifolia* (DC.) Hult.—TOMOSHIRI-SŌ. Lustrous glabrous biennial; stems 10–20 cm. long, branched at base, few-

leaved; leaves rather thick, the radical rosulate, rather many, usually withering before anthesis, the lower cauline petiolate, the upper leaves sessile, ovate or oblong, 1–2.5 cm. long, 8–15

mm. wide, obtuse, entire or few-toothed, narrowed at base; flowers white, small, the pedicels 7-15 mm. long; siliques ovoid-oblong, 5-7 mm. long, 3-3.5 mm. wide; style slender,

short, the stigma capitate.—Rocks by the sea; Hokkaido (Nemuro Prov.).—Kamchatka, Kuriles, Sakhalin, and Ochotsk Sea region.

10. SISYMBRIUM L. KAKANE-GARASHI ZOKU

Annuals, biennials, or perennials usually with coarse simple hairs; cauline leaves alternate, variously divided to entire; racemes usually elongate; flowers yellow or yellowish; petals often with a slender claw at base; siliques linear to narrowly so, sometimes narrowed above, terete or angled, the valves often 3-nerved; style short, the stigma usually bifid; seeds in 1 series; cotyledons incumbent.—Many species, mainly in the Old World.

- 1A. Siliques about 12 mm. long, appressed to the axis, on very short pedicels, gradually narrowed from the base to the apex; flowers small; biennial. 1. *S. officinale*
 1B. Siliques 8-10 cm. long, erect or obliquely spreading, narrowly linear, uniformly thickened from base to the apex.
 2A. Annual or biennial herbs; siliques as broad as the stout pedicels.
 3A. Pedicels 3-4 mm. long; sepals pilose, obtuse. 2. *S. orientale*
 3B. Pedicels 7-10 mm. long; sepals glabrous with a mucro below the apex. 3. *S. altissimum*
 2B. Perennial herb; siliques twice as broad as the pedicel; flowers rather large. 4. *S. luteum*

1. *Sisymbrium officinale* (L.) Scop. *Erysimum officinale* L.—KAKANE-GARASHI. More or less coarsely hispid-pilose annual or biennial herb, 30-80 cm. high with obliquely ascending branches; leaves pinnately cleft to parted, petiolate, the segments 2 or 3 pairs, unequal, spreading, the terminal ones relatively large and toothed, the upper leaves nearly sessile; flowers small; petals about 3 mm. long; siliques 10-12 mm. long, acuminate, appressed to the axis, 1-1.2 mm. across at base, shortly soft-pubescent, terete, the pedicels appressed to the axis, slenderer than the silique, 2-3 mm. long.—May-July. Naturalized; Honshu (near Tokyo).

Var. *leiocarpum* DC. HAMA-GARASHI. Siliques glabrous.—Naturalized in Hokkaido and Honshu (near Tokyo).—Europe, w. Asia, and N. America.

2. *Sisymbrium orientale* L. *S. columnae* var. *orientale* (L.) DC.—INU-KAKINE-GARASHI. Resembles the preceding; pedicels erect, stout; petals about 6 mm. long, narrowly spatulate; siliques 7-8 cm. long, narrowly linear.—May-July. Naturalized in our area.—Eurasia.

3. *Sisymbrium altissimum* L. HATAZAO-GARASHI. Resembles the preceding; pinnae of leaves 4 or 5 pairs, the pedicels ascending, 7-10 mm. long; sepals glabrous; siliques 8-10 cm. long.—May-July. Widely naturalized.—Europe and w. Asia.

4. *Sisymbrium luteum* (Maxim.) O. E. Schulz. *Hesperis lutea* Maxim.—KIBANA-HATAZAO. Coarsely pilose branched perennial herb, 80-120 cm. high; leaves petiolate, the lower ones pinnate, the lateral segments 1 to 3 pairs, the terminal ones narrowly deltoid-ovate, 8-12 cm. long, 3-5 cm. wide, acute, short-toothed; racemes elongate after anthesis, the pedicels 12-15 mm. long, ascending; sepals 8-9 mm. long, more or less coarsely pilose; petals yellow, 12-13 mm. long; siliques narrowly linear, 8-10 cm. long; stigma shallowly bilobed.—May-June. Honshu (centr. distr.), Kyushu (Tsu-shima); rare.—Korea and Manchuria.

11. BARBAREA R. Br. YAMA-GARASHI ZOKU

Erect branched glabrous biennials or perennials; leaves lyrate to sinuately pinnatifid or entire; flowers yellow, sometimes bracteate; sepals equal; petals clawed, obovate; siliques linear, compressed-tetragonous or subcompressed, the valves costate or keeled; style short, the stigma capitate or bifid; seeds in 1 series, oblong, elliptic, sometimes margined; cotyledons accumbent.—About 10 species, in temperate and cold regions.

1. *Barbarea orthoceras* Ledeb. *B. cochlearifolia* H. Boiss.; *B. patens* H. Boiss.; *Sisymbrium japonicum* H. Boiss.; *B. vulgaris lusitana* Regel; *B. sibirica* (Regel) Nakai; *B. hondoensis* Nakai; *B. vulgaris* var. *stricta* sensu auct. Japon., non Regel.—YAMA-GARASHI, MIYAMA-GARASHI. Deep green glabrous perennial herb, 20-40 cm. high; stems striate, branched above; radical leaves petiolate, lyrate, the terminal segments large, ovate to cordate, 1-3 cm. long, 1-2.5 cm. wide, the lateral segments to 5 pairs, smaller, the cauline leaves

nearly equal, decurrent and auriculate at base, clasping; racemes elongate after anthesis, erect, many-flowered, the pedicels slender; petals yellow, 7-8 mm. long, obovate; siliques erect or ascending, 3-4 cm. long, about 1.5 mm. wide, flat, straight; seeds thinly margined, 1.5-2 mm. long.—May-Aug. Wet places especially along streams and around ponds in high mountains; Hokkaido, Honshu (centr. and n. distr.).—Siberia, Kamchatka, Manchuria, Korea, Sakhalin, Kuriles, and N. America.

12. RORIPPA Scop. INU-GARASHI ZOKU

Branched annuals or perennials, glabrous or with simple hairs; leaves entire, lobed or parted; flowers yellow, sometimes solitary in upper axils, usually in racemes; sepals short, equal, spreading; petals slightly clawed, spreading or rarely absent; stamens 6 or fewer; siliques often curved, nearly terete, on spreading or arcuate sometimes very short pedicels, the valves membranous, weakly 1-nerved or nerveless; style short or rather long, the stigma simple or 2-lobed; seeds in 2 series, small, turgid; cotyledons accumbent.—About 50 species, in temperate and warmer regions of the N. Hemisphere, few in the S. Hemisphere.

- 1A. Flowers distinctly pedicelled, bractless, in racemes.
 2A. Siliques narrowly linear, 15–25 mm. long; style thick and short.
 3A. Flowers apetalous; siliques straight. 1. *R. dubia*
 3B. Flowers with spatulate petals slightly longer than the sepals; siliques more or less arcuate. 2. *R. indica*
 2B. Siliques globose to narrowly oblong, 3–6 mm. long; style slender and short.
 4A. Siliques cylindric-oblong; biennial. 3. *R. islandica*
 4B. Siliques globose; perennial. 4. *R. nikkoensis*
 1B. Flowers subsessile, solitary in leaf-axils. 5. *R. cantoniensis*

1. **Rorippa dubia** (Pers.) Hara. *Sisymbrium dubium* Pers.; *R. sinapis* Ohwi & Hara, excl. syn.; *Nasturtium heterophyllum* Bl.; *Cardamine sublyrata* Miq.; *N. sublyratum* (Miq.) Fr. & Sav.; *R. sublyrata* (Miq.) Hara; *N. indicum* forma *apetalum* Makino—MICHIBATA-GARASHI. Glabrous perennial with short rhizomes; stems branched at base, 10–20 cm. long, often ascending-spreading, few-leaved; radical leaves narrowly ovate, the lower cauline more or less lyrate, petiolate, 4–10 cm. long, irregularly dentate-serrate; racemes 3–5 cm. long, erect or ascending, straight; flowers about 10 in a raceme, small, the pedicels 4–6 mm. long; petals absent; sepals 2–2.5 mm. long; siliques narrowly linear, straight, 20–25 mm. long, 1–1.2 mm. wide; seeds minute, about 0.5 mm. long.—May–Aug. In shaded places around houses and on roadsides in lowlands; Honshu, Shikoku, Kyushu.—India, China, Malaysia, Ryukyus, and Formosa.

2. **Rorippa indica** (L.) Hiern. *Sisymbrium indicum* L.; *S. sinapis* Burm.; *R. sinapis* (Burm.) Ohwi & Hara; *Nasturtium indicum* (L.) DC.; *S. atrovirens* Hornem.; *N. atrovirens* (Hornem.) DC.; *R. atrovirens* (Hornem.) Ohwi & Hara; *N. montanum* Wall. ex Benth.; *N. montanum* var. *obtusulum* Miq.; *N. obtusulum* (Miq.) Koide.—INU-GARASHI. Resembles the preceding; stems often more branched, 20–40 cm. long; terminal segment of radical leaves often larger, 1–2 cm. wide, irregularly dentate-serrate, the upper leaves sessile, lanceolate; racemes 4–6 cm. long, often branched below; petals yellow, spatulate, slightly longer than the petals, about 3 mm. long; siliques narrowly linear, 15–22 mm. long, about 1.2 mm. wide, slightly incurved, the pedicels 5–8 mm. long; style thick and short.—May–Sept. Rather wet places in lowlands, especially in paddy fields and along roadsides; Hokkaido, Honshu, Shikoku, Kyushu; common.—China, Ryukyus, Formosa, Malaysia, India, and Africa.

3. **Rorippa islandica** (Oed.) Borb. *Sisymbrium islandicum* Oed.; *Nasturtium palustre* (L.) DC.; *R. palustris* (L.) Bess.; *S. amphibium* var. *palustre* L.; *Radicula palustris* (L.) Moench—SUKASHI-TAGOBÔ. Nearly glabrous biennial herb;

stems spreading, branched, 30–50 cm. long; radical leaves petiolate, lyrate, 7–15 cm. long, 15–30 mm. wide, toothed, the cauline leaves sessile, auriculate, toothed, lobed or undivided; racemes 5–15 cm. long, many-flowered, the pedicels spreading or reflexed, 5–7 mm. long; petals cuneate-obovate, about 3 mm. long, slightly longer than the sepals, yellow; siliques short, oblong or oblong-cylindric, 4–6 mm. long, 2–2.5 mm. wide; style very short; seeds minute.—Apr.–Oct. Wet places in lowlands especially in paddy fields and along river margins; Hokkaido, Honshu, Shikoku, Kyushu; common.—Temperate and warmer regions of the N. Hemisphere.

4. **Rorippa nikkoensis** Hara. *Nasturtium amphibium* sensu auct. Japon, non R. Br.—MIGIWA-GARASHI. Glabrous perennial herb; stems to 50 cm. long, branched; lower leaves lyrate, the upper ones parted to cleft, 7–15 cm. long, 15–50 mm. wide, auriculate, the terminal segments narrowly ovate to oblong, irregularly toothed, the lateral segments 2–10, rather small; racemes rather many-flowered, the pedicels spreading, 4–6 mm. long; petals nearly as long as the sepals, 1.5–2 mm. long, broadly spatulate; siliques globose or broadly ellipsoidal, 3–4 mm. long, 2–3 mm. wide; style rather slender; seeds about 0.8 mm. long.—July–Aug. Mountains; Honshu (Nikko).

5. **Rorippa cantoniensis** (Lour.) Ohwi. *Ricottia cantoniensis* Lour.; *Nasturtium microspermum* DC.; *N. sikkianum* Fr. & Sav.—KO-INU-GARASHI. Glabrous branched annual or biennial, 10–40 cm. high; leaves cleft, 3–6 cm. long, 1–2 cm. wide, irregularly incised and toothed, auriculate, the upper leaves (or bracts) broadly lanceolate, 5–20 mm. long, incised, sessile; flowers solitary in leaf-axils, nearly sessile; petals broadly oblanceolate, about 3 mm. long, slightly longer than the sepals; siliques short-cylindric, 6–10 mm. long, 2–3 mm. wide; style short and thick; seeds minute.—Apr.–June. Edge of paddy fields and along margins of rivers in lowlands; Honshu (Kantô Distr. and westv.), Shikoku, Kyushu; common.—China and Manchuria.

13. CAPSELLA Medic. NAZUNA ZOKU

Annual or biennial herbs, stellate-pubescent; radical leaves rosulate, lyrate; stems erect, few-leaved; flowers small, white, bractless; sepals equal; siliques cuneate or obtriangular, flattened laterally or subterete, the valves navicular, flattened, keeled on back, the septum narrow, membranous; style short, the stigma sessile; seeds many, wingless; cotyledons incumbent or sometimes accumbent.—Few species, in both hemispheres.

1. **Capsella bursa-pastoris** (L.) Medic. *Thlaspi bursa-pastoris* L.—NAZUNA. Annual or biennial herb with simple and stellate hairs; radical leaves lyrate, the cauline lanceolate, auriculate and sessile, toothed; stems 10–40 cm. long, often branched below; flowers many, in racemes, the pedicels slender; petals obovate, clawed, about 2–2.5 mm. long; siliques

obtriangular, glabrous, flattened, 6–7 mm. long, 5–6 mm. wide, shallowly and broadly retuse to emarginate; style short; seeds 20–25, obovate, about 0.8 mm. long.—Mar.–June. Cultivated fields and along roadsides in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Temperate regions of the N. Hemisphere.

14. DRABA L. INU-NAZUNA ZOKU

Usually densely tufted annuals, biennials, or perennials with stellate or simple hairs; leaves entire or incised-toothed, the radical rosulate; stems naked or few-leaved; racemes short or elongate; flowers bractless, small, white or yellow, rarely rose or purple; siliques elliptic to broadly linear, flat, many- to few-seeded, the valves nearly flat, rarely nerved, deciduous, the septum membranous; styles short or elongate, the stigma simple; seeds in 2 series, wingless, sometimes with a membranous appendage; cotyledons accumbent.—About 270 species, mostly in mountains and northern regions of the N. Hemisphere.

- 1A. Biennial; flowers yellow; style very short; siliques much shorter than the pedicels. 1. *D. nemorosa* var. *hebecarpa*
 1B. Perennials; innovation-shoots present; style distinct.
 2A. Flowers yellow. 2. *D. japonica*
 2B. Flowers white.
 3A. Petals 7–8 mm. long; style 2.5–4 mm., rarely 1.5 mm. long; siliques pilose. 3. *D. sachalinensis*
 3B. Petals 3–6 mm. long; style less than 2 mm. long.
 4A. Siliques puberulent, prominently contorted; petals 5–6 mm. long; style 0.2–0.5 mm. long; rocks by the sea. 4. *D. borealis*
 4B. Siliques glabrous, not or slightly contorted; petals 3–4 mm. long; rocks and dry slopes in mountains and alpine regions.
 5A. Seeds appendaged on one end. 5. *D. sakuraii*
 5B. Seeds not appendaged.
 6A. Leaves glabrous on both sides, ciliate. 6. *D. shiromana*
 6B. Leaves minutely stellate-pubescent on both sides. 7. *D. kitadakensis*

1. *Draba nemorosa* L. var. *hebecarpa* Lindbl. *D. hirta* sensu Miq. non L.—INU-NAZUNA. Rather prominently stellate-pilose biennial; stems erect, simple or branched at base, 10–20 cm. long, slender, leafy; radical leaves rosulate, spatulate, 2–4 cm. long, 8–15 mm. wide, slightly toothed, nearly sessile, the cauline leaves few, narrowly ovate to narrowly oblong, 1–3 cm. long, 5–15 mm. wide, broadly cuneate, sessile; racemes many-flowered, the pedicels 10–20 mm. long, spreading; petals about 3 mm. long; siliques narrowly oblong, flat, 5–8 mm. long, 2–2.2 mm. wide, short-pilose; style very short or nearly absent; seeds not appendaged, about 0.4 mm. long.—Mar.–May. Sunny places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Temperate regions of the N. Hemisphere.

Var. *leiocarpa* Lindbl. ME-NU-NAZUNA. Siliques glabrous.—Rare. Occurs with var. *hebecarpa*.

2. *Draba japonica* Maxim. *D. yezoensis* Nakai—NAMBU-NU-NAZUNA. Perennial herb, stellate-pubescent, the caudex branched, tufted, the innovation-shoots slightly elongate; stems 5–10 cm. long, few-leaved; rosulate leaves oblanceolate to narrowly so, 5–15 mm. long, 1.5–3 mm. wide, entire or with few coarse teeth, subobuse, gradually narrowed below, the cauline leaves sessile, 8–10 mm. long, 2–6 mm. wide; racemes short-pilose; petals obovate, clawed below, yellow, 4–4.5 mm. long; siliques narrowly ovate, glabrous, 4–6 mm. long, 2.5–3.5 mm. wide; style 0.2–0.5 mm. long, the stigma discoid; seeds not appendaged, about 1.5 mm. long.—June–Aug. Alpine regions; Hokkaido (Mount Yubari), Honshu (Mount Hayachine); rare.

3. *Draba sachalinensis* Trautv. *D. grandiflora* Franch., non C. A. Mey.; *D. franchetii* O. E. Schulz; *D. moiwana* Koidz.; *D. shinanomontana* Ohwi; *D. sachalinensis* var. *shinanomontana* (Ohwi) Okuyama—MOIWA-NAZUNA. Perennial herb, densely grayish stellate-puberulent; stems 10–25 cm. long, 2- to 4-leaved on lower half, the sterile innovation shoots slightly elongate, with a tuft of rosulate leaves at the tip; rosulate leaves oblanceolate, few-toothed or subentire, 2–3 cm. long, 5–8 mm. wide, subacute, gradually narrowed below, the cauline leaves ovate to broadly lanceolate, 1.5–2 cm. long, 3–10 mm. wide, toothed, rarely entire, cuneate; racemes rather many-flowered, stellate-puberulent, the pedicels ascending, 15–20 mm. long; petals 7–8 mm. long; siliques broadly lanceolate, stellate-puberulent, 8–10 mm. long, 2.5–3 mm. wide;

stigma capitate; seeds not appendaged, 1–1.2 mm. long.—May–June. Rocky places in mountains; Hokkaido, Honshu (Shinano Prov.).—Sakhalin.

4. *Draba borealis* DC. SHIROBANA-NU-NU-NAZUNA, Ezo-NU-NAZUNA. Rather densely stellate-puberulent perennial, the innovation shoots somewhat elongate and sparingly branched; stems few-leaved, 6–20 cm. long; rosulate leaves spatulate, 15–30 mm. long, 5–8 mm. wide, obtuse, few-toothed or sometimes entire, the margin with scattered simple hairs, the cauline leaves ovate to oblong, 8–25 mm. long, toothed, usually acute, the innovation-leaves usually without simple hairs; racemes rather many-flowered, puberulent, the pedicels about 10 mm. long; petals obovate, clawed, 5–6 mm. long; siliques broadly lanceolate, usually prominently contorted, 5–8 mm. long, 2.5–3 mm. wide, puberulent, rarely glabrous; style 0.2–0.4 mm. long, the stigma capitate; seeds without appendage, about 1 mm. long.—June–July. Rocky cliffs near the sea; Hokkaido (Nemuro and Hidaka Prov.).—Kuriles, Sakhalin, and Ochotsk Sea region.

5. *Draba sakuraii* Makino. *D. sinanensis* Makino—TOGAKUSHI-NAZUNA. Loosely tufted perennial, rather densely stellate-pubescent; stems 7–20 cm. long, 2- to 5-leaved, with scattered stellate and simple hairs, the innovation-shoots rarely elongate; rosulate leaves oblanceolate or broadly so, 1–2.5 cm. long, 2–8 mm. wide, toothed or subentire, subobuse, often with simple hairs on margin, the cauline leaves narrowly ovate to oblong, usually coarsely few-toothed, 8–15 mm. long, 5–10 mm. wide, puberulent, the pedicels puberulent; petals 3.5–4(–5) mm. long, cuneate-obovate; siliques narrowly lanceolate, flat; style 1–2 mm. long, the stigma capitate; seeds with a membranous tail.—June–July. Rocky dry places in high mountains; Honshu (n. part of centr. distr.).

Var. *nipponica* (Makino) Takeda. *D. nipponica* Makino; *D. ontakensis* Makino; *D. nihoensis* Koidz.; *D. sakuraii* var. *ontakensis* (Makino) Takeda; *D. sakuraii* var. *rigidula* Takeda; *D. linearis* Satake—KUMOMA-NAZUNA. Plant more slender, less puberulent, with glabrous more slender pedicels and shorter-tailed seeds.—Honshu (centr. distr. and Nikko).

6. *Draba shiromana* Makino. SHIROUMA-NAZUNA. Perennial with short slightly branched caudex; stems 5–10 cm. long, 1- to 4-leaved, glabrous; rosulate leaves linear-spatulate, 5–12 mm. long, 1.5–2 mm. wide, entire or rarely few-toothed, glabrous on both sides, ciliate, gradually narrowed

below, the cauline sessile, broadly linear, 5–12 mm. long, 1.5–2 mm. wide; racemes glabrous, rather few-flowered; petals about 3.5 mm. long, cuneate-obovate; silicles broadly linear, often slightly contorted; style minute; seeds with obtuse margin, not appendaged, 1–1.5 mm. long.—July–Aug. Dry gravelly or rocky slopes in alpine regions; Honshu (centr. distr., on Mount Shirouma and in Akaishi Mts.); rare.

Draba okamotoi Ohwi is a sterile, alleged hybrid possibly between *D. shiroumana* and *Arabis tanakana*.

7. **Draba kitadakensis** Koidz. *D. nakaiana* Hara; *D. kamtschatica* var. *yezoensis* Nakai; *D. oiana* Honda—KITADAKE-NAZUNA, SŌUN-NAZUNA. Perennial gray-green herb, densely appressed stellate-puberulent; stems 10–15 cm. long,

short-branched and with short sterile shoots at base, erect, 3- to 10-leaved; rosulate leaves oblanceolate or narrowly so, 6–12 mm. long, 1.5–3 mm. wide, acute, narrowed at base, few-toothed or entire, the cauline narrowly ovate or broadly lanceolate, 8–20 mm. long, acute, toothed; racemes rather densely more than 10-flowered, the pedicels 3–7 (–15) mm. long, densely minute-puberulent; petals about 3 mm. long, narrowly cuneate-obovate; silicles lanceolate, contorted, 7–10 mm. long, about 2 mm. wide; style 0.2–1.5 mm. long, the stigma scarcely thickened, truncate; seeds about 1 mm. long, obtuse on margin, not tailed.—May–June. Rocky cliffs in mountains; Hokkaido, Honshu (e. Shinano and Kai Prov.); rare.

15. ARABIS L. HATAZAO ZOKU

Annuals, biennials, or perennials, nearly glabrous or with bifurcate, stellate, or simple hairs; radical leaves usually spatulate, toothed or entire, the cauline sessile, often toothed or lobed; racemes bractless; flowers white or rose-purple; sepals obtuse, equal or the lateral ones gibbous; petals clawed, entire, longer than the sepals; silicles linear, sessile, the valves flat, sometimes with a midrib, the septum membranous; style short, the stigma simple or shallowly bilobed; seeds in 1 or sometimes 2 series, flat, sometimes narrowly winged on margin; cotyledons accumbent.—Many species, mainly in temperate to northern regions of the N. Hemisphere.

1A. Cauline leaves sessile and clasping or when not clasping, the plants erect, 50–80 cm. high; radical leaves entire or toothed.

2A. Cauline leaves auriculate and clasping, at least in the lower ones.

3A. Petals 5–10 mm. long, cuneate-obovate, white.

4A. Silicles nearly appressed to the axis; style 0.3–0.7 mm. long, stout. 1. *A. stelleri* var. *japonica*

4B. Silicles spreading to ascending, rarely suberect; style usually about 2 mm. long, slender. 2. *A. serrata*

3B. Petals 4–5 mm. long, cuneate-oblongate, white or creamy white; silicles obliquely ascending, erect, or appressed.

5A. Seeds narrowly winged; plant coarsely hirsute; petals white; seeds 1-seriate. 3. *A. hirsuta*

5B. Seeds not winged; plant glaucous, coarsely pubescent only on lower half; petals creamy white; seeds imperfectly 2-seriate.

4. *A. glabra*

2B. Cauline leaves not auriculate or clasping.

6A. Stems 50–80 cm. long, often branched above, hispid; cauline leaves hispid; petals cuneate-oblongate, 3–4 mm. long; silicles nodding or pedulous. 5. *A. pendula*

6B. Stems scapellike, 3–25 cm. long, simple, appressed stellate-pubescent; cauline leaves appressed stellate-pubescent; petals cuneate-obovate; silicles spreading to ascending.

7A. Style 3–5 mm. long; plants stoloniferous; leaves toothed, 1–7 cm. long, 8–12 mm. wide; petals 7–12 mm. long.

6. *A. flagellosa*

7B. Style less than 3 mm. long; stolons absent; leaves entire, 3–10 mm. long, 1–3 mm. wide; petals 2.5–3 mm. long.

7. *A. tanakana*

1B. Lower cauline leaves often petioled; radical leaves usually lyrate.

8A. Silicles (2.5–)3–4 cm. long, not torulose or scarcely inflated; style stout, about 0.5 mm. long; stems erect, bearing no innovation-shoots on the upper part.

9A. Green or only slightly glaucescent perennial; seeds rather many, 1.5 mm. long, with a narrow wing at the end.

8. *A. lyrata* var. *kamtschatica*

9B. Glaucescent biennial; seeds many, about 1 mm. long, wingless. 9. *A. kawakajiana*

8B. Silicles 10–20 mm. long, slightly torulose and somewhat inflated; style slender, about 1 mm. long; stems usually decumbent after anthesis and bearing innovation-shoots. 10. *A. gemmifera*

1. **Arabis stelleri** DC. var. *japonica* (A. Gray) F. Schmidt. *A. stelleri* sensu auct. Japon., non DC.; *A. alpina* var. *japonica* A. Gray; *A. japonica* (A. Gray) A. Gray; *A. yokoscensis* Fr. & Sav.—HAMA-HATAZAO. Rather densely hairy with usually 2- to 3-branched hairs; stems erect, rather stout, 20–40 cm. long; radical leaves oblong to oblanceolate, 3–7 cm. long, 8–25 mm. wide, few-toothed, gradually narrowed to a rather broad petiole at base; racemes often slightly branched; flowers rather large and many; silicles appressed to the axis, dense, 4–6 cm. long, 1.5–2 mm. wide; style short and stout; seeds narrowly winged, about 1.5 mm. long, in 1 series.—Apr.–June. Dunes along the sea; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Amur, and Sakhalin.

2. **Arabis serrata** Fr. & Sav. *A. amplexicaulis* var. *ser-*

rata (Fr. & Sav.) Makino; *A. serrata* var. *platycarpa* Ohwi—FUJI-HATAZAO. Usually more or less tufted perennial with 2- to 4-branched short hairs; stems 10–30 cm. long, few-leaved; radical leaves rosulate, 1.5–7 cm. long, 8–15 mm. wide, prominently coarse-toothed, narrowed to the relatively long petiole; flowers white, few to rather many; petals cuneate-obovate, 6–10 mm. long; silicles 3.5–6 cm. long, 1.5–2 mm. wide; style 1.5–2 mm. long; seeds 1.2 mm. long, narrowly winged.—July–Aug. Rocky or sandy places in mountains; Honshu (Mount Fuji); very variable.

Var. *sikokiana* (Nakai) Ohwi. *A. boissieuana* var. *sikokiana* Nakai; *A. sikokiana* (Nakai) Honda—SHIKOKU-HATAZAO. Radical leaves long-attenuate at base; silicles 7–9 cm. long.—Mountains; Honshu (Tōkaidō and Kinki Distr. and westw.), Shikoku, Kyushu.—Korea (Quelpaert Isl.).

Var. *japonica* (H. Boiss.) Ohwi. *A. amplexicaulis* var. *japonica* H. Boiss.; *A. boissieuana* Nakai; *A. serrata* var. *japonica* f. *grandiflora* (Nakai) Ohwi; *A. jauriei* var. *grandiflora* Nakai; *A. kishidai* Nakai; *A. serrata* var. *japonica* f. *glabrescens* (Ohwi) Ohwi; *A. serrata* var. *glabrescens* Ohwi; *A. serrata* var. *japonica* f. *jauriei* (H. Boiss.) Ohwi; *A. jauriei* H. Boiss.; *A. iwataensis* Makino—IWA-HATAZAO. Radical leaves gradually narrowed to a rather short petiole, the teeth usually less prominent.—Rather common in mountains, often alpine; Honshu (centr. and n. distr.).

Var. *glauca* (H. Boiss.) Ohwi. *A. glauca* H. Boiss.; *A. pseudoauriculata* H. Boiss.; *A. boissieuana* var. *glauca* (H. Boiss.) Koidz.—EZO-NO-IWA-HATAZAO. Resembles var. *japonica*, but the radical leaves pilose with coarser, 2-parted, distinctly stipitate hairs above.—Hokkaido, Honshu (n. distr.).—s. Kuriles and Sakhalin.

3. *Arabis hirsuta* (L.) Scop. *Turritis hirsuta* L.; *A. sagittata* DC.; *A. nipponica* H. Boiss.—YAMA-HATAZAO. Erect perennial with 2- to 4-branched hairs; stems erect, usually simple, leafy, 30–80 cm. long, often with spreading hairs on lower part; radical leaves oblanceolate, 5–10 cm. long, 1–2 cm. wide, obsoletely few-toothed, gradually narrowed to the petiole, the cauline sessile, 2–7 cm. long; petals cuneate-oblanceolate, 3–5 mm. long; siliques appressed to the axis or erect, 4–6 cm. long, 1–1.2 cm. wide, the axis much-elongate; style very short, stout; seeds about 1.2 mm. long, very narrowly winged.—May–June. Sunny hills and low mountains; Hokkaido, Honshu, Kyushu.—Cool to warm regions of the N. Hemisphere.

4. *Arabis glabra* (L.) Bernh. *Turritis glabra* L.; *A. perfoliata* Lam.—HATAZAO. Glaucescent erect biennial, hairy only on the lower half; stems usually simple, to 80 cm. long, terete; radical leaves oblong-oblanceolate or narrowly oblong, hirsute, the cauline sagittate, entire or nearly so, gradually narrowed and subobtusely to obtuse at apex; flowers on an elongate raceme, the petals creamy white; siliques appressed to the axis; seeds about 0.8 mm. long, not winged, nearly 2-seriate.—Apr.–June. Sunny places in lowlands to foothills; Hokkaido, Honshu, Shikoku, Kyushu.—Temperate regions of the N. Hemisphere.

5. *Arabis pendula* L. *A. subpendula* Ohwi.—EZO-HATAZAO. Erect hirsute biennial, with simple spreading and 2- to 5-branched short hairs; stems 50–100 cm. long, erect, branched above, hirsute; lower cauline leaves oblong, obovate or broadly lanceolate, 3–10 cm. long, 1–5 cm. wide, acute to acuminate, sessile and slightly auriculate, toothed, coarsely hirsute above, usually hirsute on the nerves beneath; racemes loosely many-flowered; sepals glabrous to sparingly pilose, about 1.8 mm. long; petals white, oblanceolate, about 3 mm. long; siliques flat, nodding or deflexed, 7–10 cm. long, 1.5–2 mm. wide; style very short; seeds narrowly winged on margin, 1-seriate.—June–Aug. Woods and thickets in mountains; Hokkaido, Honshu (n. and centr. distr.).—Europe, Siberia, Manchuria, and Sakhalin.

6. *Arabis flagellosa* Miq. SUZU-SHIRO-SŌ. Perennial stoloniferous herb with (2–)3- to 4-branched hairs; rhizomes slender, branched; stems simple, 10–25 cm. long, few-leaved; radical leaves petiolate, 3–7 cm. long, 8–20 mm. wide, spatulate, toothed, the cauline sessile, 1–2 cm. long, ovate; leaves of the stolons broadly obovate to narrowly ovate, 1–3.5 cm. long, 1–1.5 cm. wide, toothed, cuneate; siliques 4–10, in a loose raceme, ascending to spreading, 2–3 cm. long, about 1.5

mm. wide, glabrous; style slender; seeds several to more than 10, very narrowly winged.—Mar.–Apr. Foothills; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyus. —Forma *lasiocarpa* (Matsum.) Ohwi. *A. flagellosa* var. *lasiocarpa* Matsum.—KE-SUZU-SHIRO-SŌ. Siliques pilose. —Occurs with the typical phase.

7. *Arabis tanakana* Makino. KUMOI-NAZUNA. Stellate-pubescent perennial herb; stems 3–8 cm. long, erect, few-leaved; radical leaves rosulate, linear-spathulate, entire, 5–10 mm. long, 1.5–3 mm. wide; racemes usually solitary, 3- to 10-flowered; petals 2.5–3 mm. long; siliques flat, spreading, about 10 mm. long, 1 mm. wide, linear; seeds nearly in 2 series, wingless.—July–Aug. Dry alpine slopes and rocky cliffs; Honshu (centr. distr. on Mount Shirane in Kai and Mount Shirouma in Shinano); very rare.

8. *Arabis lyrata* L. var. *kamtshatica* Fisch. *A. kamtschatica* Fisch.; *A. lyrata* sensu auct. Japon, non L.; *A. petraea* var. *kamtshatica* (Fisch.) Regel.—MIYAMA-HATAZAO. Green to glaucous perennial, nearly glabrous to sparingly pilose; stems few, erect or ascending, 10–30 cm. long, few-leaved, sometimes sparingly branched, soft-hairy toward the base; radical leaves lyrate, abruptly petiolate, 2–5 cm. long, 5–8 mm. wide, with simple and branched stipitate hairs, the cauline leaves broadly lanceolate to broadly linear, 1–4 cm. long, 1–10 mm. wide, the lowermost dentate-serrate, the upper entire; racemes loosely few-flowered; petals cuneate-obovate, white, sometimes with a rosy hue, 3.5–4.5 mm. long; siliques obliquely spreading, 3–4 cm. long, 1–1.2 mm. wide; style short; seeds about 1.5 mm. long with a very narrow wing on the upper end.—June–Aug. Rocky dry slopes in high mountains; Hokkaido, Honshu (centr. and n. distr. and Mount Daisen in Hōki Prov.).—ne. Asia and N. America.

9. *Arabis kawasakiana* Makino. TACHI-SUZU-SHIRO-SŌ. Resembles the preceding; glaucous biennial herb; stems erect, 25–40 cm. long, few-leaved, slightly branched below, usually glabrous; flowers several to more than 10; petals 4–6 mm. long; siliques 2–4 cm. long, 1–1.2 mm. wide, straight; style very short; seeds about 1 mm. long, wingless.—Apr.–June. Sunny sandy places in lowlands especially near the sea; Honshu (Kinki Distr. and westw.), Shikoku.

10. *Arabis gemmifera* (Matsum.) Makino. *Cardamine gemmifera* Matsum.; *A. axillaris* Komar.; *A. maximowiczii* N. A. Busch; *C. greatrexi* Miyabe & Kudo; *A. greatrexi* (Miyabe & Kudo) Miyabe & Tatew.; *A. halleri* sensu auct. Japon, non L.; *A. senanensis* Makino—HAKUSAN-HATAZAO. Perennial; stems 10–30 cm. long, solitary or tufted, often spreading-pubescent, few-leaved, decumbent after anthesis and bearing innovation-shoots in the leaf-axils; radical leaves lyrate, 2–6 cm. long, 8–15 mm. wide, with scattered bifurcate hairs or nearly glabrous, the lower cauline leaves often petiolate, the upper ones oblanceolate to narrowly lanceolate, 1–5 cm. long, acute, few-toothed, glabrous; racemes elongate and loose after anthesis; petals 5–6 mm. long; siliques obliquely spreading, 10–20 mm. long, 0.8–1 mm. wide, somewhat torulose, compressed, glabrous; style slender, about 1 mm. long, the stigma capitate; seeds scarcely winged, about 1 mm. long, in 1 series.—Mar.–May. Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu.—Forma *alpicola* (Hara) Ohwi. *A. gemmifera* var. *alpicola* Hara—Ibuki-HATAZAO. Densely hairy on all parts.—Honshu (Mount Ibuki in Oomi Prov.). —Korea.

16. ARABIDOPSIS Heynh. SHIRO-INU-NAZUNA ZOKU

Biennials or perennials with the habit of *Arabis kawasakiana*, the hairs bifurcate; radical leaves lyrate; flowers white, small, in racemes; style very short, the stigma bilobed; siliques narrowly linear; seeds in 1 or 2 series; cotyledons incumbent.—Few species, in the N. Hemisphere.

1. *Arabidopsis thaliana* (L.) Heynh. *Arabis thaliana* L.; *Stenophragma thaliana* (L.) Celak.; *Arabis pubicalyx* Miq.; *Arabis thaliana* var. *pubicalyx* (Miq.) Makino.—SHIRO-INU-NAZUNA. Biennial herb; stems 20–30 cm. long, branched below, often with simple spreading hairs on the lower portion; radical leaves rosulate, 1–5 cm. long, broadly oblanceolate, 3–15 mm. wide, gradually narrowed below, with few obsolete teeth, the hairs bifurcate, the cauline leaves few or absent;

petals oblanceolate, about 3 mm. long; stamens slightly shorter than the petals; siliques obliquely spreading to sub-erect, 15–20 mm. long, about 0.7 mm. wide; seeds about 0.5 mm. long, the margin obtuse.—Mar.–May. Sunny grassy places in lowlands, especially near the sea; Hokkaido, Honshu, Shikoku, Kyushu.—Europe, Africa, centr. Asia, China, Korea, and N. America.

17. DONTOSTEMON Andrz. HANA-HATAZAO ZOKU

Erect annual, biennial, or perennial branched herbs, the hairs simple, often glandular-tipped; leaves entire to pinnately cleft; flowers in bractless racemes, rather small, pale rose to white; sepals equal; stamens of the longer 4 with the filaments united in pairs; siliques linear-cylindric, angled, the valves inflated; style short, stout, the stigma simple; seeds many, in 1 series, sometimes margined; cotyledons linear, incumbent.—Few species, in e. Asia.

1. *Dontostemon dentatus* (Bunge) Ledeb. *Androschia dentata* Bunge.—HANA-HATAZAO. Biennial with short incurved puberulence; stems erect, rather firm, 25–50 cm. long, often branched, puberulent; leaves rather many, petiolate in the lower ones, sessile in the upper, lanceolate, 2–8 cm. long, 3–10 mm. wide, sparingly toothed, narrowed at both ends, sparsely puberulent; flowers rather many; petals 8–10 mm. long, obovate, clawed, pale rose-purple, about 2.5 times as long

as the sepals; siliques 4–5 cm. long, about 1.5 mm. across, the pedicels 7–10 mm. long, rather stout, obliquely spreading, glabrous, straight or slightly curved; style stout and short; seeds narrowly margined, about 1.5 mm. long.—June–July. Honshu (centr. distr. and s. part of n. distr.); rare.

Var. *glandulosus* Maxim. NEBARI-HANA-HATAZAO. Hairs glandular.—Occurs with the typical phase.—e. Asia.

18. BERTEROELLA O. E. Schulz HANA-NAZUNA ZOKU

Erect branched stellate-pubescent annuals; cauline leaves rather numerous, obovate-oblong or oblanceolate, narrowed below, nearly sessile, entire, rounded and mucronate at apex; petals pale rose; filaments of the inner stamens dilated at base; siliques sessile, stellate-puberulent, linear, the valves 3-nerved; style rather long, glabrous, the stigma small, truncate; seeds wingless; cotyledons incumbent.—A single species.

1. *Berteroella maximowiczii* (Palib.) O. E. Schulz. *Sisymbrium maximowiczii* Palib.—HANA-NAZUNA. Gray-green biennial, densely stellate-pubescent; stems erect, 20–40 cm. long, often branched above; leaves 1.5–3 cm. long, 5–13 mm. wide; racemes many-flowered, the pedicels erect, slender,

3–8 mm. long; petals 3–4 mm. long, cuneate-oblong; siliques white-pubescent, erect, subulate-linear, 10–12 mm. long; style about 2.5 mm. long; seeds few, about 1.5 mm. long.—May–Oct. Honshu (Chūgoku Distr.), Kyushu (Tsushima Isl.); rare.—Korea, Manchuria, and n. China.

19. DESCURAINIA Webb & Berthel. KUJIRAGUSA ZOKU

Annuals, biennials, or perennials, the minute hairs stellate or bifurcate; stems usually branched, leafy; leaves pinnate or bipinnate; flowers small, white or yellow, in bractless racemes; siliques linear, on long slender pedicels, the valves 1-nerved; style very short, the stigma simple; seeds small, in 1 or 2 series; cotyledons incumbent.—About 40 species, in the N. Hemisphere and S. America.

1. *Descurainia sophia* (L.) Prantl. *Sisymbrium sophia* L.—KUJIRAGUSA. White-pubescent annual or biennial; stems erect, 30–60 cm. long, sometimes branched; leaves sessile, 3–5 cm. long, 2–2.5 cm. wide, narrowly ovate, bipinnate, the ultimate segments oblanceolate, subentire, 3–5 mm. long, 1–1.5 mm. wide; flowers small, the pedicels slender, 10–15

mm. long; petals oblanceolate, white, about 2.5 mm. long, slightly longer than the sepals; siliques narrowly linear, 15–25 mm. long, about 1 mm. across, ascending, slightly curved; seeds about 1 mm. long, unappendaged, in 1 series.—June–Aug. Honshu (centr. distr., naturalized in Kantō Distr.).—Europe and Asia.

20. ERYSIMUM L. EZO-SUZU-SHIRO ZOKU

Annuals, biennials, or perennials, the hairs appressed, 2- or 3-branched or stellate, rarely tomentose; stems erect, branched; leaves linear to oblong, entire, sinuate, toothed or rarely pinnatifid; racemes bractless; flowers yellow, orange-yellow or rarely purple; lateral sepals gibbous; stamens free, entire; siliques linear, 4-angled, terete or sometimes flat, the valves linear, often 1-nerved, the replum often keeled on back; style short or elongate, the stigma 2-lobed, capitate or emarginate; seeds in 1 series, oblong; cotyledons incumbent.—About 100 species, in the temperate regions of the N. Hemisphere.

1. *Erysimum cheiranthoides* L. var. *japonicum* H. Boiss. *E. japonicum* (H. Boiss.) Makino—Ezo-SUZU-SHIRO-SŌ. Erect biennial, uniformly clothed with appressed 2- or 3-branched hairs; stems 50-100 cm. long, densely many-leaved, terete, obsolete striate, often slightly purplish red near base, simple or short-branched above; leaves membranous, ascending, linear-lanceolate, 4-6 cm. long, 6-8 mm. wide, obtuse, gray-green, sessile, subentire, slightly recurved on margin; racemes rather densely many-flowered, pilose, the pedicels

oblique, 5-7 mm. long; flowers 4-5 mm. long; sepals rather densely pilose, 2-2.5 mm. long, obtuse and scarious at the apex; petals cuneate; siliques erect, obtusely 4-angled, sparsely pilose, 12-15 mm. long, about 1 mm. across, the valves obtuse, 1-nerved; style very short, the stigma distinctly discoid, dilated, absolutely 2-lobed; seeds about 15 on each side of a white membranous septum.—By the sea; Hokkaido (Tokoro in Kitami); rare.—The typical phase occurs in the temperate regions of Eurasia and N. America.

Fam. 99. DROSERACEAE MŌSENGOKE KA Sundew Family

Perennials or rarely annuals, mostly terrestrial or rarely aquatic, usually glandular-hairy; leaves circinnate in bud; stipules sometimes absent; flowers solitary or in racemes, bisexual, actinomorphic; sepals 4-5; petals as many, free; stamens 4-5 (-20); ovaries 1-locular; carpels 3-5; styles 3-5, the stigma simple or lobed; fruit a capsule; seeds many or few; endosperm copious.—Six genera, with more than 100 species, all insectivorous.

- 1A. Terrestrial; leaves alternate or rosulate, entire, with glandular hairs on upper side; flowers in racemes. 1. *Drosera*
1B. Aquatic; leaves verticillate, with sensitive hispid hairs; flowers solitary. 2. *Aldrovanda*

1. DROSERA L. MŌSENGOKE ZOKU

Perennials or rarely annuals with short rhizomes; stems absent or elongate and leafy; leaves alternate, cauline or radical, circinnate in bud, with long glandular-tipped bristlike hairs; stipules absent or scarious, adnate to base of the petiole; inflorescence circinnate while young; flowers in radical or axillary racemes; sepals 4-8, persistent; petals 4-8, white or rose, persistent; stamens 4-8; ovary superior, free from the calyx; ovules on parietal placentae, many; capsules loculicidally dehiscent.—About 100 species in both hemispheres.

- 1A. Stemless, the plants scapose; stipules scarious, adnate to the base of the petiole, laciniate.
2A. Leaves 3-15 cm. long; racemes glabrous or nearly so; sepals 4-6 mm. long, subobtusely or obtuse, as long as to shorter than the oblong capsule. 1. *D. rotundifolia*
3A. Leaves depressed-obovate to depressed-orbicular, abruptly long-petiolate; seeds nearly linear. 2. *D. anglica*
3B. Leaves linear-oblanccolate or oblanceolate, gradually long-petiolate; seeds lanceolate, impressed-punctulate. 3. *D. spatulata*
2B. Leaves 10-20 mm. long, closely appressed to the ground; racemes with dense minute glandular hairs; sepals 2.5-3 mm. long, acute, longer than the globose capsules. 4. *D. peltata*
1B. Stems elongate; stipules absent.
4A. Annual herb, not tuberous; leaves narrowly linear, 4-6 cm. long, to 2.5 mm. wide, the petiole 7-15 mm. long; sepals short-glandular, lanceolate. 5. *D. indica*
4B. Perennial herb with tubers; leaves transversely lunate, broader than long, 2-3 mm. long, 4-6 mm. wide, the petioles 8-15 mm. long, distinct; sepals laciniate, ovate. 6. *D. peltata* var. *nipponica*

1. *Drosera rotundifolia* L. MŌSENGOKE. Perennial usually with a reddish hue and short rhizomes; leaves rosulate, ascending or spreading, depressed-obovate to depressed-orbicular, 5-10 mm. long and as wide, abruptly petiolate, with long gland-tipped bristlike hairs on upper side, the petioles 3-13 cm. long; scapes 6-30 cm. long, glabrous, the inflorescence racemose, terminal, few-flowered, one-sided; sepals narrowly oblong, with short glandular-hairs on margin; petals about twice as long as the sepals, 4-6 mm. long; styles 3, the stigma 2-parted.—June-Aug. Wet places in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Temperate to cold regions of the N. Hemisphere.

2. *Drosera anglica* Huds. *D. longifolia* L. pro parte; *D. intermedia* sensu auct. Japon., non Heyne.—NAGABA-MŌSENGOKE. Usually reddish perennial with slightly elongate rhizomes; leaves erect, 2-4 cm. long, 1.5-4 mm. wide, rounded at apex, gradually narrowed to the petiole; scapes 10-20 cm. long, the inflorescence terminal, racemose, one-sided; petals 5-7 mm. long, white; seeds lanceolate, obtuse at both ends.—July-Aug. Bogs; Hokkaido, Honshu (Oze in Kotsuke); rare.—Bogs in the colder regions of the N. Hemisphere.

Drosera × *obovata* Mert. & W. Koch. SAJIBA-MŌSENGOKE. Hybrid of Nos. 1 and 2; leaves broadly oblanceolate

to narrowly obovate, 1-2 cm. long, 3-6 mm. wide.—Occurs where the two parent species grow together.

3. *Drosera spatulata* Labill. *D. loweiri* Hook. & Arn.; *D. burmannii* DC., non Vahl.—KO-MŌSENGOKE. Usually reddish perennial with very short rhizomes; radical leaves rosulate, rather many, spreading, obovate-spatulate, 10-20 mm. long, 2.5-3.5 mm. wide, rounded at the apex with long gland-tipped bristlike hairs on the upper side, cuneate and decurrent to a rather broad short-petiole; scapes few, 5-15 cm. long, slender; flowers few to more than 10, in a terminal unbranched, one-sided glandular-hairy raceme; flowers about 4 mm. across; sepals lanceolate; petals rose, 1.5-2 times as long as the sepals; style 2-parted, the stigma capitate; capsules 1.5 mm. long; seeds minute, fusiform, obtuse and mucronulate at both ends.—June-Sept. Shaded places in wet bare soils in lowlands and foothills; Honshu (Rikuzen and southw.), Shikoku, Kyushu; commoner near the sea.—Ryukyus, Formosa, China, to s. Asia and Australia.

4. *Drosera indica* L. *D. makinoi* Masam.—NAGABA-NO-ISHI-MOCHI-SŌ. Glandular-hairy annual; stems 7-15 cm. long, loosely leafy; leaves narrowly linear, 4-6 cm. long, 2-2.5 mm. wide, gradually narrowed to a filiform point, with long gland-tipped bristlike hairs on the upper side, the petioles 7-15 mm. long, as wide as the lower portion of the blade,

without long glandular-tipped hairs on upper side; racemes short-pedunculate, 5–10 cm. long, loosely 3- to 10-flowered, rather densely short glandular-hairy, the pedicels spreading, 10–15 mm. long; flowers white or rose; sepals lanceolate, acute; petals 6–8 mm. long; capsules subglobose, about 3.5 mm. long; styles 3, bilobed, the stigma capitate; seeds about 0.5 mm. long, broadly ovate-elliptic, black, slightly acute at one end, longitudinally ribbed and cross-lined.—July–Aug. Wet grounds in lowlands; Honshu (Kantō and Tōkaidō Distr.).—China, Malaysia, Australia, India, and Africa.

5. *Drosera peltata* Smith var. *nipponica* (Masam.) Ohwi. *D. nipponica* Masam.; *D. peltata* var. *lunata* sensu auct. Japon., non Clarke; *D. lunata* sensu auct. Japon., non Hamilt.—ISHI-MOCHI-SŌ. Tuberous perennial herb, mostly glabrous except for glandular hairs on upper side of the

leaves; stems erect, 10–30 cm. long, slender, sparingly branched above; radical leaves withering before anthesis, the cauline loosely alternate, lunate, 2–3 mm. long, 4–6 mm. wide, with long gland-tipped bristlelike hairs on the upper side, acute on the angles, the petioles slender; racemes 2- to 10-flowered, 2–6 cm. long including the short peduncle, the pedicels 4–6 mm. long; sepals ovate, lacinate, the segments glandular-tipped; petals 6–8 mm. long; capsules subglobose, about 2.5 mm. long; styles 4-parted; seeds broadly elliptic, slightly attenuate at both ends, about 0.5 mm. long with fine longitudinal ribs and obsolete cross-lines.—May–June. Wet places; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—China. The typical phase occurs in India, Australia, and e. Asia.

2. ALDROVANDA L. MUJINA-MO ZOKU

Floating aquatic herb, green, glabrous, without roots; stems jointed, slightly elongate, sparingly branched, 15–20 mm. across, inclusive of the verticillate leaves; leaves 6–8 at each node, the petioles cuneate, spreading, with few bristles above, the blade cochleate, with a hinge-joint; flowers solitary on an axillary pedicel, bractless, pale green, 5-merous, the calyx 5-sected; petals 1.5 times as long as the calyx, narrowly oblong, thinly membranous; stamens 5; ovary superior, ovoid, with 5 parietal placentae; ovules in 2 series; styles 5, rather elongate, the stigma flabellate, irregularly lobed; capsules ovoid-globose, slightly longer than the petals, crowned with the withered corolla; seeds minute, ellipsoidal, black, shining, with a mucro at base.—A single species.

1. *Aldrovanda vesiculosa* L. MUJINA-MO.—July–Aug. Shallow ponds; Honshu; rare.—centr. and s. Europe, India, and Australia.

Fam. 100. CRASSULACEAE BENKEI-SŌ KA Stonecrop Family

Usually fleshy herbs or shrubs; leaves opposite, alternate or verticillate, without stipules; flowers in terminal cymes, rarely solitary or in spikes, bracteate or ebracteate; sepals 3–5 or rarely more, as many as the petals; petals free or connate at base, imbricate in bud; stamens as many or more often twice as many as the petals; nectariferous glands opposite the carpels or rarely absent; carpels 3–5, rarely more, free or rarely connate at base; ovules many or sometimes few, inserted on the suture on the ventral side, ascending or pendulous; fruit follicular, the seeds small, usually oblong, with fleshy endosperm.—About 20 genera, with about 1,300 species, nearly cosmopolitan, except Australia, especially abundant in S. Africa and centr. Asia.

1A. Plant fleshy; carpels free or nearly so.

2A. Stamens 3–5, as many as the sepals, petals, and carpels. 1. *Tillaea*

2B. Stamens 8–10, twice as many as the sepals, petals, and carpels. 2. *Sedum*

1B. Plant not fleshy; carpels connate below and forming a 5-lobed capsule. 3. *Penthorum*

1. TILLAEA L. AZUMA-TSUME-KUSA ZOKU

Small, glabrous, rather fleshy herbs; leaves opposite, linear, entire, often terete; flowers axillary, solitary or in cymes or terminal panicles; sepals 3–5, often connate at base; petals 3–5, linear; stamens 3–5, the filaments filiform, the glands scalelike, 3–5 or absent; carpels 3–5, free, the ovules 1 to many in each locule.—Wet places or in water, with more than 20 species, in both hemispheres.

1. *Tillaea aquatica* L. *Bulliarda aquatica* (L.) DC.; *Tillaeastrum aquaticum* (L.) Britt.; *Elatine tetrandra* Maxim.—AZUMA-TSUME-KUSA. Glabrous, sparsely branched annual 2–6 cm. high; leaves broadly linear, opposite and connate at the base, 5–8 mm. long, about 1 mm. wide; flowers sessile and solitary in the axils, 4-merous; petals whitish, about

1.5 mm. long, obtuse, ovate or narrowly so, membranous, about twice as long as the calyx; stamens shorter than the petals; carpels erect, narrowly ovate, slightly shorter than the persistent petals, the glands terete; seeds few, narrowly oblong.—May–June. Wet places in lowlands; Hokkaido, Honshu.—Eurasia, N. Africa, and N. America.

2. SEDUM L. KIRIN-SŌ ZOKU

Fleshy and usually glabrous annuals or perennials; leaves alternate, simple, opposite or verticillate, rarely rosulate, entire or toothed, rarely spine-tipped, usually sessile; flowers in terminal cymes or solitary, rarely in spikes, yellow, white, or rose-purple, bisexual (plants sometimes dioecious); sepals 4–5, free; petals as many, free, persistent; stamens twice as many as the sepals and petals, the filaments subulate or filiform; nectariferous glands 5 or 4, minute; ovary superior; carpels 5, sometimes 4, free or shortly connate below; styles short, the ovules rather many; fruit a follicle.—About 350 species, abundant in the temperate regions of the Old World, also in N. and S. America.

- 1A. Plants dioecious, the flowers usually 4-merous, rarely 5-merous.
- 2A. Leaves elliptic, obovate or narrowly oblong, glaucous, obsoletely serrate, 5–15 mm. wide, smooth on margin. 1. *S. rosea*
- 2B. Leaves oblanceolate not glaucous, coarsely serrate, 3–5 mm. wide, uneven on margin. 2. *S. ishidae*
- 1B. Plants bisexual, the flowers usually 5-merous.
- 3A. Leaves not spine-tipped; inflorescence cymose.
- 4A. Rhizomes stout; leaves basifixed, usually toothed.
- 5A. Flowers greenish white to rose-purple.
- 6A. Flowers rose-purple.
- 7A. Stems tufted, 5–25 cm. or rarely to 30 cm. long, densely leafy; leaves 1–2.5 cm. or rarely to 3 cm. long.
- 8A. Leaves ternate, flabellate-orbicular, manifestly shorter than broad, sparingly undulate-toothed. 3. *S. sieboldii*
- 8B. Leaves opposite or alternate, ovate-orbicular to oblanceolate, as long as to narrower than wide.
- 9A. Leaves short-petiolate, usually few-toothed. 4. *S. caudicolum*
- 9B. Leaves sessile, entire. 5. *S. pluricaule* var. *yezoense*
- 7B. Stems few or solitary, 30–50 cm. long, loosely leaved; leaves 4–8 cm. long.
- 10A. Stamens conspicuously longer than the petals; leaves verticillate or opposite. 6. *S. spectabile*
- 10B. Stamens as long as or slightly shorter than the petals; leaves alternate or opposite. 7. *S. telephium* var. *purpureum*
- 6B. Flowers greenish white or greenish.
- 11A. Leaves sessile, rounded or obtuse at base; flowers 7–10 mm. across. 8. *S. tsugaruense*
- 11B. Leaves more or less narrowed to a petiole or petiolelike base; flowers usually smaller.
- 12A. Leaves verticillate, subacute to obtuse, dentate, impressed-punctate with scattered minute black spots. 9. *S. verticillatum*
- 12B. Leaves alternate or opposite, rarely subverticillate, rounded to subobtus, undulate-toothed to nearly entire.
- 13A. Plants glaucous; leaves 5–8 cm. long.
- 14A. Stems rather stout, erect; lowest pair of branches on inflorescence rather elongate. 10. *S. erythrostictum*
- 14B. Stems rather slender, ascending; lowest pair of branches of inflorescence rather short. 11. *S. okuyamae*
- 13B. Plants brownish green.
- 15A. Leaves usually alternate, rarely opposite, decurrent to a short petiole. 12. *S. sordidum*
- 15B. Leaves opposite, abruptly and distinctly petiolate. 13. *S. viride*
- 5B. Flowers yellow.
- 16A. Stems solitary or few, usually simple, 20–50 cm. long; leaves oblanceolate, 3–6 cm. long. 14. *S. aizoon*
- 16B. Stems tufted, often branched at base, 7–20 cm. long; leaves obovate or broadly oblanceolate, 2–3.5 cm. long. 15. *S. kamtschaticum*
- 4B. Plants without stout rhizomes; leaves more or less attached to the stem above the base, entire.
- 17A. Leaves terete or only slightly flattened, linear to narrowly oblong.
- 18A. Leaves of fertile stems verticillate.
- 19A. Leaves linear, gradually acute and scarcely flattened at apex; anthers conical-ovoid, 0.5–0.6 mm. long. 16. *S. lineare*
- 19B. Leaves narrowly oblanceolate, narrowed and flattened toward the obtuse apex; anthers narrowly ovoid, 0.8–1 mm. long. 17. *S. sarmentosum*
- 18B. Leaves of fertile stems alternate.
- 20A. Flowers solitary, terminal; leaves oblong-cylindric, 3–5 mm. long. 18. *S. uniflorum*
- 20B. Flowers few to many, in terminal cymes.
- 21A. Petals 1.5–2 times as long as the sepals, spotless or with few brown short striations; leaves cylindric-oblong to lanceolate-cylindric, 5–10 mm. or sometimes to 12 mm. long, obtuse.
- 22A. Inflorescence on lateral stems; leaves obovate-cylindric, rounded at apex; carpels ascending; on rocks near seashores. 19. *S. oryzifolium*
- 22B. Inflorescence terminal on the main axis; leaves rather narrower, obtuse; carpels spreading; on rocks in lowlands and high mountains. 20. *S. japonicum*
- 21B. Petals 2.5–4 times as long as the sepals, usually brown-striated; leaves linear, 10–20 mm. long.
- 23A. Flowers 4-merous; leaves linear, obtuse; plant of shaded places on tree-trunks. 21. *S. hakonense*
- 23B. Flowers 5-merous; leaves linear to oblanceolate-linear, obtuse to subobtus.
- 24A. Leaves broadly linear, very many and densely disposed on the stem. 22. *S. polytrichoides*
- 24B. Leaves linear-spathulate, to about 4.5 mm. wide. 23. *S. yabeanum*
- 17B. Leaves distinctly flattened, at least the sterile ones spatulate.
- 25A. Perennial stoloniferous herbs; leaves entire or emarginate, smooth on margin; stems without bulbils in leaf-axils.
- 26A. Leaves dimorphic, linear or only slightly broadened above on the flowering shoots, obovate on the vegetative shoots; petals as long as to slightly longer than the sepals. 24. *S. subtile*
- 26B. Leaves nearly all alike, spatulate; petals 2–5 times as long as the sepals.
- 27A. Carpels erect in fruit. 25. *S. formosanum*
- 27B. Carpels obliquely spreading or ascending in fruit.
- 28A. Leaves on flowering shoots opposite. 26. *S. makinoi*
- 28B. Leaves on flowering shoots alternate.
- 29A. Leaves obtuse to rounded at apex; carpels 3–5. 27. *S. tricarpum*
- 29B. Leaves emarginate; carpels 5. 28. *S. tosaense*
- 25B. Annual or biennial herbs without stolons; leaves entire, somewhat uneven on the upper margin; reproducing by bulbils. 29. *S. bulbiferum*
- 3B. Plant either with spine-tipped leaves or with spicate inflorescence.
- 30A. Inflorescence a few-flowered cyme; leaves 7–12 mm. long, 1.5–2.5 mm. wide. 30. *S. leveilleianum*
- 30B. Inflorescence a many-flowered dense spike; leaves 2–8 cm. long, 4–40 mm. wide.
- 31A. Leaves callose on upper margin, ending in a short spine, broadly linear, slightly flattened. 31. *S. erubescens*

31B. Leaves not spine-tipped.

32A. Leaves glaucous.

33A. Flowering stems stout, simple, without stolons. 32. *S. iwawange*

33B. Flowering stems slender, with innovation-shoots at base. 33. *S. furusui*

32B. Leaves green. 34. *S. aggregatum*

1. *Sedum rosea* (L.) Scop. *Rhodiola rosea* L.; *R. tachiroei* (Fr. & Sav.) Nakai; *R. maxima* Nakai; *R. hideoi* Nakai; *R. rosea* var. *vulgare* (Regel & Tiling) Hara; *R. sachalinensis* A. Boreau; *S. rhodiola* DC.; *S. rhodiola* var. *vulgare* Regel & Tiling; *S. rhodiola* var. *tachiroei* Fr. & Sav.; *S. roseum* var. *vulgare* (Regel & Tiling) Maxim.; *S. roseum* var. *tachiroei* (Fr. & Sav.) Takeda—IWA-BENKEI. Dioecious glaucous perennial herb with stout brown-scaly caudex; stems tufted, 7–30 cm. long, erect; leaves fleshy, flat, obovate to elliptic, sometimes narrowly oblong, 1–3 cm. long, 5–15 mm. wide, usually rounded with an obtuse tip, sessile, shallowly toothed especially on upper half; the lower leaves smaller; inflorescence dense, many-flowered; staminate flowers yellowish; stamens longer than the petals; pistillate flowers rather small, often purplish; carpels usually erect, 6–7 mm. long, the style short-spreading.—June–Aug. Hokkaido (rocks in alpine regions and along the sea), Honshu (alpine regions of N. and centr. distr.).—Alpine and cooler regions of the N. Hemisphere.

2. *Sedum ishidae* Miyabe & Kudo. *Rhodiola ishidae* (Miyabe & Kudo) Hara; *R. stephanii* sensu auct. Japon. non Trautv. & Mey.—HOSOGA-IWA-BENKEI, AO-NO-IWA-BENKEI. Resembles the preceding; leaves green, not glaucous, oblanceolate, rather prominently narrowed at each end, deeply toothed, the margin translucent, slightly uneven; petals slightly longer; carpels 7–10 mm. long.—June–Aug. Alpine regions; Hokkaido, Honshu (n. distr. and Nikko in Shimotsuke Prov.).

3. *Sedum sieboldii* Sweet. MISEBAYA. Rhizomes stout; stems tufted, 15–30 cm. long, declined above; leaves ternate, glaucous, often more or less purplish (white-variegated in some garden cultivars), flabellate-orbicular, 10–15 mm. long, 13–20 mm. wide, fleshy, sessile, with obsolete undulate teeth; inflorescence densely flowered, rather small; flowers about 6 mm. across, rather numerous, on short pedicels; sepals narrowly ovate, subacute; petals spreading, acute, about 4 mm. long, narrowly ovate; stamens nearly as long as the petals; anthers red-purple; carpels erect, ovate.—Oct.–Nov. Frequently cultivated as a pot plant; recently discovered in Shikoku (Shōdoshima in Sanuki Prov.).

Sedum kagamontanum Maxim. KAGA-NO-BENKEI-SŌ. Stems branched, stouter, the lower leaves ternate, to 3 cm. long, the upper leaves alternate; may be a larger form of *S. sieboldii*. Reported to be spontaneous in Honshu (Kaga Prov.).

4. *Sedum caucolicum* Praeg. HIDAKA-MISEBAYA. Rhizomes branched; stems 10–15 cm. long, tufted, ascending to suberect; leaves opposite, sometimes alternate, glaucous, ovate-orbicular to elliptic, 10–25 mm. long, 7–20 mm. wide, obtuse or subrounded, fleshy, flat, broadly cuneate at base, usually with few undulate teeth, the petioles 2–7 mm. long; inflorescence densely flowered; flowers rose-purple; sepals linear-lanceolate, sometimes ovate; petals ovate-lanceolate, 5–7 mm. long; stamens nearly as long as the petals, the anthers red-purple.—Sept. Hokkaido (Hidaka and Tokachi Prov.).

5. *Sedum pluricaule* (Maxim.) Kudo var. *yezeense* (Miyabe & Tatew.) Tatew. & Kawano. *S. telephium* var. *pluricaule* auct., non Maxim.; *S. yezeense* Miyabe & Tatew.;

(?) *S. sieboldii* var. *erectum* Makino—EZO-MISEBAYA. Glau-
cous perennial; stems tufted, 5–8 cm. long; leaves narrowly ob-
long to oblanceolate or obovate, 1–2.5 cm. long, 4–6 mm. wide,
obtuse, entire; inflorescence densely flowered; flowers rose-purple,
short-pedicelled; sepals lanceolate; petals broadly lanceo-
late, 4–6 mm. long, about twice as long as the sepals; stamens
slightly shorter than the petals, the anthers dark purple.—
July–Sept. Reported to occur in Hokkaido.—The typical
phase occurs in Sakhalin and Amur.

6. *Sedum spectabile* Boreau. Ō-BENKEI-SŌ. Rather
stout, glaucous perennial; stems erect, 30–70 cm. long, terete,
thick; leaves verticillate or opposite, flat, fleshy, ovate to nar-
rowly so, 4–10 cm. long, 2–5 cm. wide, obtuse, sessile, sparsely
undulate-toothed; inflorescence large, densely many-flowered;
flowers about 10 mm. across; sepals lanceolate, acute; petals
broadly lanceolate, acuminate, 5–6 mm. long, about 3 times as
long as the sepals; stamens 6–7 mm. long, prominently longer
than the petals, the anthers purplish.—July–Sept. Cultiva-
ted in gardens and for cut flowers.—Korea and Man-
churia.

7. *Sedum telephium* L. var. *purpureum* L. *S. pur-
pureum* (L.) Link—MURASAKI-BENKEI-SŌ. Stems often
solitary, erect, 30–50 cm. long; leaves glaucous, flat, more or
less fleshy, alternate or opposite, narrowly ovate to oblong,
3–6 cm. long, 12–25 mm. wide, subobtusely, narrowed to the
sessile base, short-toothed; inflorescence densely many-flowered,
rather large; sepals broadly lanceolate; petals lanceolate, acute,
4–5 mm. long, 3–4 times as long as the sepals, brown-striated
when dried, about as long as the stamens; carpels erect, rather
shorter than the petals.—Aug.–Sept. Hokkaido, Honshu,
Kyushu.—Europe and Siberia.

8. *Sedum tsugaruense* Hara. TSUGARU-MISEBAYA. Erect
glaucous perennial herb, 10–40 cm. high, from a short thick
caudex; leaves opposite or alternate, or in lower ones some-
times ternate, spreading, ovate to elliptic, 2–4 cm. long, 1.2–3.5
cm. wide, irregularly crenate; cymes 3–5 cm. across, densely
many flowered, sometimes branched; flowers pedicelled, ovate-
oblong in bud; sepals deltoid-lanceolate, about 1 mm. long;
petals 5, oblong-lanceolate, pale green, 5 mm. long, spreading;
stamens exserted; carpels 5, rarely 4, the fruiting ones suberect,
4.5–5 mm. long.—Sept. Honshu (Mutsu Prov.).

9. *Sedum verticillatum* L. MITSUBA-BENKEI-SŌ. Stems
erect, 30–60 cm. long; leaves somewhat glaucous, verticillate,
narrowly ovate, oblong or broadly lanceolate, 3–13 cm. long,
1–3 cm. wide, subobtusely, toothed, often partly dark brown
spotted, the veins becoming brown and prominent when
dry, the petioles 2–10 mm. long; inflorescence densely many-
flowered, sometimes lobed; flowers yellow-green; sepals nar-
rowly ovate, acute; petals oblong-lanceolate, acute, about 4
mm. long, 4–5 times as long as the sepals; stamens about as
long as the petals, the anthers dark-colored; carpels erect in
fruit, about 3 mm. long, ovoid.—Aug.–Oct. Hokkaido,
Honshu, Shikoku, Kyushu.—Europe and Siberia.

10. *Sedum erythrostictum* Miq. *S. alboroseum* Baker
—BENKEI-SŌ. Rather stout glaucous perennial; stems 30–
60 cm. long; leaves opposite or alternate, fleshy, elliptic or
oblong-ovate, 6–10 cm. long, 3–4 cm. wide, obtuse, obsoletely

toothed, short-petiolate; inflorescence large, very many-flowered; sepals narrowly deltoid; petals oblong-lanceolate, 5–6 mm. long, acute, 3–4 times as long as the sepals; stamens about as long as the petals, the anthers purplish, narrowly ovoid. —July–Oct. Planted in our area, unknown as a wild plant.

11. *Sedum okuyamae* Ohwi. KO-BENKEI-SŌ. Resembles the preceding, but more slender, and the upper part of the stems declined, the lowest branches of the inflorescence shorter; glaucous glabrous perennial; stems solitary, terete, about 30 cm. long; leaves opposite, obtuse, toothed, 3–9 cm. long, 2–4 cm. wide, yellowish brown spotted, the veinlets slender, obscure; flowers many, pale green; sepals narrowly deltoid, about 2 mm. long; petals acuminate, about 5 mm. long; carpels suberect, 4–5 mm. long in fruit. —Sept. Honshu (n. distr.).

12. *Sedum sordidum* Maxim. CHICHIPPA-BENKEI-SŌ. Stems 20–40 cm. long; leaves alternate, sometimes opposite, ovate or ovate-orbicular, 2–4 cm. long, 15–30 mm. wide, obtuse, tinged with brown-purple, remotely undulate-toothed, the petiole often to 10 mm. long; inflorescence many-flowered, often lobed; flowers pale yellow-green; sepals ovate, acute; petals narrowly ovate, about 4 mm. long, 2–3 times as long as the sepals, acute; stamens about as long as the petals, the anthers brown-purple; carpels ovate in fruit, erect. —Aug.–Oct. Honshu (Uzen, Echigo, and Shinano Prov.); rather rare in mountains.

13. *Sedum viride* Makino. AO-BENKEI-SŌ. Closely allied to the preceding; leaves usually opposite, rather loosely arranged, with shallower depressed marginal teeth, the petioles distinct, to 15 mm. long; inflorescence densely flowered, usually not lobed. —Aug.–Oct. Shikoku, Kyushu.

14. *Sedum aizoon* L. *S. maximowiczii* Regel. —HOSOBABA-NO-KIRIN-SŌ. Rhizomes stout; stems 1–2, erect, 20–50 cm. long, rather stout; leaves fleshy, usually alternate, oblanceolate to broadly so, rarely narrowly oblong, 3–6 cm. long, 5–7 mm. wide, subacute, toothed, sessile; inflorescence many-flowered; flowers yellow, 10–13 mm. across; sepals broadly linear, obtuse, slightly broadened below; petals lanceolate to broadly so, long-acuminate, 6–7 mm. long, 1.5–2 times as long as the sepals; stamens shorter than the petals, the anthers yellow; carpels ovate, ascending, briefly connate at base. —July–Sept. Hokkaido, Honshu. —Siberia.

15. *Sedum kamschatcicum* Fisch. *S. sikhokianum* Maxim.; *S. aizoon* subsp. *kamschatcicum* (Fisch.) Froedstr.; *S. ellacombianum* Praeg. —KIRIN-SŌ. Resembles the preceding; rhizomes stout; stems tufted, 5–30 cm. long, sometimes branched at base; leaves alternate, rarely opposite, broadly oblanceolate to obovate, 2–4 cm. long, 1–2 cm. wide; flowers many to few; carpels ascending to spreading; anthers yellow. —July–Sept. Hokkaido, Honshu, Shikoku, and Kyushu; rather common on rocks in mountains especially northward. —Sakhalin, Kuriles, Kamchatka, and Ussuri.

16. *Sedum lineare* Thunb. O-NO-MANNENGUSA. Stems 10–20 cm. long, fleshy; sterile innovation-shoots ascending, later creeping; leaves linear, 20–25 mm. long, about 2 mm. wide, ternate, rarely subopposite, rather flat and broadened at base, gradually narrowed and terete above, acute, with an obtuse tip; inflorescence rather large, lobed, loosely rather many-flowered; flowers sessile in the axils of linear bracts; sepals broadly linear to lanceolate; petals lanceolate, 6–7 mm. long, acuminate, 1.5 times as long as the sepals; stamens shorter than the petals, the anthers oblong, cordate, mucronate fol-

lowing anthesis; carpels 5, suberect. —May–June. Honshu, Shikoku, Kyushu. —Ryukyus.

17. *Sedum sarmentosum* Bunge. *S. lineare* var. *contractum* Miq. —TSURU-MANNENGUSA. Resembles the preceding; leaves oblanceolate, 15–25 mm. long, 3–5 (–6) mm. wide, obtuse, flat; sepals linear-lanceolate, 1/2–3/4 as long as the petals; anthers narrowly ovoid to oblong, cordate. —May–June. Frequently planted; reported to be spontaneous in Kyushu. —Korea, Manchuria, and n. China.

18. *Sedum uniflorum* Hook. & Arn. KOGOME-MANNENGUSA. Stems creeping, tufted and much-branched, 3–10 cm. long, fleshy, densely leafy; leaves alternate, narrowly cylindric-oblong, 3–5 mm. long, 1.5–2 mm. wide, rounded at the apex, slightly narrowed at base, sessile; flowers terminal, solitary; sepals narrowly oblong, slightly narrowed at base, 2.5–3 mm. long; petals oblong, subobtusely, longer than the sepals; stamens shorter than the petals. —Rocks near the sea; Kyushu (Yakushima); rare. —Ryukyus.

19. *Sedum oryzifolium* Makino. TAITŌGOME. Stems long-creeping; stems erect, 5–12 cm. long; sterile shoots densely leafy on upper part; leaves alternate, cylindric-obovoid to oblong, 3–6 mm. long, 1–1.5 mm. wide, rounded to very obtuse, sessile; inflorescence often trichotomously branched, rather densely many-flowered; sepals ovate-oblong, rounded at the apex; petals broadly lanceolate, acuminate, 4–5 mm. long, at most 1.5 times as long as the sepals; stamens shorter than the petals, the anthers ovate-globose, cordate; carpels slightly ascending. —May–July. Rocks near the sea; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

20. *Sedum japonicum* Sieb. ME-NO-MANNENGUSA. Flowering stems erect, terete, 10–15 cm. long, bearing sterile shoots at base; leaves nearly terete to slightly flattened, 5–10 mm. long, about 2 mm. wide, broadest slightly above the middle, rounded to very obtuse; inflorescence usually 3 or 4 times branched, many-flowered; flowers nearly sessile; sepals unequal in length, linear-oblong to oblong, obtuse to subrounded; petals lanceolate, acuminate, 6–7 mm. long; stamens shorter than the petals, the anthers ovoid-globose, cordate; carpels spreading. —May–June. Rocks in thin woods and sunny slopes in foothills; Honshu, Shikoku, Kyushu; common.

Var. *senanense* (Makino) Makino. *S. senanense* Makino —MIYAMA-MANNENGUSA. Slightly smaller in all parts, and frequently reddish, the leaves narrowly oblong, slightly narrowed above, obtuse. —May–Aug. Alpine slopes; Honshu (centr. distr.).

21. *Sedum hakonense* Makino. MATSU-NO-HA-MANNENGUSA. Stems 5–10 cm. long, erect, ascending or creeping, much branched at the base; leaves linear, 1–2.5 cm. long, (1–)2–3 mm. wide, fleshy, slightly flattened, somewhat rounded at the apex; inflorescence often trichotomously branched, rather loosely many-flowered; flowers sessile; sepals 4, rather unequal, deltoid to oblong, very obtuse; petals 4, yellow, broadly lanceolate, about 4 mm. long, acute, much longer than the sepals; stamens 8, as long as the petals, the anthers cordate-globose. —Aug. Honshu (Sagami, Izu, and Suruga Prov.); rare.

Var. *rupifragum* (Koidz.) Ohwi. *Sedum rupifragum* Koidz. —ŌME-NO-MANNENGUSA. Flowers 4- to 5-merous. —Honshu (Izumo).

22. *Sedum polytrichoides* Hemsl. *S. kiusianum* Makino —UNZEN-MANNENGUSA. Stems densely tufted, erect, branching at base, about 10 cm. long, usually simple above,

densely many-leaved, dark brown below; leaves broadly linear, 6–15 mm. long, 1–2.5 mm. wide, acute, entire, slightly narrowed below; cymes rather small, the branches obliquely spreading, few-flowered; flowers sessile, about 1 cm. across; sepals 5, slightly unequal, linear to subulate-linear, about 2 mm. long; petals 5, acuminate, yellow, 5–6 mm. long; fruiting carpels 5, shortly connate at base.—Rocks in mountains; Honshu (w. distr.), Kyushu; rare.—Korea and China.

23. *Sedum yabeanum* Makino.—TSUSHIMA-MANNENGUSA. Stems 5–15 cm. long, erect, ascending to short-creeping and branched at the base; leaves linear to narrowly oblanceolate, 1–2 cm. long, 1.5–3(–4) mm. wide, subacute, entire, ascending; inflorescence often 3-lobed; flowers sessile, yellow; sepals broadly lanceolate, obtuse; petals narrowly lanceolate, acuminate, 5–6 mm. long, 3 or 4 times as long as the sepals; stamens shorter than the petals, the anthers globose, slightly cordate; carpels 5, obliquely spreading.—June–July. Kyushu.

24. *Sedum subtile* Miq. *S. zentaro-tashiroi* Makino —HIME-RENGE, KO-MANNENGUSA. Green slender perennial; stems rather slender, 4–10 cm. long, short-creeping from the base; sterile shoots loosely leaved with a tuft of rosulate leaves at the apex; leaves of sterile shoots opposite, rarely verticillate in 3's to 5's, obovate, 5–15 mm. long, 3–5 mm. wide, rounded to very obtuse, narrowed below to a slender petiolelike base; leaves of flowering shoots alternate, rarely opposite, linear, 5–20 mm. long, 1–2 mm. wide, obtuse; inflorescence loosely flowered, the bracts linear; sepals narrowly lanceolate to broadly linear, obtuse, slightly shorter to as long as the petals; petals thin, lanceolate, about 5 mm. long, yellow; stamens shorter than the petals, the anthers ovoid; carpels 5, ascending.—Apr.–June. On mossy rocks in mountain forests; Honshu, Shikoku, Kyushu.

25. *Sedum formosanum* N. E. Br. HAMA-MANNENGUSA. Green fleshy perennial; stems 10–15 cm. long, ascending, rather stout, densely leaved, sparsely branched; leaves alternate, obovate to nearly orbicular, 15–22 mm. long, 8–12 mm. wide, broadly rounded at apex, narrowed to the cuneate base; cymes rather large, 5–8 cm. across, many-flowered; flowers sessile, about 1 cm. across, yellow, the bracts leaflike; sepals unequal, linear-lanceolate, 2–3 mm. long, obtuse; petals narrowly lanceolate, acuminate, 6–7 mm. long; stamens much shorter than the petals; carpels 5, the fruiting ones erect, broadly lanceolate, 5–6 mm. long, connivent above, shortly acuminate, terminated by a slender style about 1 mm. long.—Kyushu.—Ryukyus, Formosa, and China.

26. *Sedum makinoi* Maxim. MARUBA-MANNENGUSA. Stems 8–20 cm. long, ascending from a creeping branched base; leaves opposite, rarely partly verticillate, alternate in the inflorescence, spatulate, 7–15 mm. long, 3–8(–10) mm. wide, flat, fleshy; inflorescence large, much branched, the lower bracts leaflike, ternate; flowers sessile, loosely arranged; sepals linear-spatulate, ascending, spreading and rounded at apex, unequal in length; petals narrowly lanceolate, 5–6 mm. long, 3–5 times as long as the sepals; stamens slightly shorter than the petals, the anthers broadly ovoid, cordate; carpels ascending.—June–July. Honshu, Shikoku, Kyushu.

27. *Sedum tricarpum* Makino. TAKANE-MANNENGUSA. Flowering stems 10–25 cm. long, rather stout, the sterile basal shoots more or less creeping; leaves alternate, spatulate, 20–25 mm. long, 5–10 mm. wide, rounded at apex, flat, fleshy, dense and disposed mainly toward the top of the sterile shoots,

otherwise loosely arranged; inflorescence large, much branched; flowers rather loosely arranged, the lower ones with an oblanceolate or narrowly spatulate, leaflike bract; sepals linear-spatulate to lanceolate, obtuse; petals narrowly lanceolate, about 5 mm. long, much longer than the sepals; anthers broadly ovoid; carpels 3–5, ascending.—May–July. Honshu (Chûgoku Distr.), Shikoku, Kyushu.

28. *Sedum tosaense* Makino. YAHAZU-MANNENGUSA. Closely allied to No. 27; leaves spatulate, fleshy, rounded and retuse; carpels consistently 5, spreading in fruit.—Shikoku (Tosa Prov.).

29. *Sedum bulbiferum* Makino. *S. alfredii* sensu auct. Japon., non Hance; *S. lineare* var. *floribundum* Miq.; *S. subtile* var. *obovatum* Fr. & Sav.—KO-MOCHI-MANNENGUSA. Biennial or perennial with axillary bulbils; stems 7–20 cm. long, short-decumbent and branched at base, without sterile shoots; bulbils consisting usually of 2 pairs of small fleshy scalelike leaves; lower cauline-leaves opposite, ovate-spatulate, abruptly narrowed below, the upper ones alternate, spatulate-oblanceolate, 10–15 mm. long, 2–4 mm. wide, obtuse; inflorescence often branched; sepals broadly lanceolate to oblanceolate, obtuse; petals lanceolate, 4–5 mm. long, yellow, 1.5–2.5 times as long as the sepals; stamens shorter than the petals, the anthers ovoid-ellipsoidal or ovoid-oblong; carpels 5, 4–5 mm. long.—May–June. Shaded places in lowlands; Honshu, Shikoku, Kyushu; common.

Sedum alfredii Hance var. *nagasakianum* Hara is allied to *S. bulbiferum*, but the axillary bulbils are lacking; cauline leaves opposite to ternate.—Reported from Kyushu.

Sedum rosulato-bulbosum Koidz. KÔRAI-KO-MOCHI-MANNENGUSA. Differs from *S. bulbiferum* in the obovate leaves, the tufted stems, and the late-appearing many-leaved bulbils.—Reported to occur in Hachijo Isl. in Izu Prov.—Amami-oshima and Korea.

30. *Sedum leveilleianum* Hamet. *Cotyledon sikokiana* Makino; *S. orientasiaticum* Makino; *Orostachys sikokianus* (Makino) Ohwi; *Meterostachys sikokianus* (Makino) Hara —CHABO-TSUME-RENGE. Caudex short, rather stout; stems 3–7 cm. long; basal leaves rosulate, linear to narrowly oblanceolate, only slightly flattened, fleshy, glabrous, 7–12 mm. long, about 2 mm. wide, more or less callose and short spined at apex; cauline leaves obsolete or short spine-tipped, the lowermost ternate, the upper ones alternate; flowers few, in cymes, white to pinkish; sepals 1/3–1/2 as long as the petals; petals 3–4 mm. long; ovules 2 in each locule.—July–Sept. Rocks in mountains; Honshu (w. distr.), Shikoku, Kyushu.—s. Korea.

31. *Sedum erubescens* (Maxim.) Ohwi. *Umbilicus erubescens* Maxim.; *Cotyledon erubescens* (Maxim.) Fr. & Sav.; *Orostachys erubescens* (Maxim.) Ohwi—TSUME-RENGE. Monocarpic perennial; stems 6–15 cm. long, densely linear-lanceolate leaved; winter basal leaves narrowly spatulate, fleshy, flat, 1.5–3 cm. long, 4–7 mm. wide, callose, few-toothed on the upper margin, short spine-tipped; summer cauline and radical leaves scarcely callose-margined; spikes solitary, terminal, 4–10 cm. long, 15–20 mm. wide, densely many-flowered; flowers white to pinkish, 6–8 mm. long, very short-pedicellate; anthers reddish at first, dark purple following pollen dehiscence.—Sept.–Oct. Rocks and dry slopes; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu.—Korea, Manchuria, Ussuri, and n. China.

Var. **polycephalum** (Makino) Ohwi. *Cotyledon polycephala* Makino; *S. polycephalum* (Makino) Makino; *Orostachys polycephalus* (Makino) Hara—YATSUGASHIRA. Plants with sterile innovation-shoots at base.

Var. **japonicum** (Maxim.) Ohwi. *Cotyledon japonica* Maxim.; *S. japonicola* Makino; *Orostachys japonicus* (Maxim.) Berger—HIRO-HA-TSUME-RENGE. Radical leaves ovate-oblong to narrowly so, often to 10 mm. wide, the cauline leaves oblong-linear.—Rocks near the seashore; Honshu.

32. **Sedum iwarengae** (Makino) Makino. *Cotyledon iwarengae* Makino; *Orostachys iwarengae* (Makino) Hara; *C. malacophylla* var. *japonica* Fr. & Sav.—IWA-RENGE. Monocarpic perennial; stems erect, densely leaved on lower half, 10–25 cm. long; caudex and stems densely many-leaved; leaves glaucous, fleshy, flat, oblong-spathulate, 3–7 cm. long, 7–28 mm. wide, obtuse to rounded; spike solitary and terminal, erect, very densely many-flowered, 5–20 cm. long; flowers short-pedicellate, white; petals 5–7 mm. long, about twice as long as the sepals.—Sept.–Nov. Not known wild in our area but frequently planted.—China (?).

33. **Sedum furusei** (Ohwi) Ohwi. *Orostachys furusei* Ohwi—REBUN-IWA-RENGE. Glaucous perennial; sterile stems slender, ascending, short, densely leaved at the apex, the basal innovation-shoots somewhat elongate, ascending to short-creeping; radical leaves fleshy, flat, obovate, 10–20 mm. long, 5–10 mm. wide, cuneate, entire; spikes many-leaved, 5–10 cm.

long, simple, many-flowered, the flowers dense, sessile; sepals 5, ascending, 3.5 mm. long, lanceolate-spathulate, subequal; petals 5, greenish white, slightly longer than the sepals, narrowly ovate, 4.5–5 mm. long, ascending in anthesis, closely appressed to the carpels in fruit; carpels 5, erect, oblong, as long as the petals; styles erect, about 1 mm. long.—Oct.–Nov. Rocks near the sea; Hokkaido (Momoiwa in Rebun Isl.); rare.

34. **Sedum aggregatum** (Makino) Makino. *Cotyledon malacophylla* sensu auct. Japon., non Pall.; *C. aggregata* Makino; *Orostachys aggregatus* (Makino) Hara—AO-NO-IWA-RENGE, KO-IWA-RENGE. Closely resembles No. 32, but the leaves smaller, obtusely rounded, green, not glaucous, 2–4 cm. long, 1–2 cm. wide.—June–Oct. Rocks near the sea; Honshu (Pacific Ocean side from Mutsu to Iwaki Prov.).

Var. **genkaiense** (Ohwi) Ohwi. *Orostachys genkaiensis* Ohwi. GENKAI-IWA-RENGE. Rosulate leaves larger, to 8 cm. long.—Kyushu (n. distr.); rare.

Var. **boehmeri** (Makino) Ohwi. *Cotyledon malacophylla* var. *boehmeri* Makino; *C. boehmeri* (Makino) Makino; *Orostachys boehmeri* (Makino) Hara; *S. boehmeri* (Makino) Makino—KO-MOCHI-RENGE. Innovation-shoots stout, horizontally spreading, with a tuft of rosulate leaves at the apex.—Seashores; Hokkaido, Honshu (Japan Sea side from Mutsu to Ugo Prov.).

3. PENTHORUM L. TAKO-NO-ASHI ZOKU

Perennials with stolons; stems erect; leaves alternate, membranous, lanceolate, long-acuminate at both ends, sessile, serrulate; cymes terminal, the branches scorpioid; flowers yellow-green, small; calyx-tube short, the lobes 5; petals 5 or absent; stamens 10, nectary glands absent; carpels 5, united on the lower half; style short; capsules depressed, 5-beaked, dehiscent from the base of the free portion of the carpels, the upper portion deciduous; seeds many, ovoid.—Two species, one in e. Asia, the other in N. America.

1. **Penthorum chinense** Pursh. *P. sedoides* var. *chinense* (Pursh) Maxim.; *P. sedoides* sensu auct. Japon., non L.; *P. sedoides* forma *angustifolium* Miq.—TAKO-NO-ASHI. Stems 30–70 cm. long, terete; inflorescence branched, many-

flowered; capsules about 7 mm. across; seeds ovoid.—Aug.–Sept. Wet muddy places along rivers in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; locally common.—Korea, China, Manchuria, and e. Siberia.

Fam. 101. SAXIFRAGACEAE YUKI-NO-SHITA KA Saxifrage Family

Herbs or shrubs, rarely trees; leaves alternate or opposite, often stipulate; flowers bisexual, sometimes unisexual, the marginal ones sometimes sterile; calyx often gamosepalous and adnate to the ovary, the perianth lobes imbricate or valvate in bud; stamens as many as the calyx-lobes or twice as many, sometimes more, staminodia often present; disc frequently well developed; ovary superior or inferior; carpels 2–5, nearly free or united; fruit a capsule, sometimes a berry.—About 110 genera, with about 1,200 species, most abundant in the N. Hemisphere but also in the S. Hemisphere.

1A. Fruit a capsule.

2A. Herbs; carpels usually 2; stamens as many or twice as many as the petals.

3A. Staminodia absent.

4A. Ovary 2-locular with axile placentae.

5A. Leaves pinnately, ternately, or palmately compound, rarely simple; seeds irregularly shaped.

6A. Flowers ebracteate, apetalous; carpels connate below; leaves palmately divided; stipules scarious. 1. *Rodgersia*

6B. Flowers bracteate.

7A. Carpels nearly free; leaves ternately compound, rarely simple; stipules brown-scarious. 2. *Astilbe*

7B. Carpels connate; leaves simple, evergreen, coriaceous; stipules indistinct. 3. *Tanakaea*

5B. Leaves simple; seeds globose.

8A. Calyx-tube usually slender, completely adnate to the ovary; stamens 10. 4. *Saxifraga*

8B. Calyx-tube campanulate, adnate to the ovary only at base; petals and stamens inserted on the margin of the calyx-tube.

9A. Stamens 10; petals deciduous; leaves peltate. 5. *Peltoboykinia*

9B. Stamens 5; petals rather persistent; leaves palmately cleft, petiolate, basifixed. 6. *Boykinia*

4B. Ovary 1-locular with parietal placentae.

10A. Flowers 4-merous, apetalous, in cymes; bracts rather leaflike. 7. *Chrysosplenium*

10B. Flowers 5-merous, usually petaloid, in racemes; bracts not leaflike.

- 11A. Carpels unequal; petals lanceolate to subulate, entire. 8. *Tiarella*
 11B. Carpels equal; petals often pinnately divided, simple or absent. 9. *Mitella*
 3B. Staminodia present, plants scapose; flowers solitary. 10. *Parnassia*
 2B. Plants woody, rarely herbaceous; carpels 2-5; stamens sometimes many.
 12A. Stamens 10 to many.
 13A. Inflorescence usually with showy sterile marginal flowers.
 14A. Styles connate.
 15A. Woody climbers; bisexual flowers small, the petals valvate in bud; one sepal of sterile marginal flowers becoming petallike. 11. *Schizophragma*
 15B. Erect perennial herbs; bisexual flowers rather large, the petals imbricate in bud; 3 sepals of sterile marginal flowers becoming petallike. 12. *Deinanthia*
 14B. Styles free.
 16A. Stamens more than 4 times as many as the petals.
 17A. Leaves opposite; fertile flowers rather large, the petals valvate in bud; calyx of sterile flowers large, 3- to 5-lobed.
 17B. Leaves alternate, sometimes opposite; fertile flowers small, the petals imbricate in bud; sepals of sterile flowers 3. 13. *Platyterater*
 16B. Stamens 2-4 times as many as the petals; calyx-lobes of sterile flowers 3-5; fertile flowers small; leaves opposite, rarely ternate. 14. *Cardiandra*
 13B. Inflorescence without marginal flowers; fertile flowers moderate to large. 15. *Hydrangea*
 18A. Plants woody.
 19A. Flowers 4-merous; stamens many; styles connate; hairs simple. 16. *Philadelphus*
 19B. Flowers 5-merous; stamens twice as many as the petals; styles free; hairs stellate or peltate. 17. *Deutzia*
 18B. Plants herbaceous; stamens 3 times as many as the petals; styles free; hairs peltate. 18. *Kirengeshoma*
 12B. Stamens 5, as many as the petals; woody plants with alternate leaves. 19. *Itea*
 1B. Fruit a berry; leaves alternate, simple, often palmately cleft. 20. *Ribes*

1. RODGERSIA A. Gray YAGURUMA-SŌ ZOKU

Large rather thick perennial herbs with short, stout creeping rhizomes; indument of two forms, hairlike and paleaceous; leaves palmately compound, large, toothed, often trilobulate, the stipules scarious; stems erect, few-leaved; inflorescence paniculate, large, terminal, the ultimate branches scorpioid-cymose; flowers white, small, bractless, bisexual; calyx-tube shallow, short, the lobes 5, spreading, white in anthesis; petals narrowly linear, small, sometimes absent; stamens 10; capsules subsuperior, 2-locular, dehiscent between the 2 persistent styles; seeds many, small.—Few species, in e. Asia.

1. *Rodgersia podophylla* A. Gray. *R. japonica* A. Gray ex Regel; *Astilbe podophylla* (A. Gray) Franch.—YAGURUMA-SŌ. Stems 20-130 cm. long, terete, few-leaved, rather stout; radical leaves long-petiolate, the leaflets 5, chartaceous, 15-35 cm. long, 10-25 cm. wide, acuminate, cuneate, sessile, irregularly toothed, 3- to 5-lobulate on the upper portion, the lobules deltoid, the petioles long-hairy at top; inflorescence 20-40 cm. long, the branches densely many-flowered, densely pubescent, the hairs scalelike; calyx-lobes ovate, acute, 2-4 mm. long; filaments exerted; capsules broadly ovoid, subsuperior, about 5 mm. long; styles 2, persistent.—June-July. Woods in mountains; Hokkaido, Honshu.—Korea.

2. ASTILBE Hamilt. CHIDAKE-SASHI ZOKU

Perennial rhizomatous herbs, with scattered long brown scalelike hairs; leaves radical and cauline, alternate, ternately compound, rarely simple, the stipules scarious, the leaflets lanceolate to ovate-orbicular, toothed; inflorescence a terminal panicle; flowers small, white or rose-purple, bracteate, bisexual or unisexual (plants sometimes dioecious); calyx-tube short, lobes 5, sometimes 7-11; petals persistent, linear or absent; stamens 5, 10, or 8; ovary subsuperior; carpels 2, connate at the base; capsules 2-locular, dehiscent between the styles; seeds small.—Few species, in e. Asia, Himalayas, and N. America.

- 1A. Flowers apetalous; calyx-lobes 7-11, lanceolate; leaves biternate. 1. *A. platyphylla*
 1B. Flowers with narrow petals; calyx-lobes 5, oblong to elliptic.
 2A. Leaves simple; calyx-lobes spreading in anthesis. 2. *A. simplicifolia*
 2B. Leaves ternately compound; calyx-lobes erect in anthesis.
 3A. Leaflets obtuse to short-acute; inflorescence narrow with short ascending or suberect branches; flowers rose-purple.
 4A. Hairs of inflorescence 1-2 mm. long, brown, curled, woolly; petals linear; leaflets short-acute. 3. *A. chinensis* var. *dauidii*
 4B. Hairs of inflorescence 0.5 mm. long or less, often glandular; petals linear-spathulate; leaflets usually obtuse. 4. *A. microphylla*
 3B. Leaflets acuminate; inflorescence with elongate, ascending or spreading branches; flowers white to rose-colored.
 5A. Leaflets lanceolate or oblanceolate, thick-chartaceous, the terminal ones narrowed at base. 5. *A. japonica*
 5B. Leaflets ovate-orbicular to narrowly ovate, rarely lanceolate, thin-chartaceous, rounded to cordate at base, the terminal ones very rarely narrowed at base. 6. *A. thunbergii*

1. *Astilbe platyphylla* H. Boiss. MOMIJI-SHŌMA. Dioecious stoloniferous perennial; stems to 50 cm. long; radical leaves 2-ternate, the terminal leaflets broadly rhombic-ovate, 8-17 cm. long, 6-15 cm. wide, long-acuminate, 2- to 5-lobulate, doubly acute-toothed; inflorescence 10-20 cm. long, the

branches simple or the lower ones branched, the axils minutely glandular-hairy and with scalelike hairs; flowers yellow-green; calyx-lobes 7-11, lanceolate, subacute; petals absent; stamens 8-10; capsules 4-5 mm. long.—June-July. Hokkaido (Hidaka, Tokachi, and Oshima Prov.); rare.

2. *Astilbe simplicifolia* Makino. HITOTSUBA-SHŌMA. Rhizomes short; stems 10–30 cm. long, usually with 1 leafless node; radical leaves simple, thinly chartaceous, broadly to narrowly ovate, often 3- to 5-lobulate, 3–8 cm. long, 2–5 cm. wide, doubly incised-toothed, the petioles 5–15 cm. long; inflorescence 5–20 cm. long, the axis with short glandular hairs, the branches spreading; flowers in loose panicles, white, the pedicels 1–5 mm. long; calyx-lobes narrowly ovate to broadly lanceolate, white in anthesis, spreading; petals linear-spathulate, as long as the stamens; anthers pale yellow; capsules 3–4 mm. long.—Honshu (Suruga and Sagami Prov.); rare.

3. *Astilbe chinensis* (Maxim.) Franch. var. *davidii* Franch. *A. davidii* (Franch.) Henry—ŌCHIDAKE-SASHI. Rhizomes stout; stems 30–70 cm. long; radical leaves 2- to partially 3-ternate, the terminal leaflets ovate, 2–8 cm. long, 1–4 cm. wide, short-acute, doubly acute-toothed, chartaceous; inflorescence 15–30 cm. long, erect, the branches densely flowered, the axis densely long brown-hairy, the pedicels very short; flowers rose-purple; petals linear, about 5 mm. long, twice as long as the stamens; anthers purple; capsules 3–4 mm. long.—July–Aug. Reported from Kyushu (Tsushima).—Korea, Manchuria, n. China, Amur, and Ussuri. The typical phase does not occur in our area.

4. *Astilbe microphylla* Knoll. *A. chinensis* var. *japonica* Maxim.—CHIDAKE-SASHI. Stems 30–80 cm. long; radical leaves 2–4 times ternately compound, long-petiolate, the terminal leaflets chartaceous, broadly ovate, obovate or elliptic, 1–5 cm. long, 5–30 mm. wide, usually obtuse, irregularly doubly acute-toothed; inflorescence narrow, 10–20 cm. long, rather loosely short-branched, the axis glandular-hairy, the ultimate branches racemose; flowers pale rose-colored; petals linear-spathulate, obtuse, 3–5 mm. long, longer than the stamens; capsules 3–4 mm. long.—July–Aug. Mountains, rather common in sunny grassy places; Honshu, Shikoku, Kyushu.

5. *Astilbe japonica* (Morr. & Decne.) A. Gray. *Hoteia japonica* Morr. & Decne.—AWAMORI-SHŌMA. Perennial herb; stems 50–80 cm. long; radical leaves 2-ternate, thick-chartaceous, the terminal leaflets rhombic-lanceolate, oblanceolate or rhombic-oblong, 3–7 cm. long, 1–2 cm. wide, deeply and doubly acute-toothed; panicles 10–20 cm. long, short-glandular, densely flowered; flowers white; petals narrowly spatulate, 3–4 mm. long, usually longer than the stamens; capsules 3–4 mm. long.—May–June. Rocks in mountain ravines; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

Var. *terrestris* (Nakai) Murata. *A. glaberrima* Nakai; *A. glaberrima* forma *terrestris* Nakai—YAKUSHIMA-SHŌMA. Stems 5–50 cm. long, the terminal leaflets often 3-lobed, broadly lanceolate, long-acuminate, thinly chartaceous.—Kyushu (Yakushima).

6. *Astilbe thunbergii* (Sieb. & Zucc.) Miq. *A. perplexi-*

pexa Koidz.; *Hoteia thunbergii* Sieb. & Zucc.; *A. kiusiana* Hara; *A. thunbergii* var. *kiusiana* Hara—AKA-SHŌMA. Rhizomes stout; stems 40–80 cm. long; radical leaves 3-ternate, the terminal leaflets chartaceous, ovate or narrowly so, 4–12 cm. long, 2–5 cm. wide, caudate, doubly acute-toothed, obtuse to shallowly cordate at base; panicles 10–30 cm. long, slenderly branched, the lower branches simple, elongate, densely glandular; flowers white; petals linear-spathulate, 3–4 mm. long, longer than the stamens; capsules 2–3 mm. long.—May–July. Sunny grassy slopes; Honshu, Shikoku, Kyushu; common and very variable.

Var. *sikokumontana* (Koidz.) Murata. *A. sikokumontana* Koidz.—HIME-AKA-SHŌMA. Leaflets doubly incised-toothed, sometimes narrower than in the typical variety.—Mountains; Shikoku.

Var. *shikokiana* (Nakai) Ohwi. *A. shikokiana* Nakai—SHIKOKU-TORIASHI-SHŌMA. Rhizomes sometimes long-creeping.—Shikoku.

Var. *fujisanensis* (Nakai) Ohwi. *A. fujisanensis* Nakai—FUJI-AKA-SHŌMA. Resembles the typical phase, but the leaflets firmer, smaller, and doubly incised-toothed, and the petals rather short, 2–2.5 mm. long, nearly as long as the stamens, the capsules 3–4 mm. long.—Mountains; Honshu (Sagami, Suruga, and Izu Prov.).

Var. *congesta* H. Boiss. *A. odontophylla* Miq.; *A. senanensis* Matsum.; *A. pedunculata* (H. Boiss.) Nakai—TORIASHI-SHŌMA. Resembles the typical phase, but the terminal leaflets ovate to broadly so, 5–12 cm. long, 4–10 cm. wide, and shallowly cordate, the panicles broadly pyramidal, the lower branches paniculately compound.—Hokkaido, Honshu (n. and centr. distr.).—Forma *bandaica* (Honda) Ohwi. *A. congesta* var. *bandaica* Honda; *A. odontophylla* var. *bandaica* (Honda) Hara; *A. bandaica* (Honda) Koidz.—BANDAISHŌMA. An alpine phase.

Var. *formosa* (Nakai) Ohwi. *A. chinensis* var. *formosa* Nakai; *A. formosa* (Nakai) Nakai; *A. nipponica* Nakai—HANA-CHIDAKE-SASHI. Leaflets short-acuminate, the panicle rachis densely glandular, the petals narrow, 4–6 mm. long.—Grassy slopes and thickets in mountains; Honshu (Shinano and Etchu Prov.).

Var. *okuyamae* (Hara) Ohwi. *A. okuyamae* Hara; *A. odontophylla* var. *okuyamae* Hara—MIKAWA-SHŌMA. Resembles var. *congesta*, but the leaflets ovate-cordate, regularly doubly shallow-toothed, the panicle-branches rather distant, not much elongate, the petals narrow, nearly as long as the stamens.—Honshu (Mikawa Prov.).

Var. *hachijoensis* (Nakai) Ohwi. *A. hachijoensis* Nakai—HACHIJŌ-SHŌMA. Leaflets firmly chartaceous and lustrous above, the terminal ones broadly to narrowly ovate, often 3-lobed, the cauline leaves usually 3-foliolate, the bracts and bracteoles prominent, 2–4(–10) mm. long, the petals white, about 3 mm. long.—Honshu (Izu Is.).

3. TANAKAEA Fr. & Sav. IWA-YUKI-NO-SHITA ZOKU

Evergreen dioecious perennial with creeping rhizomes and stolons; radical leaves tufted, petiolate, oblong, irregularly coarse-toothed, firm and thick, flat, exstipulate; stems scapose, erect, usually naked; inflorescence paniculate, the bracts small, linear; flowers white; calyx-tube short, shallow, the lobes 5(4–7); petals absent; stamens 10; ovary nearly superior; styles short, capitate; capsules nearly superior; seeds acute at both ends.—One species in China and Japan.

1. *Tanakaea radicans* Fr. & Sav. IWA-YUKI-NO-SHITA. Radical leaves subcoriaceous, green above, paler beneath, obtuse or subacute, 2–8 cm. long, 1–5 cm. wide, rounded or sometimes cordate at base, the petioles loosely coarse-hairy; scapes 10–30 cm. long, loosely long coarse-hairy; inflorescence

densely flowered, erect or often declined or nodding in fruit, 5–15 cm. long; flowers small, whitish, apetalous; capsules 3–4 mm. long; carpels 2, connate nearly the whole distance, dehiscent.—May–June. Wet shaded rocks; Honshu (Tōkaidō Distr.), Shikoku, Kyushu; rare.

4. SAXIFRAGA L. YUKI-NO-SHITA ZOKU

Perennials, sometimes annuals or biennials; leaves simple, often toothed or lobed; flowers 1 to many, usually in cymes, white or yellowish, bisexual; calyx-tube prominent or shallow and short, the lobes or segments 5; petals 5, equal or unequal; stamens 10, the filaments filiform or sometimes dilated above; carpels 2, connate at base; styles 2, short or rather elongate, free, the stigma small; capsules dehiscent between the styles; seeds many, small, sometimes tuberculate, sometimes caudate.—More than 300 species, especially abundant in the N. Hemisphere.

1A. Calyx-tube well developed; ovary semisuperior; leaves reniform-orbicular, palmately lobed.

2A. Inflorescence with bulbils; petals oblanceolate, 6–8 mm. long, 3–4 times as long as the calyx-lobes; alpine. 1. *S. cernua*

2B. Inflorescence without bulbils; petals broadly obovate, about 5 mm. long, 1.5–2 times as long as the calyx-lobes; wet rocks near the sea. 2. *S. bracteata*

1B. Calyx-tube short and shallow; ovary superior or nearly so.

3A. Stems scapose, simple or only sparsely branched at base; leaves distinctly petiolate (except nos. 6–7).

4A. Flowers actinomorphic; petals all alike and equal.

5A. Radical leaves reniform-orbicular, long-petiolate.

6A. Flowers red-brown or greenish brown; petals twice to several times as long as the stamens; disc prominently raised.

6B. Flowers white or sometimes purplish red; petals slightly longer than the stamens; disc narrow.

7A. Scapes 15–80 cm. long, naked or with a single small leaf; radical leaves cordate, 3–10 cm. long and nearly as wide, irregularly toothed; seeds long-tailed at each end. 4. *S. japonica*

7B. Scapes 5–25 cm. long, naked; radical leaves reniform, 2–4 cm. long, 3–6 cm. wide, regularly toothed; seeds not tailed. 5. *S. reniformis*

5B. Radical leaves ovate to oblong-cuneate, sessile or short-petiolate.

8A. Scapes 10–40 cm. long; radical leaves 4–10 cm. long, with many teeth; hairs with 1 longitudinal row of cells.

8B. Scapes 5–10 cm. long; radical leaves 1–3 cm. long, coarsely 5- to 11-toothed; hairs with many rows of cells. 7. *S. laciniata*

4B. Flowers zygomorphic; petals of two forms.

9A. Aerial stems stout, usually simple, 3–20 cm. long, erect; leaves ovate-orbicular. 8. *S. sendaica*

9B. Aerial stems absent; leaves radical, usually reniform-orbicular.

10A. Upper petals nearly lanceolate, gradually narrowed at base, not spotted; seeds smooth, not tubercled; summer and autumn flowering. 9. *S. fortunei*

10B. Upper petals broadly ovate, abruptly narrowed below to a claw, spotted; seeds tubercled.

11A. Leaves palmately cleft to lobed, the lobes broadly ovate to oblong; autumn flowering. 10. *S. cortusaeifolia*

11B. Leaves shallowly and obsoletely lobulate, the lobules depressed; spring flowering.

12A. Stolons present; leaves deep green and obsoletely variegated on upper side, purplish red beneath; upper petals with yellow and small red spots. 11. *S. stolonifera*

12B. Stolons absent; leaves green and not variegated on upper side; upper petals with yellow spots only near base.

12. *S. nipponica*

3B. Stems well-developed, short, much-branched and tufted, densely leafy; leaves small, ciliate.

13A. Petals narrowed at base, not clawed, lanceolate, with small spots.

14A. Leaves 3-lobed, glandular on the margin. 13. *S. nishidae*

14B. Leaves undivided, ciliate and bristle-margined. 14. *S. cherlerioides* var. *rebunshirensis*

13B. Petals broadly ovate, distinctly clawed at base, not spotted; leaves 6–25 mm. long, often shallowly 3-lobed, with long glandular hairs on margin. 15. *S. merkiti*

1. *Saxifraga cernua* L. MUKAGO-YUKI-NO-SHITA. Perennial with short rhizomes and numerous small scalelike fleshy bulbils; scapes erect, simple, 5–25 cm. long, long-pubescent, naked except for few leaves on lower half; radical leaves few, reniform-orbicular, palmately 5- to 7-cleft, 5–15 mm. long, 7–17 mm. wide, slightly fleshy, the petioles slightly dilated at base, with soft curled hairs; cauline leaves short-petioled, broadly cuneate to shallowly cordate, the lobes acute, the upper leaves gradually becoming bracteate; flowers few, loosely spicate (bulbils appearing in place of the lowermost flowers), the bracts lanceolate to elongate-ovate, sessile, the rachis with curled glandular hairs, the terminal flowers usually well-developed, white; calyx-lobes broadly lanceolate, ob-

tuse, glandular-pilose, about 2.5 mm. long; petals ascending, spreading above, oblanceolate, 3-nerved, 6–8 mm. long; capsules usually not developed.—Aug. Wet shaded rocks in high mountains; Honshu (alpine regions in Shinano Prov.); rare.—Mountains and northern regions of the N. Hemisphere.

2. *Saxifraga bracteata* D. Don. *S. laurentiana* Ser.; *S. rivularis* var. *laurentiana* (Ser.) Engl.; *S. jauriei* H. Boiss.; *S. exilis* sensu Yabe & Yendo, non Steph.—KIYOSHI-SŌ. Resembles the preceding, but larger and less pubescent; stems stouter, often shortly branched; leaves 1–4 cm. wide, the shallowly lobed bracts leaflike; inflorescence cymose, loose, few-flowered, without bulbils; calyx-lobes broadly ovate; petals

broadly obovate, about 5 mm. long, 1.5–2 times as long as the calyx-lobes; capsules subinferior, broadly obovoid, about 8 mm. long, shallowly 2-lobed; seeds ovoid, smooth.—July–Aug. Wet rocks near the sea; Hokkaido (Nemuro Prov.).—Kuriles, Sakhalin, Ochotsk Sea region, Alaska, and Kamchatka.

3. *Saxifraga fusca* Maxim. *S. fusca* var. *divaricata* Fr. & Sav.—EZO-KURO-KUMO-SŌ. Perennial herb with short creeping rhizomes; radical leaves long-petiolate, reniform-orbicular, 3–6 cm. long, 4–10 cm. wide, regularly coarse-toothed, nearly glabrous; scapes 20–30 cm. high, glabrous below; panicles terminal; flowers many, loose, brown, the pedicels slender, 5–12 mm. long, sparingly glandular-hairy; calyx-lobes broadly ovate, obtuse, about 1 mm. long, recurved; petals narrowly ovate, 2.5–3 mm. long, obtuse, spreading, the disc prominent; stamens short, the filaments linear; capsules superior, erect, 4–6 mm. long, the carpels connate at base; seeds oblong, about 0.8 mm. long, 1-ribbed, short-mucronate at both ends, with minute tubercles in longitudinal rows.—July–Sept. Streams and ravines; Hokkaido, Honshu (n. distr.).—s. Kuriles.—Forma *kurilensis* Ohwi. *S. fusca* var. *kurilensis* Ohwi. CHISHIMA-KURO-KUMO-SŌ. Without glandular hairs on the inflorescence.—Forma *intermedia* Hara. USUGE-KURO-KUMO-SŌ. With longer, flexuous glandular-hairs on the inflorescence.

Var. *kikubuki* Ohwi. *S. fusca* sensu auct. Japon., non Maxim.; *S. kikubuki* Ohwi; *S. fusca* var. *kiusiana* Hara—KURO-KUMO-SŌ, KIKUBUKI. Hairs eglandular; scapes long-pubescent at base, the inflorescence short-pubescent, the pedicels 2–7 mm. long, the flowers dark purple-brown, sometimes greenish brown.—July–Sept. Wet places along streams and ravines in mountains; Honshu (centr. and n. distr.), Shikoku, Kyushu.

4. *Saxifraga japonica* H. Boiss. FUKI-YUKI-NO-SHITA. Rhizomes stout, short-creeping; radical leaves tufted, ovate-cordate, the blades 3–10 (–15) cm. long and as wide, irregularly acute-toothed, nearly glabrous, the petioles 10–35 cm. long; scapes 15–80 cm. long, often with 1 (–3) small leaves, loosely curly-pubescent; panicles 15–40 cm. long, rather loosely many-flowered; flowers white, the pedicels 5–20 mm. long; calyx-lobes ovate, recurved, obtuse; petals obliquely spreading, ovate, obtuse, 3–4 mm. long; stamens slightly longer than the petals, the filaments nearly linear, the disc surrounding the base of the ovary; capsules 10–12 mm. long, the carpels erect, obliquely ascending on the upper part; seeds fusiform, about 1 mm. long, longitudinally mammillate-ribbed, the tail at each end as long as the body.—July–Aug. Wet rocks, stream banks and ravines in mountains; Hokkaido, Honshu (n. and centr. distr.), Shikoku.

5. *Saxifraga reniformis* Ohwi. *S. punctata* sensu auct. Japon., non L.; *S. ohwi* Tatew., quoad plant.; *S. punctata* subsp. *reniformis* (Ohwi) Hara—CHISHIMA-IWABUKI. Rhizomes creeping, rather slender, short; radical leaves long-petiolate, reniform or reniform-orbicular, 5–10 cm. long, 3–6 mm. wide, regularly coarse-toothed, nearly glabrous; scapes 5–25 cm. high; inflorescence corymbose, densely flowered, the peduncles and axis soft short-pubescent; calyx-lobes recurved, narrowly ovate, about 2 mm. long, obtuse; petals obliquely spreading, white, sometimes with a reddish purple hue, oblong, about 3 mm. long, shortly clawed below; stamens as long as to slightly shorter than the petals, the filaments slightly flattened and dilated toward tip; capsules 4–5 mm. long; carpels oblong, erect, with a spreading apex; style very

short; seeds broadly fusiform, subacute, about 0.7 mm. long.—July. Wet places along streams and ravines in mountains and alpine regions; Hokkaido (Rishiri Isl. and Mount Daisetsu); rare.—Sakhalin, Kuriles, and Kamchatka.

6. *Saxifraga sachalinensis* F. Schmidt. *S. virginienensis* var. *yessoensis* Franch.; *S. yessoensis* (Franch.) Engl.; *S. reflexa* sensu auct. Japon., non Hook.—YAMA-HANA-SŌ. Perennial rhizomatous herb, rather long glandular-hairy on the vegetative parts, shorter-pubescent on the inflorescence; radical leaves rosulate, ovate to oblong, 2–10 cm. long, 1–5 cm. wide, subobtusely to rounded at apex, rather fleshy, abruptly narrowed below and decurrent, dentate, often purplish beneath, the petioles 0.5–2.5 cm. long; scapes 10–40 cm. long; panicle loosely many-flowered, the pedicels 5–15 mm. long; calyx-lobes recurved, narrowly ovate, about 2 mm. long; petals white, ovate, obtuse, 3–4 mm. long, 3-nerved; stamens nearly as long as the petals, the filaments broadened above; capsules 4–6 mm. long; carpels ovoid, ascending, shortly reflexed at apex; seeds fusiform-ellipsoidal, about 0.7 mm. long, mucronate at both ends, longitudinally ribbed.—May–June. Hokkaido.—Sakhalin and s. Kuriles.

7. *Saxifraga laciniata* Nakai & Takeda. KUMOMA-YUKI-NO-SHITA, HIME-YAMA-HANA-SŌ. Rhizomes short; radical leaves rosulate, oblong-cuneate, 2–3 cm. long, 8–12 mm. wide, sessile, with few teeth on the upper margin, glandular-ciliate, slightly fleshy, yellowish green; scapes 5–10 cm. long, glandular-pubescent; inflorescence cymose, terminal, rather few-flowered; calyx-lobes recurved, ovate-oblong, 2–3 mm. long; petals white, narrowly ovate, 4–5 mm. long, clawed at base, with 2 yellow spots on lower portion, 3-nerved; stamens shorter than the petals, the filaments subulate; capsules superior; carpels connate on lower half, ovoid, 5–6 mm. long; seeds ovoid, small, tuberculate on the longitudinal ribs.—July–Aug. Alpine; Hokkaido (Mount Daisetsu and Mount Yubari); rare.—Sakhalin and n. Korea.

Saxifraga takedana Nakai. TSURU-KUMOMAGUSA, with elongate rhizomes.—Occurs with and probably only an ecological variant of the preceding.

8. *Saxifraga sendaica* Maxim. SENDAI-SŌ. Rather fleshy perennial herb; stems simple, terete, stout, 3–20 cm. long, erect, 3–8 mm. in diameter, fleshy, leafy toward the summit, with scarios scalelike leaves below; leaves long-petiolate, ovate-orbicular, 4–10 cm. long, 3–7 cm. wide, shallowly 7- to 9-lobed, irregularly toothed, rather fleshy, lustrous above, glabrous, glandular-hairy on the margins, petioles 2–10 cm. long; scapes 5–8 cm. long; panicle corymbose, the pedicels short glandular-puberulent; calyx-lobes ovate-oblong, obtuse, about 4 mm. long; petals lanceolate, acute, white, of two lengths, the longest to 20 mm. long; stamens about 5 mm. long.—Oct. On shaded rocks in mountains; Honshu (Ise and Yamato Prov.), Shikoku, Kyushu; rare.—Forma *laciniata* (Nakai) Ohwi. *S. sendaica* var. *laciniata* Nakai. A rare phase with deeply lobed leaves.

9. *Saxifraga fortunei* Hook. f. var. *incisulobata* (Engl. & Irmsch.) Nakai. *S. cortusaefolia* sensu auct. Japon., non Sieb. & Zucc.; *S. mutabilis* Koidz.; *S. cortusaefolia* var. *typica* subvar. *incisulobata* Engl. & Irmsch.—DALMONI-SŌ. Slightly fleshy perennial with short rhizomes; radical leaves long-petiolate, stipulate, reniform-orbicular, 3–15 cm. long, 4–20 cm. wide, cordate, rarely truncate at base, palmately lobed and dentate, nearly glabrous to coarsely hirsute, the petioles 3–30 cm. long; scapes 5–35 cm. long, naked or rarely

with a small leaf, glabrous to thinly glandular-pubescent; inflorescence 1–25 cm. long, broadly pyramidal, the pedicels 3–20 mm. long, scattered glandular-pubescent; calyx-lobes spreading, ovate-oblong, 2–3 mm. long; petals spreading, white, sometimes reddish, the 3 upper ones broadly lanceolate, 3–4 mm. long, the lower 2 narrowly lanceolate, 5–15 mm. long, rarely few-toothed; stamens 4–7 mm. long, the filaments scarcely broadened above; styles short, slightly elongate after anthesis; capsules superior, ovoid, 4–6 mm. long; carpels connate nearly to the top; seeds narrowly fusiform, acute, 0.8 mm. long, smooth.—July–Oct. Wet rocks in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable. —s. Sakhalin, s. Kuriles, Korea, Manchuria, Ussuri, and China.—Forma *partita* (Makino) Ohwi. *S. cortusaeifolia* var. *partita* Makino; *S. fortunei* var. *partita* (Makino) Nakai —KAEDE-DAL-MONJI-SŌ. With cleft to parted leaves.

Var. *obtusocuneata* (Makino) Nakai. *S. cortusaeifolia* var. *obtusocuneata* Makino; *S. mutabilis* var. *obtusocuneata* (Makino) Koidz.—UCHIWA-DAL-MONJI-SŌ. Leaves ovate-oblong or flabellate-oblong, broadly cuneate to nearly truncate at base.—Along streams in mountains; Honshu, Shikoku, Kyushu.

Var. *crassifolia* (Engl. & Irmsch.) Nakai. *S. cortusaeifolia* var. *typica* subvar. *crassifolia* Engl. & Irmsch.; *S. cortusaeifolia* var. *typica* subvar. *brevifolia* Engl. & Irmsch.; *S. jotanii* Honda; *S. cortusaeifolia* var. *jotanii* (Honda) Makino—Izu-no-SHIMADA-MONJI-SŌ. Prominently long-hirsute, fleshier, the leaves shallowly lobed; scapes and pedicels with longer glandular hairs.—Oct.–Jan. Honshu (Awa and Izu Isls.).

10. *Saxifraga cortusaeifolia* Sieb. & Zucc. *S. cortusaeifolia* var. *madida* Maxim.; *S. madida* (Maxim.) Makino; *S. cortusaeifolia* var. *maximowiczii* (Engl. & Irmsch.) Hara; *S. madida* var. *maximowiczii* Engl. & Irmsch.—JINTJI-SŌ. Resembles the preceding but with longer and denser hairs; leaves often deeply cleft, sometimes with needle-shaped cystoliths (under magnification); 3 upper petals broadly ovate, distinctly clawed and with a yellow spot near the base, about 4 mm. long; capsules broad; seeds narrowly fusiform, about 0.7 mm. long, minutely tuberculate.—Sept.–Oct. Wet shaded places especially on rocks and along streams in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather rare.

Var. *stolonifera* (Makino) Koidz. *S. madida* var. *stolonifera* Makino—TSURU-JINTJI-SŌ. Plant stoloniferous.—Kyushu (Hizen and Higo Prov.).

11. *Saxifraga stolonifera* Curt. *S. sarmentosa* L.; *S. ligulata* Murr.; *S. chinensis* Lour.; *Seiki sarmentosa* (L.) Moench.—YUKI-NO-SHITA. Rather fleshy stoloniferous perennial with coarse brownish red hairs; rhizomes short; leaves fleshy, reniform-obircular, 3–5 cm. long, 3–9 cm. wide, shallowly lobulate, toothed, pale variegated above, purplish red beneath, the petioles 3–10 cm. long, dilated and long-ciliate at base; scapes 20–40 cm. long; inflorescence a broad panicle 10–20 cm. long, short glandular-pubescent; calyx-lobes narrowly ovate, 3–4 mm. long, recurved above; petals spreading, the upper 3 ovate, acute, about 3 mm. long, short-clawed, spotted, the lower 2 unequal, lanceolate, 10–20 mm. long, spotless; stamens 4–7 mm. long, the filaments slightly broadened above; capsules ovoid-globose, 4–5 mm. long, shallowly 2-lobed; styles rather long; seeds ovoid, warty, about 0.5 mm. long.—May–July. Wet soils and rocks; Honshu, Shikoku, Kyushu.—China. Frequently planted in gardens.—Forma *aptera* (Makino) Hara. *S. sarmentosa* var. *aptera* Makino

—HOSHIZAKI-YUKI-NO-SHITA. Abnormal phase with 5 equal petals.

12. *Saxifraga nipponica* Makino. HARU-YUKI-NO-SHITA. Sparsely long-pilose; rhizomes rather long, branched; leaves reniform-obircular or orbicular, 2–6 cm. long, 2–7 cm. wide, deeply cordate, toothed, very shallowly lobulate, green, with needle-shaped cystoliths; scapes 20–40 cm. long; cymes paniculate, 10–30 cm. long, with soft glandular-hairs; calyx-lobes recurved after anthesis, 2–4 mm. long; petals spreading, white, the upper 3 broadly ovate, subacute, short-clawed at base, spotted on the lower portion, 3–4 mm. long, the lower 2 larger, unequal, lanceolate, acute, 10–25 mm. long, not spotted; stamens 3–5 mm. long, the filaments slightly broadened above; capsules broadly ovoid, 4–5 mm. long, shallowly 2-fid; styles ascending; seeds small, granular-tuberculate.—Apr.–May. Mountains; Honshu (n. and centr. distr. incl. Kantō); rare.

13. *Saxifraga nishidae* Miyabe & Kudo. EZO-NO-KUMOMAGUSA. Stems slender, short, much-branched, tufted; leaves lanceolate-cuneate, 4–10 mm. long, 2–3 mm. wide, sessile, 3-lobed, the lobes narrowly ovate, short-awned, scattered glandular-hairy on margin; stems 3–7 cm. long, scattered glandular-hairy, loosely leafy; inflorescence 1- to 3-flowered, the pedicels short glandular-hairy; calyx-lobes ovate-oblong, 3–4 mm. long; petals narrowly oblong, subobtusate, 3-nerved, 6–7 mm. long, with small spots; stamens about 5 mm. long, the filaments subulate; styles slender.—Rocky places in alpine regions; Hokkaido (Mount Yubari); rare.

14. *Saxifraga cherlerioides* D. Don var. *rebunshirensis* (Engl. & Irmsch.) Hara. *S. bronchialis* sensu auct. Japon., non L.; *S. bronchialis* var. *genuina* forma *rebunshirensis* Engl. & Irmsch.; *S. bronchialis* var. *cherlerioides* sensu auct. Japon., non Engl.; (?) *S. firma* Litv.—SHIKOTAN-SŌ. Stems slender, much-branched, densely many-leaved; leaves evergreen, thick, firm, spatulate-lanceolate or narrowly lanceolate, 6–15 mm. long, 1.5–3 mm. wide, short spine-tipped, spreading bristly on the margin; stems 3–12 cm. long, scattered glandular-puberulent, sometimes with curled hairs at the base, loosely few-leaved; cymes 3- to 10-flowered; calyx-lobes ascending, narrowly ovate, 2–3 mm. long, subacute; petals narrowly oblong or oblanceolate, 5–7 mm. long, ascending, white to cream-colored, with small brown-red spots; stamens 4–5 mm. long, the filaments subulate; capsules broadly ovoid, 4–5 mm. long, 2-fid; seeds about 0.8 mm. long, granular-tuberculate.—July–Aug. Rocks and rocky slopes in alpine regions; Hokkaido, Honshu (centr. distr.); rare.—Forma *togakushiensis* (Hara) Ohwi. *S. bronchialis* var. *pseudoburseriana* sensu auct. Japon., non F. Schmidt; *S. cherlerioides* var. *togakushiensis* Hara.—HIME-KUMOMAGUSA. Smaller phase with leaves prominently spine-tipped and ciliate.—Honshu (Mount Togakushi) and Hokkaido (Sounbetsu in Ishikari).—The typical phase and several distinct variants occur in Siberia from the Ural Mts. eastw., also in N. America.

15. *Saxifraga merckii* Fisch. var. *merckii*. *S. merckii* var. *robusta* Takeda; *S. merckii* var. *typica* Engl. & Irmsch.—CHISHIMA-KUMOMAGUSA. Stems short, densely branched, densely leafy; leaves rather fleshy, green, broadly lanceolate to obovate, 6–17(–20) mm. long, 3–8(–10) mm. wide, rounded to subacute at the tip, long glandular-hairy on margin, entire, scattered-pilose above, very rarely shallowly 3-lobed; scapes 3–10 cm. long, 1- to 8-flowered, densely glandular-pilose; calyx-lobes spreading, broadly ovate, 2–3 mm. long, rounded at apex; petals broadly ovate, 6–7 mm. long, spreading, white,

spotless, abruptly narrowed to a prominent claw at base; stamens about 4 mm. long, the filaments linear; capsules broadly ovoid, 6-7 mm. long, bifid, superior.—July-Aug. Gravelly and sandy slopes in alpine regions; Hokkaido.—Kuriles and Kamchatka.

Var. *idsuroei* (Fr. & Sav.) Engl. *S. idsuroei* Fr. & Sav. —KUMOMAGUSA. Leaves often shortly 3-lobed, the flowers 1-4.—Alpine regions; Honshu (centr. distr.).

5. PELTOBOYKINIA Hara YAWATA-SŌ ZOKU

Rather large perennial herbs with short creeping rhizomes; stems few-leaved; radical leaves long-petioled, large, peltate, palmately lobed, the stipules membranous; cymes terminal; calyx-tube shallowly campanulate, adnate to the ovary on lower half, the lobes 5; petals 5, pale yellow, toothed, glandular-dotted, ascending, deciduous; stamens 10; ovary 2-locular, subsuperior; carpels connate nearly all the way, the placentae axile; styles 2, free; capsules subsuperior, enclosed in the somewhat inflated calyx-tube; seeds minute, longitudinally tuberculate.—Two species, in Japan.

- 1A. Leaves 7- to 13-lobed, the lobes ovate-deltoid, abruptly acute, broader than long. 1. *P. tellimoides*
 1B. Leaves 8- to 10-cleft, the lobes narrowly cuneate-ovate, acuminate, 2-3 times as long as wide. 2. *P. watanabei*

1. *Peltoboykinia tellimoides* (Maxim.) Hara. *Saxifraga tellimoides* Maxim.; *Boykinia tellimoides* (Maxim.) Engl.—YAWATA-SŌ. Rhizomes stout and short; radical leaves 1 or 2, long-petioled, orbicular, peltate, cordate, 10-25 cm. long and as wide, shallowly palmate-lobed, toothed, obsoletely incised, glabrous or slightly glandular-pilose, lustrous above; stems 30-60 cm. long, rather stout, 2- to 3-leaved, the cauline leaves smaller, short-petioled or subsessile; inflorescence several-flowered, the bracts small; calyx-lobes narrowly deltoid, erect, acute, 4-5 mm. long; petals creamy white, broadly oblanceolate, 10-12 mm. long, nearly acute, ascending, few-toothed toward tip; capsules 10-13 mm. long, broadly ovoid, enclosed within the calyx-tube.—May-July. Woods in mountains; Honshu (n. and centr. distr.); rare.

2. *Peltoboykinia watanabei* (Yatabe) Hara. *Saxifraga watanabei* Yatabe; *S. tellimoides* var. *watanabei* (Yatabe) Makino; *Boykinia tellimoides* var. *watanabei* (Yatabe) Engl.; *B. watanabei* (Yatabe) Makino; *P. tellimoides* var. *watanabei* (Yatabe) Hara.—WATANABE-SŌ. Closely resembles the preceding species; leaves palmately cleft below the middle, the lobes narrow, acuminate, slightly narrowed at base; rhizomes short; radical leaves long-petioled, about 25 cm. long and as wide, 8- to 10-cleft, the lobes much longer than wide, usually 2- to 3-incised, glabrous, irregularly toothed; calyx-lobes deltoid, acute, about 4 mm. long; petals pale yellow, short-glandular, 8-10 mm. long, about 2.5 mm. wide.—June-July. Woods in mountains; Shikoku, Kyushu; rare.

6. BOYKINIA Nutt. ARASHIGUSA ZOKU

More or less pubescent perennial herbs; leaves petiolate, orbicular-cordate, palmately lobed; scapes few-leaved; cymes paniculate, terminal, the bracts small; flowers small, greenish-yellow or white, bisexual; calyx-tube campanulate or subglobose, adnate to the ovary most of the way, the lobes 5; petals 5, deciduous or somewhat persistent, as many as the stamens; ovary nearly inferior; carpels adnate to the calyx-tube; capsules 2-locular, 2-beaked; styles free; seeds minute.—About 10 species, in N. America, 1 in Japan.

1. *Boykinia lycoctonifolia* (Maxim.) Engl. *Saxifraga lycoctonifolia* Maxim.; *Therofon lycoctonifolia* (Maxim.) Takeda; *Neoboykinia lycoctonifolia* (Maxim.) Hara.—ARASHIGUSA. Rhizomes slender, creeping, rather elongate; radical leaves solitary, long-petiolate, reniform-orbicular, 3-10 cm. long, 5-15 cm. wide, palmately 7- to 9-lobed or -cleft, incised and toothed, dull and nearly glabrous on upper side, long-

pubescent on the nerves beneath; stems 15-40 cm. long, few-leaved, long glandular-hairy; inflorescence glandular-pilose; flowers small, yellow-green; calyx-lobes narrowly deltoid; petals slightly shorter than the sepals, obovate, about 2 mm. long; capsules ellipsoidal, 7-8 mm. long; seeds longitudinally and minutely tuberculate.—July-Aug. Wet grassy slopes in high mountains; Hokkaido, Honshu (centr. and n. distr.).

7. CHRYSOSPLENIUM L. NEKO-NO-ME-SŌ ZOKU

Small more or less succulent perennials or biennials; leaves alternate or opposite, simple, short-toothed, petiolate, stipules absent; radical leaves often few; stems scapose, the bracts subfoliaceous often colored; flowers small, in cymes, green, yellow, or white; calyx-tube cup-shaped or infundibuliform, the limb 4-lobed; petals absent; stamens 8 or sometimes 4; ovary 1-locular; styles 2, short, free; capsules subinferior or nearly superior, depressed or laterally compressed, bifid; seeds elliptic, sometimes fusiform, small, smooth or tuberculate, often longitudinally ribbed.—Principally in China and Japan, few in Europe and Siberia, also a few in N. and S. America.

- 1A. Leaves opposite or very rarely partially alternate in the cauline ones.
 2A. Stolons hypogaeal, leafless, bearing a bulbil at apex; nearly glabrous. 1. *C. maximowiczii*
 2B. Stolons epigeal, with few pairs of leaves and without bulbils.
 3A. Plants brownish or whitish pilose.
 4A. Calyx-lobes erect at anthesis; seeds longitudinally warty; stamens as long as to slightly longer than the calyx-lobes; capsules with 2 ascending or nearly erect beaks.

- 5A. Calyx-lobes oblong or narrowly ovate, sometimes elliptic, usually white at anthesis; stamens exserted; hairs on upper side of leaves rather long; anthers dark purple. 2. *C. album*
- 5B. Calyx-lobes rounded to ovate-rounded, yellow or pale green at anthesis; anthers yellow.
- 6A. Calyx-lobes yellow to greenish yellow at anthesis; stamens slightly shorter than the calyx-lobes. 3. *C. pilosum* var. *sphaerospermum*
- 6B. Calyx-lobes pale green at anthesis; stamens as long as to slightly longer than the calyx-lobes. 4. *C. rhabdospermum*
- 4B. Calyx-lobes spreading at anthesis; seeds nearly smooth; stamens much shorter than the calyx-lobes; capsules with 2 horizontally spreading beaks. 5. *C. ramosum*
- 3B. Plants glabrous, sometimes sparsely hairy in the leaf-axils.
- 7A. Seeds with few longitudinal ribs; stamens 8.
- 8A. Ribs of seeds nearly smooth; calyx-lobes spreading; stamens very short. 6. *C. kamschaticum*
- 8B. Ribs of seeds tubercled.
- 9A. Stamens much shorter than the calyx-lobes, about 0.5 mm. long; disc prominent. 7. *C. echinus*
- 9B. Stamens longer than to slightly shorter than the calyx-lobes, 1–3 mm. long; disc not prominent.
- 10A. Rosulate leaves short-petioled or nearly sessile; seeds ribbed, the ribs wrinklelike with low tubercles. 8. *C. fauriei*
- 10B. Rosulate leaves distinctly petioled; seeds with prominently tubercled ribs. 9. *C. macrostemon*
- 7B. Seeds with a single longitudinal rib on one side, minutely papillose; stamens 4. 10. *C. grayanum*
- 1B. Leaves always alternate.
- 11A. Seeds minutely mammillate; flowers green or greenish yellow.
- 12A. Leaves with rounded teeth.
- 13A. Stolons epigeal, leafy. 11. *C. flagelliferum*
- 13B. Stolons hypogaeal, naked. 12. *C. tosaense*
- 12B. Leaves with depressed teeth; stolons absent; plants bearing bulbils at base. 13. *C. japonicum*
- 11B. Seeds quite smooth, not tubercled; flowers clear yellow; leaves short-toothed. 14. *C. alternifolium* var. *sibiricum*

1. **Chrysosplenium maximowiczii** Fr. & Sav. MUKAGONEKO-NO-ME, TAMA-NEKO-NO-ME. Stems erect, 3–15 cm. long, sparsely pubescent while young, nearly glabrous later; stolons with a small resting bulbil at the tip from which the new plant arises each year; leaves all cauline, 2 to 3 pairs, ovate-orbicular, 4–18 mm. long, 5–15 mm. wide, short-toothed, petiolate; flowers yellow-green; calyx-lobes erect, ovate-orbicular, about 1 mm. long; stamens 8, to 1 mm. long, shorter than the calyx-lobes, the disc indistinct; capsule-valves sub-erect, unequal, slightly compressed laterally; seeds ovoid-globose, about 0.6 mm. long, mammillate on the longitudinal ribs.—Mar–Apr. Wet places; Honshu (Sagami, Awa, Izu, Shimotsuke Prov.); rare.

2. **Chrysosplenium album** Maxim. *C. stamineum* Fr. & Sav.; *C. beauverdiei* Terrac.; *C. naminoense* Honda—SHIROBANA-NEKO-NO-ME, HANA-NEKO-NO-ME. Stems 5–15 cm. long, long-pubescent; stolons elongate, leafy; leaves opposite, flabellate-suborbicular, 4–10 mm. long, 5–12 mm. wide, often slightly variegated on the upper surface, obsoletely 5- to 9-toothed, subtruncate and abruptly decurrent to a petiole; flowers rather few, dense, white in anthesis, pale green in fruit; calyx-lobes erect, 3–5 mm. long, broadly lanceolate to narrowly oblong; stamens erect, the anthers dark purple.—Mar–May. Woods in foothills; Honshu (Iwaki Prov. and southw.), Shikoku, Kyushu.

Var. **stamineum** (Fr. & Sav.) Hara. A smaller plant with leaves usually 5-toothed. Western part of the distribution.

Var. **flavum** Hara. KIBANA-HANA-NEKO-NO-ME. Flowers yellow; sepals ovate, obtuse to shortly acute; anthers yellowish, often tinged with red.—Honshu (Tōkaidō Distr.); rare.

3. **Chrysosplenium pilosum** Maxim. var. **sphaerospermum** (Maxim.) Hara. *C. pilosum* var. *fulvum* (Terrac.) Hara; *C. multicaule* Fr. & Sav.; *C. vulvum* Terrac.; *C. vidalii* Fr. & Sav.—KOGANE-NEKO-NO-ME. Soft pubescent herb; stems 5–10 cm. long, with well-developed leafy stolons; radical leaves usually withering before anthesis, the lower cauline short-petiolate, flabellate, 4–15 (–20) mm. long, 5–12 (–20) mm. wide, with few short teeth; flowers few, yellow or rarely

greenish yellow at anthesis, pale green in fruit; calyx-lobes ovate-orbicular or depressed-rounded, erect, 1–1.5 mm. long; stamens 8, slightly shorter than the calyx-lobes; capsules and seeds nearly the same as in the preceding species.—Mar–May. Wet places; Honshu, Shikoku, Kyushu.

4. **Chrysosplenium rhabdospermum** Maxim. *C. doianum* Ohwi—TSUKUSHI-NEKO-NO-ME. Radical leaves petiolate, depressed-orbicular, 5–10 mm. long, 5–15 mm. wide, undulate-toothed; scapes 5–10 cm. long, loosely few-flowered; calyx-tube cup-shaped, the lobes pale green, erect, ovate to depressed-rounded; stamens slightly longer than to as long as the calyx-lobes, the anthers yellow; capsules compressed, erect, the valves unequal; seeds mammillate on the ribs.—Mar–Apr. Kyushu.

5. **Chrysosplenium ramosum** Maxim. *C. ramosum* var. *atrodiscum* (Suto) Hara; *C. yesoense* Fr. & Sav.; *C. crenulatum* var. *atrodiscum* Suto; *C. microphyllum* Tatew. & Suto—MARUBA-NEKO-NO-ME. Thinly long-pubescent; stems 7–15 cm. long; stolons very elongate, branched, with widely spaced pairs of orbicular leaves; radical leaves withering before anthesis, the cauline petiolate, ovate-orbicular or sub-orbicular, 5–15 mm. long, 6–15 mm. wide, broadly cuneate at base, with subrounded teeth; flowers green, purple-green or purple-brown; calyx-lobes horizontally spreading, depressed-rounded; stamens inserted on the margin of a prominent disc, much shorter than the calyx-lobes; capsules subinferior, the valves horizontally spreading, nearly equal; seeds narrowly ovoid-ellipsoidal, about 1 mm. long, obsoletely ribbed or nearly smooth.—May–June. Hokkaido, Honshu (Kinki Distr. and northw.), s. Sakhalin, Korea, Manchuria and Amur.

6. **Chrysosplenium kamschaticum** Fisch. *C. costulatum* Franch.; *C. corrugatum* Franch.; *C. nodulosum* Franch.; *C. aomorense* Franch.; *C. flabellatum* Terrac.; *C. kamschaticum* var. *costulatum* (Franch.) Suto; *C. kamschaticum* var. *aomorense* (Franch.) Hara—CHISHIMA-NEKO-NO-ME. Slender glabrous herb; stems 5–15 cm. long; stolons much elongate, often with a pair of leaves at wide intervals, with a tuft of rosulate leaves at apex; radical leaves rosulate, ovate-orbicu-

lar, short-petiolate, undulately toothed; leaves on stolons orbicular, 5–15 mm. long and as wide, abruptly decurrent at base, short-petiolate, sometimes nearly sessile; flowers few to more than 10, yellowish green or brownish green; calyx-lobes spreading at anthesis, orbicular, about 1 mm. in diameter, the disc prominent; stamens marginal, shorter than the calyx-lobes; capsules ascending, the valves unequal; seeds longitudinally ribbed and finely cross-barred on the ribs.—Apr.–May. Hokkaido, Honshu (Kinki Distr. and northw.).—Kuriles, Sakhalin, and Kamchatka.

7. *Chrysosplenium echinus* Maxim. *C. echinulatum* Fr. & Sav.—IWA-NEKO-NO-ME. Glabrous stoloniferous herb without radical leaves in anthesis; stems 5–12 cm. high; leaves distinctly petioled, orbicular, 5–20 mm. in diameter, subtruncate at base, with undulate incurved teeth; flowers green; calyx-lobes spreading, depressed-orbicular or broadly ovate, 1–1.5 mm. long; stamens about 0.5 mm. long, on the margin of the prominent disc; capsule-valves ascending, unequal; seeds about 1 mm. long, longitudinally ribbed, with elongate terete tubercles on the ribs.—Apr.–May. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

8. *Chrysosplenium fauriei* Franch. HOKURIKU-NEKO-NO-ME. Glabrous stoloniferous herb; radical leaves ovate-orbicular, 1–2.5 cm. long and as wide, nearly sessile or short-petiolate; leaves of stolons orbicular to flabellate-orbicular, short-petiolate or sessile, with incurved teeth; flowers rather many, yellow; calyx-lobes erect, elliptic to orbicular, 1.5–2 mm. long; stamens 8, 2.5–3 mm. long, longer than the calyx-lobes; capsules ascending, the valves unequal; seeds about 0.8 mm. long, longitudinally ribbed with low mammillae on the ribs.—May. Honshu (Japan Sea side from Echigo to Izumo Prov.).

Var. *kiotense* (Ohwi) Ohwi. *C. kiotense* Ohwi.—BOTAN-NEKO-NO-ME. Stamens shorter than the calyx-lobes, and the seeds with rugose ribs.—Honshu (centr. distr. and westw.).

9. *Chrysosplenium macrostemon* Maxim. *C. discolor* Fr. & Sav.; *C. calcitrapa* Franch.; *C. macrostemon* var. *calcitrapa* (Franch.) Hara.—IWA-BOTAN. Stems 5–15 cm. long; stolons elongate after anthesis; radical leaves often persistent at anthesis, long-petiolate, broadly ovate, 1–2.5 cm. long, 0.8–2 cm. wide, with incurved teeth; leaves of stolons ovate-orbicular to ovate-elliptic, 5–40 mm. long, 4–35 mm. wide; flowers rather numerous, yellow-green; calyx-lobes nearly erect at anthesis, elliptic, 1–1.8 mm. long; stamens longer than the calyx-lobes, 2–3 mm. long, the anthers yellow; capsules ascending, the valves unequal; seeds about 0.8 mm. long, longitudinally ribbed with a series of clavate tubercles on the ribs.—Mar.–May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *atrardrum* Hara. YOGORE-NEKO-NO-ME. Flowers with dark-colored anthers.—Occurs with the typical phase.

Var. *shioharensis* (Franch.) Hara. *C. discolor* var. *shioharensis* (Franch.) Suto; *C. viridescens* Suto; *C. discolor* var. *viridescens* Suto.—NIKKŌ-NEKO-NO-ME. Radical leaves usually withering before anthesis; stolons much-elongate at anthesis, with smaller, orbicular leaves; anthers red-purple, rarely yellow.—Apr.–May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

10. *Chrysosplenium grayanum* Maxim. *C. nipponicum* Fr. & Sav.; *C. dickinsii* Fr. & Sav.; *C. grayanum* var.

polystichum Fr. & Sav.; *C. grayanum* var. *nipponicum* (Fr. & Sav.) Fr. & Sav.; *C. grayanum* var. *dickinsii* (Fr. & Sav.) Fr. & Sav.—NEKO-NO-ME-SŌ, MIZU-NEKO-NO-ME. Glabrous, without radical leaves; stems 5–20 cm. long; stolons elongate after anthesis, sparsely leafy, without a tuft of rosulate leaves at apex; leaves short-petiolate, broadly ovate to ovate-orbicular, 5–20 mm. long, 5–18 mm. wide, with incurved teeth; flowers more than 10, yellowish green; calyx-lobes suborbicular, about 1 mm. long, erect, concave on back; stamens 4, about 0.5 mm. long; capsules ascending, the valves unequal; seeds broadly ovoid, about 0.7 mm. long, 1-ribbed, minutely mammillate.—Apr.–May. Hokkaido, Honshu, Shikoku, Kyushu.—Korea, s. Kuriles, and China.

11. *Chrysosplenium flagelliferum* F. Schmidt. TSURU-NEKO-NO-ME. Green sparsely pubescent herb; radical leaves sometimes persistent until anthesis; stems 5–20 cm. long; stolons leafy; leaves alternate, cordate-orbicular, 3–10 mm. long, 4–12 mm. wide, with rounded teeth, slightly cordate; leaves on stolons similar to the radical ones but larger, distinctly cordate, to 4 cm. long and as wide, long-petiolate; flowers yellowish green; calyx-lobes spreading, depressed-orbicular or elliptic, 1–2 mm. long; stamens short; capsules subinferior, subtruncate; seeds ovoid, about 0.6 mm. long, 1-ribbed, minutely mammillate.—Apr.–May. Hokkaido, Honshu (n. Kinki Distr. and northw.), Shikoku.—Korea, Manchuria, Amur, Ussuri, Sakhalin, and Kuriles.

12. *Chrysosplenium tosaense* (Makino) Makino. *C. flagelliferum* var. *tosaense* Makino.—TACHI-NEKO-NO-ME. Closely resembling the preceding species; stolons subterranean; radical leaves long-petioled, reniform-orbicular, 5–17 mm. long, 5–25 mm. wide, 5- to 9-toothed, slightly whitish beneath; stems erect, 5–12 cm. high, 3- to 4-angled, leafless or 1- to 2-leaved; flowers pale green; sepals spreading, broadly ovate, obtuse; stamens short; ovary inferior, embedded in the disc; capsules convex; seeds 1-ribbed, minutely mammillate.—Mar.–May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather common.

13. *Chrysosplenium japonicum* (Maxim.) Makino. *C. alternifolium* sensu auct. Japon., non L.; *C. alternifolium* var. *japonicum* Maxim.; *C. alternifolium* var. *papillosum* Fr. & Sav.—YAMA-NEKO-NO-ME. Thinly soft-pubescent; stems 10–20 cm. long, thickened and bearing bulbils at base; stolons absent; radical leaves prominent, long-petioled, reniform-orbicular, 5–20 mm. long, 8–30 mm. wide, cordate, very shallowly toothed; flowers rather many, pale green; calyx-lobes spreading, depressed-orbicular, about 1 mm. long; stamens very short, about 0.5 mm. long; capsules subinferior, cup-shaped, subtruncate; seeds broadly ovoid, about 0.6 mm. long, 1-ribbed, minutely mammillate.—Mar.–May. Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; rather common.—Korea and Manchuria.

14. *Chrysosplenium alternifolium* L. var. *sibiricum* (Steph.) Ser. *C. sibiricum* Steph.; *C. alternifolium* sensu auct. Japon., non L.—EZO-NEKO-NO-ME. Thinly pubescent; stems 5–12 cm. long; stolons subterranean; radical leaves long-petioled, reniform-orbicular, 3–6 mm. long, 5–12 mm. wide, shallowly toothed; flowers yellow in anthesis; calyx-lobes spreading, subrounded, 1–1.5 mm. long; stamens 8, about 0.5 mm. long; capsules nearly inferior; seeds ellipsoidal, glabrous, smooth.—Apr.–June.—Bogs; Hokkaido (ne. distr.).—Sakhalin, Kuriles, n. China, Siberia, Himalayas, and N. America.

8. TIARELLA L. ZUDA-YAKUSHU ZOKU

Perennial herbs with short-creeping rhizomes; radical leaves long-petiolate, simple, sometimes 3-foliate, the cauline leaves few, with small stipules; racemes or cincinni simple or sparsely branched, the bracts minute; calyx 5-lobed, subpetaloid, the calyx-tube cup-shaped, adnate to the ovary at base; petals 5, small; stamens 10, filaments filiform; ovary nearly superior, 1-locular, with 2 parietal placentae; styles slender, the stigma punctiform; capsules nearly superior, thinly chartaceous; carpels very unequal; seeds few, smooth.—Few species, in N. America, one in E. Asia and the Himalayas.

1. *Tiarella polyphylla* D. Don. ZUDA-YAKUSHU. Rhizomes creeping, branched; stolons subterranean; radical leaves few, cordate-orbicular, 2–7 cm. in diameter, shallowly 5-lobed, obtusely toothed, long-hairy and glandular-puberulent, the stipules membranous, brown, the petioles 2–10 cm. long; scapes 10–40 cm. long, glandular-puberulent, with 2 or 3 short-petioled cauline leaves; racemes often with a short

branch near base, the pedicels spreading, 3–7 mm. long; flowers rather numerous, white, nodding; calyx-lobes 1–2 mm. long, narrowly ovate; petals subulate-linear, slightly longer than the calyx-lobes; stamens exserted; capsule-valves very unequal, 7–12 mm. long.—June–Aug. Damp woods in mountains; Hokkaido, Honshu (Kinki Distr. and northw.), Shikoku.—China, Formosa, and Himalayas.

9. MITELLA L. CHARUMERU-SŌ ZOKU

Low usually hirsute perennial herbs with creeping rhizomes; radical leaves long-petiolate, simple, ovate, incised to lobulate, the stipules scarious; stems leafless or few-leaved; inflorescence racemose, terminal, bracteate; flowers small; calyx 5-lobed, the calyx-tube cup-shaped or campanulate, more or less adnate to the ovary; petals 5, on the margin of the calyx-tube, often pinnatifid, sometimes simple or absent; stamens 5 or 10; ovary 1-locular, superior or subinferior; styles 2; seeds ovoid, small, often tubercled.—About 20 species, in N. America, Siberia, Japan, and Formosa.

1A. Ovary nearly superior, nearly free from the calyx-tube.

2A. Stamens 5; petals subulate-linear, entire; stems 1- to 3-leaved. 1. *M. integripetala*

2B. Stamens 10; petals pinnatifid; stems scapose or 1-leaved. 2. *M. nuda*

1B. Ovary inferior, adnate at least partially to the calyx-tube.

3A. Petals absent; scapes 2–7 cm. long, 1- to 3-flowered; calyx-tube campanulate. 3. *M. doiana*

3B. Petals present; scapes 10–50 cm. long, often many-flowered; calyx-tube cup-shaped to broadly obconical.

4A. Stamens attached to the disc; leaves wider than to as wide as long; racemes few-flowered; style undivided. 4. *M. pauciflora*

4B. Stamens attached to the base of the petal; leaves usually longer than wide; racemes rather many-flowered; style often lobed.

5A. Petioles and the underside of leaves glabrous. 5. *M. acerina*

5B. Petioles and leaves hirsute.

6A. Calyx-lobes erect with an ascending to slightly recurved tip.

7A. Petals entire, smooth, subulate-linear; calyx-lobes not ciliate; seeds papillose. 6. *M. leiopetala*

7B. Petals pinnatifid, glandular-roughened; calyx-lobes ciliate; seeds smooth or papillose.

8A. Leaves obtuse or subobtusely; seeds not papillose. 7. *M. stylosa*

8B. Leaves acute to subacute; seeds papillose. 8. *M. makinoi*

6B. Calyx-lobes spreading in anthesis, often reflexed at apex.

9A. Rhizomes short, thickened, with a tuft of leaves at the apex.

10A. Leaves broadly ovate-orbicular, the petioles glandular-hirsute; stipules usually glabrous.

11A. Calyx-lobes not ciliate; petals mostly 7-parted. 9. *M. koshiensis*

11B. Calyx-lobes ciliate; petals 9- to 11-parted. 10. *M. furusei*

10B. Leaves usually elongate-ovate, the petioles glandular-hirsute; stipules long-ciliate. 11. *M. japonica*

9B. Rhizomes long-creeping, rather slender, loosely leaved.

12A. Seeds papillose; leaves broadly ovate; calyx-lobes deltoid; styles 2, 2-lobed. 12. *M. kiusiana*

12B. Seeds not papillose; leaves narrowly ovate; calyx-lobes depressed-deltoid; styles 2, undivided. 13. *M. yoshinaga*

1. *Mitella integripetala* H. Boiss. EZO-NO-CHARUMERU-SŌ. Stoloniferous; radical leaves membranous, long-petiolate, deltoid-ovate, cordate, shallowly 3- to 5-lobed, toothed, scattered-pilose on upper side, glabrescent beneath; flowering stems with 1–3 short-petiolate leaves; racemes rather many-flowered, the pedicels less than 3 mm. long, minutely glandular-puberulent; calyx-tube cup-shaped, the lobes lanceolate, about 2 mm. long, acute; petals linear, 4–5 mm. long, entire, minutely glandular; styles 2, subulate, entire.—Hokkaido (sw. distr.), Honshu (n. distr.); rare.

2. *Mitella nuda* L. MARUBA-CHARUMERU-SŌ. Rhizomes slender, elongate; stolons filiform; radical leaves few, ovate-orbicular, 15–35 mm. long and as wide, often subcordate, obtuse, obsoletely incised and short-toothed, scattered-pilose on both sides, the petioles 5–10 cm. long, slender, glandular-hairy, the stipules short; flowering stems 15–25 cm. long, short glandular-pubescent, often with a single small leaf; ra-

cemes few-flowered; calyx-lobes deltoid-ovate, acute, spreading, subrecurved at the tip; petals 5, pinnatifid, not glandular; seeds glabrous, smooth, black.—June. Woods in mountains; Hokkaido, Honshu (centr. distr.); rare.—n. Korea, Manchuria, Ussuri to Siberia, and N. America.

3. *Mitella doiana* Ohwi. HIME-CHARUMERU-SŌ. Rhizomes creeping; radical leaves tufted, ovate-cordate, 8–13 mm. long, 7–10 mm. wide, shallowly 3-lobed, acute, deeply cordate, hirsute on both sides, the petioles 1–3 cm. long, hirsute, the stipules scarious, entire, glabrescent; flowering stems 2–7 cm. high, hirsute and glandular-pubescent, 1- to 3-flowered toward the top; calyx-tube subcampanulate, the lobes ovate-deltoid, erect in anthesis, with a slightly recurved tip; petals absent; styles 2, terete, about 0.8 mm. long, scarcely thickened at apex; seeds papillose.—May–July. Kyushu (Yakushima); rare.

4. *Mitella pauciflora* Rosend. KO-CHARUMERU-SŌ. Rhizomes rather slender, elongate; leaves all radical, broadly

ovate to ovate-orbicular, 2-5 cm. long, 2.5-6 cm. wide, deeply cordate, hirsute and minutely glandular-puberulous on both sides, subacute to acute, shallowly 5-lobed, incised and toothed; scapes 15-25 cm. long, glandular-puberulous, coarsely hairy at the base, 2- to 10-flowered, the pedicels short; calyx-lobes depressed-deltoid, subacute, spreading, subcurved at the tip; petals pinnatifid, minutely glandular, the disc prominent; stamens inserted on the margin of the disc, very short; style very short, entire, the stigma punctiform; seeds often glandular.—Apr.–June. Along streams and ravines in mountains; Honshu, Shikoku, Kyushu.

5. *Mitella acerina* Makino. MOMIJI-CHARUMERU-SŌ. Rhizomes elongate, branched, creeping; leaves broadly ovate, 4-12 cm. long, 4-10 cm. wide, acute to acuminate, deeply cordate, acutely 5- to 7-lobed, incised and toothed, thinly pilose above, glabrous beneath, the petioles 15-30 cm. long, glabrous, the stipules glabrous; scapes glabrous, 20-40 cm. long; racemes 10-20 cm. long, rather densely short-glandular, many-flowered; calyx-lobes erect in anthesis, recurved at the tip, ovate-deltoid; petals 3-parted, minutely glandular; styles 2, very short, the stigma thickened, indistinctly 2-lobed; seeds not papillose.—May–June. Wet places along ravines and streams in mountains; Honshu (Japan Sea side of centr. and Kinki Distr.).

6. *Mitella leiopetala* Ohwi & Okuyama. *M. japonica* var. *integripetala* Makino; *M. stylosa* var. *integripetala* (Makino) Ohwi; *M. stylosa* forma *integripetala* (Makino) Hara —HARIBEN-CHARUMERU-SŌ, TAKIMI-CHARUMERU-SŌ. Rhizomes somewhat thickened, creeping, with a tuft of leaves at the apex; radical leaves ovate, 4-5 cm. long, 3-4 cm. wide, cordate, subacute to obtuse, obsoletely lobulate and irregularly toothed, hirsute on upper side, sparsely papillose-pilose beneath, the petioles 7-10 cm. long, purplish, hirsute, the stipules white-scarious, oblong; scapes terete, about 25 cm. long, whitish papillose-pilosulous, white-hairy at base; racemes about 7 cm. long, many-flowered, the bracts minute, the pedicels shorter than the calyx; calyx obconical, brown-purple, 3.5-4 mm. long, the lobes about 1.2 mm. long, deltoid, erect, the tip recurved, glandular externally; petals linear-subulate, 2.5-3 mm. long, entire or very rarely with a short lobe on one or both sides; styles very short, the stigma 4-lobed; seeds papillose.—Apr. Wet places along ravines and streams in mountains; Honshu (Ise and Mino Prov.); rare.

7. *Mitella stylosa* H. Boiss. *M. longispica* Makino, pro parte, non Maxim. —CHARUMERU-SŌ. Rhizomes rather short, thickened; radical leaves tufted, broadly ovate, 4-8 cm. long, 3-5 cm. wide, obtuse to subacute, deeply cordate, shallowly and irregularly toothed, long-hirsute and minutely glandular-puberulous on both sides; scapes 30-50 cm. high, hirsute below; racemes 15-30 cm. long, many-flowered, short glandular-puberulous; calyx-lobes erect, ovate-deltoid; petals 3-parted, the segments narrowly linear, glandular-dotted; styles very short, thickened, the stigma shallowly 2- to 4-lobed; seeds not papillose.—Apr.–May. Wet places along streams and ravines in foothills; Honshu (Kantō Distr. and westw.), Kyushu.

8. *Mitella makinoi* Hara. *M. japonica* Makino, pro parte, non Maxim. —SHIKOKU-CHARUMERU-SŌ. Rhizomes ascending, thickened, with a tuft of radical leaves at the tip; leaves broadly ovate, 2-7 cm. long, 2-6 cm. wide, acute, cordate, 5- to 7-lobulate, toothed, coarsely hirsute on upper side, with rather short spreading glandular hairs beneath; scapes 20-40 cm. long, glandular-hairy; racemes 15-25 cm. long,

many-flowered; calyx-lobes erect; petals pinnately parted, glandular-dotted; style short, the stigma thickened, retuse; seeds papillose.—Apr.–May. Shikoku.

9. *Mitella koshiensis* Ohwi. KOSHI-NO-CHARUMERU-SŌ. Rhizomes thickened; leaves tufted, broadly ovate to orbicular-ovate, 3-6 cm. long and nearly as wide, cordate, acute, shallowly 5-lobed, incised, long-hirsute on both sides, the petioles 3-10 cm. long, with coarse reddish hairs, the stipules scarious, glabrous; scapes long-hirsute; racemes glandular-puberulous, rather many-flowered; calyx-lobes depressed-deltoid, subacute, spreading in anthesis, with a slightly recurved tip; petals reddish, pinnately parted, the segments linear, glandular-dotted; stamens very short; styles very short, the stigma shallowly 2-lobed, the lobes retuse; seeds not papillose.—May. Honshu (Japan Sea side, Etchu and Echigo Prov.).

10. *Mitella furusei* Ohwi. MIKAWA-CHARUMERU-SŌ. Rhizomes creeping, densely leaved near the top; leaves broadly ovate, 3-6 cm. long and nearly as wide, slightly lobulate, irregularly toothed, acute, pilose, the petioles with long multicellular hairs, 5-10 cm. long; scapes 30-45 cm. long, pilose; racemes simple, loosely many-flowered, glandular on the axis and pedicels; flowers greenish; calyx-lobes 5, deltoid, spreading at anthesis, erect in fruit, uniformly glandular-pilose on back and on margin, acute, often shallowly lobulate; petals 5, purplish, spreading, 5-6 mm. long, glandular-roughened, pinnately divided, with 4-5 pairs of filiform lobes; stamens 5, anthers yellow, nearly sessile, obsoletely lobulate; seeds fusiform, about 1.2 mm. long, not papillose.—May. Honshu (Mikawa Prov.).

11. *Mitella japonica* (Sieb. & Zucc.) Maxim. *Mitellopsis japonica* Sieb. & Zucc.; *M. triloba* Miq. —Ō-CHARUMERU-SŌ. Rhizomes thickened; leaves tufted, ovate to narrowly so, 5-10 cm. long, 3-7 cm. wide, acute to short acuminate, cordate, usually shallowly 5-lobed and incised, long-hirsute on upper side, glandular-hairy beneath, the nerves sometimes without glandular hairs, the petioles with spreading glandular hairs, the stipules ciliate; scapes 20-35 cm. long, glandular pilose; racemes many-flowered; calyx-lobes depressed-deltoid, acute; petals with 5-7 linear-subulate glandular-dotted segments; styles very short, the stigma thickened, the lobes retuse; seeds not papillose.—Apr.–May. Wet places along streams and ravines in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.

12. *Mitella kiusiana* Makino. TSUKUSHI-CHARUMERU-SŌ. Rhizomes elongate, branched; leaves rather loosely arranged, broadly ovate, 2-7 cm. long, 1-6 cm. wide, acute, cordate, acutely 5-lobulate, and irregularly toothed, long-hirsute above and on nerves beneath, the petioles 4-10 cm. long, brown-hirsute, the stipules glabrescent; scapes 15-20 cm. long, hirsute below, glandular-pilosulous above; racemes rather many-flowered; calyx-lobes deltoid, acute, spreading, with a slightly recurved tip; petals pinnately parted into linear-subulate glandular-dotted segments; styles 2, bifid, the lobes entire or somewhat retuse; stigma not thickened; seeds papillose on back.—Apr.–May. Along ravines and streams in mountains; Kyushu.

13. *Mitella yoshinagae* Hara. TOSA-CHARUMERU-SŌ. Rhizomes elongate, branched; leaves rather loosely arranged, ovate, 3-9 cm. long, 2-7 cm. wide, acute, cordate, 3- to 4-lobulate on each side and incised, long-hirsute on upper side and on nerves beneath, minutely glandular-pilose beneath; scapes hirsute on upper side and on nerves beneath, minutely

glandular-pilose beneath; scapes 20–30 cm. long, glandular-pilous, many-flowered; calyx-lobes depressed-deltoid, acuminate, spreading, with a slightly recurved tip; petals

pinnately parted into linear-subulate glandular-dotted segments; styles 2, short, the stigmas spreading, depressed-globose, sometimes retuse; seeds not papillose.—Apr. Shikoku.

10. PARNASSIA L. UMEBACHI-SŌ ZOKU

Glabrous perennial herbs; leaves radical, long-petiolate, orbicular-cordate, entire; stems scapiform, unbranched, angled, 1-flowered, naked to several leaved; flowers white, erect; calyx-lobes 5; petals 5; stamens 5, alternate with the staminodes; ovary superior or subinferior, 1-locular; style very short; capsules loculicidally dehiscent, 3- to 4-valved; seeds many.—More than 10 species, in the temperate to northern regions of the N. Hemisphere.

1A. Stems 2- to 8-leaved; petals fimbriate; staminodes 3-fid, the lobes terminating in a globose gland. 1. *P. foliosa*
1B. Stems 1-leaved; petals entire.

- 2A. Flowers large, 2–2.5 cm. across; staminodes digitately cleft into many filiform segments, each ending in a globose gland; anthers grayish white; pollen pale yellow. 2. *P. palustris*
2B. Flowers small, 8–10 mm. across; staminodes 3- to 5(-7)-cleft, the lobes subulate, obtuse, not gland-tipped; anthers dark gray; pollen dark brown. 3. *P. alpicola*

1. *Parnassia foliosa* Hook. f. & Thoms. var. *nummularia* (Maxim.) T. Itô. *P. nummularia* Maxim.—SHIRA-HIGE-SŌ. Glabrous green perennial; stems several, tufted, 15–30 cm. long; leaves deeply cordate, rounded, mucronate, 15–30 mm. in diameter; radical leaves long-petiolate, the cauline sessile and clasping; flowers 2–2.5 cm. across; petals ovate, fimbriate, distinctly clawed at base; anthers about 1.5 mm. long, the filaments spreading in anthesis.—Aug.–Sept. Wet places in mountains; Honshu (centr. distr. and westw.), Shikoku, Kyushu.

Var. *japonica* (Nakai) Ohwi. *P. japonica* Nakai; *P. yud-zurumana* T. Itô.—ŌSHIRA-HIGE-SŌ. Plants larger than in the preceding with leaves to 6 cm. across, the flowers 3–3.5 cm. across, the petals about 15 mm. long, the staminodes about 5 mm. long.—Aug.–Sept. Wet places in mountains; Honshu (Mount Togakushi and Mount Ontake in Shinano).

2. *Parnassia palustris* L. *P. mucronata* Sieb. & Zucc.—UMEBACHI-SŌ. Glabrous perennial with short rhizomes; stems 10–50 cm. long, 1-leaved, usually few together; leaves orbicular-cordate, sometimes broadly ovate, 15–35 mm. long and nearly as wide, rounded to obtuse, sometimes subacute, the radical leaves long-petiolate, the cauline sessile and clasping; flowers 2–2.5 cm. across, white; petals broadly ovate to elliptic, scarcely clawed at base, rounded at apex; anthers broadly ovoid, 2–3 mm. long, the staminodes 12- to 22-cleft; capsules 10–12 mm. long, broadly ovoid.—Aug.–Oct. Wet places; Hokkaido, Honshu, Shikoku, Kyushu.—Temperate and northern regions of the N. Hemisphere.

ing; flowers 2–2.5 cm. across, white; petals broadly ovate to elliptic, scarcely clawed at base, rounded at apex; anthers broadly ovoid, 2–3 mm. long, the staminodes 12- to 22-cleft; capsules 10–12 mm. long, broadly ovoid.—Aug.–Oct. Wet places; Hokkaido, Honshu, Shikoku, Kyushu.—Temperate and northern regions of the N. Hemisphere.

Var. *tenuis* Wahlenb. *P. palustris* var. *alpina* Drude.—KO-UMEBACHI-SŌ. Small alpine phase with 9- to 11-cleft staminodes.—Alpine regions of Hokkaido and Honshu (centr. distr.).—Cold regions and high mountains of the Old World.

3. *Parnassia alpicola* Makino. *P. simplex* Hayata.—HIME-UMEBACHI-SŌ. Small perennial; stems 1-leaved, 5–15 cm. long, solitary or few together; leaves reniform-orbicular, 7–15 mm. long and as wide, the radical ones long-petiolate, the cauline sessile and clasping; flowers white, 8–10 mm. across; petals 4–6 mm. long, ovate or oblong, entire, with distinct ascending claws at base; anthers orbicular, about 0.5 mm. long, the staminodes shortly 3- to 8-cleft; capsules broadly ovoid, 5–6 mm. long.—Aug. Wet places in alpine regions; Honshu (centr. and n. distr.); rare.

11. SCHIZOPHRAGMA Sieb. & Zucc. IWAGARAMI ZOKU

Scandent deciduous woody vines climbing by means of aerial roots; leaves opposite, long-petiolate, simple, usually toothed, exstipulate; inflorescence corymbose, some of the marginal flowers neutral and one of the sepals large and petalike, the bisexual flowers small, many, 4- to 5-merous; calyx-teeth small, deltoid; petals 5, caducous; stamens 10; style columnar, short, thickened, the stigma 4- to 5-lobed, capitate; ovary nearly inferior; capsules narrowly obconical, 10-ribbed, splitting between the ribs; seeds small, linear, many.—Few species, in E. Asia.

1. *Schizophragma hydrangeoides* Sieb. & Zucc. IWAGARAMI. Stems or branches to 10 m. or more long; leaves suborbicular to broadly ovate, 5–12 cm. long and as much wide, abruptly short-acuminate, rounded to cordate, coarsely acute-toothed, glabrous above, glaucous and with tufts of axillary hairs or glabrous beneath, the petioles 3–10 cm. long; inflorescence rather large, densely many-flowered, the enlarged neutral calyx-lobes deltoid-ovate, 2–3 cm. long; petals of bi-

sexual flowers narrowly ovate, about 2 mm. long, caducous; capsules 6–8 mm. long inclusive of a rather elongate style, longitudinally ribbed.—June–July. Woods and thickets in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.

Var. *concolor* Hatus. TERIHA-IWAGARAMI. Leaves green and lustrous on both sides.—Kyushu.

12. DEINANTHE Maxim. GIMBAI-SŌ ZOKU

Coarse perennial herbs with creeping woody rhizomes; stems erect, leafy; leaves opposite, rather large, petiolate, coarsely hirsute, broadly obovate, toothed, membranous, usually bilobed; inflorescence a terminal corymb, the marginal flowers often neutral, the bisexual flowers white, the bracts persistent; calyx-tube short, obconical, the lobes rather large, persistent; petals 5, imbricate in bud, obovate, deciduous; stamens very many, inserted on the margin of the disc; ovary subinferior, imperfectly 5-locular; style solitary, grooved; capsules subsuperior, subglobose, deflexed; seeds many, small, with a short taillike wing at each end.—Two species, in E. Asia.

1. *Deinanthë bifida* Maxim. GIMBAI-SŌ. Stems 40–70 cm. long, simple; lower leaves small, scarious, scallike, the normal leaves 10–20 cm. long, 6–12 cm. wide, toothed and sometimes obscurely incised, shallowly 2-fid, the petiole 1–10 cm. long; inflorescence glabrescent, few- to more than 20-flowered; sterile flowers with 2 or 3 enlarged calyx-lobes;

calyx-lobes of bisexual flowers elliptic, 6–8 mm. long, obtuse, green; petals obovate-orbicular, about 10 mm. long; capsules 8–10 mm. across, the style conical.—July–Aug. Woods in mountains in warmer regions; Honshu (s. Kantō Distr. and southwestw.), Shikoku, Kyushu.

13. PLATYCRATER Sieb. & Zucc. BAIKA-AMA-CHA ZOKU

Deciduous shrubs; leaves opposite, petiolate, toothed, exstipulate; inflorescence loose, cymose, the marginal neutral flowers with enlarged 3- to 5-lobed calyx; bisexual flowers rather large, 4-merous; calyx-tube narrowly obconical, the calyx lobes lanceolate, persistent, acute; petals ovate, white; stamens very many; styles 2, free; ovary inferior, 2-locular; capsules narrowly obconical; seeds small, many, with a taillike wing at each end.—Two species, in Japan and China.

1. *Platycrater arguta* Sieb. & Zucc. *P. serrata* Makino, excl. basionym—BAIKA-AMA-CHA. Sparsely and coarsely hairy; leaves rather thinly membranous, oblong to broadly lanceolate, 10–15 cm. long, 3.5–(7) cm. wide, short-toothed, acuminate, paler beneath, the petioles 5–30 mm. long, winged above; inflorescence terminal, several-flowered, the pedicels

slender; calyx in neutral flowers shallowly 3- to 5-lobed, the calyx-lobes in bisexual flowers 4–7 mm. long; petals about 10 mm. long; capsules 5–8 mm. long; styles persistent, 7–8 mm. long.—July–Aug. Honshu (Totomi, Yamato, and Kii Prov.), Shikoku, Kyushu.

14. CARDIANDRA Sieb. & Zucc. KUSA-AJISAI ZOKU

Sparsely hirsute, suffrutescent herb; leaves alternate, rarely nearly opposite, broadly lanceolate to oblong, acutely toothed, exstipulate; inflorescence a terminal corymb with few neutral peripheral flowers; neutral flowers with 3, often colored, petaloid calyx-lobes; bisexual flowers small, many, white or rose-colored; calyx-tube ellipsoidal, the teeth 4–5, deltoid; petals 5, small, imbricate in bud; stamens many; ovary nearly inferior, imperfectly 3-locular; styles 3; capsules ovoid; seeds many, small, with a small narrow wing at each end.—Few species, in e. Asia.

1. *Cardiandra alternifolia* Sieb. & Zucc. KUSA-AJISAI. Stems 20–70 cm. long, usually simple; leaves membranous, acuminate at both ends, 10–20 cm. long, 2.5–6 cm. wide; calyx-teeth deltoid, obtuse; petals broadly obovate, about 3 mm.

long; capsules broadly ovoid, about 4 mm. long inclusive of the styles; styles 3; seeds small, elliptic, with a very short wing at each end.—July–Sept. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

15. HYDRANGEA L. AJISAI ZOKU

Erect or scandent deciduous shrubs; leaves opposite, simple, petiolate, usually toothed, exstipulate; inflorescence a terminal cyme or panicle; flowers small, bisexual, some of the marginal ones neutral with enlarged petallike sepals; calyx-lobes in bisexual flowers 4–5, small, toothlike; petals 4–5, usually valvate in bud; stamens 8–20; ovary inferior or subsuperior; styles 2–5, small; capsules 2- to 5-locular; seeds small, many, often winged.—Species 20–25, in temperate and warmer regions of e. Asia, India, and N. America.

1A. Scandent shrub; petals connate above, calytrately deciduous at anthesis; seeds flat, winged on margin; stamens 15–20. . . 1. *H. petiolaris*
1B. Erect shrubs; petals usually not connate, spreading in anthesis; seeds winged or wingless.

2A. Inflorescence a pyramidal panicle; seeds with a taillike wing at each end. 2. *H. paniculata*
2B. Inflorescence a flat-topped cyme.

3A. Seeds with a taillike wing at each end; ovary inferior; styles usually 2.

4A. Leaves toothed, with few incisions; inflorescence not enveloped by large bracts in bud. 3. *H. sikokiana*

4B. Leaves minutely toothed, not incised; inflorescence enveloped by few large bracts in bud. 4. *H. involucrata*

3B. Seeds entire or scarcely winged; ovary subsuperior; styles 2–3.

5A. Petals ovate-oblong, not narrowed at base. 5. *H. macrophylla*

5B. Petals obovate or broadly spatulate, narrowed at base.

6A. Inflorescence destitute of neutral flowers; more or less pilose shrub, with compact many-flowered inflorescence. 6. *H. hirta*

6B. Inflorescence at least partially bearing neutral flowers; glabrescent shrubs with rather loose inflorescence.

7A. Leaves acuminate, 6–12 cm. long, rather many-toothed; petals obtuse.

8A. Leaves coarsely dentate; anthers ellipsoidal; branches purple-brown. 7. *H. angustipetala*

8B. Leaves short-toothed; anthers subglobose; branches gray-brown. 8. *H. scandens*

7B. Leaves acute to short-acuminate, 3.5–(6) cm. long, with few coarse teeth; petals mucronate or subacute.

9. *H. luteovenosa*

1. *Hydrangea petiolaris* Sieb. & Zucc. *H. scandens* sensu Maxim., non Ser. (1830) nec Poeppig. (1830); *H. cordifolia* Sieb. & Zucc.; *H. anomala* D. Don subsp. *petiolaris* (Sieb. & Zucc.) McClintock.—GOTŌ-ZURU, TSURU-AJISAI. Scandent shrub, the branches with aerial roots; leaves ovate-cordate or

broadly ovate, 4–10 cm. long, 3–10 cm. wide, acutely toothed, nearly glabrous, abruptly acute, paler and with tufts of axillary hairs beneath, the petioles 3–8 cm. long; inflorescence rather large, cymose; enlarged calyx-lobes of neutral flowers sometimes toothed; petals narrowly ovate, not narrowed at base;

stamens 15–20, the anthers subglobose; capsules globose, truncate at apex.—June–July. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Sakhalin, s. Kuriles, and s. Korea.

2. *Hydrangea paniculata* Sieb. NORI-UTSUGI. Erect spreading-branched shrub, the branches rather stout, usually scattered-pubescent when young; leaves elliptic, ovate or oblong, 5–12 cm. long, 3–8 cm. wide, abruptly acuminate, slightly pilose above, paler and sometimes coarsely hirsute on nerves beneath, the petioles 1–3 cm. long; inflorescence relatively large, 8–30 cm. long, pyramidal, more or less pubescent, the neutral flowers usually white, sometimes pale rose; calyx-teeth in bisexual flowers deltoid; petals narrowly ovate; anthers depressed-globose; capsules ovoid, 4–5 mm. long inclusive of the short style; seeds 3–4 mm. long inclusive of the tail-like wing at the apices.—July–Sept. Sunny slopes and open woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.—s. Kuriles, Sakhalin, and China.—Cv. *Grandiflora*. *H. paniculata* forma *grandiflora* (Sieb.) Ohwi; *H. paniculata* var. *grandiflora* Sieb.; *H. paniculata* var. *hortensis* Maxim.—MINAZUKI. Cultivated phase with all or most of the flowers neutral.

3. *Hydrangea sikokiana* Maxim. YAHAZU-AJISAI. Shrub with stout terete branches; leaves broadly ovate, 10–20 cm. long, 7–15 cm. wide, sharply serrate, sparingly incised toward the tip, coarsely hirsute on both sides especially on the nerves beneath, and paler beneath, the petioles 5–15 cm. long; inflorescence a rather large cyme, hirsute, with large neutral marginal flowers; calyx-teeth in bisexual flowers short; petals narrowly ovate; anthers globose-cordate; capsules globose, truncate, about 3.5 mm. across; styles 2.—July. Honshu (w. distr.), Shikoku, Kyushu.

4. *Hydrangea involucreta* Sieb. *H. cuspidata* Makino, excl. basionym, non Miq.—TAMA-AJISAI. Coarsely hirsute and scabrous shrub with rather stout branches; leaves oblong, elliptic or obovate, sometimes broadly ovate, 10–20 cm. long, 5–10 cm. wide, with short awn-shaped teeth, acuminate, sometimes subcordate, coarsely hairy beneath, the petioles 1–8 cm. long; inflorescence rather small, enveloped at first by a few large whitish bracts; petals in bisexual flowers narrowly ovate; anthers subglobose; styles 2.—July–Sept. Sunny rocky places or in open woods in mountains; Honshu (n. and centr. distr.), Shikoku, Kyushu.—Cv. *Hortensis*. *H. involucreta* forma *hortensis* (Maxim.) Ohwi; *H. involucreta* var. *hortensis* Maxim.—YAE-NO-GYOKUDAN-KA. Cultivated phase with the sterile and bisexual flowers double.

5. *Hydrangea macrophylla* (Thunb.) Ser. var. *macrophylla*—AJISAI. Nearly glabrous slender fleshy shrub with stout branches; leaves lustrous above, broadly elliptic to broadly elliptic-ovate or broadly obovate, 10–15 cm. long, 7–10 cm. wide, abruptly acute to abruptly acuminate, dentate, yellowish to fresh-green, sparsely short-pilose on nerves above while young, paler and sparsely short-pilose while young beneath, the petioles 2–4 cm. long; inflorescence rather large, flat-topped, short-pilose, with neutral flowers on the periphery; calyx-teeth in bisexual flowers small; petals narrowly ovate; anthers globose; capsules ovoid, 6–8 mm. long inclusive of the styles, enveloped for 2/3 of the length by the calyx-tube.—June–July.—Forma *normalis* (Wils.) Hara. *H. hortensis* var. *azisai* (Sieb.) A. Gray; *H. azisai* Sieb. Inflorescence with neutral flowers only on the periphery.—Sunny places near the sea; Honshu (Sagami and Idzu Prov. inclusive of Idzu

Is.); sometimes cultivated in gardens.—Forma *macrophylla*. *Viburnum macrophyllum* Thunb.; *H. macrophylla* (Thunb.) Ser.; *H. otaka* Sieb. & Zucc.; *H. macrophylla* forma *otaka* (Sieb.) Wils.—AJISAI. The most commonly cultivated phase with a large globose inflorescence and most of the flowers neutral.

Var. *megacarpa* Ohwi. MUTSU-AJISAI. Intermediate between the typical phase and var. *acuminata*, with thin leaves and the capsules about 6 mm. long, inclusive of the styles.—Hokkaido, Honshu (n. distr.).

Var. *acuminata* (Sieb. & Zucc.) Makino. *H. acuminata* Sieb. & Zucc.; *H. hortensis* var. *acuminata* (Sieb. & Zucc.) A. Gray; *Viburnum cuspidatum* Thunb.; *H. cuspidata* (Thunb.) Miq.; *H. belzonii* Sieb. & Zucc.; *V. serratum* Thunb.; *H. serrata* (Thunb.) Ser.; *H. macrophylla* subsp. *serrata* (Thunb.) Makino—YAMA-AJISAI, SAWA-AJISAI. Branches more slender than in the typical phase, the leaves thinner, lanceolate to elliptic, 5–15 cm. long, 2–10 cm. wide, often caudate, green to vivid green, often loosely hirsute, the nerves short-pilose beneath, the capsules shorter, 3–4 mm. long inclusive of the styles.—June–Aug. Mountains; Honshu, Shikoku, Kyushu; common and variable.—Korea.—Cultivars of var. *acuminata* are frequently grown in gardens of which the following are the best known: Cv. *Rosalba*. *H. japonica* Sieb. & Zucc.; *H. japonica rosalba* Van Houtte; *H. serrata* forma *rosalba* (Van Houtte) Wils.; *H. macrophylla* forma *japonica* Ohwi, excl. syn.—BENIGAKU. The neutral and bisexual flowers deep rose-colored.—Cv. *Prolifera*. *H. macrophylla* var. *acuminata* forma *prolifera* (Regel) Ohwi; *H. macrophylla* forma *stellata* (Sieb. & Zucc.) Makino & Nemoto; *H. sitstani* Sieb.; *H. stellata* Sieb. & Zucc.; *H. hortensis* var. *stellata* (Sieb. & Zucc.) Maxim.; *H. stellata* forma *prolifera* Regel; *H. serrata* forma *prolifera* (Regel) Rehd.—SHICHIDANKA. The neutral and bisexual flowers double.

Var. *thunbergii* (Sieb.) Makino. *H. thunbergii* Sieb., excl. syn.—AMA-CHA. Closely resembles var. *acuminata* but differs in the sugary taste of the dried leaves, and the calyx-lobes of the neutral flowers usually orbicular.—Spontaneous in Honshu (centr. distr.); often cultivated.

Var. *angustata* (Fr. & Sav.) Hara. *H. hortensis* var. *angustata* Fr. & Sav.; *H. macrophylla* var. *amagiana* Makino; *H. serrata* var. *amagiana* Makino—AMAGI-AMA-CHA. Fresh leaves sugary to taste, lanceolate to broadly so, the calyx-lobes in the neutral flowers ovate to ovate-orbicular, obtuse to rounded at the apex.—Spontaneous in Honshu (Izu Prov.).

6. *Hydrangea hirta* (Thunb.) Sieb. *Viburnum hirtum* Thunb.—KO-AJISAI. Small much-branched shrub with slender purple-brown branches; leaves thinly membranous, ovate to broadly so or obovate, 4–8 cm. long, 3–5 cm. wide, acute, dentate, the petioles 1–3 cm. long; inflorescence many-flowered, rather compact, without neutral flowers; flowers blue-purple; calyx-teeth small, ovate-deltoid; petals narrowly ovate or narrowly obovate; anthers subglobose; capsules subglobose, about 3 mm. long inclusive of the persistent styles.—June–July. Honshu (Kantō and westw.), Shikoku.

Hydrangea amagiana Makino. AMAGI-KO-AJISAI. Alleged hybrid of *H. macrophylla* × *H. scandens*. Leaves narrow, coarsely dentate on upper half.—Honshu (sw. Kantō Distr.) and Mount Amagi in Izu Prov.

7. *Hydrangea angustipetala* Hayata. *H. umbellata* Rehd. & Wils.; *H. kawagocana* var. *grosseserrata* (Engl.) Hatus.; *H. grosseserrata* Engl.—YAKUSHIMA-AJISAI. Gla-

brescent shrub with slender, purple-brown branches; leaves broadly lanceolate, 8–15 cm. long, 2–4 cm. wide, long-acuminate, coarsely toothed, paler beneath, the petioles 8–15 mm. long; inflorescence rather small, with few neutral marginal flowers; calyx-teeth of bisexual flowers narrowly deltoid; petals broadly spatulate; anthers elliptic; capsules broadly ovoid, 4–5 mm. long inclusive of the rather prominent styles. —Woods along streams and ravines at low elevations in the mountains; Kyushu (Yakushima). —Ryukyu, Formosa, and China.

8. *Hydrangea scandens* (L. f.) Ser. *Viburnum scandens* L. f.; *V. virens* Thunb.; *H. virens* (Thunb.) Sieb. —GAKU-UTSUGI, KONTERIGI. Sparingly short-pilose or nearly glabrous shrub with slender gray-brown branches; leaves ovate-oblong, 5–8 cm. long, 2–3.5 cm. wide, narrowly ovate or

oblong, somewhat chartaceous, acuminate, vivid-green above, short-toothed, paler beneath, the petioles 3–10 mm. long; inflorescence rather small, with few neutral flowers; calyx-teeth of the bisexual flowers small, deltoid; petals obovate; anthers subglobose; capsules broadly ellipsoidal, 4–5 mm. long, inclusive of slightly spreading styles. —May–June. Honshu (Tōkaidō and Kinki Distr.), Shikoku, Kyushu.

9. *Hydrangea luteovirens* Koidz. *H. virens* sensu Sieb. & Zucc., excl. syn., non Sieb. —KO-GAKU-UTSUGI. Closely allied to the preceding but somewhat smaller, with purple-brown branches, the leaves often tinged dark purplish, 3–5 cm. long, 1–2 cm. wide, acute or short-acuminate, the teeth prominent but fewer, the petioles 2–5 mm. long; petals slightly larger, acute to mucronate. —Apr.–June. Honshu (Izu Prov. and westw.), Shikoku, Kyushu.

16. PHILADELPHUS L. BAIKA-UTSUGI ZOKU

Deciduous shrubs; leaves short-petioled, opposite, toothed or sometimes entire, 3- to 5-nerved; inflorescence a raceme, cyme, or panicle; flowers rarely single, white, 4-merous; calyx-tube obconical, the lobes valvate in bud; petals rather large, imbricate in bud, white; stamens many; styles 4, connate below; ovary 4-locular, nearly inferior; capsules 4-valved, dehiscent; seeds small, many. —Temperate regions of the N. Hemisphere.

1. *Philadelphus satsumi* Sieb. ex Lindl. & Paxt. *P. satsumanus* Sieb. ex Miq.; *P. matsumuranus* Koehne; *P. acuminatus* Lange; *P. coronarius* var. *satsumi* Maxim.; *P. schrenkii* sensu auct. Japon., non Rupr. —BAIKA-UTSUGI. Thinly pubescent shrub, the second-year branches brownish, the bark longitudinally split and peeling; leaves ovate, to narrowly so or oblong, 5–8 cm. long, 2–3.5 cm. wide, long-acuminate, sparsely short-toothed, sometimes slightly pilose above, paler and nearly glabrous beneath except tufts of axillary hairs, the petioles 5–10 mm. long; racemes about 10-flowered; flowers

white; calyx-tube and pedicels often puberulous; calyx-lobes ovate, acute, 4–5 mm. long; petals broadly ovate, 12–15 mm. long; styles pilose to glabrous. —May–July. Honshu, Shikoku, Kyushu. —Forma *nikoensis* (Rehd.) Ohwi. *P. satsumanus* var. *nikoensis* Rehd. —KE-BAIKA-UTSUGI. Leaves prominently pubescent beneath.

Var. *lancifolius* (Ueyeki) Murata. *P. shikokianus* Nakai; *P. shikokianus* var. *lancifolius* Ueyeki —SHIKOKU-UTSUGI. Styles pilose near the base. —Honshu, (Tōkaidō and Kinki Distr.), Shikoku, Kyushu.

17. DEUTZIA Thunb. UTSUGI ZOKU

Deciduous or sometimes semi-evergreen stellate-pubescent shrubs; leaves opposite, short-petioled, exstipulate, usually dentate; flowers in racemes, cymes or sometimes solitary, white; calyx-teeth 5; petals 5; stamens 10, the filaments winged, usually with a tooth on each side at tip; ovary inferior; styles 3–5, free; capsules 3- to 5-valved; seeds minute, many. —e. Asia, Himalayas, and Mexico. Our species have the petals valvate in bud.

1A. Flowers in panicles or racemes.

2A. Leaves all alike, petiolate, sometimes subsessile; filaments toothed.

3A. Leaves grayish brown on upper side, densely stellate-pubescent beneath.

4A. Leaves rather thick, pale green beneath. 1. *D. crenata*

4B. Leaves membranous, densely stellate-pubescent and whitish beneath. 2. *D. maximowicziana*

3B. Leaves vivid-green, glabrous to thinly stellate-pubescent beneath. 3. *D. gracilis*

2B. Leaves slightly dimorphic, sessile and barely clasping in those immediately below the inflorescence, very short-petioled in the others; filaments of the longer stamens without teeth. 4. *D. scabra*

1B. Flowers 1, very rarely 2, from lateral buds of the previous year, usually without basal leaves. 5. *D. uniflora*

1. *Deutzia crenata* Sieb. & Zucc. *D. scabra* Thunb., pro parte —UTSUGI. Shrub; leaves ovate to broadly lanceolate, 3–6 cm. long, 1.5–3 cm. wide, acuminate to subobtusate, with 4- to 6-rayed stellate hairs above, pale green and with 10- to 15-rayed stellate hairs beneath; petioles 2–5 mm. long; inflorescence a simple raceme sometimes branched at base; calyx with simple and stellate hairs; petals about 15 mm. long; styles 3–4; capsules 3.5–6 mm. across. —May–June. Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.

Var. *heterotricha* (Rehd.) Hara. *D. heterotricha* Rehd.; *D. hebecarpa* Nakai; *D. ferruginea* Satake —BIRDO-UTSUGI. Leaves beneath, pedicels and calyx-tube with spreading hairs. —Honshu, Kyushu.

Var. *nakaiana* (Engl.) Hara. *D. floribunda* Nakai, non Lemoine; *D. nakaiana* Engl. —KO-UTSUGI. Leaves relatively narrower, with shorter teeth, the flowers smaller and more numerous, the petals 5–8 mm. long, the capsules about 3 mm. across. —Honshu (w. distr.), Shikoku, Kyushu.

2. *Deutzia maximowicziana* Makino (Feb. 1892). *D. discolor* Maxim., non Hemsl.; *D. hypoleuca* Maxim. (Nov. 1892) —URAJIRO-UTSUGI. Closely allied to the preceding, but the branches more slender; leaves green, acute to acuminate, minutely toothed, membranous, white stellate-pubescent beneath. —May–June. Honshu (Shinano Prov. and westw.), Shikoku.

3. *Deutzia gracilis* Sieb. & Zucc. *D. nagurae* Makino;

D. gracilis var. *nagurae* (Makino) Makino—HIME-UTSUGI. Young branches glabrous or glabrescent; leaves membranous, vivid-green, ovate to broadly lanceolate, 3.5–10 cm. long, 2–4 cm. wide, acuminate, minutely toothed, scattered stellate-pubescent above, somewhat paler beneath with 5- to 8-rayed stellate hairs or subglabrous, the petioles 3–8 mm. long; racemes often branched at base; flowers white, the pedicels slender; calyx-teeth deltoid, glabrous; petals about 10 mm. long; capsules about 4 mm. across.—May–June. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *zentaroana* (Nakai) Hatus. *D. zentaroana* Nakai—BUNGO-UTSUGI. Leaves larger and prominently stellate-pubescent beneath.—Occurs with the typical phase.

Var. *ogatae* (Koidz.) Ohwi. *D. ogatae* Koidz.—AO-KO-UTSUGI. Closely resembles the preceding variety, but the inflorescence is paniculate with more numerous smaller flowers.—Shikoku.

4. *Deutzia scabra* Thunb. *D. sieboldiana* Maxim.; *D. sieboldii* Koehne; *D. kiusiana* Koidz.; *D. subvelutina* Nakai; *D. taradakensis* Nakai; *D. microcarpa* Nakai; *D. reticulata* Koidz.; *D. sieboldiana* var. *dippeliana* C. K. Schn.; *D. sieboldii*

forma *dippeliana* (C. K. Schn.) Nakai—MARUBA-UTSUGI, TSUKUSHI-UTSUGI. Shrub; leaves subtending the inflorescence sessile, the others short-petiolate, green, thinly chartaceous, ovate to oblong, 3–8 cm. long, 2–4 cm. wide, acuminate, minutely dentate-serrulate, the stellate hairs 3- to 4-rayed on upper side, 4- to 6-rayed beneath, also with scattered simple and stipitate stellate hairs on nerves below, the petioles 2–4 mm. long; panicles rather many-flowered, densely stellate and spreading-hairy; petals 6–7 mm. long; capsules about 3 mm. across.—Apr.–May. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

5. *Deutzia uniflora* Shirai. UME-UTSUGI. Shrub; young branches brownish purple; leaves ovate to oblong-ovate, 4–7 cm. long, 2–3.5 cm. wide, acuminate, shallowly dentate, scattered stellate-pubescent on both sides, the petioles 4–6 mm. long, often slightly winged above; flowers white, solitary, rarely 2–3, the pedicels 5–12 mm. long, with 2 small bracts, sparingly stellate-pubescent; calyx-teeth lanceolate-deltoid, glabrous; petals about 20 mm. long; teeth of the filaments linear-lanceolate; capsules 4–5 mm. across.—Apr.–May. Rocks in mountains; Honshu (w. Kantō Distr.); rare.

18. KIRENGESHOMA Yatabe KIRENGE-SHŌMA ZOKU

Tall erect perennial herbs with stout short rhizomes; leaves opposite, petiolate, palmately lobed, exstipulate; cymes terminal and axillary; flowers large, yellow; calyx-tube subglobose, the teeth depressed; petals 5, convolute in bud; stamens 15, free; ovary subinferior, 3(–4)-locular; styles 3(–4), free, filiform; capsules broadly ovoid, loculicidally dehiscent, 3(–4)-valved; seeds many, flat, margined with a wing of unequal width.—One or two species, in Japan and Korea.

1. *Kirengeshoma palmata* Yatabe. KIRENGE-SHŌMA. Stems glabrous, 80–120 cm. long; leaves membranous, orbicular-cordate, 10–20 cm. long and as wide, palmately lobed, thinly pilose with ventrally fixed hairs, toothed, the lobes deltoid, acuminate, the petioles long in the lower ones, sessile in the upper ones; inflorescence a ternately branched panicu-

late cyme; flowers large, erect, the pedicels deflexed in fruit; calyx-teeth undulate; petals erect, about 30 mm. long, narrowly obovate-oblong, subacute, deciduous; styles about 20 mm. long, glabrous, persistent; capsules glabrous, about 15 mm. long.—Aug. Woods in mountains; Shikoku, Kyushu; rare.

19. ITEA L. ZUINA ZOKU

Evergreen or deciduous trees or shrubs; leaves alternate, simply toothed or entire, exstipulate, short-petiolate; inflorescence a raceme; flowers small, bisexual, white, 5-merous; calyx-tube short, the lobes persistent; petals deciduous or persistent, valvate in bud; stamens 5, alternate with the petals; ovary superior, 2-locular; styles 2, connate; capsules with a groove on each side; seeds flat.—About 10 species, in the temperate and warmer regions of e. Asia, one in N. America.

1. *Itea japonica* Oliv. *Reinia racemosa* Fr. & Sav.—ZUINA. Large deciduous shrub with glabrous yellow-green young branches; leaves membranous, vivid-green, oblong, ovate or ovate-oblong, 7–12 cm. long, 3–6 cm. wide, long-acuminate, serrulate, short-pilose on the nerves above, paler and often short-pilose beneath, the petioles 4–7 mm. long; inflorescence 7–20 cm. long, densely many-flowered, spreading-

puberulent on the axis, the pedicels 1–3 at the node, puberulent, 2–3 mm. long, bracteate; flowers about 3 mm. long; calyx-lobes narrowly deltoid, acute, about half as long as the petals; petals persistent, lanceolate, obtuse, 1-nerved; capsules slightly longer than the petals; styles short, the stigma capitate.—May. Honshu (s. Kinki Distr.), Shikoku, Kyushu.

20. RIBES L. SUGURI ZOKU

Deciduous often armed shrubs; leaves alternate, petiolate, palmately lobed, usually exstipulate; flowers solitary to several in leaf-axils or in racemes, 5-merous or rarely 4-merous, bisexual or unisexual (plants sometimes dioecious); calyx rotate, the lobes slightly connate below; petals small; ovary inferior, 1-locular; styles 2, more or less connate at base; fruit a berry; seeds usually many.—About 150 species, in N. Hemisphere and S. America.

1A. Unarmed shrubs; pedicels jointed.

2A. Flowers fasciated or solitary in axils.

3A. Fruit with long glandular hairs; small epiphytic shrub.

3B. Fruit glabrous; terrestrial shrub.

2B. Flowers in racemes.

1. *R. ambiguum*

2. *R. fasciculatum*

- 4A. Racemes about 10-flowered; branches slender; leaves less than 4 cm. long; flowers unisexual. 3. *R. maximowiczianum*
 4B. Racemes more than 10-flowered; branches rather stout; leaves 5–10 cm. long; flowers bisexual.
 5A. Leaves with yellow glandular dots beneath.
 6A. Flowers rotate; racemes 10–15 cm. long; calyx-limb very short; native shrub. 4. *R. japonicum*
 6B. Flowers tubular-campanulate; racemes 4–6 cm. long; calyx-limb tubular, as long as the lobes; cultivated exotic shrub. 5. *R. americanum*
 5B. Leaves not glandular-dotted beneath.
 7A. Fruit with long-glandular hairs. 6. *R. sachalinense*
 7B. Fruit without glandular hairs.
 8A. Flowers short-campanulate; calyx-limb as long as the lobes. 7. *R. latifolium*
 8B. Flowers rotate; calyx-limb very short.
 9A. Procumbent native shrub; anther-locules contiguous. 8. *R. triste*
 9B. Erect cultivated exotic shrub; anther-locules distant. 9. *R. sativum*
 1B. Spiny or prickly shrubs; pedicels not jointed.
 10A. Branches densely slender-spiny; leaves and petioles often with glandular spines; flowers 6–7. 10. *R. horridum*
 10B. Branches with slender simple or stout ternate spines at the nodes; leaves unarmed; flowers 1–2.
 11A. Fruit glabrous, red; petals broadly lanceolate, acute or mucronate, 3–4 mm. long; inner side of calyx-limb and lower portion of styles glabrous; native shrub. 11. *R. sinanense*
 11B. Fruit short-pubescent and sometimes also glandular-pilose, green, yellowish, or reddish; petals cuneate-obovate, rounded, about 2 mm. long; inner side of calyx-limb and lower portion of styles hairy; cultivated exotic shrub. 12. *R. grossularia*

1. *Ribes ambiguum* Maxim. *R. burejense* sensu Maxim., pro parte, non F. Schmidt; *R. cynosbati* sensu Thunb., non L. —YASHABISHAKU. Sparsely branched small epiphytic shrub with rather stout stems and branches; leaves orbicular, 3–5 cm. in diameter, cordate, shallowly 3- to 5-lobulate, toothed, short-pubescent, sometimes glabrescent above, the petioles 1–3 cm. long, short-pubescent; flowers 1 or 2, the pedicels 5–10 mm. long, with 2 small deciduous bracteoles near the top; ovary with long brownish red glandular hairs; calyx-lobes oblong, the limb short; berry broadly ellipsoidal, 10–12 mm. long.—Apr.–May. Epiphytic on tree-trunks and branches in mountains; Honshu, Shikoku, Kyushu; rather rare.

Var. *glabrum* Ohwi. *KE-NASHI-YASHABISHAKU*. Leaves and petioles glabrous.—Kyushu (Mount Gozendake in Chikugo Prov.).

2. *Ribes fasciculatum* Sieb. & Zucc. *R. japonicum* Carr., non Maxim. —YABU-SANZASHI. Erect dioecious shrub; leaves suborbicular, 3–4 cm. long, 3.5–5 cm. wide, truncate to slightly cordate, sparsely short-pilose especially beneath, 3- to 5-lobed, the lobes obtuse or subobtusely, irregularly toothed, the petioles 1–4 cm. long; flowers few, in axillary fascicles, the staminate cup-shaped, the pistillate ovoid, the pedicels short, bractless; calyx-limb extremely short, the lobes elliptic, recurved; petals minute; berry broadly ellipsoidal, red, 8–10 mm. long.—Mar.–Apr. Honshu (centr. distr. and westw.), Shikoku, Kyushu; rare.—Korea and China.

3. *Ribes maximowiczianum* Komar. *R. maximowiczii* Komar., non Batal.; *R. maximowiczianum* var. *umbrosum* Komar.; *R. tricuspe* Nakai; *R. alpinum* var. *mandshuricum* Maxim.; *R. alpinum* var. *japonicum* Maxim.; *R. distans* Jancz.; *R. maximowiczianum* var. *mandshuricum* (Maxim.) C. K. Schn.; *R. maximowiczianum* var. *japonicum* (Maxim.) C. K. Schn.; *R. distans* var. *japonicum* (Maxim.) Jancz.—ZARICOMI. Dioecious shrub with slender gray-brown branches; leaves deltoid-orbicular, 2–4 cm. in diameter or slightly narrower than broad, thinly pilose on both sides or nearly glabrous, often with a tuft of axillary hairs beneath, 3-lobed, the lobes acute to subacuminate, coarsely toothed, the lateral lobes often smaller and sometimes again 2-lobed, the petioles 7–10 mm. long; staminate inflorescence 7- to 10-flowered, the pistillate 2- to 6-flowered, 1–2.5 cm. long, the bracts lanceolate, 3–4 mm. long; flowers rotate, yellowish, 4–5 mm. across; calyx-limb extremely short, the lobes elliptic, glabrous; pedicels of the pistillate flowers about 1 mm. long, of the staminate 3–4

mm. long; fruit red, glabrous, ellipsoidal, about 7 mm. long.—May–June. Honshu (centr. distr.).—Korea and Manchuria.

4. *Ribes japonicum* Maxim. KOMAGATAKE-SUGURI. Erect, spreading-puberulent shrub with rather stout branches; leaves membranous, orbicular, 7–15 cm. in diameter, 5-cleft, cordate, puberulent to nearly glabrous above, prominently puberulent and with sessile yellow-brown glandular dots beneath, the lobes short-acuminate, doubly toothed, the petioles 10–15 cm. long; racemes many-flowered, 10–15 cm. long, the pedicels 3–7 mm. long, the bracts linear, shorter than the pedicel; flowers rotate, 8–10 mm. across, yellow-green; calyx-limb short, the lobes broadly ovate, slightly recurved; petals small, obtriangular; berry black, broadly ellipsoidal, 6–7 mm. long.—May–July. Woods in mountains; Hokkaido, Honshu, Shikoku.

5. *Ribes americanum* Mill. *R. floridum* L'Hérit.—AMERIKA-KURO-SUGURI. Resembles the preceding; leaves smaller, 3–8 cm. long and as wide, truncate or sometimes cordate, not prominently puberulous; racemes 4–6 cm. long; flowers more than 10, yellowish, campanulate, the bracts longer than the pedicels; ovary glabrous; calyx-limb nearly as long as the lobes; petals and stamens not exerted; berry glabrous, black.—May. A shrub of e. N. America rarely planted in our area.

6. *Ribes sachalinense* (F. Schmidt) Nakai. *R. affine* var. *sachalinense* F. Schmidt; *R. laxiflorum* var. *japonicum* Jancz.; *R. laxiflorum* sensu auct. Japon., non Pursh.—TOGA-SUGURI. Procumbent sparingly branched shrub, the branches rather stout, puberulent while young; leaves membranous, orbicular, 4–10 cm. in diameter, deeply 5-cleft, loosely glandular-hairy on the nerves beneath; inflorescence 5–10 cm. long, loosely 7- to 10-flowered, short-glandular, the bracts linear, very much shorter than the pedicels; flowers rotate, 5–6 mm. across, yellow-green; ovary densely glandular-pubescent; calyx-limb extremely short, the lobes obovate-rounded, glabrous; berry glandular-hairy, broadly ellipsoidal, about 8 mm. long, dark red.—June–July. Hokkaido, Honshu (centr. distr.), Shikoku.—Sakhalin.

7. *Ribes latifolium* Jancz. *R. petraeum* var. *tomentosum* Maxim., pro parte—EZO-SUGURI. Erect shrub, the young branchlets puberulent and often glandular-hairy; leaves orbicular, 5–10 cm. in diameter, or slightly broader than long, rather densely white-hairy to glabrous on upper side, cordate,

5-lobed, the lobes acute to obtuse, doubly toothed, the petioles 5-10 cm. long; racemes 5-8 cm. long, 10- to 20-flowered; flowers purple-red, short-campanulate, the bracts minute, ovate, the pedicels puberulent and often sparingly glandular-hairy; ovary glabrescent or glabrous; calyx-limb as long as the lobes, the lobes obovate, truncate-rounded at the tip, often puberulent on back; berry red, globose, about 7 mm. long.—June-July. Hokkaido.—s. Kuriles and Sakhalin.

8. *Ribes triste* Pall. TOKACHI-SUGURI, CHISHIMA-SUGURI. Procumbent shrub; leaves membranous, suborbicular, 5-10 cm. wide, cordate, glabrous on upper side, glabrate or slightly pilose beneath, 3- to 5-lobed, the lobes acute to obtuse, coarsely toothed, the petioles usually pilose; racemes to 3.5 cm. long, glandular-hairy; flowers purplish, sometimes greenish, rotate; calyx-lobes obliquely spreading, orbicular; berry dark red, 6-8 mm. across.—Hokkaido.—c. Asia, s. Kuriles, and Sakhalin.

9. *Ribes sativum* Syme. *R. rubrum* sensu auct. Japon., non L.—AKA-SUGURI. Erect shrub, the branches somewhat glandular-hairy when young; leaves suborbicular, 3-7 cm. in diameter, cordate, nearly glabrous on upper side, short-pilose beneath especially on the nerves, the lobes acute to obtuse, irregularly toothed, the petioles 3-6 cm. long, short-pilose; racemes nodding, rather many-flowered, nearly glabrous, the bracts ovate, minute; flowers rotate, the receptacle swollen, 5-angled; anther-locules distant; berry red.—Apr.-May. Cultivated in our area.—Europe.

10. *Ribes horridum* Rupr. *R. lacustre* Poir. var. *horridum* (Rupr.) Jancz.—KURO-MI-NO-HARI-SUGURI. Shrub, the branches elongate, yellowish, slightly lustrous, glabrous, densely yellowish prickly, more so on the nodes; leaves suborbicular, 3-6 cm. long and as wide, cordate, scattered prickly on both sides, glabrous, deeply 5-cleft, the lobes acute, often

again 3-lobed or shallowly incised, the petioles 3-6 cm. long, prickly; inflorescence 5- to 8-flowered, glandular-hairy, the bracts broadly lanceolate, about half as long as the pedicels; berry blackish red, long glandular-hairy.—Hokkaido (Tokachi Prov.).—c. Siberia, n. Korea, and Sakhalin.

11. *Ribes sinanense* F. Mackawa. *R. grossularioides* Maxim., non Steud.—SUGURI. Shrub with simple to 3-parted stout spines on the nodes, the internodes prickly; leaves suborbicular, 2-3.5 cm. in diameter, truncate to subcordate, slightly pilose to subglabrous on both sides, 3- to 5-cleft or -lobed, the lobes obtuse to subrounded, with few coarse obtuse teeth, the petioles 1.5-3 cm. long; pedicels slender, axillary, 1.5-3 cm. long, the bracts 2-3 mm. long, inserted at the middle of the pedicel; ovary glabrous to slightly pilose; calyx tubular-campanulate, the free portion about 8 mm. long, the limb twice as long as the lobes, the lobes linear-oblong, yellow-green, reflexed, rounded at the apex, glabrous inside, puberulent outside; petals reddish, erect; stamens as long as the style; anthers not tipped with a gland; berry red, glabrous, subglobose, about 12 mm. long.—May-June. Mountains; Honshu (centr. distr.); rare.

12. *Ribes grossularia* L. MARU-SUGURI. Allied to the preceding; spines simple to 3-parted; branches usually puberulent while young; leaves orbicular, 2-5 cm. in diameter, subcordate, usually puberulent on both sides, 3- to 5-cleft, the lobes obtuse, coarsely toothed; flowers 1-2, greenish; ovary puberulent and sometimes glandular hairy; calyx-limb about as long as the lobes, hairy inside, the lobes narrowly oblong, loosely puberulent outside, reflexed, rounded at apex; berry green, yellowish, sometimes reddish, globose to ellipsoidal.—Apr.-May. Cultivated for the edible fruit.—Europe, N. Africa, and Caucasus.

Fam. 102. PITTOSPORACEAE

TOBERA KA

Pittosporum Family

Shrubs or trees, sometimes scandent; leaves alternate, entire, toothed or incised, exstipulate; flowers bisexual, actinomorphic or slightly oblique, white, blue, yellow, or rarely reddish, solitary and terminal, in corymbs or in panicles, rarely in axillary fascicles; sepals 5, free or rarely connate at base, imbricate in bud; petals 5, imbricate in bud, usually with an erect to ascending claw, the limb spreading; stamens 5, alternate with the petals, free, the anthers versatile; style simple, the stigma minute to capitate; ovules many; fruit a capsule, rarely a berry.—About 10 genera, with about 200 species, mostly Australian.

1. PITTOSPORUM Banks & Soland., ex Gaertn.

TOBERA ZOKU

Usually evergreen often dioecious shrubs or trees; leaves entire or undulate-toothed, short-petiolate, alternate, often aggregated toward the tips of the branches, stipules absent; flowers in terminal cymes, panicles or umbels, sometimes solitary in the upper axils; sepals often connate at the base; petals deciduous, usually connivent thus forming a tube on the lower portion, the upper part spreading; anthers erect; ovary imperfectly 2- to 5-locular; fruit a globose, ovoid or obovoid capsule, loculicidally dehiscent, the valves woody or coriaceous; seeds rather plump, often viscid.—About 160 species, in Africa, Asia, Australia, and the Pacific Islands.

- 1A. Leaves coriaceous, rounded at apex; inflorescence a simple or branched umbel, short-pubescent. 1. *P. tobira*
 1B. Leaves chartaceous, acuminate, sometimes the tip obtuse; inflorescence a few-flowered simple umbel, glabrous. 2. *P. illicioides*

1. *Pittosporum tobira* (Thunb.) Ait. *Euonymus tobira* Thunb.—TOBERA. Large stout much-branched shrub; leaves narrowly obovate, 7-10 cm. long, 2-3 cm. wide, glabrous, entire and slightly recurved on margin, short-petiolate, lustrous and dark green above; flowers white, changing to yellow, fragrant; sepals ciliate; petals spatulate, about 12 mm. long; capsules subglobose, about 12 mm. across, valves 3, thickened, nearly woody; seeds red.—Apr.-June. Sunny

slopes near the sea; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common, often planted in gardens and for hedges.—s. Korea, China, and Ryukyus.

2. *Pittosporum illicioides* Makino. *P. glabratum* sensu auct. Japon., non Lindl.—KOYASU-NO-KI. Glabrous green shrub, the branches rather slender, grayish brown, minutely lenticellate, terete; lower leaves alternate, approximate toward the top, deep green and slightly lustrous above, paler beneath,

6-10 cm. long, 2.5-4 cm. wide, gradually acuminate, sometimes with an obtuse tip, petiolate, the margin barely undulate and cartilaginous; flowers 1-4, in the upper axils; petals about 8 mm. long; style about 2.5 mm. long, thickened toward the

base, the stigma dilated; ovary 3- to 4-angled; capsules with thin-coriaceous valves.—May-June. Honshu (Harima Prov.); rare.

Fam. 103. HAMAMELIDACEAE

MANSAKU KA

Witch-hazel Family

Evergreen or deciduous shrubs or trees, with simple or stellate pubescence or glabrous; leaves alternate, rarely opposite, petiole, simple or palmately lobed, entire or toothed, the stipules 2, deciduous or persistent, rarely absent; flowers in heads or spikes, rather small, unisexual or bisexual; perianth sometimes wholly reduced in the staminate flowers; calyx-tube adnate more or less to the ovary, the calyx-limb truncate or 5-lobed, the lobes valvate or imbricate in bud; petals 4, 5 or sometimes many or absent, linear to obovate, imbricate or valvate in bud; stamens 4 to many; ovary 2-locular, inferior, subinferior, or rarely superior; carpels 2; ovules 1 to many in each locule, anatropous, pendulous; styles subulate, persistent; capsules woody, bipartite.—About 23 genera, with about 150 species, in the temperate to subtropical regions of both hemispheres, except Europe.

- 1A. Leaves palmately nerved; ovules several in each locule. 1. *Disanthus*
 1B. Leaves penninerved; ovules solitary in each locule.
 2A. Petals present.
 3A. Leaves evergreen; flowers white, the petals linear. 2. *Loropetalum*
 3B. Leaves deciduous; flowers yellowish to brownish red.
 4A. Flowers 4-merous, in pairs on a short peduncle, the petals linear. 3. *Hamamelis*
 4B. Flowers 5-merous, in spikes, the petals spatulate to narrowly obovate. 4. *Corylopsis*
 2B. Petals absent; evergreen trees; ovary superior. 5. *Distylium*

1. DISANTHUS Maxim. MARUBA-NO-KI ZOKU

Deciduous glabrous shrub; leaves long-petiolate, palmately 5- to 7-nerved, entire, cordate or ovate-orbicular, obtuse to subacute, glaucescent beneath, the stipules rather large, caducous; flowers paired, bisexual, sessile on top of the peduncle; calyx-5-lobed, pilose, the lobes recurved; petals 5, linear-lanceolate, dark purple, caudate; stamens 5, very short; ovary superior; styles short; capsules obcordate, bifid, rather large; seeds several in each locule, black, shining.—One species in Japan and possibly also in China.

1. *Disanthus cercidifolius* Maxim. MARUBA-NO-KI, BENI-MANSAKU. Leaves 5-12 cm. long and equally wide, somewhat cordate, entire, smooth; stipules small in adult plants, large and leaflike in young vigorous plants; peduncles

3-10 mm. long; flowers about 12 mm. across; calyx hairy, the lobes short, recurved; capsules 15-17 mm. long and equally wide.—Oct.-Nov. Honshu (sw. part of centr. distr. and Aki Prov.), Shikoku; rare.—China (?)

2. LOROPETALUM R. Br. TOKIWA-MANSAKU ZOKU

Small evergreen tree, stellate-pubescent; leaves alternate, oblong or obliquely ovate, entire, penninerved, abruptly acute; stipules membranous, deciduous; flowers 6-8 in short pedunculate heads, white; calyx-lobes 4; petals 4, broadly linear; stamens 4, very short; ovary subinferior; styles 2; capsules broadly obovoid, 4-parted; seeds solitary in each locule, black, shining.—One species, in Japan, China, and n. India.

1. *Loropetalum chinense* Oliv. TOKIWA-MANSAKU. Small tree with stellate pubescence; branches dark brown, slender; leaves obliquely ovate or obliquely oblong, 2-4 cm. long, 1-2 cm. wide, deep green above, whitish beneath with raised veinlets, the petioles 3-5 mm. long; calyx-lobes ovate,

2-3 mm. long, obtuse; petals about 20 mm. long, about 2.5 mm. wide; anthers about 0.7 mm. long, the appendage of the connective nearly as long as the anther; capsules 6-7 mm. long.—May. Honshu (Ise Prov.); rare.

3. HAMAMELIS L. MANSAKU ZOKU

Deciduous shrubs or trees with stellate pubescence; leaves short-petiolate, alternate, simple, oblique, deeply undulate-toothed; stipules deciduous; flowers bisexual, 4-merous, in axillary, short-pedunculate, few-flowered clusters; calyx 4-parted, adnate to the ovary at base, the lobes ovate, obtuse, persistent, stellate-pubescent; petals linear, yellow or reddish yellow; stamens 4, short, the staminodia alternate with the stamens; styles short; ovary subinferior or nearly superior; capsules ellipsoidal, 2-fid, the valves bifid again; seeds 2, black, shining, oblong.—Few species, in N. America and e. Asia.

1. *Hamamelis japonica* Sieb. & Zucc. *H. arborea* Ot. tol.; *H. zuccariniana* Ot. tol.—MANSAKU. Deciduous shrub or small tree; leaves rhombic-orbicular, broadly ovate or obovate, 4-12 cm. long, 3-8 cm. wide, slightly oblique at the base, deltoid on the upper half, subobtuse, stellate-pubescent while

young, the lateral nerves 6 to 8 pairs, the petioles 5-12 mm. long; calyx-lobes elliptic, reflexed; petals about 2 cm. long, yellow; capsules with persistent calyx-lobes near the base.—Mar.-Apr. Hokkaido, Honshu, Shikoku, Kyushu; very variable.

Var. *bitchuensis* (Makino) Ohwi. *H. bitchuensis* Makino
—ATETSU-MANSAKU. Leaves persistent stellate-pubescent.
—Honshu (Chûgoku Distr.).

Var. *obtusata* Matsum. *H. obtusata* (Matsum.) Makino
—MARUBA-MANSAKU. Leaves subrounded on the upper
half, rounded to subretuse at tip, the stellate hairs deciduous;
petals yellow.—Mountains; Honshu (Japan Sea side).—
Forma *incarnata* (Makino) Ohwi. *H. incarnata* Makino

—AKABANA-MANSAKU. Petals reddish.—Forma *flavo-
purpurascens* (Makino) Rehd. *H. obtusata* forma *flavopur-
purascens* Makino.—NISHIKI-MANSAKU. Petals yellow on
upper part, reddish at base.

Hamamelis megalophylla Koidz. with larger leaves is
doubtfully distinct.—Honshu (Kantô Distr.).

Hamamelis virginiana L., an American species, is occa-
sionally cultivated; flowering in autumn.

4. CORYLOPSIS Sieb. & Zucc. TOSA-MIZUKI ZOKU

Deciduous stellate-pubescent shrubs; leaves petiolate, simple, penninerved, toothed, broadly ovate, usually slightly oblique;
stipules membranous, deciduous, rather large; flowers in axillary pendulous spikes, bisexual, yellow, sessile, precocious, bracteate,
the bracts membranous, concave, the lower ones larger; calyx-lobes short, persistent, the tube adnate to the ovary; petals 5,
clawed, obovate to spatulate; stamens 5, alternate with the staminodia; ovary subinferior, 2-locular; styles filiform, the stigma
capitellate; ovules solitary in each locule; capsules subglobose or broadly obovate, 2-valved, the valves bifid; seeds solitary in each
locule, black, shining.—More than 10 species, in e. Asia and the Himalayas.

1A. Spikes 1- to 3-flowered; leaves 3-5 cm. long, 1.5-3 cm. wide. 1. *C. pauciflora*

1B. Spikes 5- to 10-flowered; leaves larger, 3-10 cm. long, 2-8 cm. wide.

2A. Young branches, petioles, and inflorescence with yellowish hairs. 2. *C. spicata*

2B. Young branches and other parts glabrous or nearly glabrous.

3A. Leaves ovate-orbicular, short-dentate with prominently awn-pointed teeth; stamens about half as long as the petals.

3. *C. glabrescens*

3B. Leaves obovate, sometimes obovate-orbicular, with very short-awned teeth; stamens nearly as long as the petals. . . . 4. *C. gotoana*

1. *Corylopsis pauciflora* Sieb. & Zucc. HYÛGA-MIZUKI,
IYO-MIZUKI. Much-branched shrub, 1-2 m. high, with slender
glabrous branches; leaves membranous, oblique, ovate, 3-5
cm. long, 1.5-3 cm. wide, acute, slightly cordate, glabrous on
upper side, glaucescent and short stellate-hairy while young
beneath, appressed-pilose on the under side of the nerves, undu-
late, short awned-toothed, the lateral nerves 5 to 7 pairs,
the petioles 5-15 mm. long; flowers 1-3, pale yellow, about 15
mm. long; stamens slightly shorter than the petals.—Mar.-
Apr. Mountains; Honshu (n. Kinki Distr. and Kaga, Echizen,
and Mino Prov.); widely planted.—Formosa.

2. *Corylopsis spicata* Sieb. & Zucc. C. *kesakii* Sieb. &
Zucc.—TOSA-MIZUKI. Shrub about 2 m. high, with rather
stout branches, usually pilose when young; leaves ovate-orbicular
to obovate-orbicular, abruptly acute, glabrous on upper side,
glaucescent and pilose beneath, short awn-toothed, the lateral
nerves 6 or 7 pairs, the petioles 1-2.5 cm. long; spikes 7- to 10-
flowered; flowers yellow, about 10 mm. long; stamens about

as long as the petals, the anthers dark purple.—Mar.-Apr.
Mountains; Shikoku; rare; widely planted.

3. *Corylopsis glabrescens* Fr. & Sav. C. *kesakii* sensu
auct. Japon., non Sieb. & Zucc.—KIRISHIMA-MIZUKI. Large
shrub; leaves glabrous on upper side, glaucescent and sparingly
stellate-pubescent beneath while young, abruptly acute, slightly
cordate, the nerves appressed-pilose while young; spikes several-
flowered; flowers yellow, about 15 mm. long; stamens
half as long as the petals, the anthers purple.—Apr. Moun-
tains; Kyushu (Kirishima Mts.).

4. *Corylopsis gotoana* Makino. KÔYA-MIZUKI, MIYAMA-
TOSA-MIZUKI. Large shrub or small tree to 5 m. high; leaves
with scattered, long, appressed hairs while young, glaucescent and
appressed-pilose on the nerves and stellate-pubescent beneath
while young, usually becoming glabrate; flowers about 10
mm. long; petals obovate; stamens nearly as long as the petals,
the anthers purplish.—Apr. Mountains; Honshu (centr.
distr. and westw.), Shikoku, Kyushu; rather rare.

5. DISTYLIUM Sieb. & Zucc. ISU-NO-KI ZOKU

Evergreen stellate-pubescent trees; leaves coriaceous, short-petiolate, entire or few-toothed, penninerved; stipules membranous,
deciduous; flowers polygamous (plants sometimes dioecious), apetalous, bracteate, in axillary spikes; calyx free from the ovary,
3- to 5-parted, the lobes imbricate in bud; stamens 2-8, the filaments short; ovary superior, usually densely stellate-pubescent;
styles 2; capsules nearly woody, oblong to subglobose, cuspidate, 2-valved, the valves bifid; seeds oblong-cylindric, shining.—
Few species, in Japan, China, and the Himalayas.

1. *Distylium racemosum* Sieb. & Zucc. ISU-NO-KI.
Branchlets glabrate, yellowish stellate-hairy while young;
leaves oblong to narrowly obovate, 3-7 cm. long, 1.5-3 cm.
wide, acute to obtuse, sometimes undulate-toothed on the
upper margin, stellate-pubescent while young; spikes axillary,

shorter than the leaves, stellate-pubescent; anthers red; cap-
sules broadly ovoid, shallowly bifid, about 10 mm. long,
yellow-brown tomentose.—Mar.-May. Honshu (s. Kantô
Distr. and westw.), Shikoku, Kyushu; occasionally planted.
—Ryukyus. A phase with variegated leaves is known.

Fam. 104. ROSACEAE BARA KA Rose Family

Herbs, shrubs or trees of various habit; leaves alternate, rarely opposite, simple or compound, usually stipulate; flowers actino-
morphic; calyx superior or inferior, the lobes usually 5, imbricate in bud; petals usually as many as the calyx-lobes, rarely absent,
perigynous, often orbicular with or without a short claw at base, imbricate in bud; stamens many, rarely definite, perigynous or

inserted on the calyx or receptacle, inflexed or incurved in bud; receptacle (hypanthium) often adnate to the calyx-tube; carpels 1 to many, free or connate, sometimes adnate to the calyx-tube or perigynous receptacle, the ovules solitary or collaterally paired in each locule, anatropous; fruit various.—About 100 genera, with about 3,000 species, cosmopolitan, especially abundant in temperate regions.

- 1A. Fruit dehiscent; stipules sometimes absent.
- 2A. Leaves simple, entire or lobed.
- 3A. Stipules present; carpels solitary; inflorescence a corymbose panicle. 1. *Stephanandra*
- 3B. Stipules absent; carpels 5; inflorescence an umbellate raceme or panicle. 2. *Spiraea*
- 2B. Leaves pinnate or ternately compound.
- 4A. Shrubs; carpels connate at base, opposite the calyx-lobes; leaves pinnate; stipules present. 3. *Sorbaria*
- 4B. Herbs; carpels free, alternate with the calyx-lobes; leaves ternately compound; stipules absent. 4. *Aruncus*
- 1B. Fruit indehiscent, dry or fleshy.
- 5A. Ovary superior or rarely apparently inferior because of the tightly enclosing calyx-tube.
- 6A. Carpels many, if 1 or 2, not drupelike; leaves usually compound.
- 7A. Carpels not enclosed within a fleshy calyx-tube (hypanthium).
- 8A. Carpels superior, not enveloped when ripe within the calyx-tube.
- 9A. Filaments persistent.
- 10A. Fruitlets (achenes) dry, not fleshy; plants unarmed.
- 11A. Styles deciduous.
- 12A. Shrubs with simple leaves.
- 13A. Flowers white, 4-merous, calyculate at base; leaves opposite. 5. *Rhodotypos*
- 13B. Flowers usually yellow, 5-merous, not calyculate; leaves alternate. 6. *Kerria*
- 12B. Herbs, rarely shrubs; leaves compound.
- 14A. Carpels many.
- 15A. Receptacles accrescent after anthesis.
- 16A. Flowers yellow; receptacles not fleshy. 7. *Duchesnea*
- 16B. Flowers white; receptacles fleshy in fruit. 8. *Fragaria*
- 15B. Receptacles scarcely accrescent; herbs, rarely shrubs, with ternately or pinnately, rarely palmately compound leaves; flowers yellow, rarely white or blood-red. 9. *Potentilla*
- 14B. Carpels few or rather few.
- 17A. Herbs; petals prominent; stamens many. 10. *Waldsteinia*
- 17B. Dwarf procumbent subshrubs; petals small; stamens 5. 11. *Sibbaldia*
- 11B. Styles persistent, usually elongate after anthesis.
- 18A. Calyx-lobes and petals 8 or 9; leaves simple, evergreen, obtusely toothed; styles plumose in fruit; dwarf shrubs. 12. *Dryas*
- 18B. Calyx-lobes and petals 5; leaves pinnately compound; styles sometimes plumose in fruit; dwarf shrubs or herbs. 13. *Geum*
- 10B. Fruitlets juicy in fruit; usually armed plants with prickles or bristles. 14. *Rubus*
- 9B. Filaments deciduous after flowering; fruit an achene. 15. *Filipendula*
- 8B. Carpels inferior, enveloped by a nonfleshy calyx-tube.
- 19A. Petals absent.
- 20A. Leaves pinnately compound; flowers not calyculate. 16. *Sanguisorba*
- 20B. Leaves simple, palmately lobed; flowers calyculate at base. 17. *Alchemilla*
- 19B. Petals present; calyx with hooked bristles; leaves pinnately compound. 18. *Agrimonia*
- 7B. Carpels enclosed in a fleshy calyx-tube; usually armed shrubs. 19. *Rosa*
- 6B. Carpel solitary; fruit a drupe; trees or large shrubs, usually deciduous, rarely evergreen; leaves simple, usually with a pair of glands near the base or on the upper portion of the petioles. 20. *Prunus*
- 5B. Ovary inferior; carpels 2-5, connate and adnate to the receptacle; fruit a pome, sometimes berrylike.
- 21A. Carpels bony; fruit drupelike. 21. *Crataegus*
- 21B. Carpels with coriaceous or papery walls at maturity; fruit a 1- to 5-loculed pome, each locule with 1 or more seeds.
- 22A. Evergreen trees; leaves coriaceous, simple, toothed or entire.
- 23A. Inflorescence a compound corymb or flat-topped panicle. 22. *Photinia*
- 23B. Inflorescence an acute-topped panicle.
- 24A. Calyx persistent; fruit rather large, yellow in maturity. 23. *Eriobotrya*
- 24B. Calyx deciduous; fruit small, black. 24. *Rhaphiolepis*
- 22B. Deciduous trees or shrubs; leaves simple or compound.
- 25A. Flowers in umbels or fascicles, rarely in umbellike corymbs or solitary.
- 26A. Carpels many-seeded; flowers short-pedicelled. 25. *Chaenomeles*
- 26B. Carpels 1- or 2-seeded; flowers on rather elongate pedicels.
- 27A. Styles connate at base; fruit usually without or with very few stone-cells in the flesh. 26. *Malus*
- 27B. Styles free; fruit with abundant stone-cells. 27. *Pyrus*
- 25B. Flowers in racemes or compound-corymbs.
- 28A. Flowers in racemes. 28. *Amelanchier*
- 28B. Flowers in compound corymbs.
- 29A. Fruiting pedicels with prominent warts; leaves coriaceous, finely toothed; calyx persistent. 29. *Pourthiaea*
- 29B. Fruiting pedicels without prominent warts; leaves pinnately compound or if simple the calyx deciduous after anthesis. 30. *Sorbus*

1. STEPHANANDRA Sieb. & Zucc. KOGOME-UTSUGI ZOKU

Deciduous shrubs; leaves alternate, petioled, simple, with irregular toothlike incisions, often slightly lobulate; stipules leaflike, persistent; inflorescence a terminal, corymbose panicle; flowers small, bisexual, ebracteolate, the pedicels bracteate at base; calyx persistent, cup-shaped, the teeth 5, ovate-deltoid, slightly imbricate in bud; petals 5, spatulate, small, white; stamens 10 to many, inserted on the throat of the calyx-tube, incurved; disc hairy; carpels solitary, hairy; style terminal, filiform; ovules pendulous, nearly apical; fruit a small hairy follicle enclosed in the calyx, 1- or 2-seeded; seeds rather small, subglobose, with abundant endosperm.—Few species, in the temperate regions of E. Asia.

1A. Stamens 10; leaves 3–6 cm. long, subpinnately cleft, with 4–6 pairs of lateral nerves; calyx-teeth elliptic, obtuse to rounded at apex.

1. *S. incisa*

1B. Stamens about 20; leaves 5–9 cm. long, shallowly lobed, with 6–8 pairs of lateral nerves; calyx-teeth ovate-deltoid, cuspidate.

2. *S. tanakae*

1. **Stephanandra incisa** (Thunb.) Zabel. *Spiraea incisa* Thunb.; *Spiraea flexuosa* Sieb. & Zucc.—KOGOME-UTSUGI. Much-branched shrub with slender terete nearly glabrous branchlets; leaves broadly deltoid-ovate, slightly pilose to nearly glabrous, caudately acuminate, whitish green beneath, pinnately cleft to lobed, incised and toothed, 3–6 cm. long, 2–3.5 cm. wide, the petioles 4–8 mm. long; stipules linear to broadly lanceolate, ascending, 1.5–7 mm. long; inflorescence paniculate, terminal on young branches, 2–6 cm. long, many-flowered; flowers creamy white, 4–5 mm. across; bracts caducous, broadly linear; petals slightly longer than the calyx; fruiting carpels globose, short-pubescent, about 2 mm. long; seeds shining, about 1.5 mm. across.—May–June. Thickets

in low mountains; Hokkaido (Hidaka Prov.), Honshu, Shikoku, Kyushu; common.—Korea.

2. **Stephanandra tanakae** Fr. & Sav. KANA-UTSUGI. Resembles the preceding, the branches slightly stouter, flexuous, glabrous; leaves shallowly 3- to 5-lobed, with incised acute teeth, glabrous on upper side, slightly pubescent on nerves beneath, 5–9 cm. long, 3.5–6 cm. wide, caudately acuminate at apex, the petioles 10–15 mm. long, slightly pubescent; stipules 5–12 mm. long; inflorescence glabrous, 4–10 cm. long, flowers slightly larger than in *S. incisa*.—May–June. Mountains; Honshu (Kinki, Tōkaidō, and Kantō Distr., and Ugo Prov.); rare.

2. SPIRAEA L. SHIMOTSUKE ZOKU

Shrubs or semishrubs; leaves alternate, usually simple, toothed; stipules often indistinct; flowers white to rose, small, in racemes, cymes or panicles; calyx persistent, with 4 or 5 teeth; petals small, usually as many as the sepals, sometimes many, inserted on the throat of the calyx-tube; stamens 20–60; disc thickened, adnate to the calyx-tube; carpels usually 5, inserted at the base of the calyx, free or connate at base; styles terminal; ovules many to few; follicles dehiscent on inner side, seeds pendulous, without endosperm.—About 100 species, in the temperate to cold regions of the N. Hemisphere.

1A. Inflorescence umbellate.

2A. Inflorescence sessile on last year's branchlets, without leaves at base.

3A. Leaves broadly lanceolate to elliptic or ovate.

4A. Leaves broadly lanceolate to narrowly ovate-oblong, glabrous or nearly so; flowers single. 1. *S. fauriana*

4B. Leaves ovate or broadly so, pilose beneath; flowers usually double. 2. *S. prunifolia*

3B. Leaves linear-lanceolate. 3. *S. thunbergii*

2B. Inflorescence peduncled or subsessile, terminal on the current year's leafy branchlets.

5A. Calyx-lobes reflexed after anthesis; stamens longer than the petals; axis of inflorescence more or less distinct.

6A. Leaves oblong to elliptic, entire or with few teeth toward the tip; branches more or less terete. 4. *S. media* var. *sericea*

6B. Leaves ovate, with doubly incised-serrate margin on upper half; branches distinctly angled. . . 5. *S. chamaedryfolia* var. *pilosa*

5B. Calyx-lobes erect or spreading, but not reflexed in fruit.

7A. Buds flat, outer bud scales longer; leaves entire or with 2 or 3 teeth near the tip; inflorescence with a rather distinct axis.

6. *S. nipponica*

7B. Buds terete, outer bud-scales shorter than the inner; leaves usually distinctly toothed, sometimes lobulate.

8A. Leaves acute, rhombic-lanceolate, glabrous. 7. *S. cantoniensis*

8B. Leaves obtuse to rounded at apex, flabellate-orbicular to rhombic-ovate, glabrous to pubescent.

9A. Leaves glabrous or nearly so, obtuse to subrounded at apex. 8. *S. blumei*

9B. Leaves pubescent beneath, obtuse to subacute at apex; nerves and veinlets impressed above, raised beneath. . . 9. *S. nervosa*

1B. Inflorescence a compound corymb or panicle.

10A. Inflorescence a flat-topped to convex compound corymb.

11A. Leaves obtuse; inflorescence convex at top. 10. *S. betulifolia*

11B. Leaves acute to acuminate; inflorescence flat-topped.

12A. Leaves thinly membranous, glabrous, concolorous; inflorescence on short branches of the current year, these rising usually from arcuate elongate branches of the preceding year. 11. *S. miyabei*

12B. Leaves membranous to coriaceous, pubescent to subglabrate and pale green to glaucous beneath. 12. *S. japonica*

10B. Inflorescence a panicle. 13. *S. salicifolia*

1. **Spiraea fauriana** C. K. Schn. *S. pruniflora* Honda —EZO-NO-SHIJIMIBANA, KO-SHIJIMIBANA. Shrub; branches more or less angled, glabrous or short-pubescent while young; leaves broadly lanceolate, sometimes oblong, 2.5–4 cm. long,

6–12 mm. wide, acute, sometimes subobtusely, cuneate at base, serrulate except on the lower margin, nearly concolorous, glabrous or sparingly pubescent while young, pinninerved, the petioles 1–2 mm. long; inflorescence 4- to 6-flowered, with few

bracts at base; pedicels slender, 1-2 cm. long, glabrous; flowers white, single; calyx glabrous, the teeth deltoid, erect, short-pubescent within; fruiting carpels glabrous or sparingly pilose. —Apr.-May. Hokkaido, Honshu (n. distr.); rare.

2. *Spiraea prunifolia* Sieb. & Zucc. SHIJIMIBANA. Shrub; branchlets scarcely angled, short-pubescent; leaves ovate to broadly so, 2-3.5 cm. long, 1.5-2 cm. wide, obtuse to acute, serrulate, appressed-pubescent beneath, the petioles 3-7 mm. long, appressed-pubescent; inflorescence sessile, umbellate, 3- to 5-flowered, with few green bracts at base; pedicels 2-4 cm. long, thinly pubescent; flowers white, double, about 10 mm. across. —Apr.-May. A Chinese shrub, cultivated in gardens. The nomenclatorial type is based upon the double-flowered phase in cultivation. —Forma *simpliciflora* Nakai. HIROENO-SHIJIMIBANA. Flowers single. —The indigenous wild phase of Formosa, Korea, and centr. China.

3. *Spiraea thunbergii* Sieb. YUKI-YANAGI, KOGOMEBANA. Shrub; branches slender, elongate, arcuate above, slightly angled and short-pubescent while young; leaves linear-lanceolate, 2-4 cm. long, 3-6 mm. wide, acuminate to acute, acuminate at base, with upwardly directed acute teeth, glabrous except for thin pubescence on midrib while young, the petioles scarcely distinct; inflorescence sessile, 2- to 5-flowered, with few bracts at base; pedicels glabrous, 1-1.5 cm. long; flowers about 8 mm. across, single; calyx glabrous, the teeth erect, deltoid; petals broadly obovate, much longer than the stamens; fruiting carpels spreading, glabrous. —Mar.-Apr. A Chinese shrub, widely cultivated and extensively naturalized in Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

4. *Spiraea media* F. Schmidt var. *sericea* (Turcz.) Regel. *S. mombetsusensis* Franch.; *S. media* var. *mombetsusensis* (Franch.) Cardot; *S. sericea* Turcz. —EZO-SHIMOTSUKE. Shrub; branches slightly angled or terete, short-pubescent while young; leaves oblong to narrowly so, sometimes elliptic, 2-4 cm. long, 6-20 mm. wide, rounded to subacute at apex, entire or with few teeth on upper margin, silky-pubescent beneath and on margin while young, short-pubescent above only while young, often becoming glabrous on both sides, the petioles none or to 2 mm. long; inflorescence solitary on short young branchlets from the lateral buds on the previous year's branches, umbellately racemose with a short axis, many-flowered; pedicels 7-15 mm. long; flowers white, about 7 mm. across; calyx-teeth reflexed, rounded to obtuse; stamens longer than the petals; fruiting carpels short-pubescent, about 2 mm. long. —June-July. Hokkaido, Honshu (Mutsu Prov.). —Kuriles, Sakhalin, Ussuri, Manchuria, and Korea. The typical phase occurs from se. Europe to Siberia.

5. *Spiraea chamaedryfolia* L. var. *pilosa* (Nakai) Hara. *S. ulmifolia* var. *pilosa* Nakai; *S. ussuriensis* Pokraj. —AIZU-SHIMOTSUKE. Shrub; young branches angled, glabrous or sparingly short-pubescent; leaves membranous, ovate to narrowly so, 3-6 cm. long, 1.5-3.5 cm. wide, acute, acutely duplicate-toothed except on lower margin, thinly puberulent with appressed short hairs above while young, more or less pubescent beneath, the petioles 3-8 mm. long, slightly pubescent; inflorescence a loosely pubescent umbellate raceme, with short axis; pedicels 10-15 mm. long; flowers many, white, about 10 mm. across; calyx-teeth reflexed, subacute; petals orbicular, shorter than the stamens; fruiting carpels connivent, about 3 mm. long, pubescent, the styles suberect. —May. Hokkaido, Honshu (centr. distr. and northw.). —Sakhalin, n. Korea,

Manchuria, Amur, Ussuri, and Siberia. The typical phase occurs from Europe to Siberia.

6. *Spiraea nipponica* Maxim. *S. ogawae* Nakai; *S. bracteata* Zabel, non Raf. —IWA-SHIMOTSUKE. Shrub; branches angled, glabrous; leaves chartaceous, narrowly oblong to obovate-orbicular, usually elliptic to broadly so, 1-2.5 cm. long, 7-15 mm. wide, rounded to very obtuse at apex, entire or with few obtuse teeth on upper margin, glabrous, glaucous beneath, the petioles 1.5-4 mm. long, glabrous; inflorescence terminal on short branchlets, glabrous or nearly so, usually with slightly developed axis, rather many-flowered; pedicels 1-1.5 cm. long; flowers white, 6-7 mm. across; calyx glabrous, the teeth deltoid, erect, acute, brown-pubescent within; petals orbicular, nearly as long as the stamens; fruiting carpels more or less brown-pubescent to nearly glabrous. —May-July. Mountains; Honshu (Kinki Distr. and eastw.). —Forma *rotundifolia* Makino, MARUBA-IWA-SHIMOTSUKE, has broader leaves. —Forma *oblanceolata* (Nakai) Ohwi. *S. nipponica* var. *oblanceolata* Nakai —NAGABA-IWA-SHIMOTSUKE, has narrower leaves.

Var. *tosaensis* (Yatabe) Makino. *S. tosaensis* Yatabe —TOSA-SHIMOTSUKE. Leaves broadly to narrowly oblanceolate, 1.5-3 cm. long, 3-8 mm. wide, entire or 2- or 3-toothed near the apex. —May. Mountains; Shikoku.

7. *Spiraea cantoniensis* Lour. KO-DEMARI. Glabrous shrub; branches rather slender, the young branchlets not angled; leaves lanceolate to narrowly rhombic-oblong, 2-5 cm. long, 6-20 mm. wide, cuneate to obtuse at base, loosely and irregularly incised-serrate, often glaucescent beneath, the nerves and veinlets raised beneath, the petioles 2-10 mm. long; inflorescence rather many-flowered, the axis sometimes slightly developed; pedicels 1-1.5 cm. long, sometimes with filiform bracteoles at base; flowers white, 7-10 mm. across, single; calyx-teeth deltoid, acute; disc short-pilose; fruiting carpels glabrous. —Apr.-May. Introduced Chinese shrub long cultivated in gardens.

8. *Spiraea blumei* G. Don. *S. kinashii* Koidz.; *S. amabilis* Koidz.; *S. ribisoidea* Koidz.; *S. hypoglauca* Koidz.; *S. tsushimensis* Nakai; *S. sikoqualpina* var. *glabra* Koidz. —IWAGASA. Glabrous or nearly glabrous shrub, branches terete; leaves rhombic-ovate, broadly ovate, oblong or narrowly obovate, 1.5-3.5 cm. long, 1-3 cm. wide, obtuse to subrounded or subacute at apex, broadly cuneate to obtuse at base, irregularly toothed or incised except on the lower half, sometimes 3-lobed, the lateral nerves slightly impressed above, raised beneath, the petioles 3-10 mm. long; inflorescence umbellate, rather many-flowered; pedicels 10-15 mm. long, slender; flowers white, 6-8 mm. across; calyx-teeth erect, narrowly deltoid, acute; petals orbicular, as long as or slightly shorter than the stamens; fruiting carpels glabrous or slightly hairy on ventral side. —May. Mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu. Very variable.

Var. *pubescens* (Koidz.) Ohwi. *S. ribisoidea* var. *pubescens* Koidz.; *S. sikoqualpina* Koidz. —IYO-NO-MITSUBA-IWAGASA. Young branches and inflorescence short-pubescent. —Shikoku.

Var. *hayatae* (Koidz.) Ohwi. *S. hayatae* Koidz.; *S. miyajimensis* Makino —URAJIRO-IWAGASA. Leaves glabrous or slightly pubescent beneath; inflorescence, young branchlets, and fruit pubescent. —Honshu (Chūgoku Distr.).

9. *Spiraea nervosa* Fr. & Sav. *S. dasyantha* sensu auct.

Japan., non Bunge; *S. kiusiana* Nakai—Ibuki-Shimotsuke. Shrub; branches not angled, short-pubescent while young; leaves ovate to broadly so or rhombic-oblong, 2–4 cm. long, 8–20 mm. wide, obtuse to subacute at apex, cuneate, obtuse, or rounded at base, irregularly incised-toothed, sometimes obsoletely 3-lobed, pubescent above while young, with pale yellowish appressed pubescence beneath, the nerves and veinlets impressed above, prominently raised beneath, the petioles 3–6 mm. long, pubescent; inflorescence solitary on short branchlets, short-pubescent, rather many-flowered; pedicels 10–15 mm. long; flowers white, 6–8 mm. across; calyx pubescent, the teeth spreading, deltoid, acute, thinly puberulent with short brownish soft hairs or nearly glabrous within; disc short-pubescent; fruiting carpels glabrous or hairy on ventral side.—Apr.–June. Honshu (Kinki Distr.), Shikoku, Kyushu.

Var. *angustifolia* (Yatabe) Ohwi. *S. dasyantha* var. *angustifolia* Yatabe; *S. chinensis* Maxim.; *S. yatabei* Nakai—Hosoba-no-Ibuki-Shimotsuke, Tō-shimotsuke. Fruiting carpels thinly hairy all over.—Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—China.

10. *Spiraea betulifolia* Pall. MARUBA-SHIMOTSUKE. Shrub; young branches slightly striate, glabrous or sparingly pubescent; leaves obovate to broadly obovate or orbicular-ovate, 15–50 mm. long, 10–40 mm. wide, rounded to obtuse at apex, usually broadly cuneate, sometimes rounded or truncate at base, toothed except near base, pale green to slightly glaucous beneath, the nerves pinnate, the petioles glabrous, 1–3 mm. long; inflorescence terminal, many-flowered, glabrous or with thin rather long pubescence while young; flowers white, 5–8 mm. across; calyx-teeth deltoid, reflexed in fruit; petals ovate-orbicular, shorter than the stamens; nectaries prominent; fruiting carpels glabrous or slightly pilose within.—July–Aug. High mountains; Hokkaido, Honshu (n. and centr. distr.); rather common.—e. Siberia, Sakhalin, and Kuriles.

Var. *aemiliana* (C. K. Schn.) Koidz. *S. aemiliana* C. K. Schn.; *S. betulifolia* subsp. *aemiliana* (C. K. Schn.) Hara; *S. stevenii* Rydb.; *S. beauverdieana* C. K. Schn.—Ezo-no-MARUBA-SHIMOTSUKE. Smaller in all parts; young branches usually more or less short-pubescent; leaves broad, rounded at base, 7–15 mm. long, 8–18 mm. wide, the veinlets impressed above; inflorescence smaller, usually short-pubescent; flowers 3–5 mm. across.—July–Aug. High mountains; Hokkaido.—Kuriles and Kamchatka.—Forma *glabra* (Hara) Ohwi. *S. betulifolia* var. *glabra* (Hara) Hara; *S. aemiliana* var. *glabra* Hara. Plant glabrous.

11. *Spiraea miyabei* Koidz. EZO-NO-SHIROBANA-SHIMO-

TSUKE. Shrub; young branches angled, glabrous or nearly so; leaves concolorous, broadly lanceolate to narrowly ovate, 3–7 cm. long, 1–3 cm. wide, acuminate, cuneate at base, doubly toothed on margin with acute incised teeth, loosely white-pilose on midrib beneath near base and on margin when young, the petioles 4–6 mm. long, glabrous; inflorescence terminal on short young branchlets from last year's branches, many-flowered, short-pubescent; flowers white, about 8 mm. across; calyx glabrous, the teeth reflexed, deltoid, acute; petals orbicular, about half as long as the stamens; fruiting carpels with short spreading-hairs.—Apr. Hokkaido (sw. distr.), Honshu (n. distr.); rare.

12. *Spiraea japonica* L. f. *S. callosa* Thunb.; *S. albiflora* (Miq.) C. K. Schn.; *S. callosa* var. *albiflora* Miq.—SHIMOTSUKE. Shrub; branches usually not or scarcely angled, glabrous or pubescent; leaves lanceolate to ovate, sometimes broadly ovate, 1–8 cm. long, 0.8–4 cm. wide, acute to acuminate, rounded to narrowly cuneate at base, irregularly and loosely acute-toothed or incised-toothed, pale green to glaucous beneath, glabrous on both sides or pubescent beneath, the petioles 1–5 mm. long, glabrous to pubescent; inflorescence flat-topped, often lobed, rather large to small, sometimes short-pubescent, densely many-flowered; flowers pale pink, rarely white, 3–6 mm. across; calyx-teeth deltoid, erect, later obliquely spreading, acute; stamens longer than the petals; disc with nectary glands on the margin; fruit glabrous.—May–Aug. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common and very variable.—Korea, China to the Himalayas.

Var. *bullata* (Maxim.) Makino. *S. bullata* Maxim.—KOSHIMOTSUKE. Small pubescent shrub; leaves small, broadly ovate, bullate above; flowers small, without glands.—Rarely cultivated in our area, not known as a wild plant, possibly of garden origin.

13. *Spiraea salicifolia* L. HOZAKI-SHIMOTSUKE. Shrub; young branches slightly angled, pubescent on upper portion; leaves rather thinly chartaceous, lanceolate to broadly lanceolate, 3–10 cm. long, 1–3 cm. wide, acuminate to acute, usually acutely duplicate-toothed, slightly pubescent on upper side while young, the petioles 1–3 mm. long; inflorescence terminal, densely many-flowered, 7–15 cm. long, short-pubescent; flowers pink, 5–7 mm. across; calyx pubescent, the teeth deltoid, acute, erect; stamens much longer than the petals; ovary glabrous.—July–Sept. Wet boggy places in mountains; Hokkaido, Honshu (n. and centr. distr.).—Distributed throughout the cold regions of the Old World.

3. SORBARIA A. Br. HOZAKI-NANA-KAMADO ZOKU

Deciduous shrubs; leaves large, alternate, petiolate, pinnate, the leaflets toothed, the stipules persistent; inflorescence a large terminal panicle; flowers small, white; calyx cup-shaped, the teeth 5, deltoid or rounded, short, reflexed; petals 5, suborbicular; stamens 20–50, inserted on the throat of the calyx-tube; carpels 5, opposite the calyx-lobes, connate at base; follicles ventrally dehiscent; seeds without endosperm.—More than 10 species, in the temperate regions of the Old World.

1. *Sorbaria sorbifolia* (L.) A. Braun var. *stellipila* Maxim. *S. stellipila* (Maxim.) C. K. Schn.—HOZAKI-NANA-KAMADO. Young branchlets usually stellate-pilose; stipules lanceolate to narrowly ovate, toothed; leaves 15–30 cm. long, minutely puberulent on petioles and axis, the pinnae 15–23, membranous, lanceolate or broadly so, 4–10 cm. long, 8–30 mm. wide, acuminate, acutely duplicate-toothed, more or less stellate-pilose beneath; panicles 10–20 cm. long, densely many-

flowered, stellate-pilose, becoming glabrous; flowers white, 7–8 mm. across; stamens longer than the petals; styles about 2.5 mm. long; fruit 4–6 mm. long, pubescent.—July–Aug. Hokkaido, Honshu (centr. and n. distr., rare).—Forma *incerta* (C. K. Schn.) Kitag. *S. stellipila* var. *incerta* C. K. Schn.—EZO-HOZAKI-NANA-KAMADO. Stellate hairs on underside of leaves deciduous at anthesis. The typical phase occurs in nw. Asia.

4. ARUNCUS Kostel. YAMABUKI-SHŌMA ZOKU

Dioecious perennial herbs; rhizomes short-creeping, stout; leaves radical and cauline, alternate, ternately compound, petioled, toothed, exstipulate; inflorescence a terminal panicle of densely flowered, simple to again branched racemes, the bracts linear, often partly adnate to the pedicel; flowers small; calyx 5-toothed, the teeth valvate in bud; petals 5, small, spatulate, inserted on the throat of the calyx-tube; stamens about 20; carpels usually 3, rarely more, free, the ovules many, pendulous; follicles coriaceous, ventrally dehiscent, the seeds scobiform, without endosperm.—Few species in the cold temperate regions of the N. Hemisphere.

1. *Aruncus dioicus* (Walt.) Fern. var. *kamtschaticus* (Maxim.) Hara. *A. sylvestre* var. *kamtschaticus* Maxim.; *A. kamtschaticus* (Maxim.) Rydb.; *A. sylvestre* var. *tomentosus* Koidz.; *A. tomentosus* (Koidz.) Koidz.; *A. sylvestre* var. *tenuifolius* Nakai; *A. sylvestre* var. *americanus* Maxim. pro parte; *A. kyusianus* Koidz.; *A. dioicus* var. *tenuifolius* (Nakai) Hara —YAMABUKI-SHŌMA. Glabrous to sparingly pubescent coarse perennial herb with rather stout branching rhizomes; stems 30–80 cm. long, with a few deciduous scales at base, terete, few-leaved; leaves few, 2- or 3-ternate, the leaflets thinly chartaceous, often lustrous, narrowly ovate to ovate-orbicular, 3–10 cm. long, 1–6 cm. wide, acuminate to caudate, incised and toothed, sometimes pinnately lobed; inflorescence 10–30 cm. long, short-pubescent; flowers many, white, short-pedicelled; petals broadly spatulate, small; fruit pendulous on a deflexed pedicel, the carpels lustrous, about 2.5 mm. long, the styles short, about 0.5 mm. long.—June–Aug. Hokkaido, Honshu, Shikoku, Kyushu; rather common and variable.—Kamchatka, Kuriles, Sakhalin, Ussuri, Manchuria, Korea, and China.

Var. *insularis* Hara. SHIMA-YAMABUKI-SHŌMA. Petals larger, elliptic, about 1.2–1.5 mm. long, firm; calyx-lobes larger; style longer, about 0.8 mm. long.—Izu Isl. (Oshima).

Var. *laciniatus* (Hara) Hara. *A. vulgaris* var. *laciniatus* Hara—KIREBA-YAMABUKI-SHŌMA. Leaflets deeply incised, ovate-lanceolate; petals in staminate flowers narrowly oblong, 2 mm. long.—Hokkaido (s. Hidaka Prov.).

Var. *astilboides* (Maxim.) Hara. *Spiraea aruncus* var. *astilboides* Maxim.; *A. astilboides* Maxim.; *A. sylvestre* var. *astilboides* (Maxim.) Makino; *A. vulgaris* var. *astilboides* (Maxim.) Nemoto—MIYAMA-YAMABUKI-SHŌMA. Pedicels and follicles erect when mature.—High mountains; Honshu (Mount Hayachine in Rikuchu Prov.).

Var. *subrotundus* (Tatew.) Hara. *A. subrotundus* Tatew.; *A. sylvestre* var. *subrotundus* (Tatew.) Ohwi—APOI-YAMABUKI-SHŌMA. Leaflets rather firm, ovate-orbicular to broadly ovate, rounded with a short cusp at apex, acutely toothed; fruit pendulous on a deflexed pedicel.—Hokkaido (Mount Apoi in Hidaka Prov.).

5. RHODOTYPOS Sieb. & Zucc. SHIRO-YAMABUKI ZOKU

Deciduous shrubs; leaves opposite, short-petioled, simple, penninerved, the stipules free, linear, hairy, membranous, pale green; flowers solitary, terminal on short branches, large, white, short-pedicelled; calyx persistent, the tube short, the segments 4, spreading, rather large, acutely toothed, bracts of the caliculus 4, small; petals 4, spreading, orbicular; stamens many; carpels 4; styles filiform, glabrous; ovules 2 in each carpel; achenes 1–4, black, plump.—A single species, in c. Asia.

1. *Rhodotypos scandens* (Thunb.) Makino. *Corchorus scandens* Thunb.; *Kerria tetrapetala* Sieb.; *R. tetrapetala* (Sieb.) Makino; *R. kerrioides* Sieb. & Zucc.—SHIRO-YAMABUKI. Shrub with spreading glabrous branches; leaves membranous, ovate, 4–6 cm. long, 2–4 cm. wide, acuminate, rounded at base, acutely double-toothed, more or less long-appressed yellowish pubescent beneath, the petioles 2–3 mm.

long; flowers 3–4 cm. across, on pedicels 7–20 mm. long; calyx and pedicels pubescent, the lobes narrowly ovate, 1–1.5 cm. long, the bracts of the caliculus linear to lanceolate, 4–8 mm. long; achenes 7–8 mm. long, ellipsoidal, glabrous.—Apr.–May. Honshu (Chūgoku Distr.); often cultivated.—Korea and China.

6. KERRIA DC. YAMABUKI ZOKU

Deciduous branched shrubs; leaves short-petioled, simple, alternate, the stipules linear, pale brownish; flowers pedicellate, large, terminal and solitary on short branchlets, usually yellow; calyx persistent; petals 5, or many in a double-flowered cultivar; stamens many; carpels 5–8, glabrous, the ovules solitary in each locule, the styles filiform; achenes ovate-globose, rather plump.—A single species, in China and Japan.

1. *Kerria japonica* (Thunb.) DC. *Rubus japonicus* L.; *Corchorus japonicus* Thunb.—YAMABUKI. Much-branched shrub with slender, green, spreading, glabrous branches; leaves membranous, ovate or narrowly so, 3–7 cm. long, 2–3.5 cm. wide, long-acuminate, incised duplicate-toothed, vivid green, paler beneath, nearly glabrous; flowers 2.5–5 cm. across; calyx glabrous, the tube short, the segments broadly ovate to elliptic, spreading, denticulate; petals ovate-orbicular, spreading; achenes 4–5 mm. long.—Apr.–May. Common in moun-

tains; Hokkaido, Honshu, Shikoku, Kyushu. Several cultivars are grown: Cv. *Plena*. *K. japonica* forma *plena* C. K. Schn. Flowers double.—Cv. *Stellata*. *K. japonica* forma *stellata* (Makino) Ohwi; *K. japonica* var. *stellata* Makino—KIKUZAKI-YAMABUKI. Flowers with more numerous petals than in Cv. *Plena*.—Cv. *Albescens*. *K. japonica* forma *albescens* (Makino) Ohwi; *K. japonica* var. *albescens* Makino—SHIROBANA-YAMABUKI. Flowers nearly white.

7. DUCHESNEA Smith HEBI-ICHIGO ZOKU

Stoloniferous perennial herbs; leaves alternate, 3(-5)-foliolate, toothed, petiolate, the stipules partially adnate to the base of the petioles; pedicels axillary, solitary; flowers yellow, bisexual; calyx persistent, the tube spreading, short, the segments 5, the bracts of the caliculus large, alternate with the calyx-segments, toothed; stamens 20-30; carpels many, free, inserted on a globose receptacle; achenes small, inserted on a cavity of the receptacle which is much accrescent and somewhat spongy in fruit.—Few species in temperate and warmer regions in e. and s. Asia.

- 1A. Achenes distinctly rugose-tubercled, not shining; fruiting receptacles pinkish white, not shining, 8-12 mm. across, with a whitish neck; plant smaller than the following. 1. *D. chrysanthra*
 1B. Achenes nearly smooth, glossy when fresh; fruiting receptacles bright red, glossy, 11-20 mm. across, with a red neck; plant larger than the preceding. 2. *D. indica*

1. *Duchesnea chrysanthra* (Zoll. & Moritz.) Miq. *Fragaria chrysanthra* Zoll. & Moritz.; *F. indica* var. *wallichii* Fr. & Sav., excl. syn.; *D. indica* auct. Japon., non Focke; *D. indica* var. *japonica* Kitam.; *D. formosana* Odashima.—HEBI-ICHIGO.

Rather soft green perennial herb with long, slender, leafy stolons; leaflets ovate to ovate-orbicular, 2-3.5 cm. long, 1-3 cm. wide, acute, doubly or incised-toothed, thinly pubescent with ascending hairs on both surfaces especially beneath, the lateral leaflets often shallowly 2-lobed, the petioles with short ascending hairs, the stipules narrowly ovate to broadly lanceolate; calyx-segments narrowly ovate, acute, 5-8 mm. long, the bracts of the caliculus slightly larger than the calyx-segments, spreading, obovate; petals 5-10 mm. long; fruit globose, about 10 mm. across, red, the achenes small, about

1.5 mm. long.—Apr.-June. Sunny grassy places in lowlands, especially common around paddy fields; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, China to Malaysia.

2. *Duchesnea indica* (Andr.) Focke. *Fragaria indica* Andrews; *D. fragiformis* J. E. Sm.; *Potentilla denticulosa* Ser.; *P. wallichiana* Ser.; *F. malayana* Roxb.; *F. roxburghii* Wight & Arn.; *D. indica* var. *major* Makino; *D. major* (Makino) Makino.—YABU-HEBI-ICHIGO.

Closely resembles the preceding but slightly larger, deeper green; leaflets to 7 cm. long; receptacles dark-colored, glabrous; achenes nearly smooth.—Apr.-May. Shady places in woods and on grassy slopes along streams and in ravines in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—China to India.

8. FRAGARIA L. ORANDA-ICHIGO ZOKU

Stoloniferous perennial herbs more or less long-pubescent; rhizomes rather stout; leaves radical, alternate, 3-foliate, petioled, the leaflets toothed, the stipules membranous, partially adnate to the base of the petiole; scapes radical, few-flowered; flowers white; calyx persistent, with a caliculus outside; petals 5-8, as many as the calyx-segments; stamens many; receptacle semiglobose to globose, much accrescent and globose to ellipsoidal and fleshy in fruit; carpels many, free, the style from the side of the carpel; achenes small, glabrous.—More than 10 species, in the temperate regions of the N. Hemisphere and in S. America.

- 1A. Scapes rather many-flowered; plants rather coarse; cultivated. 1. *F. × ananassa*
 1B. Scapes 1- to 5-flowered; plants slender; indigenous.
 2A. Petals 5 (rarely 6), suborbicular; leaves green, paler beneath; anthers ovate.
 3A. Stamens longer than the gynoecium.
 4A. Pedicels with ascending hairs. 2. *F. nipponica*
 4B. Pedicels with spreading hairs. 3. *F. yezoensis*
 3B. Stamens nearly as long as the gynoecium. 4. *F. vesca*
 2B. Petals 7 or 8, obovate to narrowly so; leaves green and slightly glaucescent; anthers broadly elliptic. 5. *F. iinumae*

1. *Fragaria × ananassa* Duchesne. *F. chiloensis* var. *ananassa* (Duchesne) L. H. Bailey; *F. grandiflora* Ehrh.—

ORANDA-ICHIGO. Rhizomes rather stout, with long stolons after anthesis; terminal leaflets broadly ovate or obovate, 5-8 cm. long, 4-6 cm. wide, dentate-serrate, whitish beneath with appressed pubescence especially on nerves beneath, the petioles with ascending to spreading hairs; flowers 5-15 on a scape, 2-2.5 cm. across, 5- to 6-merous; fruit globose to ovoid, 1.5-3 cm. across, the achenes in pits on the fleshy receptacle.—Apr.-May. Hybrid of *F. chiloensis* × *F. virginiana*. Garden strawberry widely cultivated for the edible fruit.

2. *Fragaria nipponica* Makino. *F. vesca* sensu auct. Japon., non L.; *F. elatior* sensu auct. Japon., non Ehrh.; *F. yakusimensis* Masam.—SHIROBANA-NO-HEBI-ICHIGO. Rhizomes rather thickened, short; terminal leaflets elliptic to broadly ovate, 2-5 cm. long, 1-3 cm. wide, subobtusely, loosely appressed-pubescent on upper side, pale green and prominently to distinctly appressed-pubescent especially on nerves beneath, the margin with ovate or subdeltoid teeth, the petioles with spreading pubescence; scapes 1- to 4-flowered, with spreading

pubescence, as long as the leaves or slightly longer; flowers 1.5-2 cm. across, on ascending-pubescent pedicels; calyx-segments narrowly ovate, acuminate, appressed-pubescent outside; stamens 3-4 mm. long; receptacles loosely short-pilose in fruit, broadly ovoid to subglobose, about 10 mm. across, the achenes in pits on the receptacles, many, smooth or very obsoletely nerved.—May-July. Mountains; Honshu (Kantō and centr. distr.), Kyushu (Yakushima).—Korea (Quelpaert Isl.).

3. *Fragaria yezoensis* Hara. *F. nipponica* var. *yezoensis* (Hara) Kitam.; *F. neglecta* sensu auct. Japon., non Lindem.—EZO-KUSA-ICHIGO. Closely resembles the preceding; stoloniferous, the pubescence rather spreading; terminal leaflets rhombic-obovate, rounded at apex, dentate-serrate, with thinly silky pubescence on both sides, denser on nerves beneath and on margin, the petioles with spreading hairs; scapes to 15 cm. long, the pedicels with spreading pubescence; flowers 1.5-2 cm. across; calyx-segments ovate-lanceolate, acute; stamens about 3.5 mm. long; receptacles pilose; achenes with 1 or 2 obsolete nerves on ventral side.—Hokkaido (c. distr.).—s. Kuriles.

4. *Fragaria vesca* L. EZO-HEBI-ICHIGO. Closely allied to No. 2, but slightly larger; terminal leaflets broadly rhombic-ovate; stamens shorter, 1.5–2.5 mm. long; receptacles glabrous or only short-pilose at base.—Grassy places in lowlands; Hokkaido; possibly not indigenous in our area.—Europe.

5. *Fragaria iinumae* Makino. *Potentilla daisenensis* Honda—NŌGŌ-ICHIGO. Rhizomes rather stout; terminal leaflets broadly obovate or cuneate-orbicular, 15–30 mm. long, 12–25 mm. wide, rounded at apex, broadly cuneate at base,

glaucous to green above, prominently glaucous beneath, glabrous above, with appressed to ascending long soft pubescence beneath especially on the nerves, the petioles long-pubescent; scapes 1- to 3-flowered, with appressed to ascending pubescence; flowers 15–25 mm. across; stamens about 2 mm. long; receptacles glabrous, ovoid to narrowly ovoid in fruit, about 8 mm. across, the achenes in pits, smooth.—June–July. Alpine regions; Hokkaido, Honshu (centr. and n. distr. and Mount Daisen in Hōki Prov.).—Sakhalin.

9. POTENTILLA L. KIJI-MUSHIRO ZOKU

Herbs or shrubs, glabrous or tomentose; leaves radical or alternate, rarely opposite on the flowering stems, digitately 3- to 7-foliolate or pinnate, the leaflets toothed or pinnately lobulate, the stipules adnate to the base of the petiole; flowers solitary in leaf-axils or in corymbs, yellow, white, rarely red; calyx persistent, the tube concave to urceolate, the lobes 5, alternate with the bracts of the caliculus, as many as the petals; stamens many; receptacles small, conical, sometimes pilose; carpels many, the style lateral or terminal, persistent or deciduous; achenes small, glabrous or pilose, sessile, 1-seeded.—More than 300 species, in temperate and cooler regions of the N. Hemisphere, rare in the mountains in the Tropics, a few in the S. Hemisphere.

1A. Receptacles not accrescent after anthesis.

2A. Herbaceous or suffrutescent.

3A. Flowers solitary in axils of much-elongate stolons, the pedicels 10–30 cm. long; leaves pinnate, the leaflets 13–19, densely white-woolly beneath; plants of wet places near the sea and in salt marshes. 1. *P. egedei* var. *groenlandica*

3B. Flowers at least partially corymbose, the pedicels not more than 4 cm. long; plants of grassy, wooded or rocky places from lowlands to high mountains.

4A. Leaflets 5, digitate. 2. *P. klemiana*

4B. Leaflets 3 or more, pinnate.

5A. Stems decumbent and branching, very slender and elongate; flowers axillary, solitary, small. 3. *P. centigrana*

5B. Stems erect or ascending only below; stolons if present not flower-bearing.

6A. Stems scapose, less than 40 cm. long, with 1–3 small cauline leaves.

7A. Leaflets glaucous beneath.

7B. Leaflets green or white-villous beneath. 4. *P. dickinsii*

8A. Leaflets 3; stolons absent; anthers ovate-globose to broadly ovoid.

9A. Achenes long-pilose; leaves broadly cuneate, truncate, with 3 coarse teeth at apex. 5. *P. miyabei*

9B. Achenes glabrous or nearly so; leaflets with few to several teeth on each side.

10A. Leaves densely white-tomentose beneath. 6. *P. nivea*

10B. Leaves green on both sides.

11A. Leaves rather densely long-pubescent, thick; flowers 3–4 cm. across. 7. *P. megalantha*

11B. Leaves loosely long-pilose, rather thin; flowers about 2 cm. across. 8. *P. matsumurae*

8B. Leaflets 3–7, if 3, plant with stolons; anthers oblong to broadly lanceolate.

12A. Leaves with dense white-woolly hairs beneath; plant without stolons. 9. *P. discolor*

12B. Leaves green or pale green beneath, not white-woolly.

13A. Leaflets 5–7, rarely 9.

14A. Stolons absent.

15A. Leaflets 5–9, the lower gradually smaller. 10. *P. fragarioides* var. *major*

15B. Leaflets 3, sometimes with a pair of smaller ones on the upper part of the leaf-axis. 11. *P. togasii*

14B. Stolons elongate. 12. *P. stolonifera*

13B. Leaflets 3, rarely 5.

16A. Leaflets usually rhombic-ovate, acute to acuminate, thinly membranous; flowers 1–7, 15–20 mm. across; rhizomes scarcely thickened, stolons much elongate, prominent. 13. *P. yokusaiana*

16B. Leaflets usually oblong, obtuse to subacute; flowers few to rather many, 1–1.5 cm. across; rhizomes short and thickened, often bearing rather short to slightly elongate stolons.

17A. Leaflets herbaceous; stipules of the bracts broadly obovate or flabellate, dilated at tip, prominently toothed on margin; anthers narrowly oblong, yellow. 14. *P. freyniana*

17B. Leaflets subcoriaceous, lustrous above; stipules of the bracts oblong to lanceolate, not dilated, with fewer smaller teeth near apex; anthers ovate-orbicular, pale yellow. 15. *P. riparia*

6B. Stems erect or with ascending base, 30–100 cm. long, rather stout, leafy; flowers many.

18A. Cauline leaves 3-foliolate, green; leaflets toothed.

19A. Stipules adnate for half the length of the petioles; perennial; cauline leaves of 3 elliptic-ovate leaflets.

19B. Stipules adnate only at the base of the petioles; annual or biennial; cauline leaves of 3 (rarely 5) obovate to oblong, obtuse to subacute leaflets. 16. *P. cryptotaeniata*

18B. Cauline leaves, at least the lower ones, pinnately compound; leaflets pinnately lobed to parted, with short white-woolly tomentum beneath. 17. *P. norvegica*

- 20A. Leaflets of radical leaves 15–27, pinnately parted nearly to the midrib, the lobes lanceolate, with accessory leaflets on primary axis; calyx-segments short-pilose and soft-pubescent, green, not white-woolly; bracts of caliculus much narrower than the calyx-segments; achenes rugose. 18. *P. chinensis*
- 20B. Leaflets of radical leaves 7–13, pinnately lobed to cleft, the lobes narrowly ovate, without small accessory leaflets; calyx-segments with white woolly tomentum; bracts of caliculus similar to the calyx-segments in size and shape; achenes smooth. 19. *P. nipponica*
- 2B. Shrub; flowers yellow or white. 20. *P. fruticosa*
- 1B. Receptacles slightly accrescent after anthesis; petals dark reddish purple, shorter than the calyx-segments; plants of bogs and around ponds. 21. *P. palustris*

1. *Potentilla egedei* Wormsk. var. *groenlandica* (Tratt.) Polunin. *P. pacifica* Howell; *P. anserina* sensu auct. Japon., non L.; *P. anserina* var. *orientalis* Card.; *P. anserina* var. *groenlandica* Tratt.—Ezo-TSURU-KIMBAI. Perennial herb with elongate slender stolons; radical leaves 10–40 cm. long; stipules scarious, adnate to the base of the petioles, the rachis with short accessory leaflets, the ordinary leaflets 13–19, oblong or narrowly so, coarsely toothed, 2–5 cm. long, 7–20 mm. wide, glabrous to long-pilose on upper side, with white-woolly hairs beneath, and long silky hairs on the nerves; leaves on the stolons very small; flowers 20–30 mm. across, pedicellate, solitary, axillary on stolons; calyx-segments ovate-deltoid, 4–6 mm. long, acute; bracts of caliculus entire, broadly lanceolate, slightly smaller than the calyx-segments; petals broadly obovate; anthers elliptic; styles about 2 mm. long; achenes smooth, rounded on back.—June–July. Wet saline places near the sea; Hokkaido, Honshu (n. distr.).—Korea, Ochotsk Sea region, Kuriles, Sakhalin, Kamchatka, and N. America.

2. *Potentilla kleiniana* Wight & Arn. *P. reptans* A. Gray; *Duchesnea sundaica* Miq.; ? *P. savatieri* Card.—O-HEBI-ICHIGO. Perennial herb with short rhizomes densely leafy at apex; stems 20–40 cm. long, erect, ascending above, few-leaved and branched, slightly ascending-pubescent; radical leaves long-petioled; stipules tightly adnate to the petiole, the free portion narrowly deltoid, acute, the cauline leaves with the stipules shortly adnate, the free portion ovate, often dentate, the leaflets 5 (or 1–3 on the upper cauline leaves), digitate, narrowly ovate to broadly oblanceolate, 1.5–5 cm. long, 8–20 mm. wide, obtuse, nearly glabrous above, paler and with appressed-pilose nerves beneath; inflorescence rather many-flowered, the pedicels 5–20 mm. long, with white ascending-pilose hairs; flowers about 8 mm. across; calyx-segments ovate, subacute; bracts of caliculus narrower; stamens broadly ovate; receptacle short-pilose at base; achenes broadly ovoid, 0.6 mm. long, slightly longitudinally rugose; styles short, nearly as long as the achenes.—May–June. Honshu, Shikoku, Kyushu; rather common.—Korea, China, India, and Malaysia.

3. *Potentilla centigrana* Maxim. *P. centigrana* var. *japonica* Maxim.; *P. centigrana* var. *mandshurica* Maxim.; *P. reptans* var. *trifoliata* A. Gray; *P. rosulifera* Lév.; *P. longepetiolata* Lév.—HIME-HEBI-ICHIGO. Rather slender perennial herb; stems decumbent, later much elongate, very slender, branching and creeping, many-leaved, slightly spreading-pilose; stipules lanceolate to ovate, subacute; leaflets 3, thin, subsessile, obovate, elliptic or obovate-obicular, 1–3 cm. long, 8–20 mm. wide, obtuse to rounded, nearly glabrous above, slightly glaucous and thinly appressed-pilose on nerves beneath; flowers appearing terminal, but soon axillary, solitary or in a terminal corymb in the upper ones, the pedicels slender, 1–4 cm. long; calyx-segments narrowly ovate, acute,

nearly as long as the bracts of the caliculus; petals about 3 mm. long, yellow; anthers elliptic; achenes broadly ovate, glabrous, with few irregular longitudinal lines; styles linear, about 0.7 mm. long.—Apr.–Aug. Wooded mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, n. China, and Ussuri.

4. *Potentilla dickinsii* Fr. & Sav. *P. ancistrifolia* var. *dickinsii* (Fr. & Sav.) Koidz.; *P. ancistrifolia* sensu auct. Japon., non Bunge—IWA-KIMBAI. Short-pubescent perennial herb with stout short woody branching rhizomes; stems 10–20 cm. long, erect; radical leaves petioled; stipules lanceolate, acuminate; leaflets 3–5, subcoriaceous, the upper 3 larger, rhombic-ovate or elliptic, 2.5–5 cm. long, 1.5–3 cm. wide, acute or sometimes obtuse, with coarse acute deltoid teeth, green above, glaucous beneath; inflorescence few- to rather many-flowered; flowers about 1 cm. across, yellow; calyx-segments narrowly ovate, acuminate; bracts of caliculus lanceolate; anthers broadly ovate; receptacle with dense white hairs about 2 mm. long; achenes ovoid, brown, smooth, with few long curled hairs longer than the body; styles filiform, about 1.5 mm. long.—June–Aug. Rocks in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

5. *Potentilla miyabei* Makino. MEAKAN-KIMBAI. Perennial herb with yellowish brown appressed strigose hairs; rhizomes creeping, short, branching, slightly woody; stems 3–10 cm. long, few-leaved, erect; leaves 3–5 cm. long; free segments of the stipules lanceolate, gradually acute; leaflets 3, subcoriaceous, broadly cuneate, 5–12 mm. long, 4–10 mm. wide, truncate and with 3 coarse teeth at apex, grayish green; flowers 1–5, about 15 mm. across; calyx-segments lanceolate, acute; bracts of caliculus similar to the calyx-segments but smaller; petals 5, 1.5 times as long as the calyx-segments, obovate-obicular; receptacle with dense strigose hairs about 4 mm. long; achenes ovoid, brown, about 1.5 mm. long, smooth, with straight hairs about 4 mm. long at the base and with minutely appressed hairs on the upper portion; styles filiform, 3–3.5 mm. long.—July–Aug. Gravelly to sandy slopes, alpine, Hokkaido; rare.

6. *Potentilla nivea* L. *P. macrantha* Ledeb.; *P. matsuoana* Makino—URAJIRO-KIMBAI. Perennial herb with stout short-creeping and branching rhizomes; stems 10–20 cm. long, 1- or 2-leaved; radical and cauline leaves beneath and the petioles with densely woolly white tomentum; stipules scarious, reddish brown, the free segments broadly lanceolate, acute, green and sometimes dentate in the cauline ones; leaflets 3, obovate-oblong to broadly ovate, 15–25 mm. long, 10–17 mm. wide, obtuse, slightly silky-pubescent and green above, with ovate marginal teeth; flowers 1–5, 1.5–2 cm. across; calyx-segments broadly lanceolate, acute; bracts of caliculus narrowly lanceolate or broadly linear; petals about 1.5 times as long as the calyx-segments, obovate-obicular; receptacles short-pilose; achenes ovoid, about 1.5 mm. long, smooth, gla-

FIG. 8.—*Potentilla matsumurae* T. Wolf. 1, Habit; 2, leaf, upper side; 3, the same, lower side; 4, hairs on leaf margin; 5, 6, stipules; 7, upper cauline leaf; 8–11, bracts; 12, flower bud; 13, 14, flowers seen from above and below; 15, 16, caliculi; 17, hairs on the caliculus; 18, 19, sepals above and below; 20, petal; 21, 22, stamens; 23, pollen; 24, 25, carpels; 26, surface of the carpel; 27, fruit; 28, the same, perianth removed; 29, 30, achenes; 31, floral diagram.

brous.—July–Aug. Rocks and dry slopes in alpine regions; Hokkaido, Honshu (centr. distr.); rare.—Widespread in northern and alpine regions of the N. Hemisphere.

7. *Potentilla megalantha* Takeda. *P. fragiformis* subsp. *megalantha* (Takeda) Hult.; *P. fragiformis* sensu Maxim., non Willd.—CHISHIMA-KIMBAI. Densely long-silky perennial with short-creeping stout branching rhizomes; stems 10–30 cm. long, few-leaved; radical leaves tufted, 5–15 cm. long; stipules brown, membranous, the free segments broadly ovate, oblique, acute; leaflets 3, broadly obovate-cuneate, 3–4 cm. long and nearly as wide, with ovate obtuse coarse teeth, rather thick-herbaceous to coriaceous-herbaceous, densely pubescent especially beneath; flowers 3–7, 3–4 cm. across; calyx-segments narrowly ovate, subacute, 6–15 mm. long; bracts of caliculus ovate, obtuse, rather small; receptacle short-pilose; achenes broadly ovoid, about 1.5 mm. long, with obsolete striations, acutely keeled on the back; styles filiform, 3–3.5 mm. long.—July–Aug. Rocky places or on rocks near the sea; Hokkaido.—Sakhalin, Kuriles, and Kamchatka.

8. *Potentilla matsumurae* T. Wolf. *P. gelida* sensu auct. Japon., non C. A. Mey.—MIYAMA-KIMBAI. Fig. 8. Perennial herb with more or less coarse pubescence; rhizomes stout, short, sparsely branching; stems 10–20 cm. long, few-leaved; stipules brown, subscarious, the segments broadly ovate, obtuse to subacute, green and ovate on the cauline leaves; leaflets 3, broadly obovate-cuneate, 1.5–3 cm. long and nearly as wide, slightly paler beneath, with few usually ovate acute teeth on each side except toward the base; flowers 1–10, about 20 mm. across; calyx-segments narrowly ovate, acute, 4–5 mm. long; bracts of caliculus oblong, obtuse; petals obovate-orbicular, about twice as long as the calyx-segments; receptacle short-pilose; achenes ovoid, smooth, 1.2–1.5 mm. long, nearly rounded on back; styles filiform, about 3 mm. long.—July–Aug. Dry alpine slopes; Hokkaido, Honshu (centr. and n. distr.); rather common and slightly variable.

Var. *lasiocarpa* Hara. KE-MIYAMA-KIMBAI. Carpels long-hairy.—Hokkaido and Honshu (n. distr.).

9. *Potentilla discolor* Bunge. TSUCHIGURI. Perennial herb with stout rhizomes; stems 15–40 cm. long, densely white-woolly while young, sparingly long-pilose, few-leaved; radical leaves tufted, 8–20 cm. long; stipules white-woolly, membranous, the segments short, lanceolate, acute, green and ovate with few teeth in the cauline ones; leaflets 3–7 (rarely 9), oblong to narrowly so, 2–4 cm. long, 8–15 mm. wide, obtuse to acute, green, with thin woolly pubescence above while young, densely white-woolly tomentose beneath, the nerves beneath with appressed long pilose hairs while young, the marginal teeth broadly ovate, subacute; inflorescence few-to many-flowered; flowers 12–15 mm. across; calyx-segments narrowly ovate, acute, 3–4 mm. long; bracts of caliculus slightly smaller; petals 5, about twice as long as the calyx-segments, broadly obovate; receptacle hairy; achenes ovoid, nearly smooth and glabrous, brown, about 1 mm. long, rounded on back; styles rather stout, about 1 mm. long.—Apr.–June. Honshu (Kinki Distr.), Kyushu.—Formosa, China, Manchuria, and Korea.

10. *Potentilla fragarioides* L. var. *major* Maxim. *P. fragarioides* var. *spengeliana* (Regel) Maxim.; *P. spengeliana* Lehm.; *P. rufescens* Fr. & Sav.—KIJI-MUSHIRO. Perennial more or less pubescent or pilose herb with short stout rhizomes; stems 5–30 cm. long, often ascending at base, with coarse long hairs; leaflets of the radical leaves 5–7 (rarely 3–9),

the lower pairs gradually smaller, the upper 3 nearly equal, larger, broadly ovate to elliptic, 1.5–5 cm. long, 1–3 cm. wide, obtuse to subrounded, the teeth broadly ovate or rather deltoid; stipules membranous, coarsely pilose outside, the segments broadly lanceolate, acute, green and ovate with few teeth in the cauline ones; flowers few to many, rather large, 15–20 mm. across; calyx-segments narrowly ovate to broadly lanceolate, subacute, 4–8 mm. long, the bracts of caliculus equal or slightly smaller; petals 1.5–2 times as long as the calyx-segments; receptacle hairy; achenes ovoid, finely rugulose, 1–1.2 mm. long, glabrous; styles rather stout, 1–1.5 mm. long.—Mar.–Aug. Sunny slopes and waste grounds in lowlands and on mountains; Hokkaido, Honshu, Shikoku, Kyushu; very variable.—c. Asia. The typical phase occurs in Siberia, India, and China.

11. *Potentilla togasii* Ohwi. ECHIGO-KIJI-MUSHIRO. Thinly pubescent, green perennial; rhizomes stout, sometimes branched; radical leaves many, 15–35 cm. long, much shorter at anthesis, the leaflets usually 3, membranous, sometimes with a pair of much smaller ones on the petiole, the terminal rhombic-ovate, 4–10 cm. long, 2–6 cm. wide, toothed, acute or nearly so at both ends; flowers yellow, 15–20 mm. across; sepals and bracts of caliculus deltoid-lanceolate; petals 5, orbicular; receptacles white-pilose.—May–June. Honshu (Japan Sea side from Uzen to Etchu).

12. *Potentilla stolonifera* Lehm. *P. fragarioides* var. *flagellaris* Lehm.; *P. fragarioides* var. *stolonifera* (Lehm.) Maxim.; *P. fragariiformis* var. *japonica* A. Gray; *P. japonica* Bl.—TSURU-KIJI-MUSHIRO. Closely allied to No. 10; stolons elongate; stems rather fewer flowered.—Sunny slopes on mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Kuriles, Sakhalin, and Kamchatka.

13. *Potentilla yokusaiana* Makino. *P. freyniana* var. *grandiflora* T. Wolf.—TSURU-KIMBAI. Rather soft vivid green perennial herb with loose pubescence and long slender loosely leaved stolons; rhizomes short, not or very slightly thickened; stems 10–20 cm. long; radical leaves 3-foliolate, petioled; stipules membranous, pale, the segments narrowly ovate, acute, green on the stolons; leaflets 3 or very rarely with an additional small pair on the upper part of the petiole, membranous, rhombic ovate to broadly so, acute to short-acuminate (acute to obtuse in the radical leaves), 1.5–4 cm. long, 1.2–3 cm. wide, rather deeply and acutely toothed; flowers few, 15–20 mm. across; calyx-segments narrowly ovate to broadly lanceolate, acuminate; bracts of caliculus nearly alike; petals 1.5 times as long as the calyx-segments; receptacle hairy on margin; achenes glabrous, the style about 2 mm. long, nearly filiform.—Apr.–June. Wooded mountains; Honshu, Shikoku, Kyushu.

14. *Potentilla freyniana* Bornm. *P. ternata* (Maxim.) Freyn, non C. Koch; *P. fragarioides* var. *ternata* Maxim.—MITSUBA-TSUCHIGURI. Perennial short-pilose herb, with short slender stolons; rhizomes short and stout; stems 15–30 cm. long, slender; stipules of radical leaves pale green to brownish; leaflets 3 (rarely also with a pair of small accessory leaflets on the upper part of the petiole), oblong to ovate or obovate, rounded to subacute, toothed, rather thin, green above, often somewhat purplish beneath; flowers rather many, 10–15 mm. across; calyx-segments broadly lanceolate, acute; bracts of caliculus slightly smaller; petals 1.5 times as long as the calyx-segments; receptacle slightly pilose; achenes about 1 mm. long, pale, rugulose, glabrous; styles rather stout, about 1 mm. long.

—Apr.–June. Sunny slopes of hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and Amur.

15. *Potentilla riparia* Murata. TERI-HA-KIMBAI. Perennial herb with slender elongate stolons to 80 cm. long; rhizomes short, ascending, rather slender; leaves few, subcoriaceous, ternate, sparingly pilose, the terminal leaflet slightly larger than the lateral, elliptic to obovate-elliptic, 2–5 cm. long, 1–2 cm. wide, obtuse, cuneate at base; scapes slender, 10–25 cm. long, ascending, few-bracted and few-flowered; flowers pale yellow, 12–13 mm. across; bracts of caliculus shorter than the sepals, linear-oblancoate; sepals 5, deltoid-lanceolate, 4–5 mm. long, acute; petals 5, obovate, slightly emarginate; receptacle pilose.—Apr.–June. Honshu (Kinki Distr. and westw.); rare.

16. *Potentilla cryptotaeniae* Maxim. *P. cryptotaeniae* var. *insularis* Kitag.—MITSUMOTO-SŌ. Perennial herb with spreading pilose hairs; stems 50–100 cm. long, slightly branched above; radical leaves withering before anthesis; lower cauline leaves long-petioled, the upper sessile; stipule-segments lanceolate to narrowly ovate, acute; leaflets 3, ovate or narrowly so, or ovate-oblong, 3–8 cm. long, 2–3.5 cm. wide, acute to short-acuminate, slightly appressed-pilose on upper side, paler beneath, the teeth ovate, acute, often duplicate; inflorescence branched, many-flowered; flowers about 10 mm. across; calyx-segments narrowly ovate, acuminate; bracts of caliculus broadly lanceolate, subobtuse to acute; petals yellow, broadly obovate, as long as the calyx-segments, about 4 mm. long; anthers small, ovate-orbicular; receptacles short-pilose; achenes many, about 0.8 mm. long, obsoletely rugulose; styles rather stout, about 1 mm. long.—June–Sept. Mountains; Hokkaido, Honshu, Kyushu.

17. *Potentilla norvegica* L. EZO-NO-MITSUMOTO-SŌ. Annual or biennial herb with long pilose hairs; stems 20–60 cm. long; leaves 5-foliolate in the radical ones, 3-foliolate in the cauline; stipules adnate to the petiole on lower half or only at the base; leaflets obovate to oblong, obtuse to acute, the teeth ovate to lanceolate; flowers many, densely arranged; calyx-segments narrowly ovate, acute; petals obovate, shorter than the calyx-segments; receptacles short-pilose; anthers broadly elliptic, small; achenes broadly ovoid, about 0.7 mm. long, rugulose, glabrous, keeled on back; styles rather stout, nearly as long as the achene.—Hokkaido, Honshu (Shinano Prov.).—Cold regions of the N. Hemisphere.

18. *Potentilla chinensis* Ser. KAWARA-SAIKO. Perennial herb with stout rhizomes; stems 30–70 cm. long, long-pubescent; leaves obovate to narrowly so; free portion of stipules linear-lanceolate, green and laciniate to deeply toothed in the cauline leaves; leaflets 15–29, the lower gradually

smaller, the upper oblanceolate to narrowly oblong, 2–5 cm. long, 8–15 mm. wide, pinnately parted nearly to the midrib with acute lobes, nearly glabrous above, densely white-woolly-tomentose beneath; flowers many, 10–15 mm., sometimes to 20 mm. across; calyx-segments narrowly ovate, acute; bracts of caliculus lanceolate; anthers ovoid; receptacle hairy; achenes broadly ovoid, longitudinally rugose, about 1.3 mm. long, keeled on back; styles rather stout, about 1 mm. long.—June–Aug. Sandy sunny places, especially along rivers in lowlands; Honshu, Shikoku, Kyushu.—Korea, Manchuria, Amur, China, and Formosa.

19. *Potentilla nipponica* T. Wolf. *P. chinensis* var. *isomera* Fr. & Sav.; *P. isomera* (Fr. & Sav.) Koidz.—HIRO-HA-NO-KAWARA-SAIKO. Closely resembles the preceding, but the stems slightly shorter, often ascending at base; leaflets fewer, with shallower lobes; calyx-segments large, densely white-woolly; achenes smooth, glabrous.—June–Aug.—Sandy sunny places along rivers in lowlands; Hokkaido, Honshu (n. and centr. distr.).

20. *Potentilla fruticosa* L. *Dasiphora fruticosa* (L.) Rydb.—KINROBAL. Small branching shrub; leaflets elliptic to narrowly oblong, obtuse to acute, 1–2 cm. long, 3–10 mm. wide, long-pubescent on both sides at least while young, the uppermost lateral ones decurrent at base; flowers yellow, 2–2.5 cm. across, on white-hairy pedicels; calyx-segments ovate, 5–7 mm. long, with nerves raised in fruit; petals obovate; achenes ovoid, lustrous, loosely pubescent with long hairs.—June–Aug. Alpine regions; Hokkaido, Honshu (n. and centr. distr.).—Northern and alpine regions of the N. Hemisphere.

Var. *mandshurica* Maxim. *P. fruticosa* var. *leucantha* Makino—HAKUROBAL. Leaflets often mucronate; flowers white.—Alpine regions; Honshu (centr. and Kinki Distr.), Shikoku; rare.—e. Siberia and n. China.

21. *Potentilla palustris* (L.) Scop. *Comarum palustre* L.; *P. comarum* Nestl.—KUROBANA-RŌGE. Stems rather stout, creeping and branching below, 30–60 cm. long, with appressed silky pubescence above; leaflets 5–7 (rarely 3), nearly sessile, narrowly oblong, 4–7 cm. long, 12–30 mm. wide, green above, whitish beneath, with appressed silky pubescence on both sides or glabrate on upper side; flowers 15–20 mm. across; calyx-segments narrowly ovate, 7–15 mm. long, long-acuminate, pubescent; bracts of caliculus small; petals ovate, purplish, shorter than the calyx-segments; receptacles pilose.—June–Aug. Wet places and shallow water around ponds and along ditches in lowlands and on mountains; Hokkaido, Honshu (centr. and n. distr.).—Cold regions of the N. Hemisphere.

10. WALDSTEINIA Willd. KO-KIMBAI ZOKU

Perennial herb with creeping rhizomes; leaves radical or mostly so, petioled, 3-foliolate, toothed, incised or serrate, the stipules membranous; flowers solitary, scapose or few in corymbs; calyx persistent, the tube obconical, the segments 5; bracts of caliculus 5; petals 5, yellow; stamens many; carpels 2–6, free, the ovules solitary; styles nearly terminal, deciduous; achenes obliquely obovate.—Few species, in the N. Hemisphere.

1. *Waldsteinia ternata* (Steph.) Fritsch. *Dalibarda ternata* Steph.; *W. sibirica* Tratt.; *W. fragarioides* sensu auct. Japon., non Tratt.—KO-KIMBAI. Perennial herb with slender elongate creeping rhizomes; leaves radical, 3-foliolate, the leaflets slightly pilose on both sides, toothed, the terminal one broadly rhombic-obovate, 2–3 cm. long, 1.5–2.5 cm. wide, shallowly 3-lobed, the lateral ones oblique, the petioles 5–10

cm. long, slightly spreading-pubescent or glabrate; scapes 10–20 cm. long, nearly as long as the leaves, sometimes sparingly spreading-pubescent, 1- to 3-flowered; flowers yellow, about 2 cm. across; calyx-segments broadly lanceolate, subacute; petals spreading; achenes 3–4 mm. long, white-pilose.—May–June. Woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and Siberia.

11. *SIBBALDIA* L. TATEYAMA-KIMBAI ZOKU

Dwarf suffrutescent shrubs or herbs with creeping branched rhizomes; leaves radical and closely alternate, usually 3-foliate, the stipules adnate to the petiole; inflorescence a scapose cyme; calyx persistent, the tube short, the segments 5, as many as and alternate with the bracts of the caliculus; petals 5, smaller than the calyx-segments, usually narrowly obovate, commonly yellow, rarely purplish; stamens 5; disc hairy; carpels 5–10, with a short hairy stipe at base; style ventral; ovules solitary; achenes 5–10, glabrous.—About 10 species, in northern and alpine regions in the N. Hemisphere.

1. *Sibbaldia procumbens* L. *Potentilla procumbens* (L.) Clairv.; *S. sibbaldii* Haller f.—TATEYAMA-KIMBAI. Dwarf suffrutescent herb with short creeping branches densely covered with stipules and 2–6 cm. long persistent bases of the old petioles; leaflets 3, nearly similar, cuneate, truncate and with 3(–5) large teeth at apex, usually 1–1.5 cm. long, 6–10

mm. wide; inflorescence rather densely about 10-flowered, the pedicels very short; calyx-segments narrowly ovate, 3.5–5 mm. long, acute; petals narrowly obovate; achenes ovoid, small, nearly smooth.—July–Aug. Dry alpine slopes; Honshu (centr. distr.); rare.—N. Korea, Sakhalin, n. Kuriles to Europe and N. America.

12. *DRYAS* L. CHŌNOSUKE-SŌ ZOKU

Dwarf shrubs with short, densely tufted or short-creeping branches; leaves evergreen, simple, petioled, elliptic to ovate, entire or pinnately lobulate, the stipules adnate to the petioles; pedicels erect, solitary, radical; flowers white, sometimes yellow, large; calyx persistent, cup-shaped or campanulate, not caliculate at base, the segments 8 or 9; petals 8 or 9, obovate; stamens many; carpels many; styles terminal, persistent and elongate after flowering, plumose in fruit; ovules solitary; achenes many, usually pubescent.—Few species, in alpine regions in the N. Hemisphere.

1. *Dryas octopetala* L. var. *asiatica* (Nakai) Nakai. *D. octopetala* sensu auct. Japon., non L.; *D. octopetala* forma *asiatica* Nakai; *D. tschonoskii* Juzep.; *D. nervosa* Juzep.—CHŌNOSUKE-SŌ. Decumbent, much-branched dwarf shrub; leaves subcoriaceous, ovate to broadly ovate-elliptic, 10–20 mm. long, 6–15 mm. wide, obtuse, shallowly and obtusely lobulate and slightly recurved on margin, green above with impressed midrib and nerves, densely white-tomentose beneath, the peti-

ole 5–20 mm. long, white-pubescent; pedicels 3–10 cm. long, white-woolly; petals 10–15 mm. long, rounded at apex; achenes about 3 mm. long, pubescent; styles elongate, about 3 cm. long, plumose with white hairs.—July–Aug. Dry alpine slopes; Hokkaido, Honshu (centr. distr.); rare.—Kamchatka, Kuriles, Sakhalin, Ussuri, Ajan, and n. Korea. The typical phase occurs in the cold regions of the N. Hemisphere.

13. *GEUM* L. DAIKON-SŌ ZOKU

Perennial herbs or dwarf shrubs; leaves radical and often cauline, alternate, pinnate or pinnately parted, the leaflets all alike or the terminal larger, sometimes only a terminal one; stipules green, rather large or linear and small, more or less adnate on the petiole; flowers solitary or in corymbs, yellow or white, sometimes reddish purple; calyx with a short obconical tube, the segments persistent, alternate with the bracts of the caliculus; petals 5; stamens many, free; carpels many, on a slightly enlarged glabrous or hairy receptacle; styles terminal, filiform, sometimes jointed, persistent, sometimes deciduous only above the joint, sometimes persistently hairy.—About 50 species, in the temperate to cold regions of the N. Hemisphere, a few in S. America and Africa.

- 1A. Procumbent dwarf glabrous evergreen shrub; leaves with nearly equal leaflets; flowers white, rather large; styles pinnate and elongate in fruit. 1. *G. pentapetalum*
- 1B. Erect coarsely pilose perennial herbs; leaves with the terminal leaflet much larger than the lateral; flowers yellow; styles only slightly elongate after anthesis and not pinnate.
- 2A. Styles jointed, the upper portion deciduous after flowering.
- 3A. Receptacle with yellowish brown bristly hairs 2–3 mm. long; pedicels velvety puberulent. 2. *G. japonicum*
- 3B. Receptacle with very short whitish hairs less than 1 mm. long.
- 4A. Plant hispid-hirsute; lateral leaflets of the radical leaves 2 to 5 pairs; styles without stipitate glands. 3. *G. aleppicum*
- 4B. Plant setose with bristly hairs; lateral leaflets of the radical leaves very small, 1 or 2 pairs; styles with sparse stipitate glands at base. 4. *G. macrophyllum* var. *sachalinense*
- 2B. Styles not jointed, persistent; leaves with a large orbicular-cordate terminal leaflet and very small or obsolete lateral leaflets. 5. *G. calthaeifolium* var. *nipponicum*

1. *Geum pentapetalum* (L.) Makino. *Dryas pentapetala* L.; *Sieversia pentapetala* (L.) Greene; *G. anemonoides* Willd.; *S. dryadioides* Sieb. & Zucc.; *G. dryadioides* (Sieb. & Zucc.) Fr. & Sav.—CHINGURUMA, IWAGURUMA. Dwarf evergreen glabrous shrub with prostrate slender much-divided branches, about 5 mm. thick at base; leaves petioled, 3–6 cm. long, the leaflets 7–9, subcoriaceous, broadly oblanceolate to obovate, 6–15 mm. long, 4–8 mm. wide, acute, with irregular incisions, sometimes subtrilobed, lustrous and deep green above, the stipules linear; scapes about 10–20 cm. long, erect,

with a 3- to 5-parted leaf, densely puberulent above; flowers solitary, white, 2–3 cm. across; calyx-segments broadly lanceolate, long-acute, slightly recurved after flowering, the bracts of the caliculus short, lanceolate; petals orbicular; achenes rather many, about 2 mm. long, fusiform, with white ascending hairs; styles elongate after anthesis, filiform, about 3 cm. long, long white spreading-plumose.—June–Aug. Wet slopes and sometimes sphagnum bogs in high mountains; Hokkaido, Honshu (n. and centr. distr.).—Kuriles, Sakhalin, Kamchatka, and Aleutians.

2. *Geum japonicum* Thunb. *G. iyoanum* Koidz.—
DAIKON-SŌ. Perennial herb with short rhizomes; stems
simple or slightly branched, sometimes few together, some-
times solitary, short velvety-puberulent; leaves puberulent,
sometimes sparingly long-pilose, the lateral leaflets small, 1 or
2 pairs, sometimes obsolete, often with a pair of accessory
small leaflets between the larger ones, the terminal leaflet
orbicular to broadly ovate, 3–6 cm. long and as wide, rounded
to obtuse at apex, subcordate to broadly cuneate at base,
toothed, usually 3-lobed, the cauline leaves short-petioled, usu-
ally simple, deltoid-orbicular, often 3-lobed; flowers few, rarely
1, loosely arranged, long-pedicelled, about 1.5 cm. across, yel-
low; calyx-segments narrowly ovate-deltoid, acute, reflexed,
densely puberulent, sometimes with a few long spreading
hairs.—June–Sept. Woods and thickets in hills and low
mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.
—China.

3. *Geum aleppicum* Jacq. *G. vitalii* Fr. & Sav.—
Ō-DAIKON-SŌ. Coarse perennial herb 60–100 cm. high, with
spreading hispid hairs; radical leaves petioled, pinnate, the
lateral leaflets rather small, 2 to 5 pairs, alternate, with very
small accessory segments, the terminal leaflet rhombic-ovate to
orbicular, 5–10 cm. long, 3–10 cm. wide, acute to rounded at
apex, cuneate to subcordate at base, irregularly toothed, the
cauline leaves short-petioled, 3- to 5-foliate, the stipules obo-
vate, incised; flowers 3–10, long-pedicelled, 15–20 mm. across,
yellow.—June–Sept. Thickets and grassy places in lowlands
and low mountains; Hokkaido, Honshu; common.—e.
Europe, Asia Minor, Siberia, China, Korea, and N. America
(var.).

4. *Geum macrophyllum* Willd. var. *sachalinense*
(Koidz.) Hara. *G. fauriei* Lévl.; *G. japonicum* var. *sachalin-
ense* Koidz.; *G. aleppicum* var. *sachalinense* (Koidz.) Ohwi;
G. sachalinense (Koidz.) Makino, non Lévl.—KARAFUTO-
DAIKON-SŌ. Closely resembles the preceding, but with coarse
bristly setose hairs; lateral leaflets in the radical leaves much
smaller and fewer, often obsolete, the terminal leaflets orbicu-
lar, the cauline leaves simple, 3-lobed, the stipules usually
entire.—Thickets and woods in mountains; Hokkaido, Hon-
shu (centr. and n. distr.).—Sakhalin.—The typical phase
occurs in Asia and N. America.

5. *Geum calthaeifolium* Smith var. *nipponicum* (Bolle)
Ohwi. *G. calthaeifolium* sensu auct. Japon., non Smith;
Parageum calthaeifolium var. *nipponicum* (F. Bolle) Hara;
Acomastylis nipponicum F. Bolle; *A. calthaeifolia* var. *nippo-
nica* (F. Bolle) Hara—MIYAMA-DAIKON-SŌ. Coarse peren-
nial herb with yellowish spreading strigose hairs; rhizomes
stout, short, creeping and branching; radical leaves petioled,
the terminal leaflet orbicular, 5–12 cm. long and as wide, shal-
lowly lobulate and irregularly toothed, cordate at base, lustrous
above, the lateral ones minute, few; scapes 10–30 cm. long,
erect, few-flowered; flowers 2–2.5 cm. across, yellow; calyx
and pedicels densely puberulent, the calyx-segments acute, ob-
liquely spreading; achenes many, long hispid-hairy including
the lower portion of the slightly elongate style, 10–13 mm.
long in fruit.—July–Aug. Alpine slopes; Hokkaido, Hon-
shu (n. and centr. distr.), Shikoku (Mount Ishizuchi).—
Kuriles. The typical phase occurs from the Aleutians and
Kamchatka to northern N. America.

14. RUBUS L. KI-ICHIGO ZOKU

Usually armed shrubs, rarely herbs; leaves alternate, petioled, simple, palmately lobed or palmately to pinnately compound, the stipules rarely lobed, adnate to the base of the petiole; inflorescence 1- to rather many-flowered, usually terminal on short branches, in corymbs or sometimes panicles, the flowers usually bisexual, rarely unisexual; calyx without a caliculus, the tube short, broad, the segments 5, persistent; petals 5, white or rose; stamens many; carpels many, sometimes few, inserted on a raised receptacle, the ovary 1-locular, 2-ovuled; styles subterminal; fruitlets juicy or fleshy, aggregated in a globose to ovoid head, the stones small.—A difficult genus with many species and numerous natural hybrids, chiefly occurring in N. Hemisphere.

1A. Leaves simple and toothed or palmately lobed to cleft.

2A. Stipules and bracts lacinate; leaves usually evergreen; stems usually procumbent to ascending-arching.

3A. Stipules persistent; flowers 1 or 2 on short lateral branchlets borne on stolons; calyx with dense spreading straight prickles.

1. *R. pectinellus*

3B. Stipules deciduous; flowers few, axillary, often in a terminal panicle; calyx not prickly.

4A. Stems glabrous or puberulent only when young; leaves acuminate; calyx puberulent.

5A. Leaves ovate; prickles rather stout, distinctly flattened and slightly recurved; flowers many, in a large terminal panicle.

2. *R. lambertianus*

5B. Leaves suborbicular or ovate-orbicular; prickles slender, very slightly flattened, not recurved; flowers few, axillary or rarely in short terminal panicles. 3. *R. hakonensis*

4B. Stems prominently pubescent; leaves obtuse or acute; calyx long-pubescent.

6A. Branches and inflorescence without gland-tipped hairs.

7A. Stems thick, 3–6 mm. across, with slender straight or slightly recurved prickles; leaves broadly ovate to ovate-orbicular; flowers 2.5–3 cm. across; calyx-segments about 15 mm. long; bracts large. 4. *R. sieboldii*

7B. Stems slender, less than 2.5 mm. across, scarcely prickly; leaves suborbicular; flowers about 1 cm. across; calyx-segments 8–10 mm. long. 5. *R. buergeri*

6B. Branches and inflorescence densely glandular. 6. *R. hatsushimae*

2B. Stipules and bracts entire or with few teeth.

8A. Low usually simple erect herbs; flowering stems rising from slender rhizomes; flowers unisexual (plants dioecious); stipules elliptic to ovate. 7. *R. chamaemorus*

8B. Shrubs; flowering stems from the lateral bud on last year's aerial shoots; flowers bisexual.

9A. Leaf blades peltate; stipules narrowly ovate to broadly lanceolate; fruit oblong-cylindric, consisting of many very densely ar-
ranged fruitlets. 8. *R. peltatus*

9B. Leaf blades basifixed; stipules narrower; fruit globose.

10A. Leaves glaucous beneath; fruit enclosed in a semiglobose calyx; calyx rather thick, nearly glabrous outside, purplish, the
segments densely puberulent inside; pedicels slender; bud-scales persistent. 9. *R. microphyllum*

- 10B. Leaves not glaucous, green or pale green beneath.
- 11A. Flowers few, on short pedicels; bud-scales persistent. 10. *R. crataegifolius*
- 11B. Flowers solitary, if more than 1 then borne together on slender pedicels; bud-scales usually deciduous.
- 12A. Petals 4-6 mm. long; branches and other parts nearly always unarmed; leaves deeply palmately parted; pedicels long and slender. 11. *R. pseudoacer*
- 12B. Petals 10-25 mm. long; plants usually prickly.
- 13A. Calyx glabrous or nearly glabrous outside, the segments rather thick, densely white-villous inside and on margin; leaves undivided or shallowly 3-lobed. 12. *R. grayanus*
- 13B. Calyx pubescent or the segments nearly glabrous on both sides, usually membranous.
- 14A. Flowers 3-7, erect; young branchlets and pedicels with stipitate glands; leaves palmately cleft to lobed. 13. *R. trifidus*
- 14B. Flowers 1, rarely 2, nodding or pendulous.
- 15A. Fertile branchlets and petioles not at all or scarcely prickly.
- 16A. Leaves suborbicular, palmately 5-(3-7)-parted. 14. *R. chingii*
- 16B. Leaves broadly to narrowly ovate, 3-lobed or undivided, very rarely 5-lobed, the outermost lobes very small.
- 17A. Young branches and underside of leaves with short spreading pubescence. 15. *R. ribesoides*
- 17B. Young branches and underside of leaves with appressed to ascending pubescence. 16. *R. ohsumensis*
- 15B. Fertile branchlets and petioles with distinct prickles; flowers solitary on short pedicels.
- 18A. Leaves beneath densely covered with appressed and spreading hairs; fertile branches with undivided leaves. 17. *R. corchorifolius*
- 18B. Leaves nearly glabrous or with only a few appressed hairs on nerves beneath; fertile branchlets with undivided or 3- to 5-cleft leaves. 18. *R. palmatus*
- 1B. Leaves 3- to many-foliolate.
- 19A. Shrubs with woody branches; leaves ternate or pinnate, the leaflets 3 to many.
- 20A. Flowers solitary or few, large; petals orbicular or ovate-orbicular, 10-20 mm. long.
- 21A. Flowers deep reddish, nodding; petals ascending; plants unarmed. 19. *R. vernus*
- 21B. Flowers white, with spreading petals.
- 22A. Leaves ternate, the leaflets sessile or nearly so. 20. *R. nishimuranus*
- 22B. Leaves pinnate, the leaflets 3 to many, if 3, the terminal one distinctly petioluled.
- 23A. Carpophore short but distinct; petals ovate-orbicular; fruitlets small, many; calyx without prickles.
- 24A. Plants usually glandular; branches terete.
- 25A. Underside of leaves and calyx-tube with sessile discoid yellowish glands. 21. *R. minusculus*
- 25B. Plants without sessile discoid glands; pedicels and other parts with stipitate glands (glandular hairs).
- 26A. Glandular hairs 3-5 mm. long. 22. *R. sorbifolius*
- 26B. Glandular hairs 0.2-2 mm. long.
- 27A. Plants with glandular hairs only. 23. *R. croceacanthus*
- 27B. Plants with glandular hairs and prominent eglandular pubescence. 24. *R. hirsutus*
- 24B. Plants without glands; branches obtusely angled.
- 28A. Fertile branches rising directly from the underground rhizomes; leaflets usually 5-7, rarely 3; flowers single; indigenously. 25. *R. illecebrosus*
- 28B. Fertile branches on last year's shoots; leaves 3- to 5-foliolate; flowers double; cultivated. 26. *R. commersonii*
- 23B. Carpophore absent; fruitlets rather large; petals obovate; calyx prickly. 27. *R. oldhamii*
- 20B. Flowers few, small; petals obovate to elliptic, erect, connivent above or ascending, 5-8 mm. long.
- 29A. Plants not glandular-hairy or with glandular hairs not more than 1.5 mm. long.
- 30A. Prickles slender, scarcely broadened at base, not flattened; petals ascending.
- 31A. Branches, petioles, and inflorescence glandular-pilose; leaves on fertile branchlets 3-foliolate; calyx usually prickly, the segments caudately short-acuminate. 28. *R. idaeus*
- 31B. Branches and leaves usually eglandular, sometimes glandular-pilose only on pedicels; leaves on fertile branches 3- to 5-foliolate, slightly smaller; calyx usually not prickly, the segments often filiform-elongate. 29. *R. yabei*
- 30B. Prickles rather stout and flattened laterally, often slightly recurved above; plants without glandular hairs; petals erect or connivent.
- 32A. Leaves on fertile branchlets 5- to 7-foliolate; fruit red. 30. *R. coreanus*
- 32B. Leaves on fertile branchlets 3-foliolate.
- 33A. Leaflets acuminate or very acute; calyx not prickly.
- 34A. Leaflets with short white tomentum beneath, the terminal one ovate-orbicular; fruit purplish black at maturity. 31. *R. mesogaeus*
- 34B. Leaflets later becoming green, the terminal one ovate to rhombic-elliptic. 32. *R. yoshinoi*
- 33B. Leaflets obtuse to rounded; calyx more or less prickly. 33. *R. parvifolius*
- 29B. Plant with long-stiped glandular hairs 2-5 mm. long, especially on the inflorescence, stems, and leaf-axis; calyx-segments connivent even in fruit. 34. *R. phenicolasius*
- 19B. Herbs with pedately 3- to 5-foliolate leaves.
- 35A. Herbs, unarmed, with very slender filiform creeping stolons; leaflets obtuse; stipules brownish, rounded at apex. 35. *R. pedatus*
- 35B. Herbs with woody base and long ascending to erect shoots, becoming decumbent; leaflets acuminate; stipules green.
- 36A. Plant armed with prickles; calyx-segments erect in fruit. 36. *R. ikenoensis*
- 36B. Plant unarmed; calyx-segments reflexed in fruit. 37. *R. pseudojaponicus*

1. *Rubus pectinellus* Maxim. KOBA-NO-FUYU-ICHIGO. creeping, slightly prickly, the erect fertile branches 10-20 cm. Small evergreen pubescent suffrutescent shrub with slender, leaves orbicular-cordate, 3-5 cm. long, obtusely to subacutely toothed, sometimes obsoletely incised, the

petioles 4–7 cm. long, prickly; pedicels 1–5 cm. long, prickly; calyx ovoid, rather densely prickly, 15–20 mm. long, the lobes lacinate, short-pubescent inside, reflexed in fruit; petals narrowly obovate, about 10 mm. long; receptacles and carpels pilose, the stamens 2.5 mm. long, less prominently rugose.—May–July. Woods; Honshu, Shikoku, Kyushu.

2. *Rubus lambertianus* Ser. SHIMABARA-ICHIGO. Branches erect, elongate, slightly scandent above, with rather stout, flattened prickles, glabrous to short-pubescent; leaves ovate or broadly so, 5–12 cm. long, 4–8 cm. wide, acuminate, cordate at base, asperous and strigose-pilose especially on nerves on upper side, with spreading hairs beneath, acutely serrulate, shallowly 3- to 5-lobulate, the lateral lobes short, sometimes obsolete, the petioles 2–4 cm. long, prickly and short-pubescent; corymbs in a narrow terminal panicle 15–20 cm. long, short-pubescent, the pedicels 3–10 mm. long; calyx with a short tube, the lobes narrowly ovate-deltoid, 5–7 mm. long, acuminate, ascending, with dense white tomentum on margin; petals 4–5 mm. long, obovate-spathulate; stamens about 1.5 mm. long, obliquely rugose.—Oct.–Nov. Kyushu (Higo and Hizen Prov.).—Formosa and S. China.

3. *Rubus hakonensis* Fr. & Sav. *R. lambertianus* subsp. *hakonensis* (Fr. & Sav.) Focke—MIYAMA-FUYU-ICHIGO, MIYAMA-ICHIGO. Stems slender, woody, loosely prickly with slender, scarcely flattened, spreading prickles, glabrous to short-pubescent; leaves subcoriaceous, broadly ovate to ovate-orbicular, 5–8 cm. long, 4–7 cm. wide, short-acuminate, cordate at base, glabrate on both sides or short-pubescent beneath, especially on nerves, and on nerves above, 3- to 5-lobulate, the lateral lobes short or often obsolete, with short-awned teeth, the petioles 3–7 cm. long; inflorescence rather densely few-flowered, short-pubescent, the pedicels short; calyx pubescent, 7–8 mm. long, the tube short, the lobes nearly ovate, acuminate, sometimes 2- to 4-lobed, densely short-pubescent on margin; petals 4–5 mm. long, obovate; fruit red, the stamens about 2 mm. long, obliquely rugose.—Aug.–Oct. Woods in mountains; Honshu (centr. distr. and westw.), Shikoku, Kyushu.—China (?).

4. *Rubus sieboldii* Bl. HŌROKU-ICHIGO. Branches stout, elongate and subscaudent above, with slender, spreading or slightly recurved scattered prickles, short-puberulent and with long spreading hairs; leaves coriaceous, broadly ovate to ovate-orbicular, 7–25 cm. long, 6–20 cm. wide, cordate at base, shallowly and obtusely lobulate and mucronate-toothed, with deciduous woolly hairs on upper side, with yellowish tomentum beneath, sparsely prickly on both sides, the petioles 2–7 cm. long, loosely prickly and densely puberulent; inflorescence axillary, densely few-flowered, the pedicels very short, the bracts large; calyx yellowish tomentose, the lobes broadly ovate to elliptic, sometimes obtusely toothed; petals about 15 mm. long and as wide; fruit red.—Mar.–June. Thickets and cut-over areas in low mountains and hills; Honshu (Izu Is. and Kinki Distr.), Shikoku, Kyushu.—S. China and Ryukyus.

***Rubus pseudosieboldii* (Makino) Makino. *R. buergeri* var. *pseudosieboldii* Makino**—Ō-FUYU-ICHIGO. An alleged hybrid of Nos. 4 and 5, with characters intermediate between the parents, especially the branches somewhat more slender than in No. 4.

5. *Rubus buergeri* Miq. FUYU-ICHIGO. Shrub with slender creeping stems sparingly armed with short slender

slightly flattened prickles or often unarmed, densely short-pubescent; leaves chartaceous, deep green, nearly orbicular, 5–10 cm. long and as wide, cordate, rounded to subacute at apex, with short-awned small teeth, obsolete 3- to 5-lobulate with rounded depressed lobules or often unlobed, short-pubescent on the nerves above, spreading-pilose beneath, the petiole 3–10 cm. long, densely pubescent; inflorescence axillary, densely few-flowered, often aggregated in a terminal panicle, the flowers short-pedicelled; calyx with long yellowish hairs, 8–10 mm. long; petals 7–8 mm. long; fruit red, the stamens about 2.5 mm. long, pitted.—Aug.–Nov. Woods in low mountains; Honshu (Awa and Izu Prov. and westw.), Shikoku, Kyushu.—S. Korea, Formosa, and China.

6. *Rubus hatsushimae* Koidz. TSUKUSHI-AKI-TSURU-ICHIGO. Leaves ovate, acute, cordate, indistinctly incised-lobed, acutely toothed, appressed-pubescent on upper side, densely white-pubescent beneath, yellowish hairy on nerves above, glandular-hairy on nerves beneath; calyx densely hairy and glandular-pilose outside, the segments lanceolate-filiform, 1- or 2-lacinate above; petals spatulate-obovate.—Reported from Kyushu (Shimabara in Hizen Prov.).

7. *Rubus chamaemorus* L. HOROMU-ICHIGO. Unarmed dioecious herb, with branched, slender rhizomes; stems erect, 10–25 cm. long, simple, 2- or 3-leaved, slightly soft-pubescent, with few scalelike leaves at base; leaves deep green, reniform-orbicular, cordate, 4–7 cm. long and as wide, shallowly (3–)5-lobulate with depressed rounded lobes, nerves above palmately impressed, loosely appressed-pubescent to glabrate on upper side, spreading-pubescent beneath especially on nerves, the stipules membranous, 3–7 mm. long, obtuse; flowers unisexual, solitary, terminal; calyx-lobes narrowly ovate or elliptic, obtuse to rounded, soft-pubescent, sometimes with a few glandular hairs; petals white, 8–10 mm. long; stamens about 3 mm. long, obsolete striate on upper portion.—June–July. Sphagnum bogs; Hokkaido, Honshu (n. distr.).—Kuriles, Sakhalin, and N. Korea to Europe and N. America.

8. *Rubus peltatus* Maxim. HASU-NO-HA-ICHIGO. Shrub with rather stout glabrous often glaucous loosely prickly branches, the prickles spreading, flattened, slightly curved; leaves peltate, ovate-orbicular, cordate, 10–25 cm. long, 7–20 cm. wide, shallowly 5-lobed, the lobes acuminate, toothed, the nerves beneath with spreading hairs, the stipules 10–15 mm. long; receptacle densely short-pilose; flowers glabrous, solitary on short branchlets; calyx-segments narrowly ovate; fruit short-cylindric, about 4 cm. long; fruitlets very many, densely spreading-puberulent; stamens prominently pitted.—May–June. Mountains; Honshu (Mino, S. Shinano, and Echizen Provs. and westw.), Shikoku, Kyushu; rather rare.

9. *Rubus microphyllus* L. f. *R. incisus* Thunb.; *R. pseudoincisus* O. Kuntze; *R. geifolius* O. Kuntze—NIGAI-ICHIGO. Shrub with rather slender branches usually purplish brown, with rather slender prickles, more or less glaucous, the fertile branchlets scarcely elongate, 2- to 4-leaved toward base; leaves ovate to orbicular, 2–5 cm. long, 1.5–4 cm. wide, rounded to acute at apex, rounded to cordate at base, usually shallowly 3-lobed, toothed, distinctly glaucous beneath, the petioles sometimes slightly pubescent on the upper side; flowers 1(–3) on reddish purple pedicels 1–2.5 cm. long; calyx glabrous, 5–7 mm. long, reddish purple, the segments densely white-tomentose inside; petals white, 10–12 mm. long;

fruit enclosed in a persistent calyx, red; stones pitted.—Apr.–May. Low mountains; Honshu, Shikoku, Kyushu; common.—China.

Var. *subcrataegifolius* (Lév. & Van't.) Ohwi. *R. crataegifolius* var. *subcrataegifolius* Lév. & Van't.; *R. koehneanus* Focke; *R. incisus* var. *koehneanus* (Focke) Koidz.—MIYAMA-NIGA-ICHIGO. Similar to the typical phase but larger, with few slender prickles, the fertile branchlets slightly elongate, to 7–15 cm. long; leaves 4–8 cm. long, acuminate, 3-lobed; flowers 1–3; calyx-segments caudately acuminate.—May–June. Mountains; Honshu; rather common.

10. *Rubus crataegifolius* Bunge. *R. wrightii* A. Gray; *R. morifolius* Sieb., non P. J. Muell.; *R. savatieri* L. H. Bailey.—KUMA-ICHIGO, EZO-NO-KUMA-ICHIGO, TACHI-ICHIGO. Shrub with rather stout flattened prickles, the flowering branches few-leaved, slightly elongate, more or less pubescent; leaves broadly ovate to orbicular, 4–10 cm. long, 3.5–8(–10) cm. wide, acuminate to sharply acute, truncate to cordate at base, glabrous to loosely appressed-pubescent on upper side, with spreading hairs beneath especially on the nerves, 3(–5)-lobed or -cleft and irregularly toothed, the lateral lobes acute; inflorescence 2- to 6-flowered, rather densely short-pubescent, the pedicels short, 5–10 mm. long; calyx 8–10 mm. long, cup-shaped, short-pubescent outside, the lobes narrowly ovate, acuminate, densely white-tomentose on margin and inner side; petals white, obovate; fruit globose, red, the stones pitted, about 2 mm. long, the receptacle pilose.—Apr.–June. Waste grounds and clearings in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common with variable pubescence.—China.

11. *Rubus pseudoacer* Makino. MIYAMA-MOMIJI-ICHIGO. Scarcely small erect shrub, the fertile branchlets rather elongate, nearly glabrous; leaves membranous, orbicular, cordate, 6–10 cm. long and as wide, palmately 5- to 7-parted with acuminate, often 3-fid, incised and toothed segments, slightly pilose to glabrous on both sides; flowers few, loose, on slender glabrous pedicels 2–4 cm. long; calyx glabrous outside, the tube cup-shaped, the segments ovate, caudate, white-puberulent inside and on margin; petals broadly ovate, 4–6 mm. long; fruit globose, the fruitlets glabrous; stones pitted.—July–Aug. Mountains; Honshu (Kantō to Kinki Distr.), Shikoku; rare.

12. *Rubus grayanus* Maxim. RYŪKYŪ-ICHIGO, SHIMAWA-ICHIGO. Glabrous unarmed or very sparingly prickly shrub with elongate branches; leaves ovate or elliptic, 6–10 cm. long, 4–6 cm. wide, obtuse to acute, rounded to shallowly cordate at base, usually undivided, with shallow teeth; flowers solitary on a short fertile branchlet, the pedicels rather slender, 1–1.5 cm. long; calyx with shallowly cup-shaped tube, the segments narrowly ovate-deltoid, acuminate, 6–10 mm. long, white-tomentose on margin and on inner side; fruit globose; stones pitted.—Kyushu (Yakushima and Tanegashima).—Ryukyus and S. China.

Var. *chaetophorus* Koidz. TOGE-RYŪKYŪ-ICHIGO. Prickles distinct; leaves 3-lobed.—Kyushu (Oosumi Prov.).

13. *Rubus trifidus* Thunb. *R. hydrastifolius* A. Gray.—KAJI-ICHIGO. Stout bushy unarmed shrub to 1.5 m. high; branches elongate, terete, rather stout, pubescent and glandular-hairy; leaves orbicular, cordate to truncate at base, 5- to 7-cleft or shallowly parted with very acute and doubly toothed lobes, slightly lustrous and green on upper side; inflorescence few-flowered; flowers white, 3–4 cm. across; calyx

12–15 mm. long, the lobes narrowly ovate, subcaudate, white-tomentose on margin and on inner side; petals orbicular; fruit globose, yellow; stones pitted.—Apr.–May. Near seashores in warmer parts of Honshu (Pacific side, from Awa to Kii Prov., incl. Izu Isls.); rather common and much planted for the edible fruit.

Hybrids of *R. trifidus* with the second parent one of the following: 9, 15, 17, or 18: *R. × medius* O. Kuntze. HIME-KAJI-ICHIGO; *R. × manazurensis* Hisauchi. MANAZURU-KI-ICHIGO; *R. × laudabilis* Koidz. TOGE-NASHI-ICHIGO; *R. × koidzumii* Hisauchi. ŌTOGE-NASHI-ICHIGO; *R. × hisautii* Koidz. YABU-AWA-ICHIGO; *R. × kyusianus* Koidz., non Nakai; *R. × yenosimanus* Koidz.; *R. × omogoensis* Koidz.; *R. × yakumontanus* Masam.; *R. × tanakae* O. Kuntze; *R. × ribifolius* Sieb. & Zucc.; others are reported.

14. *Rubus chingii* Hu. *R. officinalis* Koidz.—GOSH-ICHIGO. Very sparingly prickly shrub with rather stout branches, the flowering branches glabrous, short; leaves membranous, suborbicular, shallowly cordate at base, 5–10 cm. in diameter, deeply 5-cleft, with long-acuminate doubly toothed segments, appressed-pubescent on nerves on both sides or glabrous above, the stipules filiform; flowers solitary, on slender glabrous pedicels 2–3 cm. long; calyx with nearly flat tube, the segments ovate or oblong, 6–8 mm. long, rounded to obtuse and sometimes with a mucro at apex, short appressed-pubescent on both sides; petals white, about 15 mm. long; fruit globose, fruitlets with dense spreading hairs.—May. Mountains; Kyushu (n. distr.).—China.

15. *Rubus ribesoides* Matsum. *R. trifidus* var. *tomentosus* Makino.—HACHIJŪ-ICHIGO, BIRŌDO-KAJI-ICHIGO. Unarmed shrub, the branches rather stout, densely velvety-puberulent while young, the fertile branchlets short; leaves broadly deltoid-ovate, 5–7 cm. long, 4–6 cm. wide, acute to short-acuminate, truncate to cordate at base, 3- to 5-cleft or -lobed, coarsely and irregularly toothed, short-puberulent on both sides especially on nerves beneath; flowers solitary, the pedicels 1–2 cm. long, nodding above, densely velvety-puberulent; calyx-lobes ovate-oblong, mucronate, densely puberulent inside; petals ovate-orbicular, spreading, about 15 mm. in diameter; fruit globose, the fruitlets nearly glabrous.—Dec.–Apr. Near seashores in warmer regions; Honshu (Pacific side), Shikoku, Kyushu.

16. *Rubus ohsumensis* Koidz. MARUBA-NO-MOMIJI-ICHIGO. Nearly unarmed shrub, the branches soft-pubescent while young, the flowering canes very short; leaves broadly ovate to ovate-orbicular, 3–7 cm. long, 3–6 cm. wide, acute, cordate at base, irregularly duplicate-toothed, 3- to 5-cleft, short-pubescent on nerves on both sides, the petioles pubescent; flowers solitary, the pedicels densely pubescent, 8–12 mm. long; calyx appressed-pubescent, the segments narrowly ovate, 6–8 mm. long, acute; petals ovate-orbicular, longer than the calyx-lobes; carpels slightly pubescent; fruit globose, the fruitlets glabrous; stones pitted.—Mar.–Apr. Near seashores; Honshu (Izu Isls.), Kyushu. Possibly a hybrid between Nos. 15 and 18.

17. *Rubus corchorifolius* L. f. *R. villosus* Thunb.; *R. oliveri* Miq.; *R. corchorifolius* var. *glaber* Matsum.—BIRŌDO-ICHIGO. Shrubs, the branches elongate, with rather stout flat prickles, densely pubescent when young with short soft spreading hairs, the flowering branchlets 2–5 cm. long, prickly; leaves membranous, elliptic-ovate or narrowly so, 4–10 cm.

long, 2-4 cm. wide, abruptly acuminate, slightly cordate at base, very rarely obsoletely 3-lobed, irregularly toothed, with ascending short hairs on nerves above, with short spreading hairs and appressed pubescence beneath; flowers solitary, white, the pedicels 7-12 mm. long, densely short-pubescent; calyx 7-10 mm. long, appressed-pubescent, the tube rather broad, shallowly cup-shaped, slightly depressed in the center, the lobes broadly lanceolate, appressed-pubescent also on the inner side; petals about 10 mm. long; fruit globose, the fruitlets densely short-pubescent, the receptacle short-pubescent.—Apr.-May. Honshu (Suruga Prov. and westw.), Kyushu.—s. Korea and China.

18. *Rubus palmatus* Thunb. *R. palmatoides* O. Kuntze; *R. edulis* Koidz.; *R. dulcis* Koidz.; *R. palmatus* var. *palmatus* O. Kuntze—NAGABA-MOMIJI-ICHIGO. Shrub, the branches with rather stout flat prickles, greenish, the flowering branchlets scarcely elongate, slightly pubescent while young; leaves ovate to narrowly so, 3-7 cm. long, 2.5-4 cm. wide, long-acute to acuminate, truncate to shallowly cordate at base, 3(-5)-lobed or -cleft, rarely undivided, with irregularly acute-toothed lobes, appressed-pubescent on nerves on both sides when young, the petioles often prickly; flowers solitary, white, nodding, the pedicels 5-10 mm. long, sparingly soft-pubescent; calyx 10-12 mm. long, the lobes membranous, more or less appressed-pubescent on both sides; petals broadly obovate, much longer than the calyx-segments; fruit globose, yellow, the fruitlets glabrous.—Mar.-May. Hills and low mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Korea and China. Common and variable.

Var. *coptophyllus* (A. Gray) O. Kuntze. *R. coptophyllus* A. Gray; *R. palmatus* forma *coptophyllus* (A. Gray) O. Kuntze; ? *R. fauriei* Lévl. & Van't.; ? *R. horiyoshitake* Koidz.—MOMIJI-ICHIGO. Leaves ovate to broadly so, palmately (3-5)-lobed to -lobulate.—Honshu (centr. and n. distr.).

Var. *kisoensis* (Nakai) Ohwi. *R. kisoensis* Nakai—KISO-KI-ICHIGO. Leaves scarcely divided, deeply cordate at base, the lateral nerves many.—Mountains; Honshu (centr. distr.); rare.

19. *Rubus vernus* Focke. *R. spectabilis* subsp. *vernus* Focke; *R. spectabilis* sensu auct. Japon., non Pursh—BENI-BANA-ICHIGO. Unarmed shrub with pale yellowish brown branches, soft-pubescent only while very young, the fertile branchlets rather short; leaves membranous, 3-foliate, the leaflets loosely pubescent on both sides or only on the nerves beneath, the terminal leaflet broadly rhombic-obovate, acute, incised or doubly toothed, 3-7 cm. in diameter, the stipules narrowly lanceolate, the petioles pubescent; flowers solitary, nodding, deep pink, the pedicels 3-6 cm. long, pubescent and with a few stipitate glands; calyx 15-18 mm. long, pubescent and glandular-pubescent, the tube broad, the segments ovate, acute; petals ovate-orbicular, ascending to obliquely spreading, 15-20 mm. long; fruit globose, yellowish red, the fruitlets glabrous; stones about 4 mm. long, pitted.—June-July. Alpine regions; Honshu (centr. and n. distr.).

20. *Rubus nishimuranus* Koidz. *R. hachijoensis* Nakai; *R. toyorensis* Koidz.; *R. sacrosanctus* Hatus.—HACHIJO-KUSA-ICHIGO. Shrub with very sparingly prickly branches, the prickles slender, spreading, scarcely flattened, the fertile branchlets slightly elongate, 7-15 cm. long, pubescent and glandular-pilose; leaves 3-foliate or sometimes the leaflets connate below in the upper ones, the terminal leaflets ovate-elliptic or narrowly ovate, 5-8 cm. long, 3-5 cm. wide, acuminate, doubly toothed, pubescent on both sides especially on the

nerves, scarcely to very shortly petioluled, the stipules lanceolate; flowers 1 or 2, the pedicels 3-6 cm. long, pubescent and glandular-pilose, often bracteate near the middle; calyx glandular-pilose and short-pubescent, 12-18 mm. long, the lobes rather thick, acuminate, densely puberulent inside; petals white, ovate-orbicular, 15-20 mm. in diameter; carpels nearly glabrous.—Apr.-May. Honshu (Kantō Distr. and Nagato Prov.), Kyushu (n. distr.).—Bonins.

21. *Rubus minusculus* Lévl. & Van't. *R. succedaneus* Nakai & Koidz.; *R. rosaeifolius* var. *tropicus* forma *minor* Makino—HIME-BARA-ICHIGO. Shrub with slender, slightly flattened, acuminate prickles, and with scattered yellowish sessile discoid glands on young branches, underside of leaves, leaf-axis, and calyx, the branches slightly prickly, short-pubescent while young, the flowering canes slightly elongate, sparingly prickly; leaflets 5-7, membranous, broadly lanceolate to narrowly ovate, 1-3 cm. long, acute to acuminate, short-pubescent on both sides especially on nerves beneath, doubly toothed, the petioles short-pubescent and with few prickles, the stipules lanceolate; flowers solitary, the pedicels 2-3 cm. long, short-pubescent; calyx 10-16 mm. long, short-pubescent, the tube nearly flat, the lobes narrowly ovate, caudately acuminate, short-puberulent inside; petals white, 12-15 mm. long, broadly obovate-orbicular; fruit globose, the receptacle pilose, the fruitlets glabrous; stones small, about 1.5 mm. long, pitted.—Apr.-May. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

22. *Rubus sorbifolius* Maxim. *R. asper* sensu auct. Japon., non Wall. nec Presl; *R. rosaeifolius* var. *sorbifolius* (Maxim.) Makino—KOJIKI-ICHIGO. Shrub with rather stout, flat prickles and long spreading glandular hairs, the branches stout, elongate, slightly prickly, glandular-pilose while young and sometimes also short-pubescent, the flowering branchlets elongate, 20-40 cm. long; leaflets (3-5)-7, membranous, narrowly ovate to broadly lanceolate, 4-8 cm. long, 1.5-4 cm. wide, acuminate, rounded to obtuse at base, doubly or irregularly acute-toothed, ascending-pubescent on upper side especially on the nerves, glandular-pilose and often slightly spreading-pubescent on nerves beneath, the petioles glandular-pubescent and sparingly prickly; inflorescence a terminal leafy corymbose soft-pubescent panicle with glandular hairs; calyx 10-15 mm. long, the lobes lanceolate-deltoid, caudate, densely white-puberulent inside and on margin, reflexed in fruit; petals obovate or oblong, about 10 mm. long; fruit oblong, the fruitlets very many, glabrous; stones about 1.5 mm. long, pitted.—May-June. Honshu (Tōkaidō and Kinki Distr.), Shikoku, Kyushu.—s. Korea, China, Formosa, (India ?).

23. *Rubus croceacanthus* Lévl. *R. rosaeifolius* sensu auct. Japon., non Smith; *R. rosaeifolius* var. *tropicus* sensu *genuinus* Makino; *R. kinokuniensis* Koidz.; *R. isensis* Honda; *R. kiusianus* Nakai; *R. okinawensis* Koidz.—Ō-BARA-ICHIGO. Shrub, the branches with rather flat prickles and glandular-pilose, often also short-pubescent, the flowering canes short, prickly; leaflets 1-5, broadly lanceolate to ovate, 2-7 cm. long, 1-3 cm. wide, acute or acuminate, rounded to obtuse at base, doubly toothed, appressed-pubescent on midrib above and on nerves beneath while young, the petioles glandular-pilose, prickly and slightly pubescent; flowers 1-3; calyx and pedicels glandular-pilose, the calyx lobes ovate-deltoid, caudate, white-tomentose inside and on the margin; petals nearly orbicular, about 15 mm. in diameter; receptacles hairy near base; fruitlets glabrous, aggregated in a broadly ellipsoidal head.—

Mar.-May. Honshu (s. Kantō Distr. and Kii Prov.), Shikoku, Kyushu.—s. Korea and Formosa.

24. *Rubus hirsutus* Thunb. *R. thunbergii* Sieb. & Zucc. —KUSA-ICHIHO. Suffrutescent or a small shrub with few slender prickles and dense spreading pubescence, often with short glandular hairs, the flowering branchlets rather short; leaflets membranous, 3 (sometimes 5 on vigorous shoots), ovate, 2.5–7 cm. long, 2–4 cm. wide, acute, rounded at base, doubly toothed, prominently hairy on both sides, the petioles soft-pubescent, sometimes with glandular hairs, the stipules lanceolate; flowers 1 or 2, white, erect, about 3 cm. across, the pedicels 3–6 cm. long, densely glandular-hairy; calyx-lobes lanceolate-deltoid, densely puberulent on both sides, glandular-pilose outside, caudately elongate above; petals obovate to ovate-orbicular, 15–20 mm. long; fruit red, globose, the fruitlets many.—Apr.-May. Thickets and waste grounds in lowlands and low mountains; Honshu, Shikoku, Kyushu; rather common.—Korea and China.—Cv. *Harae*. *R. hirsutus* forma *harae* (Makino) Ohwi; *R. thunbergii* var. *harae* Makino.—YAEZAKI-KUSA-ICHIHO. A double-flowered cultivar.—Forma *simplicifolius* (Makino) Ohwi. *R. thunbergii* var. *simplicifolius* Makino.—MARUBA-KUSA-ICHIHO. Leaves simple, 3-cleft; gradually grading into the typical phase through forma *ohmatiensis* (Nakai) Ohwi. *R. ohmatiensis* Nakai.—OMACHI-KI-ICHIHO. With simple and pinnately ternate leaves on the same plant.

25. *Rubus illecebrosus* Focke. *R. rosaeifolius* var. *coronarius* f. *simpliciflorus* Makino; *R. commersonii* var. *simpliciflorus* (Makino) Makino; *R. commersonii* var. *illecebrosus* (Focke) Makino; *R. yakusimensis* Masam.—BARA-ICHIHO. Subshrub with long-creeping stolonlike rhizomes, the prickles flat, the flowering branches erect, 20–60 cm. long, obtusely angled, glabrous, slightly prickly; leaflets 3–7, lanceolate to broadly so, 3–8 cm. long, 1–2 cm. wide, acuminate, usually rounded at base, doubly acute-toothed, glabrous to thinly appressed-pubescent above, often appressed-pubescent on nerves beneath, the petioles glabrous, loosely prickly; flowers white, few to rather many, in a terminal corymb, the pedicels glabrous, sparingly prickly; calyx glabrous, the lobes narrowly ovate, caudate, white-tomentose on margin and inner side; petals ovate-orbicular, 15–20 mm. long; fruit subglobose or broadly ellipsoidal, red.—July–Aug. Thickets and waste grounds; Honshu (centr. distr.), Shikoku, Kyushu.

26. *Rubus commersonii* Poir. *R. eustephanos* var. *coronarius* Koidz.—TOKIN-IBARA. Nearly glabrous shrub with flat prickles, the flowering branchlets rather elongate, on last year's shoots, obtusely angled, sparingly prickly; leaflets 3–5, ovate-oblong to oblong, 2–5 cm. long, 1–3 cm. wide, doubly acute-toothed; flowers 1 or 2, white, 5–6 cm. across, double, the pedicels 5–10 cm. long, sparsely prickly; calyx-lobes broadly ovate, densely appressed-puberulent inside, thinly puberulent outside, abruptly mucronate or short-caudate.—May–June. Chinese species long cultivated in our area.

27. *Rubus oldhamii* Miq. *R. pungens* var. *oldhamii* (Miq.) Maxim.—SANAGI-ICHIHO. Shrub with rather slender slightly flattened prickles on the elongate, decumbent, slender branches and pedicels, the flowering branchlets short, sometimes much abbreviated, sparingly short-pubescent above; leaflets membranous, 5(–7), the lateral ones smaller, ovate, obtuse to acute, the terminal one rhombic to deltoid-ovate, 2–4 cm. long, 1–3 cm. wide, acuminate, acute to truncate at base, often 3-lobed, doubly incised-toothed, sparingly ap-

pressed-pubescent to nearly glabrous; flowers 1(–3); calyx 8–12 mm. long, short-pubescent outside and glandular hairy, with many slender scarcely flattened prickles, the lobes narrowly ovate-deltoid, long-acuminate, rather densely appressed-puberulent inside; petals white, obovate-spathulate, about 10 mm. long; carpels soft-puberulent, the receptacle short-pilose.—May–June. Woods in mountains; Honshu, Shikoku, Kyushu; rather rare.

28. *Rubus idaeus* L. var. *aculeatissimus* Reg. & Til. *R. melanolasius* Focke; *R. idaeus* subsp. *sachalinensis* var. *matsumuranus* (Lév. & Van't.) Koidz.; *R. sachalinensis* Lév.; *R. idaeus* subsp. *inermis* Koidz.; *R. idaeus* subsp. *melanolasius* Focke.—EZO-ICHIHO, KARAFUTO-ICHIHO. Shrub, the branches with slender spreading not flattened bristlelike prickles, glandular-pilose and short-pubescent, the flowering branchlets elongate, 15–40 cm. long; leaflets 3 (sometimes 5 on vigorous shoots), the lateral ones slightly smaller, the terminal rhombic-ovate to broadly ovate or elliptic, 4–7 cm. long, 2.5–5 cm. wide, acuminate to acute, obtuse to rounded at base, irregularly and coarsely acute-toothed, with dense short white-woolly hairs beneath, the petioles prickly and short-pubescent, sometimes also with glandular hairs; inflorescence several-flowered, prickly, short-pubescent and glandular-pilose, the flowers white; calyx-segments narrowly ovate-deltoid, densely white-tomentose inside; petals spatulate, 5–7 mm. long; fruit globose, red, the fruitlets densely woolly-pubescent.—June–July. Hokkaido.—e. Asia and N. America.—Forma *concolor* (Komar.) Ohwi. *R. melanolasius* var. *concolor* Komar.; *R. strigosus* var. *kanayamensis* (Lév. & Van't.) Koidz.; *R. kanayamensis* Lév. & Van't.—KANAYAMA-KI-ICHIHO. Leaves green, not white-tomentose beneath. Hokkaido.—Temperate to cold regions of e. Asia.

29. *Rubus yabei* Lév. & Van't. *R. idaeus* subsp. *nipponicus* Focke.—MIYAMA-URAJIRO-ICHIHO. Closely resembles the preceding species, the plant more slender, usually less densely prickly, with glandular hairs usually only on pedicels and calyx; leaflets somewhat smaller, thinner in texture, often 5, sometimes 3; calyx usually without prickles, the lobes often filiform-elongate above.—June–July. Woods and thickets in high mountains; Honshu (n. and centr. distr.).—Forma *eglandulosus* (Ohwi, pro var.) Ohwi. NAEBA-KI-ICHIHO. Without glandular hairs.—Forma *marmoratus* (Lév. & Van't.) Ohwi. *R. marmoratus* Lév. & Van't.; *R. idaeus* subsp. *melanolasius* var. *marmoratus* (Lév. & Van't.) Hara; *R. yatsugataakensis* Koidz.—SHINANO-KI-ICHIHO. Without glandular hairs; leaves green and not woolly-tomentose beneath. Both forms occur in the high mountains of central Honshu.

30. *Rubus coreanus* Miq. *R. tokkura* Sieb.—TOK-KURI-ICHIHO. Shrub, the branches with stout often curved flattened prickles, the flowering branchlets glabrous; leaflets rather thick, 5–7, glabrous on both sides or slightly pubescent on nerves beneath, with awn-tipped irregular teeth, the lateral leaflets ovate, acute to obtuse, the terminal leaflet slightly larger, rhombic-ovate to suborbicular, 4–6 cm. long, 3–6 cm. wide, very acute, often 3-lobed; corymbs terminal and axillary, rather densely short-pubescent; calyx thick, the lobes broadly lanceolate, caudate-acuminate, densely white-tomentose inside; petals shorter than the calyx-segments, obovate, about 5 mm. long, white, erect.—Rarely cultivated.—Korea and China.

Rubus hirsaceus Makino. Ô-TOKKURI-ICHIHO, is an alleged hybrid of No. 30 and No. 33.

31. *Rubus mesogaeus* Focke. *R. kinasii* Lév. & Van't.;

R. occidentalis sensu auct. Japon., non L.; *R. idaeus* var. *exsuccus* Fr. & Sav.—KURO-ICHIHO. Shrub, the branches with rather stout slightly flattened prickles, the flowering branchlets slightly elongate, prickly and short-pubescent; leaflets 3, glabrous to slightly appressed-pubescent on upper side, with short white tomentum beneath, duplicately incised-serate, abruptly acuminate, the lateral ones obliquely obovate, the terminal larger, ovate-orbicular, 6–12 cm. long, 4–8 cm. wide, the lateral nerves sparingly ascending-pilose beneath, the petioles prickly and pubescent; inflorescence 5- to 10-flowered, densely white-pubescent, the pedicels short; calyx-lobes broadly lanceolate, caudate-acuminate; petals erect, about half as long as the calyx-segments, 4–5 mm. long, broadly obovate; fruit globose, purplish black, the fruitlets nearly glabrous; stones prominently pitted.—June–July. Hokkaido, Honshu, Shikoku, Kyushu.—China.

Var. *adenothrix* Miyayama. SHIMOKITA-ICHIHO. Stems, petioles, and inflorescence with short glandular hairs.—Honshu (Mutsu Prov.).

32. *Rubus yoshinoi* Koidz. KIBI-NAWASHIRO-ICHIHO. Shrub, the branches with rather flattened prickles, the flowering branchlets elongate, slightly prickly and pubescent; leaflets 3, acuminate to very acute, sparingly appressed-pubescent to glabrous and green above, with appressed-pubescent on nerves and whitish (but later becoming green) tomentose beneath, irregularly doubly acute-toothed, the terminal leaflet slightly larger, rhombic-oblong to ovate, 5–10 cm. long, 2.5–5 cm. wide, obtuse to nearly rounded at base, the petioles thinly pubescent and prickly; inflorescence terminal, few-flowered, the pedicels short; calyx thinly pubescent outside, the lobes narrowly ovate, abruptly caudate-acuminate, densely puberulent inside and on the margin; petals pinkish, obovate, 5–7 mm. long; carpels puberulent.—May–June. Honshu (Iwaki and Shinano Prov. and Chūgoku Distr.), Kyushu; rare.

33. *Rubus parvifolius* L. *R. triphyllus* Thunb.; *R. chinensis* Thunb.—NAWASHIRO-ICHIHO. Shrub, the branches with few rather slender short prickles flattened below, elongate and branching, the flowering branchlets elongate, pubescent, thinly prickly; leaflets 3, appressed-pubescent and often glabrate above, usually pubescent on nerves, with short white tomentum beneath, coarsely double-toothed, the lateral leaflets smaller, broadly obovate to cuneate-orbicular, acute to rounded, the terminal rhombic-orbicular to broadly obovate, 3–5 cm. long and as wide; inflorescence several-flowered, densely pubescent; calyx 5–8 mm. long, usually prickly, the lobes narrowly ovate, acuminate, with short white tomentum especially prominent on the inner side; petals pale pink, erect and connivent above, broadly obovate, 5–7 mm. long; fruit red, globose, the fruitlets puberulent.—May–July. Waste places and roadsides in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common.

Var. *concolor* (Koidz.) Makino & Nemoto. *R. triphyllus* var. *concolor* Koidz.—AO-NAWASHIRO-ICHIHO. Leaves green, not tomentose. Rare.—Occurs with the typical phase.

Rubus adenochlamys Focke. KARA-NAWASHIRO-ICHIHO. Resembling No. 33 but with glandular calyx and pedicels.—Reported to occur in Honshu (Mount Ibuki in Oomi Prov.).—China.

34. *Rubus phoenicolasius* Maxim. EBIGARA-ICHIHO, URAJIRO-ICHIHO. Rather stout shrub with slightly flattened spreading prickles and long dense glandular hairs on branches, inflorescence, and leaf-axis, the flowering branchlets elongate,

prickly, glandular-pilose and pubescent; leaflets 3, green and glabrous to thinly pubescent on upper side, thinly prickly and glandular-pilose on nerves, with white-woolly tomentum beneath, doubly incised-dentate, the lateral leaflets broadly ovate, the terminal larger, ovate-orbicular, short-acuminate, subcordate at base, 5–8 cm. long and as wide; corymbs terminal and in the upper axils, in a large terminal panicle, usually not prickly, glandular-pilose and short-pubescent, the pedicels short; calyx 15–20 mm. long, the lobes lanceolate, gradually narrowed at tip, caudate, glandular-pilose and short-pubescent, erect, connivent above; petals obovate, 4–5 mm. long, pale pink; fruit globose, red, the fruitlets glabrous; stones about 2 mm. long, pitted.—June–July. Waste places and clearings in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.

35. *Rubus pedatus* Smith. KOGANE-ICHIHO. Delicate slender herb, without prickles; stems filiform, much-elongate, creeping, rooting from the nodes, scattered-pilose while young; flowering branchlets in axils of radical leaves, 5–12 cm. long, erect, 1- or 2-leaved; leaves radical, 3-foliolate, green, membranous, thinly appressed-pilose on upper side, nearly glabrous beneath, the terminal leaflet slightly larger, rhombic-ovate, 1.5–3 cm. long, 1–2 cm. wide, obtuse to rounded at apex, cuneate at base, double or incised-toothed, the lateral leaflets often 2-cleft or divided, the petioles thinly short-pubescent, rarely also with short glandular hairs, the stipules elliptic to ovate, brown, scarious, broadly obtuse to rounded at apex, 2–4 mm. long; scapes 3–10 cm. long, short-pubescent, sometimes with glandular hairs; flowers solitary; calyx 8–12 mm. long, the lobes lanceolate, often toothed on upper margin, membranous; petals white, 6–7 mm. long; fruitlets few, yellowish red, glabrous; stones 3.5 mm. long, raised reticulate on the upper half.—June–July. Damp coniferous woods in mountains; Hokkaido, Honshu (centr. and n. distr.).—N. America.

36. *Rubus ikenoensis* Lév. & Van't. *R. japonicus* Maxim., non L.; *R. defensus* Focke; *R. tschonoskii* Prokhan.—GOYŌ-ICHIHO, TOGE-GOYŌ-ICHIHO. Perennial herb with woody base, the prickles very slender, spreading, bristlelike, the shoots radical, at first short, erect, afterward elongate, arcuate and decumbent, prickly, the flowering branchlets in the lower axils of the shoots, erect, rather elongate, thinly prickly or sparingly short-pubescent; leaflets 5, pedately arranged, narrowly rhombic-obovate, acuminate, cuneate at base, doubly incised-toothed, sometimes scattered appressed-pilose on upper side and on nerves beneath, green, the stipules 6–8 mm. long, lanceolate, acuminate; flowers 1 or 2, terminal, nodding, white; calyx 15–20 mm. long, short-pubescent and prickly, thinly mixed with glandular-hairs, the lobes elongate above; fruit red, the stones about 2.5 mm. long, irregularly and obliquely rugose.—May–July. Woods in high mountains; Honshu (n. and centr. distr.).

Rubus kenoensis Koidz. KIREBA-KUMA-ICHIHO, is an alleged hybrid of No. 36 and *R. crataegifolius* (No. 10).

37. *Rubus pseudojaponicus* Koidz. *R. triflorus* var. *japonicus* Maxim.—HIME-GOYŌ-ICHIHO, TOGE-NASHI-GOYŌ-ICHIHO. Pubescent unarmed herb closely resembling the preceding species, the shoots more slender; stipules acute to subacute; calyx-lobes reflexed; petals narrowly ovate, white, about 10 mm. long; stones indistinctly rugose.—May–July. Woods in high mountains; Hokkaido, Honshu (n. and centr. distr.).

15. FILIPENDULA L. SHIMOTSUKE-SŌ ZOKU

Perennial herbs; radical leaves pinnate, the terminal leaflets large, palmately lobed, toothed, the lateral leaflets small or sometimes obsolete, the cauline leaves often without lateral leaflets, the stipules membranous or foliaceous; inflorescence a cymose corymb; flowers many, small, bisexual or rarely unisexual (plants dioecious), white or pinkish; calyx-lobes 4 or 5, reflexed; petals 4 or 5, orbicular; stamens rather numerous, deciduous after anthesis, the filaments filiform; carpels 3–10, rarely to 15, free, usually short-stiped; ovules 2 in each carpel; style short, terminal; achenes or indehiscent follicles glabrous or ciliate, laterally flattened, stiped or sessile.—More than 10 species, in temperate to cooler regions of the N. Hemisphere.

- 1A. Achenes sessile, loosely contorted, semiorbicular, glabrous, rounded on outer margin at base; flowers white, unisexual; pedicels with crisped ascending eglandular hairs; lateral leaflets 3 or 4 pairs, very small. 1. *F. tsuguwoi*
 1B. Achenes stiped, not contorted, broadly oblanceolate to oblong, ciliate or glabrous, equilateral; flowers white to pink, bisexual; pedicels glabrous or with spreading strict short hairs.
 2A. Pedicels short-hairy; flowers white; achenes long-ciliate; stipules with a large semiorbicular auricle on one side. 2. *F. kamschatca*
 2B. Pedicels glabrous; flowers usually pink, rarely white; achenes ciliate or glabrous; stipules with or without a prominent auricle.
 3A. Stipules with a semirounded spreading foliaceous auricle on one side; lateral leaflets few-paired and very small or often obsolete.
 3B. Stipules not auricled; lateral leaflets at least in the lower leaves several-paired, much smaller than the terminal leaflet but prominent.

3. *F. auriculata*4. *F. multijuga*

1. *Filipendula tsuguwoi* Ohwi. SHIKOKU-SHIMOTSUKE-SŌ. Dioecious herb; stems 50–70 cm. long, erect, 5-angled, few-leaved, glabrous except for short pubescence on upper part; radical and lower cauline leaves long-petioled, the terminal leaflets membranous, orbicular, deeply cordate, 8–13 cm. in diameter, palmately 5- to 7-cleft, the lobes ovate to narrowly so, long-acuminate, duplicate-toothed, green on both sides, thinly pilose on nerves or glabrous on upper side, with crisped yellowish brown pubescence near base beneath, the lateral leaflets 3 or 4 pairs, very unequal, the larger ones ovate, to 1–2 cm. long, the smaller ones 2–3 mm. long, the stipules of the cauline leaves semi-ovate, erect, acuminate, toothed, 1–1.5 cm. long; corymbs terminal and in the upper axils, the branches and pedicels white-pubescent; flowers unisexual, white; calyx-lobes elliptic, glabrous; petals 5, spreading, glabrous, 3.5–4 mm. long; stamens about 30, usually slightly longer than the petals in the staminate flowers, much shorter than the petals in the pistillate flowers; fruiting carpels 5–6, glabrous, sessile, loosely contorted, nearly orbicular-ovate, about 3 mm. long, the stigma small, hemispheric.—July. High mountains; Shikoku, Kyushu; rare.

2. *Filipendula kamschatca* (Pall.) Maxim. *Spiraea kamschatca* Pall.—ONI-SHIMOTSUKE. Stout perennial herb; stems erect, 1–2 m. long, hispid or hispid-pilose, angled; leaves large, the terminal leaflets orbicular, shallowly cordate, 15–25 cm. in diameter, palmately (3–)5-cleft, doubly incised-toothed, green, hispid, the lateral leaflets few, very small, often obsolete in the upper leaves, the stipules green, incised-toothed, with an obliquely spreading auricle at base on one side; inflorescence large, with short spreading straight hairs on pedicels and branches; flowers white or slightly pink, 6–8 mm. across; calyx-lobes reflexed; petals obovate-orbicular, nearly entire; stamens 1.5 times as long as the petals; carpels 5; achenes oblanceolate, long-ciliate.—June–Sept. Mountains; Hokkaido, Honshu (centr. and n. distr.); often gregarious along streams and ravines; variable as to indument. Sometimes distinguished are: forma *pilosa* Koidz. with looser shorter hairs on stems and leaves, and forma *glabra* Koidz. with nearly glabrous stems and leaves.

3. *Filipendula auriculata* (Ohwi) Kitam. *F. purpurea*

var. *auriculata* Ohwi.—KOSHŪ-SHIMOTSUKE-SŌ. Rhizomes short and stout; stems erect, angled, 1–1.5 m. long, 10- to 13-leaved; radical leaves long-petioled, the terminal leaflets large, cordate, 5–15 cm. long, 10–20 cm. wide, 5- to 7-cleft, the lobes acuminate, serrulate, rarely obsoletely incised, nearly glabrous on both sides or thinly pilose on nerves beneath, the lateral leaflets usually 1 or 2 pairs or absent, ovate, 1–3 cm. long, toothed, the stipules mostly foliaceous, green, with semi-orbicular, denticulate auricles; corymbs many-flowered, rather large, glabrous; flowers pink, 4–5 mm. across; achenes broadly oblanceolate, ciliate, stiped.—July–Aug. Low mountains; Honshu (Iwashi, Echigo Prov.).

Filipendula purpurea Maxim. KYŪGANKO. Leaves mostly without lateral leaflets, the stipules smaller, with a smaller often indistinct auricle on one side; flowers pink; achenes rarely ripening.—July–Aug. Long cultivated in gardens, and possibly a hybrid of *F. multijuga* and *F. auriculata*.—Forma *albiflora* (Makino) Ohwi. *F. purpurea* var. *albiflora* Makino.—NATSU-YUKI-SŌ. Flowers white.—Rarely cultivated in gardens.

4. *Filipendula multijuga* Maxim. *Spiraea palmata* Thunb., non L. f., nec Pall.—SHIMOTSUKE-SŌ. Nearly glabrous perennial herb; stems 30–100 cm. long; terminal leaflets orbicular, subcordate, 5–10 cm. in diameter, 5- to 7-cleft to -parted, toothed, the lateral ones of few pairs, unequal, ovate, 3–30 mm. long, toothed and often incised, often reduced and obscure in the upper leaves; stipules membranous, sometimes few-toothed, erect or ascending; inflorescence a terminal many-flowered corymb, glabrous; flowers usually rose, 4–5 mm. across; calyx-lobes 4 or 5, reflexed; petals ovate-orbicular, obsoletely toothed; carpels 4 or 5; achenes short-stiped, oblong, glabrous.—July–Aug. Mountains; Honshu (centr. distr. and westw.), Shikoku, Kyushu.

Var. *ciliata* Koidz. *F. ciliata* (Koidz.) Miyabe & Kudo —AKABANA-SHIMOTSUKE. Achenes ciliate.—Honshu (centr. and Kantō Distr.).

Var. *yezoensis* Hara. *F. yezoensis* Hara.—EZO-NO-SHIMOTSUKE-SŌ. Calyx-lobes short-pilose inside; stipules smaller; petals nearly entire.—Hokkaido.

16. SANGUISORBA L. WARE-MOKŌ ZOKU

Perennial herbs with stout creeping rhizomes; stems erect, leafy, ascending at base; leaves radical and cauline, alternate, imparipinnate, with dilated petioles, the stipules adnate at base, the leaflets oblong or elliptic, toothed, sessile or short-petioluled;

spikes densely many-flowered, terminal; flowers white, greenish or pink, small, bisexual, sessile, with small bracts and bracteoles at base; calyx-tube ovoid, enclosing an achene, constricted at apex, 4-angled or -winged, with 4 small petaloid lobes; petals absent; stamens 4, rarely to 12, deciduous; carpel single, 1-ovuled; style terminal, the stigma fimbriate or pubescent; achenes coriaceous.—More than a dozen species, in temperate and cooler regions of the N. Hemisphere.

- 1A. Spikes flowering first from the apex or all flowers opening at nearly the same time, rounded at the top; (rarely flowering first from the bottom, if so the spikes deep rose-purple and nodding).
 2A. Stamens 4; spikes 2–7 cm. long.
 3A. Spikes ellipsoidal to obovoid-oblong, erect, 1–2 cm. long; flowers deep red to blood-red; filaments scarcely longer than the calyx-lobes; leaflets usually petioluled. 1. *S. officinalis*
 3B. Spikes cylindric or short-cylindric, 2–7 cm. long, often nodding above; flowers white, greenish or suffused with red; filaments much longer than the calyx-lobes.
 4A. Anthers dark colored when dry; leaflets broadly linear to narrowly oblong, sessile or short-petioluled; leaves and stems without curled hairs; flowers white to reddish. 2. *S. tenuifolia*
 4B. Anthers pale yellowish brown when dried; leaflets oblong to ovate-oblong or ovate-cordate.
 5A. Leaflets petioluled; spikes white, often partly suffused with red; stems and leaf-rachises without curled hairs. ... 3. *S. albiflora*
 5B. Leaflets nearly sessile; spikes pink; stems and leaf-rachises with reddish brown curled multicellular hairs. 4. *S. obtusa*
 2B. Stamens (4–) 6–12; spikes 4–10 cm. long, pinkish purple, nodding. 5. *S. hakusanensis*
 1B. Spikes flowering from the bottom upward, lanceolate-cylindric, obtuse or subobtuse at top, often gradually narrowed above; stamens 4, much longer than the calyx-lobes; anthers pale yellowish brown when dry; flowers white or greenish, sometimes partially suffused with red. 6. *S. stipulata*

1. *Sanguisorba officinalis* L. WARE-MOKÔ. Glabrous perennial herb scarcely glaucous throughout; rhizomes creeping, rather stout; stems erect, branching above, 30–100 cm. long, often reddish; radical leaves petioled, the leaflets 5–11, oblong to elliptic, sometimes ovate, 2.5–5 cm. long, 1–2.5 (–3.5) cm. wide, rounded at apex, cordate to rounded at base, deltoid-toothed, sessile or the petioles 6–30 mm. long, reddish, often with a small blade at the base, the cauline leaves smaller, short-petioled or sessile; spikes few, long-peduncled, 1–2 (2.5) cm. long, 6–8 mm. across, erect, blood-red; calyx-segments dark colored at base in fruit; anthers dark brown; stigma capitate.—July–Oct. Meadows in lowlands and mountains; Hokkaido, Honshu, Kyushu; rather common.

Var. *carnea* (Fisch.) Regel. *S. carnea* Fisch.—EZO-WARE-MOKÔ. Flowers flesh-red.—Occurs with the typical phase.

Var. *pilosella* Ohwi. URAGE-WARE-MOKÔ. Leaves with spreading short hairs beneath.—Honshu (Shinano Prov.).

2. *Sanguisorba tenuifolia* Fisch. var. *alba* Trautv. & C. A. Mey. *S. yezoensis* Sieb., ex Miq.—NAGABO-NO-SHIRO-WARE-MOKÔ. Glabrous perennial with stout short-creeping rhizomes; stems 80–130 cm. long, erect, branching above; radical leaves petioled, the leaflets 11–15, broadly linear to narrowly oblong, 3–8 cm. long, 5–20 mm. wide, obtuse or acute, acutely toothed, usually sessile; spikes cylindric, erect or the longer ones nodding, 2–7 cm. long, 6–7 mm. across exclusive of the stamens, the axis short-pubescent; flowers greenish white or white, often partially reddish, about 3 mm. across; calyx-segments yellowish or brownish below in fruit; filaments white, 1.5–2.5 times as long as the calyx-lobes, slightly broadened above, the anthers dark purple.—Aug.–Oct. Wet meadows and wet places along streams in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; very variable.

Var. *grandiflora* Maxim. *S. tenuifolia* var. *kurilensis* Kudo; *S. grandiflora* (Maxim.) Makino.—CHISHIMA-WARE-MOKÔ. Stems shorter; leaflets broadly oblong to elliptic or broadly ovate; spikes thicker; filaments longer.—Northern and alpine.

Var. *parviflora* Maxim. *S. parviflora* (Maxim.) Takeda; *S. tenuifolia* var. *angustifolia* Miq.—KOBANA-NO-WARE-MOKÔ. Leaflets narrower; spikes narrowly cylindric.—Western part of our area.

Var. *purpurea* Trautv. & C. A. Mey. NAGABO-NO-AKA-WARE-

MOKÔ. Flowers blood-red.—Honshu (centr. distr.), and Kyushu.—The typical phase and some other varieties occur in e. Siberia, Kamchatka, Kuriles, Sakhalin, Korea, and Manchuria.

3. *Sanguisorba albiflora* (Makino) Makino. *S. canadensis* var. *media* Maxim., pro parte; *S. obtusa* var. *albiflora* Makino; *S. obtusa* var. *contraria* Koidz.; *S. amoena* var. *contraria* (Koidz.) Koidz.—SHIROBANA-TÔ-UCHI-SÔ. Nearly glabrous perennial herb with stems 30–70 cm. long; radical leaves petioled, the leaflets 11–15, rather loosely arranged on the rachis, broadly to narrowly ovate or elliptic, 2.5–5 cm. long, 1.5–3 cm. wide, rounded at apex, cordate at base, glaucous beneath, toothed, the petioles 5–20 mm. long, distinct, sometimes with a stipulelike small blade at base, the cauline leaves smaller, the petioles sometimes with white-appressed short hairs near the base; spikes 1–5 or sometimes more, erect or slightly nodding above, 3–6 cm. long, 9–12 mm. across exclusive of the stamens; flowers white, often partially reddish, the peduncles sometimes with short reddish brown hairs; stamens 6–8 mm. long, flat and dilated above; stigma rather large.—Aug.–Sept. Alpine meadows; Honshu (n. distr.); rather common.

4. *Sanguisorba obtusa* Maxim. NAMBU-TÔ-UCHI-SÔ. Resembles the preceding but not as tall, 30–50 cm. high; stems, leaf-rachises and sometimes also the midrib on the leaflets beneath near base with reddish brown curled multicellular hairs; leaflets 13–17, rather densely arranged on the rachis, thicker than in No. 3, nearly sessile, the veinlets more prominent beneath than in the preceding; spikes 4–7 cm. long, nodding, pale rose; stamens 8–10 mm. long; stigma smaller than in No. 3.—Aug.–Sept. Alpine meadows; Honshu (Mount Hayachine); rare.

5. *Sanguisorba hakusanensis* Makino. KARA-ITO-SÔ. Nearly glabrous or sparingly reddish brown hairy; stems 40–80 cm. long, erect, few-leaved, often branching above; radical leaves long-petioled, the leaflets 9–13, oblong or ovate-oblong, 3–6 cm. long, 1.5–3.5 cm. wide, rounded at apex, cordate to rounded at base, coarsely toothed, glaucous beneath, the petioles 3–7 mm. long, the cauline leaves smaller, often with soft appressed hairs beneath near base; spikes few, pendulous, long-cylindric, 4–10 cm. long, about 10 mm. across exclusive of the stamens; flowers deep rose-purple; stamens 7–10 mm.

long, the filaments flattened and broadened above, the anthers pale yellowish brown when dried, with a deep brown base.
—Alpine meadows; Honshu (Japan Sea side of centr. distr.).
—Korea (variety).

Var. *japonensis* (Makino) Ohwi. *S. canadensis* var. *japonensis* Makino; *S. japonensis* (Makino) Kudō. —Ezo-tō-uchi-sō. Differs from the typical phase in the centripetal inflorescence. —Rocks along valleys and ravines; Hokkaido; rare.

6. *Sanguisorba stipulata* Raf. *S. sitchensis* C. A. Mey.; *S. canadensis* var. *sitchensis* (C. A. Mey.) Koidz.; *S. sitchensis* var. *typica* Hara; *S. sitchensis* var. *pilosa* Hara; *S. sitchensis* var. *bracteosa* Hara; *S. kishinamii* Honda —TAKANE-TŌ-UCHI-SŌ. Perennial herb usually nearly glabrous, with stout creeping rhizomes; stems 40–80 cm. long, often branching above; leaflets of radical leaves 11–13, rather thin, ovate-orbicular to

oblong, 2–4 cm. long, 1.5–3 cm. wide, rounded at apex, cordate to rounded at base, glaucous beneath, acutely toothed, the petiolules 5–15 mm. long, the cauline leaves smaller, often with appressed soft short hairs near base; spikes few, erect, 3–8 cm. long, 7–10 mm. across exclusive of the stamens, very densely many-flowered, flowering first from the base, white, often slightly greenish; filaments 7–8 mm. long, slightly broadened above; stigma rather small. —Aug.–Sept. Alpine meadows; Hokkaido, Honshu (Kantō and northern part of the centr. distr.); rare.

Var. *riishirensis* (Makino) Hara. *S. riishirensis* Makino; *S. sitchensis* var. *riishirensis* (Makino) Kudo; *S. chlorantha* Nakai —RISHIRI-TŌ-UCHI-SŌ. With reddish brown curled hairs on stems and leaf-rachises. —Hokkaido.

17. *ALCHEMILLA* L. HAGOROMOGUSA ZOKU

Perennial or annual herbs usually with long silky pubescence; leaves alternate, orbicular-cordate, more or less palmately lobed, the stipules connate and adnate to the lower part of the petiole; flowers small, usually green, in dense corymbs or in heads without bracteoles; calyx with urceolate or obconical tube, the lobes 4 or 5, bracts of caliculus as many and alternate with them; petal absent; stamens 4; carpels 1–4, free, the style from the ventral side or from the base of the carpel, the ovules solitary; achenes 1–4, enclosed in a calyx-tube, membranous. —Many species, in temperate to cold regions and on high mountains of the N. Hemisphere.

1. *Alchemilla japonica* Nakai & Hara. *A. vulgaris* sensu auct. Japon, non L. —HAGOROMOGUSA. Greenish, silky-pubescent perennial herb 10–30 cm. high, with stout creeping rhizomes; stems ascending from base; radical leaves long-petioled, orbicular, deeply cordate with a nearly closed sinus, 3–7 cm. in diameter, shallowly 7- to 9-lobed, toothed,

soft-pubescent on both sides, the cauline leaves few, smaller, short-petioled, the stipules green, toothed; flowers densely subumbellate, about 3 mm. across; calyx hairy, the lobes 4, 1–1.2 mm. long; achenes solitary, ovoid, glabrous, 1.5 mm. long, subacute. —Alpine meadows; Hokkaido (Mount Yubari), Honshu (centr. distr.); very rare.

18. *AGRIMONIA* L. KIN-MIZU-HIKI ZOKU

Usually hirsute perennial herbs with erect simple or branching stems; leaves alternate, imparipinnate, the leaflets toothed, often alternating with smaller ones, the stipules adnate to the lower part of the petioles; inflorescence an elongate terminal spike; flowers small, yellow, short-pedicelled, bearing a bract at the base of the pedicel and 2 bracteoles near the middle; calyx persistent, accrescent, the tube obconical, the lobes 5, connivent in fruit, bracts of the caliculus consisting of many hooked spines; petals 5, yellow; stamens 5–10; carpels 2, sessile; achenes 1 or 2, elliptic, coriaceous, enclosed in a slightly hardened calyx-tube. —More than 10 species, in the N. Hemisphere and S. America.

1. *Agrimonia pilosa* Ledeb. *A. eupatoria* sensu auct. Japon, non L.; *A. viscidula* Bunge; *A. dahurica* Willd. ex Ser.; *A. eupatoria* var. *pilosa* (Ledeb.) Nakai; *A. pilosa* var. *japonica* (Miq.) Nakai; *A. viscidula* var. *japonica* Miq.; *A. japonica* (Miq.) Koidz. —KIN-MIZU-HIKI. Coarsely hirsute perennial; rhizomes rather stout; stems erect, 30–80 cm. long, often branching above; leaves 5- to 7-foliolate, the leaflets gradually smaller in the lower ones, alternate with much smaller ones, the upper 3 uniform, larger, oblong, obovate or ovate-oblong, 3–6 cm. long, 1.5–3.5 cm. wide, acute to sub-obtuse, coarsely toothed, pale green and often with spreading short hairs on the nerves beneath; stipules green, coarsely

toothed; inflorescence terminal, erect, 10–20 cm. long; flowers loosely arranged at anthesis, yellow; calyx-tube accrescent after anthesis, about 3 mm. long in fruit, sulcate, with a series of connivent hooked spines on upper edge; petals narrowly obovate, rounded at apex, 3–6 mm. long. —July–Oct. Meadows and roadsides in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common. —Korea, China, Siberia, and E. Europe.

Var. *nipponica* (Koidz.) Kitam. *A. nipponica* Koidz. —HIME-KIN-MIZU-HIKI. Slender; leaflets 3–5, obtuse; flowers smaller. —Occurs with the typical phase.

19. *ROSA* L. BARA ZOKU

Erect or scandent shrubs usually prickly on branches and often also on petioles and other parts, the prickles at base of petioles often larger than the others; leaves alternate, imparipinnate, the stipules erect, partly adnate to the lower portion of petiole, the leaflets toothed; flowers solitary or in corymbs or panicles, white, pinkish or yellow; calyx not calcareous, the tube globose to urceolate, becoming fleshy in fruit, the limb 5-lobed, with the disc inside of the calyx-tube; petals 5; stamens many; carpels many, sometimes few, inserted on the lower portion of the calyx-tube, sessile, free; style from the ventral side of the carpel, free or connate above; achenes enclosed in the fleshy calyx-tube, coriaceous. —About 100 species, in temperate to cold regions of the N. Hemisphere.

- 1A. Styles connate above, usually exerted from the calyx-tube.
 2A. Stipules pectinate; leaflets usually pubescent beneath. 1. *R. multiflora*
 2B. Stipules entire or toothed; leaflets usually glabrous, rarely pubescent on nerves beneath; styles usually hairy.
 3A. Leaflets 5-7, the terminal one often larger than the others, acute to caudately acuminate, ovate to ovate-elliptic or broadly lanceolate, 2-10 cm. long; stipules entire or nearly so.
 4A. Leaflets 5-10 cm. long; stipules entire; flowers 4-5 cm. across; calyx-segments 12-20 mm. long. 2. *R. sambucina*
 4B. Leaflets 1-4 cm. rarely to 5 cm. long; stipules often with few teeth; flowers 2-3 cm. across; calyx-segments 5-12 mm. long. 3. *R. luciae*
 3B. Leaflets 5-9, nearly uniform in size, elliptic to obovate-orbicular, obtuse to rounded or acute, lustrous and deep green above; stipules toothed. 4. *R. wichuraiana*
 1B. Styles free.
 5A. Calyx-tube without prickles; leaflets 5-9.
 6A. Branches and prickles hairy; leaves rugose or minutely bullate above, glandular-dotted beneath. 5. *R. rugosa*
 6B. Branches and prickles nearly or entirely glabrous.
 7A. Branches with flat stipular prickles; leaflets glandular-dotted beneath; calyx-tube globose. 6. *R. davurica*
 7B. Branches without stipular prickles; leaflets not glandular-dotted; calyx-tube fusiform. 7. *R. acicularis*
 5B. Calyx-tube densely prickly; leaves 9- to 17-foliolate. 8. *R. hirtula*

1. *Rosa multiflora* Thunb. *R. polyantha* Sieb. & Zucc.; *R. wichurae* C. Koch; *R. multiflora* var. *thunbergiana* Thory —NO-IBARA. Erect branching shrub with prickles on the spreading rather stout usually glabrous branches and petioles; stipules green, membranous, short-pubescent and glandular-pilose, the free portion filiform at apex; leaflets 5-7, rather membranous, ovate, obovate or oblong, green, 2-4 cm. long, obtuse to acute, dull, nearly glabrous on upper side, paler and usually with short soft pubescence beneath, the petioles short-pubescent; panicles many-flowered, erect; flowers white, 2-3 cm. across, the pedicels often with short stipitate glands.—May-June. Hokkaido, Honshu, Shikoku; common.

Var. *adenochaeta* (Koidz.) Ohwi. *R. adenochaeta* Koidz.; *R. polyantha* var. *adenochaeta* (Koidz.) Nakai.—TSUKUSHI-IBARA. Leaflets large, 3-7 cm. long, subcoriaceous, less prominently pubescent beneath; inflorescence with prominent stipitate glands 1-2 mm. long; flowers rose, 3-4 cm. across.—Kyushu (Higo, Satsuma, and Hyuga Prov.).

Rosa pulcherrima Koidz. is an alleged hybrid of No. 1 and No. 3.

2. *Rosa sambucina* Koidz. *R. moschata* sensu auct. Japon., non Mill.—YAMA-IBARA. Shrub; branches glabrous with recurved flat prickles; stipules membranous, entire, slightly glandular on margin, the free portion linear; leaflets 5, subcoriaceous, broadly lanceolate to narrowly ovate-oblong, (3-)5-10 cm. long, 1-2.5 cm. wide, long-acuminate, glabrous, pale beneath; flowers 5-20, in corymbs or flat-topped panicles, white, 4-5 cm. across, the pedicels 3-5 cm. long, loosely short-glandular-pilose; calyx-tube loosely glandular-pilose, the styles hairy.—May-June. Honshu (s. part of centr. distr. and western Kinki Distr.), Shikoku, Kyushu; rare.

3. *Rosa luciae* Fr. & Roehrb. *R. luciae* var. *oligantha* Fr. & Sav.; *R. oligantha* (Fr. & Sav.) Koidz.; *R. franchetii* Koidz.—O-FUJI-IBARA. Nearly glabrous shrub with elongate branching stems with rather flat prickles; stipules membranous, entire, slightly glandular on margin, the free portion short, filiform; leaflets 5, sometimes 7, rather thin, slightly lustrous on upper side, paler beneath, the terminal ones ovate to narrowly so, 2-4 cm. long, 1-2 cm. wide, acuminate to long-acuminate, the lateral ones acute to acuminate, the lowest pair often smaller; inflorescence a corymb, usually eglandular, the pedicels 6-10 mm. long; flowers few, 2-3 cm. across, usually white.—May-June. Thickets in low mountains; Honshu (Kantō and Tōkaidō Distr.).

Var. *onoei* (Makino) Momiyama. *R. onoei* Makino; *R. hakonensis* var. *onoei* (Makino) Koidz.; *R. sikokiana* Koidz.;

(?) *R. fujiisanensis* var. *setifera* Koidz.; (?) *R. yakualpina* Nakai & Momiyama.—NIO-IBARA. Resembles the typical phase, the leaflets beneath and leaf-rachis pubescent.—Honshu (centr. distr. and westw.), Shikoku, Kyushu.

Var. *hakonensis* Fr. & Sav. *R. jasminoides* Koidz.; *R. oligantha* var. *jasminoides* (Koidz.) Koidz.—MORI-IBARA. Leaflets thin, glabrous, whitish beneath, the terminal ones ovate to broadly so, acute to abruptly acuminate; flowers 1 or 2.—May-June. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *fujiisanensis* Makino. *R. fujiisanensis* (Makino) Makino.—FUJI-IBARA. Leaflets (5-)7, paler beneath, glabrous or nearly so, the lateral ones slightly smaller, the terminal one subcoriaceous, ovate to elliptic-ovate, 1.5-2.5 cm. long, 1-1.5 cm. wide, acute or subacute; flowers few.—June-July. Honshu (Sagami, Suruga, and Kai Provs. and westw.), Shikoku.

Var. *paniculigera* (Makino) Momiyama. *R. paniculigera* Makino; *R. franchetii* var. *paniculigera* (Makino) Koidz.—MIYAKO-IBARA. Stipules nearly entire, glandular on margin, membranous, the free portion broadly lanceolate, acuminate; leaflets 5-9, nearly equal, 1-2.5 cm. long, 7-15 mm. wide, slightly or scarcely lustrous above, glabrous, whitish beneath, the terminal ones elliptic to obovate-elliptic or oblong-ovate, obtuse to abruptly acuminate, the lateral ones obtuse to rounded; inflorescence usually panicle, glabrous or more often glandular-pilose, few- to many-flowered; flowers white, 2-3 cm. across.—May-June. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

4. *Rosa wichuraiana* Crép. *R. luciae* sensu auct. Japon., pro parte; *R. tsusimensis* Nakai; *R. luciae* var. *yokoscensis* Fr. & Sav.; *R. yokoscensis* (Fr. & Sav.) Koidz.; *R. ampullicarpa* Koidz.; *R. wichuraiana* var. *ampullicarpa* (Koidz.) Honda.—TERI-HA-NO-IBARA. Shrub with elongate, rather stout, prostrate, prickly branches; stipules green, toothed, loosely glandular-pilose, the free portion broadly lanceolate, acuminate; leaflets 5-9, coriaceous, nearly equal, obovate-orbicular, elliptic or broadly ovate, 1-2 cm. long, 8-15 mm. wide, obtuse or sometimes subacute, lustrous above, paler beneath, glabrous on both sides; inflorescence a short, glabrous, few- to many-flowered panicle; flowers white, about 3 cm. across.—May-June. Thickets in lowlands and low mountains, especially abundant near seashores; Honshu, Shikoku, Kyushu.—Ryukyu, Formosa, Korea, and China.

5. *Rosa rugosa* Thunb. *R. ferox* Lawrance; *R. kantschatica* var. *ferox* (Lawrance) Géel; *R. rugosa* var. *thunbergiana*

C. A. Mey.; *R. rugosa* var. *ferox* (Lawrance) C. A. Mey.—**HAMA-NASU.** Erect bushy shrub with stout densely short-pubescent branches with needlelike slender spines and stout flattened short-pubescent prickles; stipules broad, membranous, the free portion broadly ovate or deltoid; leaflets 7-9, nearly equal, oblong, elliptic or obovate, 3-5 cm. long, 2-3 cm. wide, obtuse to rounded, glabrous and minutely bullate or rugulose above, densely cinereous hairy and with sessile pale glandular dots; flowers 1-3, terminal, 6-10 cm. across, deep rose, the pedicels stout, erect, 1-3 cm. long, with slender prickles; calyx with a depressed-globose tube, the lobes 3-4 cm. long, appressed-pubescent and with slender prickles, sometimes with short stipitate glands; fruit subglobose, yellowish red, 2-2.5 cm. across.—June-Aug. Sandy shores; Hokkaido, Honshu on Pacific side south to n. Kantō and on Japan Sea side south to San'in Distr.).—Temperate and northern parts of e. Asia to the Kuriles, Kamchatka, and Sakhalin.

Rosa × *iwara* Sieb. *R. yesoensis* (Fr. & Sav.) Makino; *R. iwara* var. *yesoensis* Fr. & Sav.—**KO-HAMA-NASU.** Natural hybrid of No. 5 and No. 1, differing from No. 5 in the less prominently rugose upper leaf-surfaces, and with smaller flowers 3-4 cm. across.—Occurs rarely along seashores in Hokkaido and n. Honshu.

6. *Rosa davurica* Pall. *R. willdenowii* Spreng.; *R. cin-namomea* var. *davurica* (Pall.) C. A. Mey.; *R. marretii* Lév.; *R. rubrostipulata* Nakai—**YAMA-HAMA-NASU, KARAFUTO-IBARA.** Shrub with glabrous branches becoming purplish brown with age, the prickles flat, stipular; stipules membranous, brownish, entire, the free portion oblong or ovate, rounded, rarely acute or mucronate; leaflets 7-9, oblong, 2-3 cm. long, 1-1.5 cm. wide, subacute to obtuse, slightly appressed-pubescent to glabrous on upper side, whitish, glandular, and with appressed pubescence especially on midrib beneath; flowers 1-3, deep pink, 3-4 cm. across, with glabrous pedicels; calyx with a globose, glabrous tube, the lobes elongate, with white tomentum inside and on margin; fruit globose or ellipsoid, about 12 mm. across, red.—June-July. Hokkaido, Honshu (Shinano Prov.); rare.—Sakhalin and Korea to Manchuria and e. Siberia.

7. *Rosa acicularis* Lindl. *R. fauriei* Lév., pro parte; *R. gmelinii* Bunge; *R. acicularis* var. *gmelinii* (Bunge) C. A. Mey.; *R. acicularis* var. *taquetii* Nakai—**Ô-TAKANE-IBARA.** Shrub with reddish brown, glabrous, elongate branches and needlelike slender prickles; stipules membranous, entire, glandular on margin, the free portion lanceolate to ovate, acute to acuminate; leaflets 5-7, membranous, oblong or ovate-oblong, 2-4 cm. long, acute to acuminate, vivid green, glabrous on upper side, slightly whitish and with appressed-pubescent on midrib beneath, the petioles sometimes glandular-pilose; flowers solitary, pink, 3-4 cm. across, the pedicels glandular-pilose, 3-5 cm. long; calyx with glabrous tube, the lobes elongate above, white-tomentose inside and on margin, sometimes glandular-pilose outside; fruit fusiform, 2-3 cm. long, 7-10 mm. across.—June-July. High mountains; Hokkaido, Honshu (n. and centr. distr.).—Siberia, Kamchatka, Sakhalin, Korea, and N. America (var.).

Var. *nipponensis* (Crép.) Koehne. *R. nipponensis* Crép.; *R. acicularis* var. *glauca* Fr. & Sav., non Regel.—**TAKANE-IBARA.** Stipules broader, the free portion elliptic-ovate, often obtuse; leaflets 7-9, obtuse to rounded, 1-3 cm. long, 8-15 mm. wide, with minute acute teeth; pedicels with rather long glandular hairs; fruit obovoid.—June-July. High mountains; Honshu (centr. distr. and Oze), Shikoku.

8. *Rosa hirtula* (Regel) Nakai. *R. microphylla* var. *hirtula* Regel; *R. roxburghii* var. *hirtula* (Regel) Rehd. & Wils.—**SANSHÔ-IBARA.** Large, much-branched shrub with much-flattened stipular prickles; stipules entire, glandular on margin, the free portion linear-lanceolate; leaflets 9-19, ovate-oblong or oblong, 10-25 mm. long, 5-15 mm. wide, acute, serrulate with short-awned acute teeth, nearly glabrous on upper side, paler and prominently pubescent especially on midrib beneath, the petioles and rachis short-pubescent; flowers solitary, terminal, pale pinkish, 5-6 cm. across, the pedicels stout, short, with needlelike prickles; calyx with densely prickly tube, the lobes broadly elliptic, often with a small appendage near base; fruit globose, about 2 cm. across.—June. Honshu (Sagami, Kai, and Suruga Prov.).

20. PRUNUS L. SAKURA ZOKU

Deciduous or evergreen trees and shrubs; leaves alternate, simple, toothed, conduplicate or convolute in bud; flowers solitary, in fasciculate corymbs or in racemes, white or pink; calyx deciduous, rarely persistent, the tube (hypanthium) tubular to obconical, the lobes 5, imbricate in bud; petals 5, inserted on the throat of the calyx-tube; stamens 15 to many, inserted on the throat of the calyx-tube, the filaments free; carpels solitary, the style terminal, the ovules 2, collateral; drupe fleshy, the endocarp a smooth or rugose, 1-seeded stone.—About 200 species, in the temperate and cooler regions of the N. Hemisphere and in the Tropics of Asia and America.

1A. Inflorescence a fascicle, corymb, or few-flowered short raceme; calyx-lobes deciduous after anthesis.

2A. Drupes shallowly sulcate; flowers sessile or nearly so (except No. 1).

3A. Terminal bud not developed; lateral bud solitary; leaves convolute in bud.

4A. Flowers pedicelled, usually in 3's; ovary and fruit glabrous. 1. *P. salicina*

4B. Flowers nearly sessile; ovary and fruit usually hairy.

5A. Leaves broadly ovate-obicular, 4-7 cm. wide; petioles 20-35 mm. long; flowers very short-pedicelled. 2. *P. ansu*

5B. Leaves obovate or elliptic, 3-5 cm. wide; petioles 1-2 cm. long; flowers nearly sessile. 3. *P. mume*

3B. Terminal bud present; lateral buds in 3's, the central one bearing 1 or 2 sessile flowers; drupe usually hairy; leaves conduplicate in bud. 4. *P. persica*

2B. Drupes not sulcate; flowers usually distinctly pedicelled.

6A. Buds in 3's.

7A. Leaves prominently pubescent; flowers sessile. 5. *P. tomentosa*

7B. Leaves glabrous or loosely short-pubescent; flowers pedicelled.

8A. Leaves ovate, sometimes ovate-lanceolate, acuminate, acutely duplicate-toothed; petioles 2-3 mm. long; fruit dark red-purple, with a depressed base. 6. *P. japonica*

8B. Leaves lanceolate to ovate-oblong, acute, obtusely serrulate; petioles 4-6 mm. long; fruit not depressed at base, red.

7. *P. glandulosa*

6B. Buds solitary; leaves conduplicate in bud.

9A. Calyx-lobes erect to spreading.

10A. Glands present at or near the base of the leaves; flowers usually without a common peduncle; calyx, young branches, leaves beneath, and petioles usually pilose or pubescent.

11A. Pedicels, petioles, and young branchlets with spreading hairs. 8. *P. apetalata*

11B. Pedicels, petioles, and young branchlets with appressed to ascending hairs.

12A. Leaves with few pairs of lateral nerves, 3–5 cm. long or sometimes more, doubly incised-toothed, the teeth not ending in a gland. 9. *P. incisa*

12B. Leaves with 7–14 pairs of lateral nerves, 5–12 cm. long, sparingly double-toothed, the teeth ending in a gland; calyx urceolate. 10. *P. pendula*

10B. Glands present near top of the petioles; flowers often in a corymb with a distinct common peduncle; leaves rarely pilose or pubescent beneath; branchlets and calyx glabrous.

13A. Calyx-tube campanulate-infundibuliform, 2–3 times as long as the lobes; flowers scarlet, not fully open, nodding; stones pitted. 11. *P. campanulata*

13B. Calyx-tube tubular or campanulate-tubular, as long as to longer than the lobes; flowers pale pinkish, rarely white or greenish.

14A. Leaves smaller, 4–8 cm. long, with acute incised double teeth, the petioles 7–15 mm. long. 12. *P. nipponica*

14B. Leaves larger, 8–13 cm. long, with acute often awn-tipped simple or sparingly double teeth, the petioles 1.5–3 cm. long.

15A. Leaves oblong to ovate-elliptic, with scarcely awn-tipped teeth, deep green above, whitish and not lustrous beneath.

16A. Leaves usually oblong, rounded to acute at base, finely toothed; branchlets rather slender, dark grayish brown or dark brown; flowers in corymbs. 13. *P. jamaica*

16B. Leaves usually elliptic, rounded to shallowly cordate (at least some of them), more coarsely toothed; branchlets rather stout, dark brown; flowers usually in sessile umbels. 14. *P. argentea*

15B. Leaves obovate to elliptic, with rather coarse awn-tipped teeth, pale to vivid green above, pale or bright green and lustrous beneath.

17A. Calyx-lobes entire or nearly so; bracts small, 4–6 mm. long; leaves thin, 4–6 cm. wide, with very short awn-tipped teeth; petioles and pedicels usually more or less spreading short-pubescent. 15. *P. verecunda*

17B. Calyx-lobes serrulate with minute glandular-tipped teeth; bracts large, about 1 cm. long; leaves rather thick, 5–8 cm. wide, awn-teeth about 2 mm. long; petioles and pedicels glabrous. 16. *P. lannesiana*

9B. Calyx-lobes reflexed; petals not retuse.

18A. Involucral bracts (bud scales of flowering bud) persistent through anthesis; inflorescence a sessile umbel; leaves with short obtuse teeth. 17. *P. avium*

18B. Involucral bracts or bud-scales early deciduous; inflorescence a short raceme with persistent green bracts; leaves doubly incised-toothed. 18. *P. maximowiczii*

1B. Inflorescence a many-flowered raceme.

19A. Calyx deciduous after anthesis.

20A. Leaves evergreen; racemes not leafy below.

21A. Glands of leaves on upper portion of petioles; inflorescence solitary to 5-nate; leaves 10–20 cm. long, 4–7 cm. wide, usually acutely toothed. 19. *P. zippeliana*

21B. Glands of leaves usually near the base of the blade; inflorescence solitary; leaves 6–10 cm. long, 2–3 cm. wide, the teeth sometimes obscure or sometimes large, spine-tipped. 20. *P. spinulosa*

20B. Leaves deciduous; racemes with 1–3 leaves at base.

22A. Leaves cordate, with rather awnlike mucronate teeth; glands of leaves at top of petioles. 21. *P. sibirica*

22B. Leaves acute to obtusely rounded at base.

23A. Glands of leaves at the top of the petioles; leaves with 10–13 pairs of lateral nerves; stamens shorter than the petals.

22. *P. padus*

23B. Glands of leaves on lower margin of the blade; leaves with 7–8 pairs of lateral nerves; stamens longer than the petals.

23. *P. grayana*

19B. Calyx persistent; leaves deciduous; racemes not leafy at base. 24. *P. buergeriana*

1. *Prunus salicina* Lindl. *P. triflora* Roxb.—SU-MOMO. Small tree with lustrous glabrous branches; leaves broadly oblanceolate to narrowly obovate, 5–10 cm. long, 2–4 cm. wide, abruptly acuminate, cuneate at base, subduplicately obtuse-serrulate, thinly pubescent beneath while young, becoming glabrous on both sides or slightly pilose in axils beneath, the petioles 1–2 cm. long, usually thinly pubescent and with 2–5 glands on the upper portion; flowers usually in 3's, white, 15–20 mm. across, the pedicels glabrous, 1–1.5 cm. long; drupe ovoid-globose, 5–7 cm. across, with a depression at base.—Apr. Chinese tree long cultivated in our area and sometimes naturalized.

2. *Prunus ansu* (Maxim.) Komar. *P. armeniaca* var. *ansu* Maxim.—ANZU. Small tree; leaves broadly ovate or ovate-orbicular, 6–8 cm. long, 4–7 cm. wide, caudately acuminate, rounded to subtruncate at base, glabrous, serrulate, the petioles 20–35 mm. long, glabrous; flowers pink to white,

precocious; drupe red, short-pilose, nearly globose, the stones roughened.—Apr. Introduced from China and long cultivated in Japan.

3. *Prunus mume* Sieb. & Zucc. УМЕ. Small tree with green branchlets; leaves broadly ovate, 4–10 cm. long, long-acuminate, broadly cuneate at base, acutely serrulate, sparingly pilose or sometimes only on nerves beneath, the petioles short-pilose above; flowers 1 or 2, appearing before the leaves, white or pink; drupe subglobose, the stones rugose.—Feb.–Apr. Said to be indigenous in the mountainous parts of Kyushu. A much-planted Chinese tree with many cultivars grown.

4. *Prunus persica* (L.) Batsch. *Amygdalus persica* L.; *Persica vulgaris* Mill.; *Prunus persica* var. *vulgaris* Maxim.—MOMO. Small tree with glabrous elongate branches; leaves lanceolate to broadly oblanceolate, 8–15 cm. long, 15–35 mm. wide, long-acuminate, serrulate, glabrescent, the petioles 4–10 mm. long, with glands on the upper portion; flowers pink to

white, on very short pedicels; calyx short-pubescent; drupe typically short-pilose, the stones very prominently rugose.—Apr.-May. A widely cultivated Chinese tree with many cultivars grown; said to be spontaneous in Kyushu.

5. *Prunus tomentosa* Thunb. *Cerasus tomentosa* (Thunb.) Wall.; *P. trichocarpa* Bunge; *C. trichocarpa* (Bunge) Wall.—YUSURA-UME. Shrub with dense pubescence on young branchlets, petioles and underside of leaves; leaves obovate, abruptly short-acuminate, 5-7 cm. long, 3-4 cm. wide, hairy on upper side, duplicately toothed, the petioles 2-5 mm. long; flowers 1 or 2, pale pink, small; ovary and calyx-lobes short-pubescent; drupe subglobose, red.—Apr. Cultivated for the flowers and the edible fruit.—China and Korea to the Himalayas.

6. *Prunus japonica* Thunb. *Cerasus japonica* (Thunb.) Loisel.—NIWA-UME. Shrub with slender elongate branches often puberulent while young; leaves ovate, rarely obovate-lanceolate, 3-7 cm. long, acuminate, rounded or sometimes cuneate at base, doubly acute-toothed, glabrous on both sides or short-pubescent on nerves beneath, the stipules longer than the petioles, laciniate, minutely toothed, the petioles 2-3 mm. long; flowers appearing with the leaves, 2 or 3, small, white or pale pink, single, the pedicels 5-10 mm. long; drupes subglobose.—Apr. Cultivated shrub of Chinese origin.

7. *Prunus glandulosa* Thunb. *Cerasus glandulosa* (Thunb.) Loisel.; *P. glandulosa* var. *glabra* Koehne; *P. japonica* var. *glandulosa* (Thunb.) Maxim.—HITO-NO-NIWA-ZAKURA. Deciduous shrub with slender, elongate, glabrous or sometimes puberulent branches; leaves lanceolate to ovate-oblong, 3-8 cm. long, gradually tapering above to a subobtusate tip, glabrous on both sides or slightly puberulent on nerves beneath, obtusely serrulate, the petioles 4-6 mm. long; flowers 1 or 2, small, single, white or pink, the pedicels 1-2 cm. long; drupes red, about 1.2 cm. across.—Apr.-May. Cultivated.

8. *Prunus apetalá* (Sieb. & Zucc.) Fr. & Sav. *Cerasoides apetalá* Sieb. & Zucc.; *P. cerasoides* (Sieb. & Zucc.) Maxim.; *P. crassipes* Koidz.—CHÔJIZAKURA, MEJIZOZAKURA, TANI-NOZOKI. Small tree with glabrescent or pilose branchlets; leaves obovate or cuneate-obovate, 5-8 cm. long, 3-5 cm. wide, caudately acuminate, spreading-pilose on both sides especially on nerves beneath, dull, with short, rather obtuse to acute coarse double teeth, the petioles 3-8 mm. long, spreading-pilose; flowers 1-3, in sessile umbels, nodding, small, pink to nearly white; calyx-tube slender, 7-10 mm. long, prominently pubescent, 3-4 times as long as the ovate lobes; petals 5-8 mm. long, retuse; style with a few spreading hairs on the lower part.—Apr. Low mountains; Honshu, Kyushu.

Var. *pilosa* (Koidz.) Wils. *P. matsumurana* Koehne; *P. cerasoides* sensu Koidz., non Maxim.; *P. cerasoides* var. *pilosa* Koidz.; *P. crenata* Koehne.—OKU-CHÔJIZAKURA. Less prominently hairy on all parts; leaves acutely toothed, the petioles 6-10 mm. long; flowers larger; calyx-tube 2 or 3 times as long as the lobes; petals 8-12 mm. long; style usually glabrous.—Mountain form especially abundant on the Japan Sea side of Honshu (centr. distr. and northw.). Grades into the typical phase.

9. *Prunus incisa* Thunb. *Cerasus incisa* (Thunb.) Loisel.—MAMEZAKURA. Small tree, the young branchlets sometimes pubescent; leaves obovate or ovate, 3-5 cm. long, 2-3 cm. wide, short-acuminate, pubescent on upper side and on nerves beneath, doubly acute-toothed, the petioles 8-10 mm. long; flowers 1-3, in sessile umbels, white to rose, on

glabrous to thinly pubescent pedicels 1-2.5 cm. long; calyx-tube usually glabrous, 5-6 mm. long, about twice as long as the lobes; petals about 10 mm. long, retuse.—Apr.-June. Mountains; Honshu (centr. distr. and northw.).—Forma *yamadei* (Makino) Ohwi. *P. incisa* var. *yamadei* Makino.—RYOKUGAKU-ZAKURA, MIDORI-ZAKURA. Young leaves, calyx, and pedicels green.

Var. *tomentosa* Koidz. *P. hisauchiana* Koidz. ex Hisauchi.—YABUZAKURA. Leaves larger, broader; calyx-lobes clearly serrulate.—Low mountains; Honshu (w. Kantô Distr.).

Var. *kinkiensis* (Koidz.) Ohwi. *P. kinkiensis* Koidz.—KINKI-MAMEZAKURA. Differs from the typical phase in the longer calyx-tube and slightly larger caudate leaves.—Mountains; Honshu (w. part of centr. distr. and westw.).

Var. *bukosanensis* (Honda) Hara. *P. nipponica* var. *bukosanensis* Honda.—BUKO-MAMEZAKURA. Leaves larger, broadly obovate, 5-8 cm. long, 3-5 cm. wide, glabrescent on both sides.—Mountains; Honshu (Mount Buko in Musashi).

10. *Prunus pendula* Maxim. forma *ascendens* (Makino) Ohwi. *P. pendula* var. *ascendens* Makino; *P. itosakura* var. *ascendens* (Makino) Makino; *P. subhirtella* var. *ascendens* (Makino) Wils.; *P. aequinoctialis* Miyoshi; *P. subhirtella* var. *pendula* forma *ascendens* (Makino) Ohwi; *P. microlepis* Koehne; *Cerasus herincqiana* Lavall.; *P. herincqiana* (Lavall.) Spaeth.—EDO-HIGAN, AZUMA-HIGAN. Large tree with longitudinally fissured bark, the branches elongate, rather slender, light grayish brown, ascending-pilose while young; leaves membranous, oblong to narrowly obovate, 6-12 cm. long, 3-4 cm. wide, caudately acuminate, with 10-14 pairs of obliquely spreading parallel lateral nerves, subdouble-toothed, glabrous to thinly ascending-pubescent on upper side, ascending to appressed-pubescent beneath especially on nerves, the petioles pubescent; flowers 2-5, in sessile umbels, pink, the pedicels 1.5-3 cm. long, with whitish ascending hairs; calyx-tube slightly inflated at base, about 5 mm. long, more or less pubescent; petals about 12 mm. long, retuse; style with few spreading hairs on the lower part.—Apr. Mountains; Honshu, Shikoku, Kyushu; occasionally planted in parks and around temples.—Cv. *Pendula*. *P. pendula* Maxim.; *P. itosakura* Sieb. nom. subnud.; *P. herincqiana* sensu C. K. Schn. non Spaeth; *P. subhirtella* var. *pendula* (Maxim.) Y. Tanaka.—ITROZAKURA, SHIDAREZAKURA. Branches pendulous. A much cultivated phase.

The following are alleged hybrids:

Prunus sieboldii (Carr.) Wittm. *Cerasus sieboldii* Carr.; *P. pseudocerasus* var. *sieboldii* (Carr.) Maxim.; *C. watereri* Lavall. ex Bean; *P. pseudocerasus* forma *watereri* (Lavall.) Koehne; *P. koidzumii* Makino; *P. fortis* Koidz.; *P. donarium* subsp. *fortis* (Koidz.) Koidz.—NADEN. Small tree with dark grayish brown rather stout branches more or less spreading-pubescent while young; leaves prominently spreading-pubescent, the glands small, at base of the blade, the pedicels pubescent; flowers semidouble.—Alleged hybrid of Nos. 8 and 16.

Prunus yedoensis Matsum. SOMEI-YOSHINO. Small tree with ascending-hairs on young branchlets, lower leaf surfaces, inflorescence, and calyx; leaves vivid green; flowers single, precocious.—Apr. Much planted on riverbanks and in parks. Alleged hybrid of Nos. 10 and 16.

Prunus subhirtella Miq. *P. miqueliana* Maxim., pro parte; *P. kôhigan* Koidz.; *P. subhirtella* var. *oblongifolia* Miq.; *P. herincqiana* var. *ascendens* C. K. Schn., excl. syn.; *P. itosa-*

kura var. *subhirtella* (Miq.) Koidz.; *P. subhirtella* var. *glabra* Koidz.—KO-HIGANZAKURA, CHIMOTO-HIGAN. Small tree with slender branches, ascending-pubescent while young; leaves obovate, 3–8 cm. long, duplicate-toothed, with 7–10 pairs of lateral nerves, the petioles pubescent; calyx-tube slightly inflated below, short-pubescent; style usually glabrous.—Mar.–Apr. Alleged hybrid of Nos. 9 and 10.—Cultivated only, unknown in the wild.

Var. *autumnalis* Makino. *P. autumnalis* (Makino) Koehne—JUGATSU-ZAKURA. Differs in having double flowers, appearing in spring and in autumn.—Cultivated only, unknown in the wild.

11. *Prunus campanulata* Maxim. *P. cerasoides* var. *campanulata* (Maxim.) Koidz.—HI-KANZAKURA, KAN-HI-ZAKURA. Small tree with rather stout branches; leaves obovate, ovate or elliptic, 7–12 cm. long, 3.5–5 cm. wide, glabrous; flowers 1–3, scarlet, semi-expanding, nodding.—Feb.–Mar. Cultivated in warmer parts.—Ryukyus and Formosa.

12. *Prunus nipponica* Matsum. *P. iwagiensis* Koehne; *P. nikkoensis* Koehne; *P. nipponica* var. *iwagiensis* (Koehne) Koidz.—MINE-ZAKURA, TAKANEZAKURA. Shrub to small tree; leaves obovate to broadly so, caudately acuminate, 4–8 cm. long, 2–4.5 cm. wide, often thinly pilose beneath while young, sometimes appressed-pilose above, pale green beneath, incisely and doubly acute-toothed, the petioles 7–15 mm. long, glabrous; flowers 1–3, in sessile umbels or in short-peduncled umbellike corymbs, pink, the pedicels 2–3 cm. long, glabrous; calyx-tube glabrous, about 6 mm. long, about 1.5 times as long as the lobes; petals 10–12 mm. long, retuse.—May–July. High mountains; Hokkaido, Honshu (centr. and n. distr.).

Var. *kurilensis* (Miyabe) Wils. *P. ceraseoides* var. *kurilensis* Miyabe; *P. apetalata* var. *iwozana* C. K. Schn.; *P. incisa* var. *kurilensis* (Miyabe) Koidz.; *P. kurilensis* (Miyabe) Miyabe ex Takeda; *P. nipponica* var. *pubescens* Koidz.—CHISHIMA-ZAKURA. Petioles or pedicels or both pilose.—Hokkaido, Honshu (centr. and n. distr.).—Kuriles and Sakhalin.

13. *Prunus jamasakura* Sieb. ex Koidz. *P. donarium* Sieb., pro parte; *P. serrulata* sensu auct. Japon., non Lindl.; *P. pseudocerasus* sensu auct. Japon., non Lindl.; *P. pseudocerasus* var. *jamasakura* subvar. *glabra* Makino; *P. donarium* var. *glabra* (Makino) Koidz.; *P. jamasakura* var. *glabra* (Makino) Koidz.; *P. serrulata* var. *spontanea* (Maxim.) Makino; *P. mutabilis* Miyoshi—YAMAZAKURA. Deciduous tree with dark brown transversely striate bark and rather slender glabrous branchlets; leaves oblong, narrowly elliptic or ovate to obovate-oblong, 8–12 cm. long, 3–4.5 (–5.5) cm. wide, deep green and usually glabrous on upper side, whitish and glabrous beneath, acutely serrulate, the petioles reddish, with a pair of sessile glands near the top; flowers few, in corymbs, 2.5–3 cm. across, pink, glabrous, the bracts obovate-cuneate, rounded, 3–6 mm. long; calyx-tube tubular, the lobes entire; drupe purplish black when mature.—Low mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common and variable.—Forma *pubescens* (Makino) Ohwi. *P. pseudocerasus* var. *jamasakura* subvar. *pubescens* Makino, pro parte—USUGE-YAMAZAKURA. Petioles or pedicels or both thinly puberulent.

Var. *chikusiensis* (Koidz.) Ohwi. *P. chikusiensis* Koidz.; *P. serrulata* var. *chikusiensis* (Koidz.) Hatus.—TSUKUSHI-ZAKURA. An insular phase with stout branches, thicker leaves, and larger bracts; flowers larger, nearly white.—Small islands around Kyushu.

14. *Prunus sargentii* Rehd. *P. pseudocerasus* var. *sachalinensis* F. Schmidt; *P. sachalinensis* (F. Schmidt) Koidz.; *P. jamasakura* var. *borealis* (Makino) Koidz.; *P. serrulata* var. *sachalinensis* (F. Schmidt) Makino; *P. serrulata* var. *borealis* Makino; *P. floribunda* Koehne—O-YAMAZAKURA, EZO-YAMAZAKURA, BENI-YAMAZAKURA. Resembles the preceding; bark dark chestnut-brown, the branchlets stout, glabrous, with viscid buds; leaves elliptic, ovate-elliptic or sometimes obovate-elliptic, 8–13 cm. long, 4–7 cm. wide, rounded or at least some of them subcordate at base, deep green and usually glabrous on upper side, glaucescent and glabrous beneath, with obliquely deltoid teeth, the petioles 1.5–3 cm. long, glabrous, reddish, with a pair of reddish sessile glands near the top; flowers 3–4 cm. across, in sessile umbels, glabrous, pink; calyx-lobes entire; drupe dark purple.—Apr.–May. Mountains; Hokkaido, Honshu (centr. and n. distr.).—Sakhalin and Korea.—Forma *pubescens* (Tatew.) Ohwi. *P. sargentii* var. *pubescens* Tatew.—KE-EZO-YAMAZAKURA. Pubescent on lower leaf surfaces, petioles or pedicels, or on all of them.

15. *Prunus verecunda* (Koidz.) Koehne. *P. jamasakura* var. *verecunda* Koidz.; *P. donarium* subsp. *verecunda* (Koidz.) Koidz.—KASUMIZAKURA. Resembling the preceding two species; bark grayish brown, the branchlets grayish to yellowish brown, glabrous; leaves obovate, obovate-elliptic or sometimes elliptic, rounded to cuneate, sometimes shallowly cordate at base, 8–12 cm. long, 4–6 cm. wide, vivid green and sometimes scattered-pilose on upper side, pale green to bright green and lustrous and often with spreading hairs beneath, with short-awned coarser marginal teeth than in Nos. 13 and 14, the petioles slightly reddish, with a pair of small, sessile glands on the upper part, usually more or less spreading-pilose; flowers pink to nearly white, 2.5–3 cm. across, the peduncles sometimes absent, the pedicels often spreading-pilose, the bracts 3–6 mm. long; calyx-lobes glabrous, usually entire.—Apr.–May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

16. *Prunus lannesiana* (Carr.) Wils. var. *speciosa* (Koidz.) Makino. *P. serrulata* var. *albida* subvar. *speciosa* (Koidz.) Makino; *P. donarium* subsp. *speciosa* (Koidz.) Koidz.; *P. speciosa* (Koidz.) Nakai.—OSHIMA-ZAKURA. Resembles Nos. 13–15; branchlets stouter, grayish to pale brown, glabrous; leaves rather thick, obovate to obovate-elliptic, sometimes elliptic, 8–13 cm. long, 5–8 cm. wide, rounded to broadly cuneate at base, vivid green on upper side, pale green beneath, glabrous on both sides, with narrowly deltoid awn-tipped teeth about 2 mm. long, some of the teeth doubly toothed, the petioles nearly green or slightly reddish, with a pair of glands near the top; flowers in corymbs, white, sometimes pink, 3.5–4 cm. across, the pedicels rather stout, elongate, glabrous, the bracts flabellate-obovate, about 1 cm. long; calyx-lobes serrulate with gland-tipped minute teeth; fruit rather large, dark purple.—Mar.–Apr. Low mountains near the sea; Honshu (Awa, Izu Prov., and Izu Is.).

Var. *lannesiana*. *Cerasus lannesiana* Carr.; *P. pseudocerasus* var. *hortensis* Maxim., pro parte maj.; *P. donarium* Sieb., pro parte; *P. serrulata* var. *lannesiana* (Carr.) Rehd.; *P. serrulata* var. *hortensis* (Maxim.) Makino—SATOZAKURA. Includes an assemblage of various cultivars with large single or double flowers.

17. *Prunus avium* L. SEIYŌ-MIZAKURA. Tree with pyramidal crown and stout branches; leaves ovate to obovate-oblong, 8–15 cm. long, 5–7 cm. wide, abruptly short-acuminate, irregularly obtuse-toothed, spreading-pilose beneath especially

on nerves, the petioles 3-5 cm. long; flowers 3-5, in umbels, white; calyx-tube contracted above.—Apr.-May. Europe. The cultivated edible cherry.

18. *Prunus maximowiczii* Rupr. *P. bracteata* Fr. & Sav. —MIYAMAZAKURA. Small tree with rather prominent appressed hairs on young branchlets, inflorescence, petioles, and nerves of leaves beneath; leaves obovate or rhombic-elliptic, gradually narrowed above or short-caudate, 4-8 cm. long, 2.5-6 cm. wide, coarsely and acutely double-toothed, appressed-pilose to glabrate on upper side, the petioles 7-15 mm. long, the glands on or near base of leaf-margin; flowers 4-7, in loose corymbose racemes, white, small, the bracts ovate-orbicular, persistent, 5-8 mm. long, toothed, the pedicels 10-15 mm. long; calyx-tube obconical, somewhat longer than the denticulate ovate lobes, pilose; style pilose or glabrous at base.—June. Mountains; Hokkaido, Honshu, Kyushu.—Sakhalin, Korea, Manchuria, and Ussuri.

19. *Prunus zippeliana* Miq. *P. macrophylla* Sieb. & Zucc., non Poir.—BAKUCHI-NO-KI. Evergreen tree with reddish brown exfoliating bark; leaves subcoriaceous, narrowly ovate-oblong or -elliptic, 10-20 cm. long, 4-7 cm. wide, gradually narrowed to the tip, glabrous or thinly soft-pubescent beneath, acutely toothed, the petioles 10-15 mm. long, with a gland on each side at the top; racemes short, 1- to 5-nate, densely many-flowered, nearly sessile, the bracts broadly deltoid, caducous, with pale brown pubescence; flowers white, 6-7 mm. across, the rachis and pedicels with short spreading hairs; calyx-tube broadly obconical, slightly hairy, the teeth shorter than the tube; petals reflexed, about 3 mm. long, nearly orbicular; ovary glabrous, the style 3-3.5 mm. long; drupe ovoid, about 18 mm. long, terminated by the persistent style base.—Sept.-Oct. Honshu (warmer part of Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus and Formosa.

20. *Prunus spinulosa* Sieb. & Zucc. RINBOKU. Small tree, the young branches often puberulent; leaves coriaceous, lustrous, narrowly oblong to narrowly obovate, 5-8 cm. long, 1.5-3 cm. wide, caudate-acuminate with an obtuse or acute tip, glabrous, more or less thickened on margin, remotely toothed or entire, the teeth ascending to obliquely spreading, spine-tipped, the petioles 5-10 mm. long, glabrous; inflorescence 2-8 cm. long, rather densely many-flowered, puberulent only while young, glabrescent, nearly sessile, the bracts caducous; flowers white, about 6 mm. across, the pedicels 3-7 mm. long; calyx-tube broadly obconical, longer than the loosely toothed ovate lobes; petals orbicular, about 3 mm. long, reflexed; drupes ellipsoidal or broadly ovoid, glabrous, about 8 mm. long.—Sept.-Oct. Warmer parts; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus.

21. *Prunus ssiroi* F. Schmidt. SHŪRIZAKURA, MIYAMAZAKURA. Deciduous tree with glabrous branchlets; leaves oblong to ovate, 7-15 cm. long, 3-7 cm. wide, long-acuminate, usually cordate at base, glabrous except for axillary tufts of hairs beneath, serrulate with narrow, acute, simple or some-

times double small teeth, the glands near the top of the petiole; racemes 15-20 cm. long, rather densely many-flowered, glabrous, with few small leaves at base; flowers small, white, about 10 mm. across, the pedicels 7-10 mm. long; calyx with cup-shaped tube, the teeth short, semi-rounded, with minute glandular teeth; petals spreading, elongate-orbicular, 4-5 mm. long, nearly as long as the stamens, loosely toothed.—May-June. Woods in mountains; Hokkaido, Honshu (centr. distr. and northw.).—Sakhalin, Manchuria, Ussuri, and S. Kuriles.

22. *Prunus padus* L. *P. racemosa* Lam.; *Padus racemosa* (Lam.) C. K. Schn.—EZO-NO-UWA-MIZUZAKURA. Deciduous tree; leaves obovate to elliptic or narrowly obovate, 5-9 cm. long, 3-6 cm. wide, abruptly acuminate, obtuse to rounded at base, acutely toothed, glabrous or with few axillary tufts of hairs beneath, the petioles 10-15 mm. long, glabrous, with glands at the top; racemes 10-12 cm. long, rather many-flowered, glabrous to puberulent; flowers white, 12-15 mm. across, the pedicels 8-12 mm. long; calyx with broadly obconical tube, the lobes ovate, glandular-toothed; petals 5-6 mm. long, orbicular, loosely toothed; stamens short.—May-July. Hokkaido.—Korea, Sakhalin, and widely distributed in temperate regions of the Old World.

23. *Prunus grayana* Maxim. *P. padus* var. *japonica* Miq.; *Padus grayana* (Maxim.) C. K. Schn.—UWA-MIZUZAKURA. Tree with puberulent or glabrous young branches; leaves ovate to ovate-oblong, 6-10 (-15) cm. long, 2.5-4.5 (-5.5) cm. wide, caudate to abruptly acuminate, glabrous on both sides or pilose along the midrib beneath while young, acutely toothed, the petioles 6-8 (-10) mm. long, glabrous or puberulent while young; racemes 12-20 cm. long inclusive of short few-leaved peduncles, rather dense, many-flowered, glabrous or puberulent on rachis; flowers white, 6-8 mm. across, the pedicels 3-10 mm. long; calyx with obconical tube, the teeth deltoid, short, pilose inside; petals suborbicular, about 3 mm. long; stamens longer than the petals; drupe ellipsoidal, acute, 6-7 mm. long, black.—Apr.-June. Hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Plants of the northern part of the range generally have larger leaves and more pilose calyx-teeth than those in the southern part of the distribution.

24. *Prunus buergeriana* Miq. *Laurocerasus buergeriana* (Miq.) C. K. Schn.—INUZAKURA, SHIROZAKURA. Tree, usually the branches puberulent when young; leaves chartaceous, somewhat lustrous, ovate-oblong to cuneate-oblong, 5-10 cm. long, 2-3.5 cm. wide, acuminate with an acute or sub-obtuse tip, with appressed or ascending minute teeth, glabrous on both sides except for pubescence along the midrib near the base beneath while young, the petioles 8-25 mm. long, sometimes puberulent on the upper side; racemes 5-10 cm. long, rather loosely flowered, puberulent; flowers white, about 5 mm. across; calyx with cup-shaped tube, the teeth short, broadly ovate, sometimes loosely toothed; petals broadly obovate, 2-3 mm. long, shorter than the stamens.—Apr.-June. Hills and mountains; Honshu, Shikoku, Kyushu.

21. CRATAEGUS L. SANZASHI ZOKU

Shrubs or trees, branchlets often thornlike; leaves petiolate, alternate, simple to 3-lobed or pinnatifid, the stipules usually small, deciduous; cymes or corymbs terminal; flowers white or reddish; calyx urceolate or campanulate, the teeth 5; petals 5; stamens many; ovary inferior or semi-inferior, 1- to 5-locular; styles 1-5; ovules 2 in each locule, erect; drupes subglobose, red to black, sometimes yellow, small, the stones bony; seeds solitary in each locule, erect, flat.—A large complicated genus of the N. Hemisphere, especially abundant in e. N. America.

- 1A. Leaves cuneate to obovate-cuneate, broadest above the middle, cuneate at base, sometimes 3- to 5-lobed on upper margin. 1. *C. cuneata*
- 1B. Leaves ovate to broadly so, broadest at or below the middle, truncate to broadly cuneate at base, pinnately cleft to incised. 2. *C. oxyacantha*
- 2A. Leaves pinnately cleft. 2. *C. oxyacantha*
- 2B. Leaves incised or shallowly lobed. 2. *C. oxyacantha*
- 3A. Fruit red or yellowish red; leaves rather deeply lobed, villous beneath. 3. *C. maximowiczii*
- 3B. Fruit black; leaves incised to shallowly lobed. 4. *C. chlorosarca*

1. *Crataegus cuneata* Sieb. & Zucc. *Mespilus cuneata* (Sieb. & Zucc.) C. Koch.—SANZASHI. Spiny deciduous much-branched shrub with straight ascending spines 3-8 mm. long, the branches pubescent while young; leaves cuneate, 2.5-7 cm. long, 1-4 cm. wide, obtuse, slightly appressed-pubescent while young, often glabrate on upper side, shallowly to deeply 3-lobed, irregularly incised or toothed, sometimes entire, paler beneath, sessile or the petioles to 3 cm. long; inflorescence 2- to 6-flowered, terminal on short branches, sessile, pubescent; flowers about 18 mm. across; calyx-teeth spreading, ovate, subacute; petals 5, suborbicular, white; styles usually 5; fruit subglobose, red, 10-12 mm. across.—Apr.-May. Only cultivated.—China and Mongolia.—Forma *lutea* Matsum. KIMI-SANZASHI. Fruit yellow.

2. *Crataegus oxyacantha* L. SEIYŌ-SANZASHI. Tall deciduous shrub with elongate stout spines 7-20 mm. long, the young branchlets usually glabrous; leaves broadly ovate, 1.5-5 cm. long, 2-4 cm. wide, subobtusely, deep green, deeply (3-) 5-lobed, the lobes obtuse, slightly toothed on upper margin, glabrous or nearly so, the petioles 1-2 cm. long, glabrous or nearly so; inflorescence glabrous, several-flowered, terminal on short branches; flowers white, about 15 mm. across, single; styles 2-3; fruit red, subglobose, terminated by the persistent reflexed calyx-teeth.—Apr.-May. Cultivated in gardens.—Europe.

Crataegus pinnatifida Bunge. *Crataegus oxyacantha* var. *pinnatifida* (Bunge) Regel.—Ō-SANZASHI. Allied to the preceding but with few spines, pubescent inflorescence and the young branches with rather acute leaf-lobes, and the stonies

flat on ventral side.—Occasionally cultivated.—Korea, Manchuria, and e. Siberia.

3. *Crataegus maximowiczii* C. K. Schn. *C. sanguinea* var. *villosa* Maxim.; *Mespilus sanguinea* var. *villosa* (Maxim.) Asch. & Graebn.—ARAGE-SANZASHI, ŌBA-SANZASHI. Deciduous shrub, the young branches coarsely hairy, later glabrate, lustrous reddish brown, the spines 15-35 mm. long; leaves pubescent on both sides, 7-9 cm. long, 5-6 cm. wide, rather deeply 3-cleft in vigorous elongate shoots, the petioles hairy, 15-30 mm. long; inflorescence densely flowered, coarsely hairy along with the young fruits; flowers about 1.5 cm. across; styles 3-5, nearly terminal.—Hokkaido; rare.—e. Siberia, Manchuria, Sakhalin, and Korea.

4. *Crataegus chlorosarca* Maxim. *C. sanguinea* var. *schroederi* Regel; *Mespilus chlorosarca* (Maxim.) Asch. & Graebn.—KURUMI-SANZASHI. Small deciduous tree with rather spreading, stout spines, the young branches glabrous or slightly pubescent, becoming dark purple in age; leaves membranous, dull, ovate or broadly so, 5-10 cm. long, 3.5-5 cm. wide, acute, broadly cuneate at base, slightly pubescent, shallowly lobed to incised, irregularly and acutely toothed, the petioles 1-3 cm. long, loosely pubescent on the upper side; inflorescence rather many-flowered, glabrous or slightly pubescent; flowers white, 10-15 mm. across; calyx-teeth narrowly ovate-lanceolate, subacuminate, reflexed; stamens rather long; styles 5.—May-June. Hokkaido, Honshu (Sugadaira in Shinano).—Sakhalin.

Crataegus jozana C. K. Schn. may be only a variant of the preceding with denser pubescence.

22. PHOTINIA Lindl. KANAME-MOCHI ZOKU

Glabrous to pubescent shrubs or trees; leaves alternate, petioled, coriaceous, evergreen, simple, entire or toothed, the stipules sometimes foliaceous; flowers in terminal corymbs or panicles, small, white; calyx with campanulate or napiform tube adnate to the ovary or free above, the lobes 5, obtuse; petals 5, spreading; stamens rather numerous, inserted on the throat of the calyx-tube; ovary inferior or free on upper part, 2- to 5-locular; styles 2-5, free or connate, the stigmas dilated, truncate; ovules 2 in each locule, erect; drupe ovoid, with 1 or 2 seeds in each locule, erect, with a membranous or coriaceous testa.—About 40 species, in the temperate to warmer regions of e. Asia.

1. *Photinia glabra* (Thunb.) Maxim. *Crataegus glabra* Thunb.; *P. serrulata* Sieb. & Zucc., non Lindl.—KANAME-MOCHI. Small evergreen tree, glabrous except the inflorescence; leaves oblong to narrowly obovate, 7-12 cm. long, 2.5-4 cm. wide, acute to acuminate, acute at base, serrulate, lustrous, paler beneath, the petioles 10-17 mm. long, often slightly pubescent inside near base while very young; inflorescence

many-flowered, 8-12 cm. across, the bracts erect, broadly lanceolate, caducous; flowers about 8 mm. across, white and slightly pinkish; calyx-teeth deltoid, acute, erect; petals white-puberulent inside at base; styles 2 or 3, white-puberulent on lower part; fruit subglobose, 4-5 mm. across, red.—May-June. Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.

23. ERIOBOTRYA Lindl. BIWA ZOKU

Evergreen trees; leaves short-petioled, simple, coriaceous, toothed, with straight nerves ending in the teeth; inflorescence a broad pyramidal panicle usually densely woolly-pubescent, the bracts deltoid-ovate, persistent; flowers rather small, white; calyx-teeth acute, persistent; petals 5, ovate to nearly orbicular, clawed; stamens about 20; ovary inferior with 2 ovules in each locule; styles 2-5, connate below; fruit an obovoid to globose pome, with persistent calyx-teeth at apex; the seeds few, large.—About 10 species, in e. Asia.

1. *Eriobotrya japonica* (Thunb.) Lindl. *Mespilus japonica* Thunb.; *Crataegus bibas* Lour.; *Photinia japonica* (Thunb.) Fr. & Sav.—BIWA. Woolly-pubescent coarsely branching tree with stout branches; leaves broadly oblanceolate to narrowly obovate, 15–25 cm. long, 3–5 cm. wide, acute, gradually narrowed at base, deep green, deciduous woolly-

pubescent above, loosely toothed, sessile or the petioles about 1 cm. long, the stipules lanceolate-deltoid; inflorescence densely flowered, terminal, erect; fruit globose to pyriform, 3–4 cm. across, yellow.—Nov.–Dec.—Honshu (w. distr.), Shikoku, Kyushu.—China. Much planted for the edible fruit.

24. RHAPHIOLEPIS Lindl. SHARIMBAI ZOKU

Evergreen glabrescent shrubs or trees; leaves alternate, petioled, coriaceous, entire or toothed, the stipules subulate; inflorescence a panicle or corymb, the bracts subulate, deciduous; flowers white or reddish; calyx with the tube adnate to the ovary at base, obconical or infundibuliform, the upper portion deciduous after anthesis, the lobes 5, subulate; petals 5, white to rosy clawed, oblong, acute to obtuse; stamens many, inserted on the throat of the calyx-tube; ovary inferior, 2-locular; styles 2, elongate, connate at base, obliquely thickened at apex, the stigma along the inner side at tip; ovules 2 in each locule, erect; berry 1- or 2-locular, 1- or 2-seeded, globose, purplish black or bluish black; seeds rather large, globose.—Few species, in Japan and China.

1. *Rhaphiolepis umbellata* (Thunb.) Makino. *Laurus umbellata* Thunb.; *Mespilus sieboldii* Bl.; *R. japonica* Sieb. & Zucc.; *R. ovata* Briot; *R. umbellata* forma *ovata* (Briot) C. K. Schn.—SHARIMBAI. Shrub with stout branches brownish pubescent while very young; leaves coriaceous, lustrous, ovate-oblong to obovate, 4–10 cm. long, 2–4 cm. wide, obtuse to subacute, acute at base, loosely and obtusely toothed to nearly entire, slightly recurved on margin, the veinlets slightly raised, the petioles 5–20 mm. long; inflorescence erect, more or less dense, 5–15 cm. long, densely brownish pubescent while young, becoming glabrate in fruit; calyx-tube infundibuliform, densely pubescent, the teeth deltid to narrowly ovate, subacute; petals obovate, 10–13 mm. long, rounded and often toothed at apex; fruit globose, 7–10 mm. across, lustrous.—Apr.–June. Thickets near seashores; Honshu, Shikoku, Kyushu. Commonly planted in hedges and parks; very variable.—Korea (Quelpaert Isl.) and Ryukyu.—Cv. *Minor*. R.

minor (Makino) Koidz.—HIME-SHARIMBAI. Densely branched shrub; leaves ovate-oblong, 2–4 cm. long, 12–20 mm. wide, obtuse to subacute, entire or obtusely toothed; flowers rather small. A garden cultivar.

Var. *integerrima* (Hook. & Arn.) Rehd. *R. japonica* var. *integerrima* Hook. & Arn.; *R. mertensii* Sieb. & Zucc.; *R. umbellata* var. *mertensii* (Sieb. & Zucc.) Makino.—MARUBA-NO-SHARIMBAI. Leaves broader, broadly obovate to broadly elliptic, entire or with a few teeth.—Honshu (centr. and w. distr.), Shikoku, Kyushu.

Var. *liukiuensis* Koidz. *R. liukiuensis* (Koidz.) Nakai —HOSOBASHARIMBAI. Leaves narrower, oblanceolate to narrowly oblong, 5–10 cm. long, 1–2 cm. wide, acute to obtuse, undulately and obtusely toothed or entire.—Rarely cultivated in our area; sometimes merges with the typical phase.—Ryukyu, reported from Korea (Quelpaert Isl.).

25. CHAENOMELES Lindl. BOKE ZOKU

Deciduous shrubs or small trees, sometimes with spiny branches; leaves simple, short-petioled, toothed or crenate, the stipules often large in vigorous shoots; flowers solitary or fascicled, before or after the leaves, sometimes a few staminate only; calyx-lobes 5, entire or serrulate; petals typically 5, large; stamens 20 or more; ovary 5-locular; ovules many in each locule; styles 5, connate at base; pome rather large, with many brown seeds.—Few species, in E. Asia.

- 1A. Small shrub 30–100 cm. high, with long ascending-creeping base; branchlets scabrous with low verrucose tubercles; leaves obtusely toothed, obtuse or subacute at apex. 1. *C. japonica*
1B. Erect bushy shrub 0.5–3 m. high; branchlets smooth, glabrous or slightly pubescent while young; leaves densely and acutely toothed, acute to subacute. 2. *C. speciosa*

1. *Chaenomeles japonica* (Thunb.) Lindl. *Pyrus japonica* Thunb.; *Cydonia japonica* (Thunb.) Pers.; *Cydonia lagenaria* Loisel.; *Cydonia japonica* var. *lagenaria* (Loisel.) Makino; *Chaenomeles lagenaria* (Loisel.) Koidz.; *Chaenomeles japonica* var. *alpina* Maxim.; *Chaenomeles japonica* var. *pygmaea* Maxim.; *Pyrus maulei* Masters; *Chaenomeles japonica* var. *maulei* (Masters) Lavall.; *Chaenomeles maulei* (Masters) Lavall.; *Chaenomeles alpina* (Maxim.) Koehne.—KUSA-BOKE, SHIDOMI, NO-BOKE, KO-BOKE. Small shrub 30–100 cm. high, creeping or ascending at base, the young branches with deciduous short yellowish hairs leaving verrucose scars after falling, the short branchlets often becoming spiny; leaves obovate to broadly so, 2–5 cm. long, 1–3.5 cm. wide, rounded to subacute, pale green and often lustrous beneath, glabrous on both sides, narrowed at base, the petiole 3–10 mm. long; flowers scarlet, about 2.5 cm. across, short-pedicled; calyx glabrous outside, the teeth semirounded, ciliate; styles usually glabrous; fruit subglobose, about 3 cm. across, yellowish.—Apr.–May. Low

mountains; Honshu, Kyushu.—Forma *alba* (Nakai) Ohwi. *C. maulei* var. *alba* Nakai—SHIROBANA-KUSA-BOKE. Flowers white. Rare.

2. *Chaenomeles speciosa* (Sweet) Nakai. *C. lagenaria* Koidz., excl. syn.; *Malus japonica* Andr.; *Cydonia japonica* Loisel., non Pers.; *Cydonia speciosa* Sweet; *Chaenomeles japonica* var. *genuina* Maxim.—BOKE. Shrub with glabrous branches or with pale yellowish brown short hairs while young, the short branchlets often reduced to spines; leaves oblong or broadly lanceolate to ovate, 4–8 cm. long, 1.5–5 cm. wide, acute to subobtusely, narrowed below to a short petiole, serrulate, glabrous on both sides or more or less pubescent beneath along the midrib; flowers short-pedicelled, 2.5–3.5 cm. across, scarlet or white to reddish; calyx glabrous outside, the teeth semirounded to depressed-rounded, ciliate; styles glabrous or hairy at base.—A much-planted Chinese shrub, with many cultivars of garden origin.

26. MALUS Mill. RINGO ZOKU

Deciduous shrubs or trees, often spiny; leaves alternate, toothed, petioled, simple or sometimes lobed, convolute or conduplicate in bud, stipulate; inflorescence a corymb; flowers white or pale pink; calyx-teeth 5; petals 5, suborbicular; stamens 15-50, the anthers yellow; ovary inferior, 3- to 5-locular; styles 3-5, connate at base; fruit a pome usually without stone cells, sometimes with persistent calyx-teeth at apex, rarely punctulate on outer pericarp.—About 30 species, in the temperate regions of the N. Hemisphere.

1A. Leaves always undivided, convolute in bud.

2A. Calyx-lobes ovate, as long as to shorter than the tube.

3A. Calyx-lobes subobtusely; styles 4 or 5; fruit pyriform.

4A. Flowers rose-colored, nodding, on slender pedicels 3-4 cm. long; leaves ovate to narrowly so; calyx-lobes erect. . . 1. *M. halliana*

4B. Flowers white to pinkish, on pedicels 2-2.5 cm. long; leaves obovate; calyx-lobes spreading. 2. *M. spontanea*

3B. Calyx-lobes acute to subacuminate; styles 3 or 4; fruit ellipsoidal. 3. *M. hupehensis*

2B. Calyx-lobes narrowly lanceolate, longer than the calyx-tube, acuminate. 4. *M. baccata* var. *mandshurica*

1B. Leaves conduplicate in bud, usually lobed in those of vigorous shoots.

5A. Calyx-limb deciduous after anthesis; fruit 5-7 mm. in diameter. 5. *M. sieboldii*

5B. Calyx-limb persistent after anthesis; fruit 2-3 cm. in diameter. 6. *M. tschonoskii*

1. *Malus halliana* Koehne. *Pyrus halliana* (Koehne) Voss.—Kaidō. Shrub, the branches thinly pubescent while young; leaves ovate to narrowly so or elliptic, 3-6 cm. long, 1-3 cm. wide, acute, acute to broadly cuneate at base, obtusely serrulate, nearly glabrous, the petioles about 1 cm. long, thinly pubescent; flowers deep pink, rather large, semi-expanded, nodding on long slender nearly glabrous purplish pedicels 3-6 cm. long; calyx nearly glabrous, the teeth narrowly ovate, acute to obtuse, erect, pubescent inside; styles 4 or 5, white-villous at base.—Apr.-May. Introduced from China, with the following cultivars grown in our area:

Cv. *Parkmannii*. *Pyrus malus* var. *parkmannii* Temple; *P. parkmannii* Hort.; *P. halliana* var. *parkmannii* (Temple) L. H. Bailey; *M. floribunda* var. *parkmannii* (Temple) Koidz.—YAE-KAIDŌ. Flowers double.

Cv. *Pendula*. *M. floribunda* forma *pendula* Koidz.—SHIDARE-KAIDŌ. Branches pendulous.

2. *Malus spontanea* (Makino) Makino. *M. floribunda* var. *spontanea* Makino; *M. halliana* var. *spontanea* (Makino) Koidz.—NO-KAIDŌ. Small tree; leaves obovate or narrowly so or elliptic, 3-5 cm. long, 1.5-3 cm. wide, acute to subacute, cuneate to acute at base, glabrous although soft pubescent on upper side while young, with incurved minute teeth, the petioles 1-3 cm. long, slender, thinly pubescent; flowers white to pinkish, rather large, on slender glabrous pedicels 2-2.5 cm. long; calyx glabrous, the teeth ovate to narrowly so, subobtusely, spreading, white-pubescent inside; petals 5, spreading, broadly ovate; style 4, white-villous at base; fruit pyriform, 6-8 mm. across, red, rounded at apex.—May. Mountains; Kyushu (Mount Kirishima).

3. *Malus hupehensis* (Pampan.) Rehd. *Pyrus hupehensis* Pampan.; *M. theifera* Rehd.; *P. theifera* (Rehd.) L. H. Bailey.—TSUKUSHI-KAIDŌ, CHA-KAIDŌ. Small tree; leaves coriaceous, usually ovate, subobtusely to obtuse, toothed, densely white-woolly on the midrib on both surfaces and on the petioles while young, glabrate on both sides or the pubescence persistent on the nerves beneath; flowers white, on glabrous pedicels; calyx glabrous outside, the lobes deltoid-ovate, acute, villous inside; styles 4, villous at base; fruit rounded at both ends, on pedicels 2.5-3.5 cm. long.—Reported to be spontaneous in Kyushu (Higo Prov.).—China and n. India.

4. *Malus baccata* Borkh. var. *mandshurica* (Maxim.) C. K. Schn. *M. cerasifera* Spach; *Pyrus baccata* var. *mandshurica* Maxim.; *M. mandshurica* (Maxim.) Komar.—EZO-NO-KO-RINGO, HIRO-HA-ZUMI. Small tree; leaves broadly

elliptic-ovate, sometimes oblong, 4-10 cm. long, 2.5-5 cm. wide, abruptly acute, obtuse to broadly cuneate at base, rather loosely and irregularly serrulate, with yellowish brown soft pubescence while young, later glabrate or thinly pubescent on both sides, the petioles pubescent, 1.5-3.5 cm. long; flowers white, about 3.5 cm. across, the pedicels 3-4 cm. long, pubescent to nearly glabrous; calyx pubescent to glabrescent, the lobes 5, narrowly lanceolate, long-acuminate, white-pubescent inside; styles 4 or 5, white-villous inside; fruit dark red, globose, about 8 mm. across.—Reported to be spontaneous in Hokkaido, Honshu (cent. and n. distr.).—Manchuria, n. China, Ussuri, Korea, Sakhalin, and s. Kuriles. The typical phase occurs in Siberia and e. Asia.

5. *Malus sieboldii* (Regel) Rehd. *Pyrus sieboldii* Regel; *P. toringio* Miq.; *M. sargentii* Rehd.; *P. sargentii* (Rehd.) Bean; *M. sieboldii* var. *korogio* forma *sargentii* (Rehd.) Koidz.—ZUMI. Large shrub or small tree, the young branches usually pubescent; leaves of fertile branches oblong, ovate or narrowly so, 3-8 cm. long, those of sterile shoots often broadly ovate, to 8 cm. long, 3- to 5-cleft, irregularly serrulate, acute or abruptly so, pubescent on both sides at least while young, the petioles 1.5-3 cm. long, rather slender, pubescent; flowers white, suffused with pink in bud, 2.5-3 cm. across, on slender, spreading, pubescent to glabrous pedicels 2-3.5 cm. long; calyx glabrous to pubescent, the lobes narrowly lanceolate, long-acuminate; styles 3-4, white-pubescent at base; fruit globose, 5-7 mm. across, red, rounded at both ends.—May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.—Korea.

Var. *zumi* (Matsum.) Asami. *M. zumi* (Matsum.) Rehd.; *Pyrus zumi* Matsum.; *M. baccata* var. *mandshurica* forma *zumi* (Matsum.) Matsum.—ŌZUMI. Leaves nearly always undivided, those on the fertile branches nearly or partially not toothed; styles usually 4-5.—Honshu; rare.

6. *Malus tschonoskii* (Maxim.) C. K. Schn. *Pyrus tschonoskii* Maxim.; *Eriolobus tschonoskii* (Maxim.) Rehd.; *Cormus tschonoskii* (Maxim.) Koidz.; *Macromelus tschonoskii* (Maxim.) Koidz.; *Docyniopsis tschonoskii* (Maxim.) Koidz.—ŌURA-JIRO-NO-KI, ZUMI-NO-KI. Tree, the young branches densely woolly-pubescent; leaves thinly chartaceous, ovate to broadly so, 5-13 cm. long, 4-8 cm. wide, abruptly acute to short-acuminate, rounded to subcordate at base, deciduous woolly-tomentose on both sides while young, becoming glabrous above, irregularly incised-toothed, and lobulate to incised, the petioles 2-4 cm. long, densely white-pubescent; flow-

ers white, about 3 cm. across, the pedicels rather stout, 2-2.5 cm. long, densely pubescent; calyx-lobes deltoid-ovate; fruit globose, 2-3 cm. across, yellowish green, slightly reddish

purple, densely woolly, pubescent only while young.—May. Honshu; rare.

27. PYRUS L. NASHI ZOKU

Large often spiny shrubs or trees; leaves alternate, stipulate, toothed or entire, undivided or lobed, folded in bud, petiolate, often with pale brown woolly hairs while young; inflorescence an umbellate corymb usually with a short axis; flowers white, rarely pink, opening before or with the leaves; calyx-lobes spreading or reflexed; petals short-clawed, ovate-orbicular; stamens 20-30; styles 2-5, free; ovules 2 in each locule; fruit a pome, with cartilaginous walls; seeds nearly black.—About 20 species, in temperate regions of Eurasia and N. Africa.

- 1A. Calyx-lobes persistent after anthesis.
- 2A. Leaves aristately acute-toothed. 1. *P. ussuriensis*
- 2B. Leaves obtusely serrulate. 2. *P. communis*
- 1B. Calyx-lobes deciduous after anthesis.
- 3A. Styles 2, rarely 3; leaves obtusely to subacutely crenate-toothed; ovary 2- or 3-locular. 3. *P. calleryana* var. *dimorphophylla*
- 3B. Styles, rarely 4; leaves aristately toothed; ovary 5-locular. 4. *P. pyrifolia*

1. *Pyrus ussuriensis* Maxim. var. *aromatica* (Nakai & Kikuchi) Rehd. *P. aromatica* Nakai & Kikuchi—IWATE-YAMA-NASHI. Tree; leaves ovate to broadly so, 6-11 cm. long, 4-6 cm. wide, the pedicels stout, 1.5-4.5 cm. long; fruit globose to ovoid-globose, 2-3.3 cm. across, 5-locular, obtuse at base or with depressed ends, green, the lenticels brown, minute, very numerous, the persistent calyx-lobes linear-lanceolate to lanceolate.—Apr. Honshu (n. distr.).

Var. *hondoensis* (Nakai & Kikuchi) Rehd. *P. hondoensis* Nakai & Kikuchi—AO-NASHI. Leaves ovate, 5-7.5 cm. long, 3-4 cm. wide, caudately acuminate, serrulate; pedicels 0.8-1.5 (-2) cm. long; fruit globose, slightly depressed at base, green, 2.5-3 cm. across, with minute brown lenticels, the calyx-lobes lanceolate, spreading.—Honshu (centr. distr.).—The typical phase occurs in Korea, Manchuria, and Ussuri.

2. *Pyrus communis* L. SEIYŌ-NASHI. Tree; leaves ovate-orbicular to elliptic, 4-10 cm. long, undulately toothed, glabrous or woolly-pubescent while young; pedicels 1.5-3 cm. long; fruit pyriform to subglobose.—Apr. European tree cultivated for the fruit.

3. *Pyrus calleryana* Decne. var. *dimorphophylla* (Makino) Koidz. *P. dimorphophylla* Makino—MAME-NASHI, INU-NASHI. Small tree, the young branches densely woolly-

pubescent, soon glabrate; leaves dimorphic, pubescent only while young, ovate to ovate-orbicular, sometimes narrowly ovate, 2-9 cm. long, 1.5-5.5 cm. wide, often 3-lobed in those on young vigorous shoots, with incurved teeth, the pedicels soft-pubescent, 2-3.5 cm. long; calyx-lobes deltoid to ovate-lanceolate, deciduous; styles 2, rarely 3; fruit 7-14 mm. across, rounded at base, pale brownish yellow, lenticellate.—Apr. Honshu (centr. distr.); rare. The typical phase occurs in Korea and China.

4. *Pyrus pyrifolia* (Burm. f.) Nakai. *Ficus pyrifolia* Burm. f.; *P. serotina* Rehd.; *P. montana* Nakai; *P. kleinohjiana* Koidz.—YAMA-NASHI. Small tree, the branches often woolly-pubescent while young; leaves chartaceous, ovate or narrowly so, 7-12 cm. long, 4-6 cm. wide, acuminate, rounded at base, glabrate on both sides, the pedicels 3-5 cm. long; calyx-lobes lanceolate; ovary (4-5)-locular; styles 5, rarely 4; fruit globose, 2-3 cm. across, lenticellate, brown.—Apr. Naturalized (?) in low mountains and around villages in mountains; Honshu, Shikoku, Kyushu.—China.

Var. *culta* (Makino) Nakai. *P. sinensis* var. *culta* Makino; *P. serotina* var. *culta* (Makino) Rehd.—NASHI. An assemblage of numerous improved cultivars yielding edible fruit, 5-10 cm. across, the leaves broadly ovate to ovate-orbicular.

28. AMELANCHIER Medic. ZAI-FURI-BOKU ZOKU

Deciduous trees or shrubs; leaves alternate, petioled, simple, toothed, compound in bud, the stipules small, deciduous; inflorescence a terminal raceme; flowers white; calyx-tube campanulate, the teeth small, persistent; petals 5, obovate to lanceolate; stamens 10-20; ovary inferior, the ovules 2 in each locule; styles 2-5, free or connate at base, each separated by a false wall from the back of the locule; pome berrylike, bluish black.—About 25 species, mainly in N. America, a few in Europe and Asia.

1. *Amelanchier asiatica* (Sieb. & Zucc.) Endl. *Aronia asiatica* Sieb. & Zucc.; *Amelanchier canadensis* var. *japonica* Miq.; *Pyrus taquetii* Lév.; *P. vaniotii* Lév.—ZAI-FURI-BOKU. Tree, the branches white-pubescent while young, glabrate, slender; leaves obovate or broadly so, 4-7 cm. long, 2.5-4 cm. wide, abruptly acuminate, obtuse to rounded at base, with minute low teeth, thinly appressed-pubescent on upper side while young, more densely so beneath, becoming glabrous on

both sides, the petioles 1-1.5 cm. long, white-pubescent to nearly glabrous; inflorescence a corymbose raceme, white-woolly, about 10-flowered, the bracts linear; petals 15-18 mm. long, 4-5 mm. wide, obtuse; ovary densely hairy at tip; styles 5, connate on lower half; fruit globose, 4-6 mm. across, terminated by the recurved calyx-lobes.—Apr.-May. Hills and mountains; Honshu, Shikoku, Kyushu; common.—Korea.

29. POURTHIAEA Decne. KAMA-TSUKA ZOKU

Deciduous shrubs or trees; leaves alternate, stipulate, simple, short-petioled, toothed, the stipules deciduous; inflorescence a terminal, many-flowered corymb or cyme; flowers small, white, bisexual; calyx persistent; petals 5, stamens rather many; styles 2-4, connate at base; pome globose to ovoid, small, the seeds 2 in each locule.—Few species, in temperate to warmer regions of E. Asia.

1. *Pourthiaea villosa* (Thunb.) Decne. *Crataegus villosa* Thunb.; *Photinia villosa* (Thunb.) DC.; *Photinia laevis* var. *villosa* (Thunb.) Koidz.; *Pourthiaea laevis* var. *villosa* (Thunb.) Koidz.; *Photinia villosa* var. *typica* C. K. Schn.; *Pourthiaea villosa* var. *typica* (C. K. Schn.) Nakai—WATAGE-KAMA-TSUKA, Ô-KAMA-TSUKA. Large shrub; young branches and petioles white-pubescent; leaves chartaceous, broadly obovate or narrowly so, 4–12 cm. long, 2–6 cm. wide, abruptly acuminate, cuneate at base, pale green beneath, acutely serrulate, pubescent on both sides while young, often glabrous later, the petioles 2–8 mm. long; inflorescence with dense white woolly pubescence at anthesis, glabrous in fruit, 4–8 cm. across; flowers 7–10 mm. across; calyx-lobes deltoid, obtuse, white-pubescent; petals often softly puberulent on the claw; styles usually 3, villous at base; fruit obovoid, 8–10 mm. long, red,

terminated by the persistent calyx-lobes.—Apr.–May. Low mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Korea and China.

Var. *zollingeri* (Decne.) Nakai. *Pourthiaea zollingeri* Decne.; *Photinia villosa* var. *zollingeri* (Decne.) C. K. Schn.—KE-KAMA-TSUKA. Slightly pubescent; intermediate between the typical phase and the following:

Var. *laevis* (Thunb.) Stapf. *Myrtus laevis* Thunb.; *Crataegus laevis* (Thunb.) Thunb.; *Photinia laevis* (Thunb.) DC.; *Photinia villosa* var. *laevis* (Thunb.) Dipp.; *Pourthiaea laevis* (Thunb.) Koidz.—KAMA-TSUKA. With rather smaller leaves, glabrous except when young; inflorescence glabrous or nearly so, rather small, fewer flowered.—Occurs with the typical phase.

30. SORBUS L. NANA-KAMADO ZOKU

Deciduous trees or shrubs; leaves alternate, stipulate, simple to imparipinnate, toothed; inflorescence a compound terminal corymb, the bracts caducous; flowers rather small, white, sometimes pinkish; calyx with an obconical tube, the teeth 5; petals 5, ovate, orbicular, often pubescent inside near the base; stamens 15–20, the filaments subulate; ovary inferior or semisuperior; styles free or connate at base; ovules 2 in each locule, ascending; pome 2- to 5-locular, small, with 1 or 2 seeds in each locule, these ellipsoidal to ovoid.—About 80 species, in temperate and cold regions of the N. Hemisphere.

1A. Leaves pinnate; calyx-limb persistent.

2A. Branches stout; leaflets usually acuminate, 7–15, usually the median ones largest; stipules rather small, deciduous; inflorescence usually large.

3A. Leaflets 9–11, chartaceous, slightly lustrous; inflorescence nodding; styles 5. 1. *S. sambucifolia*

3B. Leaflets 9–15, membranous to herbaceous, scarcely lustrous.

4A. Leaflets entire on lower half, vivid green, slightly glaucescent; styles 5. 2. *S. matsumurana*

4B. Leaflets toothed near to the base, deep green, scarcely glaucescent; styles 3–4. 3. *S. commixta*

2B. Branches rather slender; leaflets rounded to acute at apex, 5–11, usually the upper ones largest; stipules often rather large, toothed; inflorescence small. 4. *S. gracilis*

1B. Leaves simple; calyx-limb deciduous after anthesis.

5A. Inflorescence and leaves glabrous or nearly so, rarely with appressed pubescence on leaves beneath. 5. *S. alnifolia*

5B. Inflorescence and leaves beneath densely white-woolly. 6. *S. japonica*

1. *Sorbus sambucifolia* (Cham. & Schltdl.) Roem. *Pyrus sambucifolia* Cham. & Schltdl.—TAKANE-NANA-KAMADO. Branching shrub about 2 m. high, the young branches thinly soft-pubescent, those of the 2d year's growth grayish brown; leaves 9- or 11-foliolate, the petioles 2–3 cm. long, the leaflets narrowly ovate to broadly lanceolate, 4–6 cm. long, 1–3 cm. wide, acuminate, deep green and lustrous, slightly paler beneath, thinly white-pubescent while young, glabrescent or quite glabrous on both sides, acutely toothed, the lateral nerves slightly raised beneath; inflorescence 5–7 cm. long, often slightly more than 10-flowered, nodding, especially in fruit, glabrous or thinly pubescent; flowers white to pinkish, 10–12 mm. across; calyx glabrous, the teeth erect in fruit, ciliate; petals ascending, nearly as long as the stamens; fruit elongate-globose, red.—June–Aug. High mountains; Hokkaido, Honshu (centr. and n. distr.); rather common.—Kuriles, Sakhalin, Kamchatka, and Ochotsk Sea region.

Var. *pseudogracilis* C. K. Schn. *S. pseudogracilis* (C. K. Schn.) Koehne—MIYAMA-NANA-KAMADO. Low dwarf shrub with scarcely nodding inflorescence; calyx-teeth usually slightly incurved above; fruit slightly smaller.—Alpine regions of Hokkaido (n. and centr. distr.).

2. *Sorbus matsumurana* (Makino) Koehne. *Pyrus matsumurana* Makino; *S. sitchensis* sensu auct. Japon., non Roem.—URAJIRO-NANA-KAMADO. Small tree glabrous except for the bud-scales, nodes of leaf-rachises and top of the ovary; leaflets 9–13, thickly membranous, oblong to narrowly so,

3.7–7 cm. long, 1–2 cm. wide, obtuse to abruptly acuminate with a mucro at apex, vivid green and slightly glaucescent, whitish beneath, with ascending to incurved acuminate teeth on upper half, the lateral nerves not raised; inflorescence erect, large, many-flowered, 5–8 cm. across; flowers white, about 1 cm. across; calyx-teeth incurved in fruit, brown-ciliate; petals spreading, ovate-orbicular, short-clawed; fruit ellipsoidal to globose, red.—June–Aug. Mountains to alpine zone; Hokkaido, Honshu (centr. and n. distr.).—Forma *pseudogracilis* (Koidz.) Ohwi. *S. matsumurana* var. *pseudogracilis* Koidz.—NANKIN-NANA-KAMADO-MODOKI. With a large toothed stipule subtending the inflorescence.

3. *Sorbus commixta* Hedl. *S. aucuparia* var. *japonica* Maxim.; *Pyrus americana* var. *microcarpa* Miq.; *S. japonica* (Maxim.) Koehne, non Hedl.; *Pyrus americana* var. *micrantha* C. Koch, non Torr. & A. Gray; *S. aucuparia* sensu auct. Japon., non L.; ? *S. parviflora* Hedl.; ? *S. micrantha* (Fr. & Sav.) Koidz.; ? *P. micrantha* Fr. & Sav., non Dum. Cours.; *S. chinophylla* Nakai; *S. pruinosa* Koehne; *S. heterodonta* Koehne—NANA-KAMADO. Tree with glabrous or thinly pubescent young branchlets; leaves pinnate, 15–20 cm. long, the petioles 3–5 cm. long, glabrous or nearly so, the leaflets 9–15, lanceolate to narrowly ovate-oblong, 3–7 cm. long, 1–2.5 cm. wide, long-acuminate to acuminate, glabrous or nearly so, pale to whitish and sometimes slightly pubescent on the midrib beneath, with acuminate teeth, the lateral nerves slender; inflorescence 5–10 cm. across, densely many-flowered, glabrous

or loosely brown-pubescent at anthesis, becoming glabrous in fruit; flowers white, 6-8 mm. across; calyx glabrous, the teeth erect or only slightly incurved in fruit; petals spreading, nearly orbicular, short-clawed, often thinly pubescent inside at base, as long as the stamens; fruit red, 4-5 mm. across, globose.—May-July. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

Var. *rufoferruginea* C. K. Schn. *S. rufoferruginea* (C. K. Schn.) C. K. Schn.; *S. nikkoensis* Koidz.; *S. diabolica* Koidz.; *S. rufoferruginea* var. *ferrugineocosta* Koidz.; *S. wilfordii* Koehne.—SABIRA-NANA-KAMADO. Inflorescence, the calyx-tube at anthesis, and the leaves beneath along the midrib with long, soft, brown hairs.—Mountains; Honshu, Shikoku, Kyushu.

Var. *sachalinensis* Koidz. *S. yesoensis* Nakai; *Pyrus micrantha* var. *macrophylla* Card.; *S. macrophylla* (Card.) Koidz.—ŌNANA-KAMADO, EZO-NANA-KAMADO. Leaflets larger, to 8-9 cm. long.—Hokkaido.—s. Kuriles and Sakhalin.

Sorbus × **rikuchuensis** Makino. *Crataegus rikuchuensis* (Makino) Makino.—RIKUCHŪ-NANA-KAMADO. Leaves pinnately divided on lower half, pinnately parted to lobed on upper half, 4-8 cm. wide, glabrous on upper side, irregularly toothed, pubescent beneath, brown-pubescent on nerves beneath, 6-12 cm. long, the leaflets and lobes chartaceous, spreading.—Honshu (Rikuchu Prov.); rare; a hybrid involving *S. commixta* and an unknown second parent.

Hybrids of uncertain origin occurring in Honshu: **Sorbus** × **uzenensis** (Koidz.) Koidz.: × *Crataegosorbus uzenensis* (Koidz.) Koidz.; × *Ariosorbus uzenensis* (Koidz.) Koidz.—DEWA-NO-HAGOROMO-NANA-KAMADO.—**Sorbus** × **tangoensis** Koidz.: × *Crataegosorbus tangoensis* Koidz.; × *Ariosorbus tangoensis* (Koidz.) Koidz.—YOSANO-HAGOROMO-NANA-KAMADO.

4. **Sorbus gracilis** (Sieb. & Zucc.) C. Koch. *Pyrus gracilis* Sieb. & Zucc.; *S. schuerinii* C. K. Schn.; *S. pachyphylla* Koidz.; *S. gracilis* var. *yoshinoi* Koidz.; *S. viminalis* Koidz.—NANKIN-NANA-KAMADO. Shrub with the slender branches soft-pubescent while young; leaves pinnate, the stipules persistent, those under the inflorescence larger, flabellate, toothed, 1-2 cm. long and as wide, the petioles 1-3 cm. long, loosely soft-pubescent, often becoming glabrous, the leaflets 7-9(-11), the upper ones larger, oblong to narrowly obovate-oblong, 2-5.5 cm. long, 1-2.5 cm. wide, usually obtuse, sometimes rounded or acute, toothed on upper half, glabrous or nearly so above, glaucous to white and often with yellowish brown pubescence beneath, mixed with white hairs on midrib, the rachis usually pubescent; inflorescence 5-8 cm. long, rather many-flowered, often nodding, glabrous to slightly soft-pubescent; flowers creamy white, 5-8 mm. across; calyx-teeth deltoid, inflexed in fruit; petals as long as the stamens, 4-5 mm. long, reflexed, nearly orbicular, short-clawed; styles 2-4,

slightly white-pubescent near the base or glabrescent; fruit red, ellipsoidal or globose, 7-10 mm. long.—Apr.-June. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

5. **Sorbus alnifolia** (Sieb. & Zucc.) C. Koch. *Crataegus alnifolia* Sieb. & Zucc.; *Pyrus miyabei* Sarg.; *Micromeles alnifolia* (Sieb. & Zucc.) Koehne; *S. miyabei* (Sarg.) Mayr; *Aria tiliaefolia* Decne.—AZUKI-NASHI. Tree with purplish brown branches glabrous or thinly white-pubescent while young; leaves simple, chartaceous, ovate to broadly so, elliptic or obovate, 5-10 cm. long, 3.5-7 cm. wide, abruptly acuminate, thinly pubescent above while young, pale green and thinly appressed-pubescent beneath especially on the nerves while young, doubly toothed, the lateral nerves 8- to 10-paired, ascending, nearly straight, the petioles pubescent on the upper side while young, 10-20 mm. long, usually reddish; inflorescences terminal on short branches, compound-corymbose, rather many-flowered, glabrous to sparsely white-pubescent; flowers white, 13-16 mm. across; calyx-teeth deltoid, obtuse, spreading, deciduous, white-pubescent inside; petals 5, orbicular-ovate, slightly longer than the stamens; stamens about 20; styles 2, slightly pubescent at base; fruit oblong, red, slightly lenticellate, 7-8 mm. long.—May-June. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *lobulata* (Koidz.) Rehd. *Micromeles alnifolia* var. *lobulata* Koidz.—FUGIRE-AZUKI-NASHI. Leaves shallowly lobulate.—Honshu and Kyushu.—Korea.

Var. *submollis* Rehd. OKUSHIMO-AZUKI-NASHI. Leaves densely soft-pubescent beneath.—Hokkaido, Honshu.—Korea, Manchuria, China, and Ussuri.

6. **Sorbus japonica** (Decne.) Hedl. *Pyrus lanata* Miq., non D. Don; *Aria japonica* Decne.; *Micromeles japonica* (Decne.) Koehne; *Sorbus koehnei* Zabel.—URAJIRO-NO-KI. Tree, with dense white pubescence on young branches, inflorescence, and leaves beneath; leaves submembranous, ovate-orbicular to broadly obovate, 6-12 cm. long, 4-9 cm. wide, shallowly lobed, toothed, white-woolly on upper side while young, densely white-woolly beneath, the lateral nerves 8 to 11 pairs, ascending, nearly straight, the petioles white-woolly, 1-2 cm. long; inflorescence a compound corymb, terminal on short branches, many-flowered, the bracts scarious, caducous, brown; flowers white, about 10 mm. across; calyx white-woolly, the teeth lanceolate-deltoid, acuminate; petals subrecurved, nearly orbicular to elliptic, slightly longer than the stamens; styles 2; fruit obovoid-globose or obovoid, 8-12 mm. long, slightly lenticellate, red.—May-June. Hills and mountains; Honshu, Shikoku, Kyushu.

Var. *calocarpa* Rehd. KIMINO-URAJIRO-NO-KI. Fruit 15 mm. long, orange-yellow, not lenticellate.—Honshu (Yumoto in Nikko).

Fam. 105. LEGUMINOSAE MAME KA Pea Family

Herbs, shrubs, trees, twining or scandent vines; leaves alternate, usually compound, stipulate and often stipellate; flowers usually bisexual; sepals 5, connate at base into a tube; petals 5, rarely fewer, papilionaceous or nearly actinomorphic; stamens 10, sometimes fewer or numerous, usually diadelphous, sometimes monadelphous, or free; ovary 1-locular, 1-carpellate, superior, the ovules 1 to many, the placenta parietal; fruit a legume, dehiscent, indehiscent, or rarely fleshy, sometimes jointed; seeds without endosperm.—About 550 genera, with about 13,000 species, cosmopolitan, especially abundant in the tropics.

1. Subfamily **MIMOSOIDEAE**: Usually trees; flowers actinomorphic, small; calyx-lobes or sepals and petals valvate in bud; stamens 5 to numerous, exserted.

- 1A. Stamens 10, free, slightly exserted; anthers with a deciduous, stiped gland at apex; tendril-bearing, evergreen, eglandular-leaved vines with spicate inflorescence. 1. *Entada*
 1B. Stamens numerous, exserted, the filaments connate at base; anthers not glandular; deciduous trees without tendrils; petioles with glands; flowers in heads. 2. *Albizia*

II. Subfamily **CAESALPINOIDEAE**: Trees or herbs; flowers zygomorphic, the corolla not or only slightly papilionaceous; sepals and petals 5, imbricate in bud, the upper petal enclosed by the others; stamens 10 or sometimes fewer, free.

- 1A. Leaves pinnately compound.
 2A. Trees or shrubs, usually prickly or spiny; at least some of the leaves bipinnate; anthers versatile.
 3A. Flowers small, green or greenish yellow, in spikes; trees. 3. *Gleditsia*
 3B. Flowers rather large, yellow to orange; shrubs or vines. 4. *Caesalpinia*
 2B. Unarmed herbs (in ours); leaves simply pinnate (in ours); anthers basifixed. 5. *Cassia*
 1B. Leaves bifid or composed of 2 leaflets; tendrils often present. 6. *Bauhinia*

III. Subfamily **PAPILIONATAE**: Trees, herbs, or vines; flowers distinctly papilionaceous; petals imbricate in bud, the uppermost petal (standard) on the outside; stamens 5 or 10, monadelphous, diadelphous or free.

- 1A. Stamens 10, free or nearly so; trees or shrubs, rarely herbs.
 2A. Leaves pinnate; leaflets many.
 3A. Legumes moniliform, not flattened. 7. *Sophora*
 3B. Legumes flattened.
 4A. Leaflets opposite or nearly so; winter-buds naked in the axils of leaves. 8. *Maackia*
 4B. Leaflets alternate; winter-buds entirely covered with the base of the petiole. 9. *Cladrastis*
 2B. Leaflets 3. 10. *Thermopsis*
 1B. Stamens with filaments connate at base, monadelphous or diadelphous.
 5A. Legumes fleshy, indehiscent.
 6A. Legumes rather flattened; trees, leaflets 3-7. 11. *Pongamia*
 6B. Legumes not flattened; evergreen shrubs, leaflets 3(-7). 12. *Euchresta*
 5B. Legumes membranous to coriaceous, not fleshy.
 7A. Legumes jointed.
 8A. Filaments wholly connate into a complete tube; anthers dimorphic; leaflets 2 or 4. 13. *Zornia*
 8B. Filaments between the standard free; anthers all alike; leaflets 1 or 3, sometimes 5, or many.
 9A. Leaflets 1, 3, or 5.
 10A. Legumes 1-seeded, flat, indehiscent, not jointed.
 11A. Leaflets pinnately arranged; shrubs or perennial herbs. 14. *Lespedeza*
 11B. Leaflets digitately arranged; annuals. 15. *Kummerowia*
 10B. Legumes more than 1-seeded, jointed. 16. *Desmodium*
 9B. Leaflets many.
 12A. Leaflets even in number.
 13A. Legumes coiled, included within the calyx. 17. *Smithia*
 13B. Legumes elongate, straight, much exserted from the calyx. 18. *Aeschynomene*
 12B. Leaflets odd in number; legumes exserted. 19. *Hedysarum*
 7B. Legumes not jointed.
 14A. Leaves even-pinnate, with the rachis ending in a tendril or mucro.
 15A. Tube of the filaments obliquely truncate at apex; style slender, with a tuft of hairs at apex. 20. *Vicia*
 15B. Tube of the filaments rectangularly truncate at apex; style flattened, hairy on inner side. 21. *Lathyrus*
 14B. Leaves odd-pinnate or trifoliate, rarely digitate, without tendrils.
 16A. Twining or trailing herbs, with 3 (rarely 5 or 7) leaflets.
 17A. Leaves glandular-dotted beneath; racemes with axis not thickened on nodes; styles glabrous.
 18A. Legumes 3- to 8-seeded. 22. *Dunbaria*
 18B. Legumes 1- or 2-seeded. 23. *Rhynchosia*
 17B. Leaves not glandular-dotted.
 19A. Style bearded.
 20A. Keel dextrorsely semicortorted, spurred on one side. 24. *Azukia*
 20B. Keel not cortorted or spurred. 25. *Vigna*
 19B. Styles glabrous, not bearded.
 21A. Leaflets 3-5; keel coiled. 26. *Apios*
 21B. Leaflets 3; keel not coiled.
 22A. Flowers yellowish; calyx nearly truncate at apex. 27. *Dumasia*
 22B. Flowers purple, red, or white; calyx usually with evident teeth.
 23A. Keel conspicuously larger than the standard and wing. 28. *Mucuna*
 23B. Keel, standard, and wings nearly equal.
 24A. Stamens monadelphous; flowers and legumes of one form.
 25A. Upper 2 calyx-teeth broad, larger than the lower; legumes broad, with a longitudinal rib along the outer suture on each side. 29. *Canavalia*
 25B. Upper 2 calyx-teeth shorter and smaller than the lower; legumes narrower and smaller, hispid, without a rib on each side.

- 26A. Flowers 15–20 mm. long; nodes of racemes thickened; bracts caducous. 30. *Pueraria*
 26B. Flowers 5–8 mm. long; nodes scarcely thickened; bracts persistent. 31. *Glycine*
 24B. Stamens diadelphous; flowers and legumes of one or two forms.
 27A. Flowers and legumes monomorphic. 32. *Galactia*
 27B. Flowers chasmogamic and cleistogamic, the legumes dimorphic. 33. *Amphicarpaea*
 16B. Stems erect or decumbent, rarely woody twining plants with many leaflets.
 28A. Leaflets 3 to numerous.
 29A. Leaflets entire.
 30A. Hairs attached above the base; anthers mucronate. 34. *Indigofera*
 30B. Hairs basally attached (attached above the base in some species of *Astragalus*); anthers not mucronate at apex.
 31A. Twining woody plants.
 32A. Racemes terminal on short lateral shoots; flowers purple or white; standard with a callus on each side above the base. 35. *Wisteria*
 32B. Racemes axillary; flowers yellowish green (in ours); standard without callosity on each side. 36. *Milletia*
 31B. Herbaceous to woody, not twining, erect or decumbent plants.
 33A. Tree; introduced and naturalized. 37. *Robinia*
 33B. Herbs or semishrubby plants.
 34A. Leaflets 5, the lower 2 stipulelike; flowers yellow. 38. *Lotus*
 34B. Leaflets rather many; flowers purplish, rarely yellowish.
 35A. Keel obtuse at apex. 39. *Astragalus*
 35B. Keel with an acute appendage or point at apex. 40. *Oxytropis*
 29B. Leaflets minutely toothed.
 36A. Leaves digitately compound; leaflets 3–7. 41. *Trifolium*
 36B. Leaves pinnately compound; leaflets 3.
 37A. Legumes small, contorted; racemes rather short. 42. *Medicago*
 37B. Legumes small, ovate, straight. 43. *Melilotus*
 28B. Leaves simple, consisting of a single leaflet, rarely digitately 3-foliate in the introduced species. 44. *Crotalaria*

1. ENTADA Adans. MODAMA ZOKU

Tendrill-bearing woody vines; leaves bipinnate, the uppermost pair of leaflets reduced to tendrils; racemes solitary or in pairs; flowers polygamous, yellowish, sessile, small; calyx toothed; petals equal, narrow, slightly curved; stamens 10, free, the anthers terminated by a gland; legumes large, flat, woody, jointed, rather many-seeded.—About 20 species, widespread in the Tropics.

1. *Entada phaseoloides* (L.) Merr. *E. scandens* Benth.; *Lens phaseoloides* L.—MODAMA. Evergreen, woody vine; leaves petioled, the rachis ending in a tendril, the pinnae 4, the leaflets lustrous, coriaceous, 2–4 on each pinna, oblong to obovate, 3–8 cm. long, subacute to obtuse; racemes pedunculate, usually aggregated in a terminal panicle; flowers sessile, yellowish green, about 6 mm. long; legumes 30–60 cm. long, 7–10 cm. wide, curved, constricted between the seeds which are 5 cm. in diameter.—Evergreen forests near seashores; Kyushu (Yakushima); rare.—Ryukyus, Formosa, and Tropics of the New and Old Worlds.

lowish green, about 6 mm. long; legumes 30–60 cm. long, 7–10 cm. wide, curved, constricted between the seeds which are 5 cm. in diameter.—Evergreen forests near seashores; Kyushu (Yakushima); rare.—Ryukyus, Formosa, and Tropics of the New and Old Worlds.

2. ALBIZIA Durazz. NEMU-NO-KI ZOKU

Trees or shrubs without spines; leaves bipinnate, often with cup-shaped glands on petioles or on the rachis, the stipules various; inflorescence of globose to narrow heads, usually in panicles; flowers 5-merous, bisexual or polygamous; calyx tubular, 5-toothed at apex; corolla funnel-shaped, the segments valvate in bud; stamens numerous, exerted, the filaments connate at base into a tube; legumes broadly linear, flattened.—About 50 species, widespread in the Tropics.

- 1A. Leaflets 36–58 on each pinna, narrowly semiovate or broadly and obliquely lanceolate, 10–15 mm. long, 2.5–4 mm. wide; pinnae 10–25 on a leaf. 1. *A. julibrissin*
 1B. Leaflets 30–40 on each pinna, semiovate, 15–20 mm. long, 5–7 mm. wide; pinnae 8–10 on a leaf. 2. *A. glabrior*

1. *Albizia julibrissin* Durazz. *Mimosa julibrissin* (Durazz.) Scop.; *M. speciosa* Thunb. non Jacq.; *Acacia nemu* Willd.; *Albizia nemu* (Willd.) Benth.—NEMU-NO-KI. Deciduous tree with spreading, nearly glabrous branches; leaves petiolate, 20–30 cm. long inclusive of the petiole, the petioles with a cup-shaped gland on the upper side, the rachis and rachilla puberulent on upper side, the leaflets herbaceous, short-pubescent beneath and on margin, abruptly acute and mucronate, truncate at base, whitish beneath; panicles pubescent when young, the axis 2–4 cm. long, with more than 10 spreading branches each 3–4 cm. long and the heads about 20-flowered; flowers sessile, 7–9 mm. long, pinkish; stamens

exserted, 35–40 mm. long; legumes glabrous, short-stiped, 10–13 cm. long, 17–18 mm. wide, 10- to 15-seeded.—June–July. Woods and riverbanks in lowlands; Honshu, Shikoku, Kyushu; very common.—s. Asia, as far west as Iran.

2. *Albizia glabrior* (Koidz.) Ohwi. *A. mollis* var. *glabrior* Koidz.—HIRO-HA-NEMU. Similar to the preceding, but the leaflets larger and fewer; branchlets loosely pubescent while young; leaves 15–25 cm. long, bipinnate, the petiole 4–6 cm. long, with a sessile ovoid gland on the upper side below the middle, the pinnae 4 or 5 pairs, 10–15 cm. long, short-petioled, the leaflets 15–20 pairs on each pinna, semi-ovate, entire, 15–20 mm. long, 5–7 mm. wide, asymmetrical

at base, acute on inner side and truncate on outer side, loosely short-pubescent, whitish beneath; inflorescences of few umbellate undivided peduncles on the end of branchlets; flowers

numerous, sessile, in terminal heads; corolla pinkish, about 8 mm. long; stamens about 25, about 3 cm. long.—Kyushu (Amakusa Isl.); very rare.—Tokara Isls.

3. GLEDITSIA L. SAIKACHI ZOKU

Deciduous trees with polygamous flowers, some of the branchlets reduced to simple or branched spines; leaves pinnate to bipinnate, the leaflets sometimes undulately incised; flowers small, greenish, in racemes or spikes without bracteoles; petals and calyx-lobes 3-5; stamens twice as many as the calyx-lobes; legumes elongate, or nearly ovate, flattened, coriaceous or slightly fleshy.—About 12 species, in the warmer parts of Asia, N. America, and tropical Africa.

1. *Gleditsia japonica* Miq. *G. horrida* (Thunb.) Makino, non Willd.; *Fagara horrida* Thunb.; *Caesalpinoides japonicum* (Miq.) O. Kuntze.—SAIKACHI. Tree with nearly glabrous branches and branched spines; leaves 10-25 cm. long, simply or twice pinnate, short-pubescent on the rachis, the leaflets 12-24 on each pinna, oblique, narrowly ovate, 15-35 mm. long, 8-15 mm. wide, obtuse, entire or undulate-serrate, upper margin slightly dilated at base, nearly or quite glabrous, with raised veinlets beneath, green and slightly lustrous

above, yellowish green beneath; spikes 6-8 cm. long, densely flowered, from the short leafy shoots; flowers yellowish, 3-4 mm. across, nearly sessile; calyx slightly pubescent, the lobes oblong, slightly shorter than the tube; petals yellowish, elliptic, puberulous; stamens short-exserted; legumes 20-25 cm. long, 3-3.5 cm. wide, pendulous, slightly arcuate, on a stipe about 2.5 cm. long.—May-June. Honshu (centr. distr. and westw.), Shikoku, Kyushu.

4. CAESALPINIA L. JAKETSU-IBARA ZOKU

Trees or shrubs, often prickly, rarely scandent; leaves bipinnate, the leaflets herbaceous to coriaceous; flowers yellow or reddish, in axillary or terminal racemes often aggregated in a panicle, the bracts small, caducous, the bracteoles absent; calyx widely open, 5-lobed, the lobes imbricate in bud, the lowest one often larger; petals rounded, spreading, imbricate in bud; legumes ovate to lanceolate, flattened.—About 40 species, widely distributed in the warmer parts of the world.

- 1A. Deciduous shrub; leaflets 10-20 on each pinna, obovate or oblong, 15-20 mm. long, rounded at apex; flowers in racemes; pedicels 3-4 cm. long. 1. *C. japonica*
- 1B. Evergreen woody climber; leaflets 4-10 on each pinna, ovate or oblong, 3-5 cm. long, acute to obtuse at apex; flowers in panicles; pedicels 6-8 mm. long. 2. *C. nuga*

1. *Caesalpinia japonica* Sieb. & Zucc. *C. sepiaria* var. *japonica* (Sieb. & Zucc.) Makino; *C. crista* sensu Thunb., non L.; *C. sepiaria* sensu auct. Japon., non Roxb.—JAKETSU-IBARA. Somewhat scandent shrub, 1-2 m. high; branches much elongate, with prominent retrorse prickles, short-pubescent while young; leaves 20-40 cm. long, prickly on rachis and petioles, the pinnae 6-16, the leaflets vivid green on upper side, whitish beneath, sometimes slightly pubescent, the lateral nerves not prominent; racemes terminal, 20-30 cm. long, pedunculate, the bracts narrowly ovate, caducous, 3-4 mm. long, densely brownish pubescent, the pedicels spreading, slender; flowers 25-30 mm. across, expanded, yellow; stamens red, densely villous on the lower half; legumes oblong, slightly

arcuate, sessile, flat, glabrous, about 10 cm. long, 3 cm. wide, with a thick winglike outer suture.—Apr.-June. Woods and grassy places in lowlands and hills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather common.—Ryukyus and China (?).

2. *Caesalpinia nuga* Ait. *C. chinensis* Roxb.; *C. paniculata* Desf.—NANTEN-KAZURA. Glabrous prickly climber; leaves 20-30 cm. long, the leaflets 4-6 on each pinna, deep green and lustrous on upper side, glaucous beneath, with slightly raised veinlets on both sides; flowers 15-20 mm. across; legumes about 5 cm. long.—Kyushu (Yakushima).—India, Malay Peninsula, Formosa, China, and Ryukyus.

5. CASSIA L. KAWARA-KETSUMEI ZOKU

Herbs, shrubs, or trees; leaves even-pinnate, stipulate, the petiole or rachis with a cuplike sessile or stiped gland; flowers yellow, sometimes white or reddish, in racemes or panicles, often fasciculate in leaf-axils, bracteate and bracteolate; calyx-segments 5, imbricate; petals 5, spreading, imbricate; stamens 10 or fewer, the anthers opening by pores or longitudinally dehiscent on the upper part; legumes various, terete to flat, 2-valved, dehiscent.—About 450 species, widely distributed in tropical and warm-temperate regions.

1. *Cassia nomame* (Sieb.) Honda. *C. mimosoides* var. *nomame* (Sieb.) Makino; *C. mimosoides* sensu auct. Japon., non L.; *Soja nomame* Sieb.—KAWARA-KETSUMEI. Annual herb 30-60 cm. high; stems terete, sometimes branched, whitish puberulent; stipules subulate or subulate-lanceolate, long-acuminate, few-ribbed at base, persistent, appressed, 5-7 mm. long; leaves 3-7 cm. long, the petioles short, with a solitary sessile gland just below the insertion of the lowest leaflets, the

leaflets 30-70, linear-oblong, 8-12 mm. long, 2-3 mm. wide, scattered short-pilose on margin; flowers supra-axillary, 1 or 2 together, 6-7 mm. across, yellow, the bract similar to the stipules but smaller, the bracteoles on the top of the pedicels, narrowly lanceolate, about 2 mm. long, acuminate; calyx-segments lanceolate or broadly so, 5-6 mm. long, acuminate, short-puberulent and scarious on the margins; petals obovate, slightly longer than the calyx; fertile stamens 4 with a reduced

minute 5th stamen usually also present, the anthers truncate, smooth, glabrous, about 2.5 mm. long, the filaments less than 1 mm. long; style short; legumes flat, broadly linear, 3-4 cm.

long, 5-6 mm. wide, short-pilose, sessile, dehiscent, 2-valved. —Sandy riversides and waste grounds; Honshu, Shikoku, Kyushu; very common. —Korea, Manchuria, and China.

6. BAUHINIA L. HAKAMA-KAZURA ZOKU

Trees, shrubs, or vines with tendrils; leaves simple, entire or 2-lobed, sometimes composed of 2-leaflets, the stipules usually small and deciduous; flowers white or reddish, in simple or paniculately compound racemes, the bracts and bracteoles small; calyx closed in bud or 5-toothed; petals 5; stamens 10 or partly reduced; legumes flattened, elliptic to broadly linear, membranous to ligneous, dehiscent or indehiscent. —About 200 species, widely distributed in the Tropics.

1. *Bauhinia japonica* Maxim. *Lasiobema japonicum* (Maxim.) de Wit. —HAKAMA-KAZURA. Woody vine; branches sulcate, with red-brown short appressed hairs while young; stipules ovate, obtuse, deciduous; petioles rather elongate; leaves somewhat coriaceous, usually rounded-cordate, bifid, 6-10 cm. long, densely reddish brown pubescent when young; tendrils flat, simple, or usually paired; racemes terminal, 8-15 cm. long, many-flowered, densely reddish brown pubescent, the bracts subulate, about 2 mm. long, the pedicels

ascending, 15-20 mm. long, obsoletely bracteolate near the middle; calyx 5-lobed, about 6 mm. long; petals rather thick, 6-7 mm. long, pale green inside, densely reddish brown pubescent outside, with a claw about as long as the nearly orbicular limb; fertile stamens 3, exserted; ovary villous; legumes coriaceous, oblong or ovate, 5-8 cm. long, 25-30 mm. wide, 1- to 3-seeded, dehiscent, nearly sessile. —July. Woods near seashores; Honshu (Kii Prov.), Shikoku, Kyushu; rare. —Ryukyus.

7. SOPHORA L. KURARA ZOKU

Perennial herbs or trees; leaves odd-pinnate, the stipules subulate or absent; flowers pale yellow, white, or purplish, in terminal racemes or panicles, the bracts small or absent, the bracteoles none; calyx campanulate to cup-shaped, the teeth short; legumes moniliform, not flattened, sometimes 4-angled, fleshy to ligneous, usually indehiscent. —About 20 species, in warmer parts of the world.

- 1A. Perennial herb with racemose inflorescence. 1. *S. flavescens*
 1B. Trees or shrubs.
 2A. Shrub with racemose inflorescence. 2. *S. franchetiana*
 2B. Tree with paniculate inflorescence. 3. *S. japonica*

1. *Sophora flavescens* Ait. *S. angustifolia* Sieb. & Zucc.; *S. flavescens* var. *angustifolia* (Sieb. & Zucc.) Kitag.; *S. galeoides* Pall.; *S. kromei* Hance; *S. sororia* Hance. —KURARA. Perennial herb, usually glabrous or sometimes with sparse, yellowish, short, appressed pubescence; stems erect, 80-150 cm. long, terete, slightly ligneous near the base, branching above; stipules linear or filiform, 5-8 mm. long; leaves petioled, 15-25 cm. long, the leaflets 15-40, narrowly oblong to broadly lanceolate, 2-4 cm. long, 7-15 mm. wide, obtuse to rather acute, slightly appressed-pubescent on both sides or on the paler underside only; racemes erect, terminal, 10-20 cm. long, many-flowered; flowers pale greenish yellow, rarely purplish, 15-18 mm. long; calyx loosely appressed-pubescent, oblique, 7-8 mm. long, the teeth depressed; legumes coriaceous, linear, 7-8 cm. long, 7-8 mm. across, obtusely 4-angled, constricted between the seeds, short-stiped, appressed-pilose while young. —June-July. Grassy places in lowlands and waste grounds; Honshu, Shikoku, Kyushu; common and somewhat variable, our plants generally with smaller leaflets than in the continental Asian phase. —Siberia, China, and Korea.

2. *Sophora franchetiana* Dunn. TSUKUSHI-MURE-SUZUME, CHIKUSHI-MURE-SUZUME. Much-branched shrub, densely brown appressed-pubescent; leaves usually with 11 leaflets, the leaflets elliptic, 2.5-3 cm. long, acute, chartaceous, nearly glabrous on upper side; racemes about 5 cm. long; flowers white; ovary pubescent; legumes 2.5-3 cm. long, glabrous. —Kyushu; very rare. —China.

3. *Sophora japonica* L. *Styphnolobium japonicum* (L.) Schott. —ENJU. Deciduous tree; leaves 15-25 cm. long, the leaflets 9-15, ovate to narrowly so, 2.5 cm. long, 15-25 mm. wide, acute to subobtusate, sometimes with a minute stipel at base, deep green, glaucescent and appressed-pubescent beneath; panicles 15-30 cm. long, broadly pyramidal, with short appressed pubescence; flowers 12-15 mm. long, white to yellowish; calyx 3-4 mm. long, pubescent, the teeth depressed 4-angled, short-villous on the margins; legumes stiped, loosely appressed-pubescent, glabrate, 5-8 cm. long, rather fleshy. —July-Aug. A Chinese tree planted in our area.

8. MAACKIA Rupr. & Maxim. INU-ENJU ZOKU

Deciduous trees or shrubs with exposed, scaled buds; leaves odd-pinnate, petioled, exstipellate, the leaflets entire; flowers pedicelled, white, in terminal panicles or compound racemes, the bracts narrowly lanceolate, small, caducous, the bracteoles obsolete; calyx rather inflated, with depressed teeth; standard reflexed; legumes flattened, elliptic to broadly linear, 2-valved, dehiscent, rather thin, winged at least on the outer suture, 1- to 5-seeded. —Few species in the temperate regions of e. Asia.

- 1A. Legumes oblong to narrowly ovate, 2-4 cm. long; leaflets 11-15, 2-4 cm. long; flowers about 7 mm. long; standard nearly entire at apex. 1. *M. tashiroi*
 1B. Legumes broadly linear, 4-9 cm. long; leaflets 7-13, 3-7 cm. long; flowers 7-12 mm. long; standard prominently retuse at apex. 2. *M. amurensis*

1. *Maackia tashiroi* (Yatabe) Makino. *Cladrastis tashiroi* Yatabe.—SHIMA-ENJU. Deciduous shrub with spreading branches; branchlets slightly pubescent; leaves petioled, 15–20 cm. long, the leaflets 11–15, somewhat coriaceous, oblong or elliptic, 2–4 cm. long, subacute at both ends, short appressed-pubescent beneath or on both surfaces, glaucescent beneath; inflorescence of 1–4 racemes, 5–12 cm. long, rather densely many-flowered, densely brown-puberulent, the bracts lanceolate, small; flowers short-pedicelled, pale yellow; calyx yellowish brown villous, the teeth deltoid, short; legumes loosely short-pubescent, 10–12 mm. wide, 1- to 3-seeded, with a narrow wing on the outer suture.—July–Aug. Wet places near seashores; Kyushu.—Ryukyus and Formosa.

2. *Maackia amurensis* Rupr. & Maxim. var. *buergeri* (Maxim.) C. K. Schn. *Cladrastis amurensis* var. *buergeri* Maxim.; *C. amurensis* var. *floribunda* Maxim. ex Fr. & Sav.; *C. amurensis* var. *vidalii* Fr. & Sav.; *M. buergeri* (Maxim.) Tatew.—INU-ENJU. Small deciduous tree; leaves petioled,

20–30 cm. long, the leaflets 7–11, ovate, 4–7 cm. long, acute to subobtusate, appressed-pubescent beneath; inflorescence of 3–7 racemes arranged in a panicle, densely many-flowered, yellowish or grayish brown villous, the bracts linear, small; flowers pedicelled, 10–12 mm. long; calyx 5–6 mm. long, villous; legumes broadly linear, flat, 6–9 cm. long, 8–10 mm. wide, appressed-pubescent while young, 3- to 6-seeded, with a narrow wing on the outer suture.—July–Sept. Hokkaido, Honshu.—A variable widespread species occurring in China, Formosa, Manchuria, Amur, Ussuri, and Korea.

Var. *pubescens* (Koidz.) Ohwi. *M. floribunda* Takeda; *M. floribunda* var. *pubescens* Koidz.—HANEMI-NO-INU-ENJU. Leaflets usually 9–13, rather small, narrowly ovate to oblong, 3–5 cm. long; flowers 7–10 mm. long; legumes 4–8 cm. long, 8–12 mm. wide, appressed-pubescent, the wing on the suture slightly broader, 1–1.5 mm. wide.—Honshu, Shikoku, Kyushu.

9. CLADRASTIS Raf. FUJIKI ZOKU

Trees with buds covered by the base of the petioles; leaves odd-pinnate, leaflets alternate on the rachis, exstipellate; flowers white, in terminal panicles, the bracts and bracteoles obsolete or absent; calyx-teeth short, broad; legumes linear, flat, thin, short-stiped, wingless or winged on the margins.—Few species, in e. Asia and N. America.

1A. Leaflets with 8 to 13 pairs of lateral nerves, pale green and with raised veinlets beneath; legumes winged on both margins; winter-buds enveloped with a grayish white thin membrane. 1. *C. platycarpa*

1B. Leaflets with 13 to 15 pairs of lateral nerves, glaucous and without raised veinlets beneath; legumes wingless; winter-buds naked. 2. *C. sikokiana*

1. *Cladrastis platycarpa* (Maxim.) Makino. *Sophora platycarpa* Maxim.; *Platysporion platycarpum* (Maxim.) Maxim.—FUJIKI. Deciduous tree; leaves 20–30 cm. long, the petioles short, slightly short-pubescent, the leaflets 8–13, ovate-oblong, 5–10 cm. long, 2–4 cm. wide, acute to acuminate, slightly dilated on the upper margin at base, puberulent on the midrib above, slightly appressed-pubescent beneath; panicles 15–25 cm. long, the separate branches in racemes; flowers about 15 mm. long, the pedicels and calyx appressed brown-pubescent, the bracteoles minute on the middle portion of the pedicel; calyx 4–5 mm. long, with depressed semicircular teeth; legumes much compressed, short-stiped, broadly linear,

7–8 cm. long, 15–17 mm. wide inclusive of the narrow wings, 2- to 3-seeded, glabrous or nearly so.—June–July. Mountains; Honshu (centr. distr. and westw.), Shikoku.

2. *Cladrastis sikokiana* (Makino) Makino. *Sophora sikokiana* Makino.—YUKU-NO-KI, MIYAMA-FUJIKI. Resembles the preceding but brownish woolly-pubescent while young; leaves slightly thinner, glaucous beneath, the lateral nerves regularly arranged; flowers 15–18 mm. long, white, in terminal panicles; calyx 5–6 mm. long, short-pubescent; legumes nearly wingless, slightly thickened on the margins.—June–Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rare.

10. THERMOPSIS R. Br. SENDAI-HAGI ZOKU

Erect perennial herbs with creeping rhizomes; stipules prominent, free, leaflike, the lower ones sheathlike; leaves digitately 3-foliolate; flowers rather large, yellow, rarely purple, in terminal racemes, the bracts distinct, prominent, the bracteoles absent, the pedicels solitary; calyx narrowly campanulate with short equal teeth; standard orbicular, the keel nearly as long as the wing; stamens free; legumes linear, flat, straight or sometimes arcuate, subsessile, rather many-seeded.—About 20 species, in temperate or cooler regions of Siberia, n. India, e. Asia, and N. America.

1. *Thermopsis lupinoides* (L.) Link. *T. fabacea* (Pall.) DC.; *Sophora fabacea* Pall.; *S. lupinoides* L.—SENDAI-HAGI. Stems erect, usually not branched, 40–80 cm. long, soft-pubescent while young, soon glabrate; stipules ovate, 3–4 cm. long, usually obtuse; leaflets ovate, obovate, or elliptic, equal, 5–7 cm. long, 3–5 cm. wide, obtuse, soft-pubescent while young; racemes rather elongate, the bracts narrowly ovate, deciduous,

longer than the pedicels; flowers 23–25 mm. long; calyx 10–12 mm. long, with narrowly ovate teeth about half as long as the tube; legumes straight, flat, 8–10 cm. long, 6–7 mm. wide, pubescent while young, 12- to 15-seeded.—May–Aug. Sand dunes near the sea; Hokkaido, Honshu, Shikoku, Kyushu; common northw.—Korea, Ussuri, Sakhalin, Kuriles, regions around the Ochotsk Sea, and N. America.

11. PONGAMIA Vent. KURO-YONA ZOKU

Trees, rarely shrubs; leaves petioled, odd-pinnate, the stipules caducous, the leaflets 3–7, opposite, coriaceous, exstipellate; inflorescence an axillary raceme; flowers in 2's, 3's, or 4's, white, the bracts caducous, the bracteoles minute or absent; calyx campanulate, nearly truncate with obsolete teeth; standard broad, minutely pilose externally; stamens monadelphous, the upper filament free, short, the anthers versatile, oblong, slightly hairy at base; legumes elliptic, 1-seeded, slightly flattened, hard-fleshy, indehiscent.—A few species, in tropical Asia and Australia.

1. *Pongamia pinnata* (L.) Merr. *P. glabra* Vent.; *Cytisus pinnatus* L.—KURO-YONA. Tree with glabrous branches; leaves 15–30 cm. long, the leaflets 5–7, opposite, ovate or broadly so, 5–10 cm. long, 4–8 cm. wide, abruptly acuminate with an obtuse tip, glabrous; racemes peduncled, to

20 cm. long, many-flowered, short-pilose; flowers 15–18 mm. long, pedicelled; legumes glabrous, 5–6 cm. long, about 2.5 cm. wide, rather thick.—Near seashores; Kyushu (Yakushima); rare.—Ryukyus, Formosa, and the Tropics of Asia and Australia.

12. EUCHRESTA A. Benn. MIYAMA-TOBERA ZOKU

Evergreen shrubs; leaves odd-pinnate, the leaflets 3–7, entire, exstipellate; flowers in terminal or axillary racemes, white, the bracts minute, the bracteoles absent; calyx broadly campanulate with depressed teeth; anthers versatile; legumes fleshy, stiped, ellipsoidal, lustrous, indehiscent, 1- to few-seeded.—Few species in se. Asia.

1. *Euchresta japonica* Benth. MIYAMA-TOBERA. FIG. 9. Small evergreen, erect or decumbent shrub 30–80 cm. high, nearly simple or sometimes sparsely branched, with thick branches, short-pilose; leaves petioled, the leaflets 3, elliptic or obovate, 5–8 cm. long, 3–5 cm. wide, obtuse, glabrous, deep green and lustrous above, grayish short-pilose beneath, the lateral nerves not prominent; racemes terminal, peduncled,

rather many-flowered, short-pilose, the bracts minute; flowers 10–13 mm. long; calyx 2.5–3 mm. long, with undulate teeth; legumes ellipsoidal, 18–20 mm. long inclusive of the 2–3 mm. long stipe, about 10 mm. wide, dark bluish purple.—July. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rare.

13. ZORNIA Gmel. SUNAJI-MAME ZOKU

Herbs, sometimes suffrutescent; leaves palmately 2- or 4-foliolate, often with pellucid dots, exstipellate, the stipules linear, sometimes foliaceous or peltate; flowers sessile, solitary or in few-flowered racemes, in 2's between a pair of broad, peltate, flat, bracts, without bracteoles; calyx usually thin, 2-fid, the upper lobes 2-toothed, the lower 3-lobed; petals small; anthers of two forms, the larger basifixed and alternate with the smaller versatile ones; legumes flat, the joints smooth or spinulose.—More than a dozen species in America, one or two in Asia and Africa.

1. *Zornia cantoniensis* Mohlenbrock. *Z. diphylla* (L.) Pers.; *Hedysarum diphyllum* L.; *Z. angustifolia* J. E. Smith —SUNAJI-MAME. Slender but firm, tufted perennial herb 20–50 cm. high; leaflets 2, lanceolate, 1.5–2 cm. long, 2–3 mm. wide, sparsely pubescent with ventrally attached hairs; bracts

narrowly ovate; flowers yellow, 8–10 mm. long; legumes elliptic, 3–4 mm. long, puberulous, spinulose on both faces, joints flat.—June–Aug. Near seashores; Shikoku (Tosa Prov.); rare.—A variable species widely distributed in the Tropics of both hemispheres.

14. LESPEDEZA Michx. HAGI ZOKU

Perennial herbs or shrubs, usually pilose; leaves pinnately 3-foliolate, the leaflets entire, exstipellate, the stipules free, usually subulate, often deciduous; flowers purple or yellowish, in axillary racemes, often cleistogamous, the bracts small, the bracteoles 2; calyx-teeth equal or unequal, the upper 2 often connate; legumes ovate to orbiculate, flat, indehiscent, 1-seeded.—About 60 species, in the temperate regions of N. America and e. Asia.

- 1A. Flowers all alike, chasmogamic, rather large, 12–20 mm. long, rose-purple, rarely white; keel incurved at apex; legumes short-stiped within the calyx.
- 2A. Winter-buds flattened, the scales distichous; horizontally spreading shrubs much branched in upper part; racemes sessile or subsessile.
- 3A. Calyx-teeth ovate or broadly so, acute to subacute, not spine-pointed. 1. *L. buergeri*
- 3B. Calyx-teeth gradually acuminate and spine-tipped. 2. *L. maximowiczii*
- 2B. Winter-buds terete, the scales spirally arranged; erect or arching shrubs often with ascending branches; racemes, when elongate, distinctly peduncled.
- 4A. Calyx-teeth spine-tipped; racemes short, sessile, usually not longer than the leaves. 3. *L. cyrtobotrya*
- 4B. Calyx-teeth rounded to acuminate, not spine-tipped; racemes sometimes elongate.
- 5A. Calyx-teeth rounded to acute, often obsoletely 3-nerved, usually not longer than the tube.
- 6A. Leaflets membranous to herbaceous, at least when young with appressed to ascending hairs 0.3–0.7 mm. long; calyx-teeth oblong to lanceolate, obtuse to acute, often with darker nerves. 4. *L. bicolor*
- 6B. Leaflets somewhat thicker, with sparse appressed short hairs about 0.2 mm. long; calyx-teeth usually obtuse to rounded, the nerves of the same color, indistinct. 5. *L. homoloba*
- 5B. Calyx-teeth acute to acuminate, 1-nerved, the lowest longer than the tube. 6. *L. thunbergii*
- 1B. Flowers of two forms, the chasmogamic usually less than 12 mm. long, with the keel erect or scarcely incurved at apex, the cleistogamic apetalous or nearly so; legumes sessile or nearly so.
- 7A. Racemes of chasmogamic flowers peduncled, usually longer than the leaves.
- 8A. Densely pubescent with yellowish brown soft hairs; leaflets 3–4 cm. long, 12–20 mm. wide. 7. *L. tomentosa*
- 8B. Glabrescent or loosely white-pubescent; leaflets 1–2.5 cm. long, 5–10 mm. wide.
- 9A. Peduncles capillary, 3- to 5-flowered, glabrescent, spreading; calyx of chasmogamic flowers 4–5 mm. long. 8. *L. virgata*
- 9B. Peduncles thicker, 5- to 15-flowered, appressed-pilose, ascending; calyx of chasmogamic flowers 5–6 mm. long. 9. *L. daurica*
- 7B. Racemes of chasmogamic flowers sessile or nearly so, shorter than the leaves.
- 10A. Leaflets oblanceolate, linear, rarely obovate.

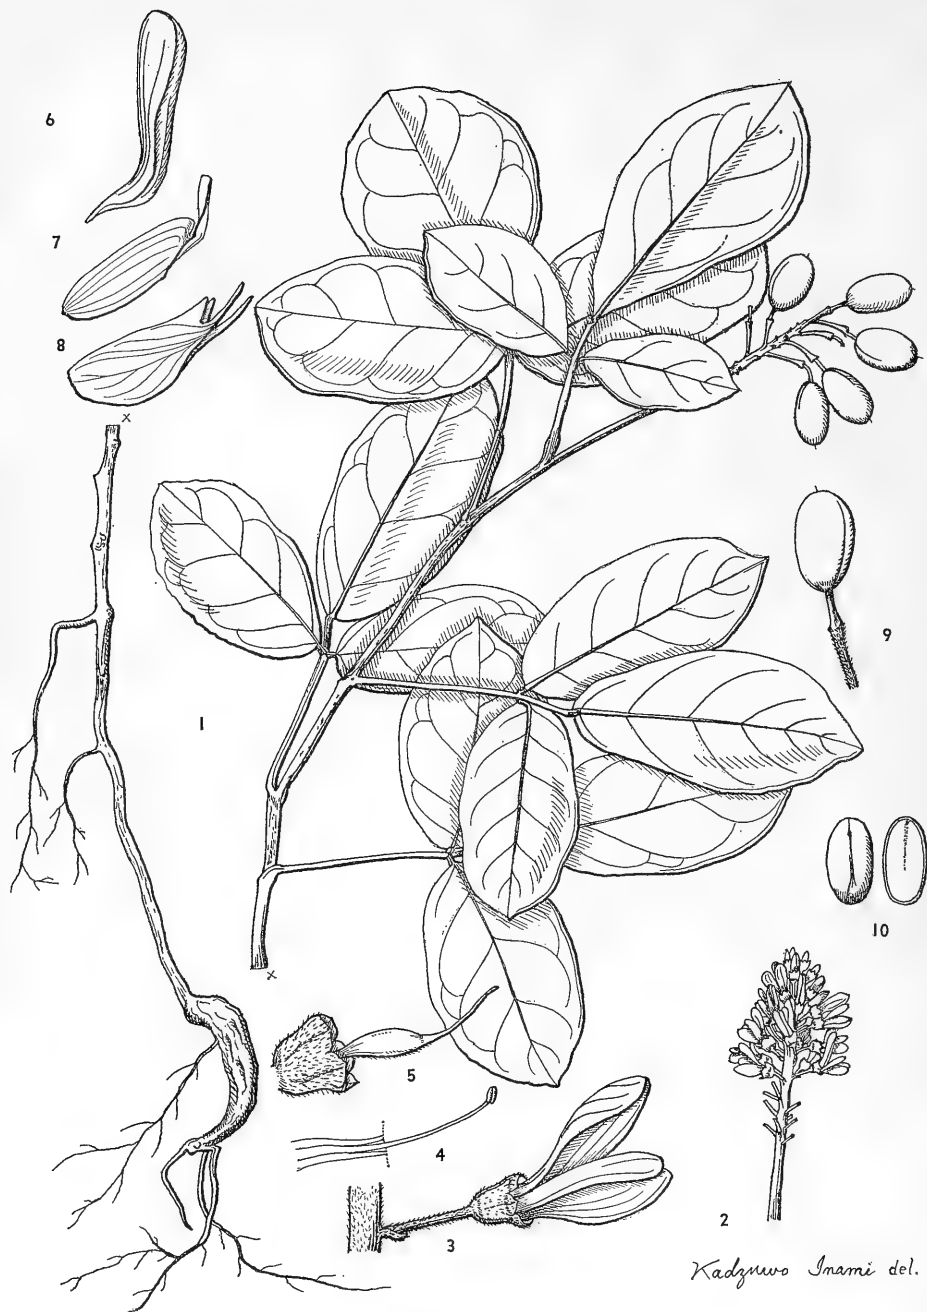

FIG. 9—*Euchresta japonica* Benth. 1, Habit; 2, raceme; 3, flower; 4, stamen; 5, pistil; 6, vexillum; 7, wing; 8, keel; 9, legume; 10, seeds.

- 11A. Calyx-teeth of the cleistogamous flowers indistinctly 1-nerved; legumes of cleistogamous flowers 1.5–2 times as long as the calyx. 10. *L. cuneata*
 11B. Calyx-teeth of the cleistogamous flowers clearly 3-ribbed; legumes of the cleistogamous flowers as long as to slightly shorter than the calyx. 11. *L. juncea*
 10B. Leaflets obovate to obovate-orbicular; long prostrate or trailing slender herb with pubescent branches and leaves. 12. *L. pilosa*

1. *Lespedeza buergeri* Miq. *L. oldhamii* Miq.; *L. buergeri* var. *oldhamii* (Miq.) Maxim.—KI-HAGI. Shrub 40–80 cm. high; the branches horizontally spreading, slender, appressed-pilose; leaves petioled, the leaflets ovate to oblong, 2–4 cm. long, 1–3 cm. wide, usually acute, deep green, glabrous or glabrescent on upper side, appressed-pilose beneath; racemes to 7 cm. long, subsessile; flowers 10–12 mm. long, white with purple blotch; calyx-teeth equal, ovate, obtuse to subacute, as long as or shorter than the tube, obsoletely 1-nerved, the upper 2 connate, the bracts ovate, obtuse, few-nerved, the bracteoles broadly ovate, many-nerved, usually ciliolate, usually slightly longer than the calyx-tube; legumes oblong, loosely appressed-pilose, about 12 mm. long, about 4 mm. wide.—July–Sept. Rocky places along rivers in mountains; Honshu, Shikoku, Kyushu; common.—China.—*Forma albiflora* Honda. SHIROBANA-KI-HAGI. Flowers white; rare.

Var. *kinashii* Ohwi. TACHIGE-KI-HAGI. Hairs of branches and racemes spreading.—Occurs with the typical phase; rare.

2. *Lespedeza maximowiczii* C. K. Schn. *L. buergeri* var. *praecox* Nakai; *L. praecox* (Nakai) Nakai—CHŌSEN-KI-HAGI. Very closely allied to the preceding species; calyx-teeth broadly lanceolate, spine-tipped, longer than the tube.—July–Aug. Kyushu (Tsushima).—Korea.

3. *Lespedeza cyrtobotrya* Miq. MARUBA-HAGI, MIYAMA-HAGI. Erect or ascending herb, woody at base, 70–120 cm. high; leaves petioled, the leaflets usually elliptic or obovate, 2–3 cm. long, 15–20 mm. wide, obtuse to rounded, often retuse, glabrous above, short-pilose beneath; racemes axillary, sessile or nearly so, short, usually not exceeding the leaves, the bracts narrowly ovate, acute, 1-nerved, the bracteoles similar, rather narrow; flowers 10–15 mm. long, rose-purple; calyx-teeth longer than the tube, 1-nerved, spine-tipped; legumes nearly orbicular, beaked, white appressed-pilose, 6–7 mm. long, about 5 mm. wide.—Aug.–Oct. Meadows and grassy places in hills and in low mountains; Honshu, Shikoku, Kyushu; common.—Korea and China.

Var. *kawachiana* (Nakai) Ohwi. *L. kawachiana* Nakai—KAWACHI-HAGI. Hairs of branches and racemes spreading.—Occurs with the typical phase; rare.

4. *Lespedeza bicolor* Turcz. EZO-YAMA-HAGI. Erect to ascending herb, often woody at base, 60–180 cm. high; stipules subulate, 3-nerved at base, the leaflets membranous to herbaceous, elliptic, 1.5–4 cm. long, 1–2.5 cm. wide, sparsely pubescent above only while young, loosely appressed-pilose to glabrate beneath, the hairs 0.5–0.7 mm. long; racemes longer to shorter than the leaves; flowers rose-purple, 12–17 mm. long, the bracts and bracteoles narrowly ovate, minute; legumes nearly orbicular, 5–7 mm. long and as wide, loosely white appressed-pilose.—July–Sept. Grassy places and thickets in lowlands and in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.—Korea, Ussuri, Manchuria, and n. China.—*Forma acutifolia* Matsum. *L. bicolor* var. *intermedia* forma *acutifolia* Matsum.; *L. spicata* Nakai & F. Mackawa; *L. melanantha* Nakai; *L. bicolor* var. *japonica* Nakai; *L. floribunda* sensu auct. Japon., non Bunge; *L. bicolor* forma *microphylla* Miq.—YAMA-HAGI. With thicker, mostly acute leaflets and scattered shorter hairs be-

neath, about 0.3 mm. long.—Very common in our area and freely passing into the typical phase.—*Forma alba* (Bean) Ohwi. *L. bicolor* var. *alba* Bean. Flowers white.

5. *Lespedeza homoloba* Nakai. *L. nikkoensis* Nakai; *L. retusa* Nakai; *L. rotundiloba* Nakai; *L. sendaica* Nakai—TSUKUSHI-HAGI, NIKKO-SHIRA-HAGI. Shrub with elongate branches, minutely appressed-pilose while young; leaflets rather thick, ovate to elliptic, 2–5 cm. long, 1–3 cm. wide, glabrous on upper side from the first, sparsely appressed-pilose beneath; racemes longer or shorter than the leaves; flowers 10–15 mm. long, rose-purple, the bracts and bracteoles narrowly ovate, minute, acute; legumes broadly obovate, about 8 mm. long, 5–6 mm. wide, appressed-pilose.—Aug.–Oct. Grassy places and thickets; Honshu, Shikoku, Kyushu; common.

6. *Lespedeza thunbergii* (DC.) Nakai. *Desmodium thunbergii* DC.; *D. penduliflorum* Oudem.; *L. penduliflora* (Oudem.) Nakai; *L. sieboldii* Miq.; *L. bicolor* var. *sieboldii* (Miq.) Maxim.; *L. grandis* Koidz.—MIYAGINO-HAGI. Stems sometimes woody at base, 100–180 cm. high, erect to arching above, short appressed-pilose while young; stipules small, subulate; leaflets narrowly oblong, sometimes elliptic or ovate, 3–5 cm. long, 1–2.5 cm. wide, usually acute, glabrous on upper side, with short appressed hairs beneath; racemes usually longer than the leaves, the bracts and bracteoles broadly lanceolate or narrowly ovate, small, acute; flowers 15–18 mm. long, rose-purple; legumes narrowly obovate to oblong, 10–13 mm. long, 4–5 mm. wide, appressed-pilose.—June–Sept. Widely cultivated in our area; spontaneous in Honshu (Hokuriku and Chūgoku Distr.).—Reported to be spontaneous in China; very variable.—*Forma angustifolia* (Nakai) Ohwi. *L. intermedia* Nakai, non Britt.; *L. intermedia* var. *angustifolia* Nakai; *L. japonica* var. *intermedia* Nakai, var. *angustifolia* (Nakai) Nakai, var. *gracilis* Nakai, var. *retusa* Nakai, and var. *spicata* Nakai—BITCHŪ-YAMA-HAGI. Leaflet pilose above; flowers rose-purple.—Spontaneous in Honshu, Shikoku, Kyushu.—Korea and Manchuria.

—Cv. *Albiflora*. *Desmodium racemosum* var. *albiflorum* Sieb. ex Miq.; *L. bicolor* var. *intermedia* forma *albiflora* Matsum.; *L. japonica* L. H. Bailey; *L. sieboldii* var. *albiflora* (Sieb. ex Miq.) C. K. Schn.; *L. intermedia* var. *alba* Nakai—SHIROBANA-HAGI. Leaflets thinly appressed-pilose on upper side; flowers white.—Long cultivated as an ornamental.—Cv. *Versicolor*. *L. penduliflora* forma *versicolor* (Nakai) Ohwi; *L. japonica* var. *versicolor* Nakai—SOMEWAKE-HAGI. With white and rose-purple flowers on the same plant. Cultivated.

Var. *obtusifolia* (Nakai) Ohwi. *L. bicolor* var. *sieboldii* forma *sericea* Matsum.; *L. patens* Nakai; *L. patens* var. *obtusifolia* Nakai—KE-HAGI. Branches and sometimes racemes with spreading hairs; leaves glabrous on upper side.—Aug.–Sept. Honshu (Uzen, Harima Prov. and elsewhere); often cultivated.—*Forma pilosella* Ohwi. UWAGE-KI-HAGI. Leaves minutely pilose above.

7. *Lespedeza tomentosa* (Thunb.) Sieb. ex Maxim. *L. villosa* (Willd.) Pers.; *Hedysarum tomentosum* Thunb.; *H. villosum* Willd.; *L. macrophylla* Bunge; *L. hirta* Miq., non Ellis—INU-HAGI. Erect stiff perennial herb, 80–150 cm.

high, densely yellowish brown ascending-pubescent; stipules linear, recurved, the leaflets oblong, obtuse to rounded, 3–6 cm. long, 10–30 mm. wide; chasmogamic flowers whitish, 8–10 mm. long, densely arranged on elongate, peduncled racemes, the bracts lanceolate, obtuse, small, the bracteoles broadly linear, about 2 mm. long, acuminate; calyx deeply 5-lobed, 5–7 mm. long, the lobes lanceolate, spine-tipped; legumes ovate, ascending-pilose; cleistogamic flowers rather many, fasciculate in the leaf-axils; calyx 4–5 mm. long; legumes 3–4 mm. long. —July–Sept. Grassy slopes in hills; Honshu, Kyushu. —e. Siberia, Manchuria, China, India, Formosa, and Ryukyus.

8. *Lespedeza virgata* (Thunb.) DC. *Hedysarum virgatum* Thunb.; *L. swinhoei* Hance —MAKIE-HAGI. Slender stiff perennial with scattered, appressed, stiff hairs; stems 40–60 cm. long, erect, purplish, sparsely pilose, branching above or nearly simple; stipules subulate; leaflets oblong to elliptic, 7–20 mm. long, 5–10 mm. wide, rather thick and firm, glabrous on upper side, deep green, paler and sparsely pilose beneath; chasmogamic flowers few, 4–5 mm. long, on long peduncles; cleistogamic flowers few, axillary; calyx 2–2.5 mm. long; legumes equal, broadly ovate, about 4 mm. long, 3 mm. wide, slightly pilose. —Aug.–Sept. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu. —Korea and Manchuria.

Var. *macrovirgata* (Kitag.) Kitag. *L. macrovirgata* Kitag. —ÔMAKIE-HAGI. Hairs at least partly spreading. —Honshu (Tamba Prov.).

9. *Lespedeza davurica* (Laxm.) Schindl. *Trifolium davuricum* Laxm.; *Hedysarum trichocarpum* Steph. ex Willd.; *L. trichocarpa* (Steph.) Pers.; *L. medicaginoides* Bunge; *L. fauriei* Lév. —ÔBA-MEDO-HAGI. Erect stiff perennial; stems 20–80 cm. long, short white appressed-pilose; stipules subulate; leaflets oblong or narrowly so, 15–30 mm. long, 5–10 mm. wide, nearly glabrous above, sparsely pilose beneath; chasmogamic flowers about 8 mm. long, in dense racemes as long as to shorter than the leaves, the peduncles rather stout, axillary, the bracts minute, the bracteoles narrowly lanceolate to subulate, 2–3 mm. long; calyx 5–6 mm. long, with narrowly lanceolate, 3-ribbed, spine-tipped lobes; cleistogamic flowers few, fasciculate in axils; calyx 4–5 mm. long; legumes broadly ovate, appressed-pilose, 3–3.5 mm. long. —Sept. Honshu (Hiratsuka in Sagami Prov.); possibly not indigenous. —e. Siberia, Manchuria, Korea, China, and Formosa.

10. *Lespedeza cuneata* (Dum. Cours.) G. Don. *Hedysarum sericeum* Thunb., non Mill.; *Anthyllis cuneata* Dum. Cours.; *L. argyrea* Sieb. & Zucc.; *Indigofera chinensis* Vogel; *L. sericea* (Thunb.) Miq., non Benth.; *L. juncea* var. *sericea* (Thunb.) Forbes & Hemsl.; *L. juncea* var. *subsericea* Miq. —MEDO-HAGI. Tufted or solitary, stiffly erect perennial, copiously branched above, 60–100 cm. high, sparsely white appressed-pilose except the upper side of leaves; stems densely leafy; stipules lanceolate, 3-nerved; leaflets oblanceolate or cuneate, rounded to retuse, 7–25 mm. long, 2–4 mm. wide, with slightly incurved margins; chasmogamic flowers 6–7 mm. long, white with a purple blotch on the center of the standard, few, fasciculate in the leaf-axils; calyx 3–4 mm. long with narrowly lanceolate lobes; legumes ovate, as long as the calyx;

cleistogamic flowers few, fasciculate in leaf-axils; calyx 1.5–2 mm. long; legumes nearly orbicular, about 3 mm. long, longer than the calyx. —Aug.–Oct. Waste ground and grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common. —Korea, Manchuria, China, Ryukyus, Formosa, to India and Australia.

Var. *serpens* (Nakai) Ohwi. *L. serpens* Nakai; *L. sericea* var. *latifolia* Maxim., pro parte; *L. prostrata* Nakai, non Pursh —HAI-MEDO-HAGI. Stems prostrate, branching, the branchlets thicker, spreading-pilose; leaflets thicker and broader; flowers with a purplish standard, the blotch at the center larger. —Aug.–Oct. Common in grassy places and abandoned lawns, especially abundant near the sea; Honshu, Kyushu. —China.

11. *Lespedeza juncea* (L. f.) Pers. *Hedysarum junceum* L. f.; *Trifolium cytisoides* Pall.; *T. hedysaroides* Pall.; *L. cytisoides* (Pall.) Nakai; *L. hedysaroides* (Pall.) Kitag. —KARA-MEDO-HAGI, INU-MEDO-HAGI. Erect stiff perennial; stems slender, sparsely short white appressed-pilose; stipules subulate, small; leaflets oblanceolate to narrowly obovate, 10–15 mm. long, 2.5–6 mm. wide, rounded to retuse, pilose beneath; chasmogamic flowers 7–8 mm. long, yellowish white, with a purple blotch on the standard, several in fascicles in leaf-axils; calyx 4–5 mm. long with lanceolate, bristly-acuminate lobes; cleistogamic flowers several in leaf-axils; calyx 3–4 mm. long, the lobes lanceolate, 3-ribbed; legumes broadly ovate, pilose, about 3 mm. long. —Sept.–Oct. Honshu (Kantō Distr. and northw.); rare. —Korea, Manchuria, n. China, and e. Siberia.

12. *Lespedeza pilosa* (Thunb.) Sieb. & Zucc. *Hedysarum pilosum* Thunb.; *Desmodium pilosum* (Thunb.) DC.; *L. pilosa* var. *latifolia* Koidz.; *L. pilosa* var. *erecta* Hatus.; *L. sylvestris* Hatus. —NEKO-HAGI. Prostrate to trailing, sparsely branched perennial; branches elongate, slender, loosely leaved, 60–100 cm. long, with spreading whitish pubescence; stipules lanceolate, recurved, acuminate; leaflets membranous, broadly obovate, 1–2 cm. long, 8–15 mm. wide, retuse to rounded, green, pubescent beneath, sparsely pubescent to glabrate on upper side; racemes very short, sessile; chasmogamic flowers yellowish to white, few, 7–8 mm. long; calyx lobes nearly linear with a slightly broadened base; cleistogamic flowers 1–3 in upper leaf-axils; calyx about 1.5 mm. long; legumes broadly ovate, 3–4 mm. long, with long ascending pubescence. —July–Sept. Thickets and grassy places in lowlands and hills; Honshu, Shikoku, Kyushu; rather common. —Korea and China.

L. × intermixta Makino. *L. juncea* var. *latifolia* Maxim., pro parte; *L. latissima* (Matsum.) Nakai; *L. juncea* var. *sericea* forma *latissima* Matsum. —TSURU-MEDO-HAGI. Hybrid of No. 10 and No. 12. Differs from *L. pilosa* in the scarcely prostrate stems and narrowly ovate to oblong leaflets with appressed to ascending pubescence. From *L. juncea* it differs in the scarcely erect stems, longer hairs, and the larger broader leaflets; legumes unknown. —Reported from Honshu. —Ryukyus and Korea.

15. KUMMEROWIA Schindl. YAHazu-sō Zoku

Rather short-pilose annuals; leaves digitately 3-foliate, the stipules soft-membranous, the leaflets subinterrate, exstipellate; flowers of 2 forms, chasmogamic and cleistogamic, both small, axillary, pedicelled, with a single bracteolelike bract subtending the calyx, the bracteoles persistent, ovate; calyx 5-lobed, the lobes pinnate-nerved; legumes flat, sessile, 1-seeded. —Two species, in e. Asia.

- 1A. Stems with downwardly curved, short, white hairs; leaves appressed-pilose on midrib and margin, nearly all alike, the leaflets obovate-oblong to narrowly oblong, obtuse or subacute; bracts and bracteoles 5- to 7-nerved; calyx loosely short-pilose; legumes slightly longer than the calyx, abruptly acute. 1. *K. striata*
- 1B. Stems with upwardly appressed short hairs; leaflets with obliquely spreading hairs on the midrib beneath and on margin; lower leaves spreading, the leaflets obovate, usually retuse, the upper leaves appressed to the stems or suberect; bracts and bracteoles 1- to 3-nerved; calyx glabrous; legumes twice as long as the calyx or longer, rounded at apex. 2. *K. stipulacea*

1. **Kummerowia striata** (Thunb.) Schindl. *Hedysarum striatum* Thunb.; *Lespedeza striata* (Thunb.) Hook. & Arn.; *Microlespedeza striata* (Thunb.) Makino; *M. makinoi* C. Tanaka—YAHazu-sō. Much-branched, erect annual with slender branches; stipules narrowly ovate, few-nerved, 5-8 mm. long, erect, persistent, pale brown; leaves with very short petioles, the leaflets thin, 10-15 mm. long, 5-8 mm. wide; chasmogamic flowers about 5 mm. long, reddish purple, the bracteoles as long as the calyx-tube, ovate, subobtusely; calyx 3-3.5 mm. long, 5-lobed, the lobes ovate, subacute; calyx of cleistogamic flowers similar to those of the chasmogamic; legumes flat, nearly orbicular, about 3.5 mm. long, with short appressed scattered hairs.—Waste ground and roadsides;

Hokkaido, Honshu, Shikoku, Kyushu; common.—Manchuria, China, Korea, Ryukyus, and Formosa; naturalized in N. America.

2. **Kummerowia stipulacea** (Maxim.) Makino. *Lespedeza stipulacea* Maxim.; *Microlespedeza stipulacea* (Maxim.) Makino; *L. striata* var. *stipulacea* (Maxim.) Deb.; *L. striata* forma *adpressa* Matsum.; *L. striata* Maxim. pro parte, non Hook. & Arn.—MARUBA-YAHazu-sō. Resembles the preceding; stems more profusely branched; leaves of 2 forms, the lower spreading, the upper nearly erect or appressed, rather densely arranged.—Aug.-Oct. Waste grounds and roadsides; Honshu, Kyushu; common.—Ussuri, n. China, Korea, and Manchuria.

16. DESMODIUM Desv. NUSUBITO-HAGI ZOKU

Herbs or shrubs, rarely small trees; leaves usually with free, linear or subulate stipules, the leaflets 1-7, pinnate, stipellate; flowers reddish purple or white, usually small, on loose, simple or compound racemes, the bracts various, the bracteoles sometimes present; calyx 5-toothed; filaments often connate into a tube; legumes sessile or long-stiped, flat, usually indehiscent, the joints smooth, glabrous or hairy.—About 180 species, in the warmer regions of the world.

- 1A. Calyx deeply 5-lobed, the segments or lobes much longer than wide; legumes sessile, shallowly constricted between the joints; flowers 3-5 mm. long; leaflets 3.
- 2A. Flowers bracteolate; legumes with rusty pubescence; joints narrowly oblong, about 13 mm. long; erect shrub, horizontally spreading on upper part; terminal leaflets 7-12 cm. long. 1. *D. caudatum*
- 2B. Flowers without bracteoles; legumes with pale minute pubescence; joints broadly elliptic, 3-4 mm. long; decumbent or prostrate, herbaceous or suffrutescent; terminal leaflets less than 3 cm. long.
- 3A. Leaflets 5-15 mm. long; racemes 5- to 10-flowered. 2. *D. microphyllum*
- 3B. Leaflets 2.5-3 cm. long; racemes many-flowered. 3. *D. heterocarpon*
- 1B. Calyx shallowly lobed with depressed deltoid teeth shorter than wide; legumes stiped, prominently constricted on lower side between the semi-obovate joints; flowers 3-10 mm. long; leaflets 3-7.
- 4A. Leaflets 7, sometimes 5; flowers 8-10 mm. long; joints of legumes 12-15 mm. long. 4. *D. oldhamii*
- 4B. Leaflets always 3.
- 5A. Principal lateral nerves of leaflets not reaching margin; stipules deltoid-lanceolate, 2-4 mm. wide at base, semipersistent; flowers 5-7 mm. long.
- 6A. Leaflets ovate; terminal leaflets only slightly larger than the lateral; filament-tube 5-6 mm. long; filament-tube, 10-18 mm. long, much longer than the stipe of legume.
- 7A. Leaflets with raised, puberulous veinlets beneath; joints of legume 8-13 mm. long. 5. *D. laxum*
- 7B. Leaflets nearly glabrous, without raised veinlets beneath; joints of legume 13-16 mm. long. 6. *D. leptopus*
- 6B. Leaflets oblong-ovate to broadly lanceolate; terminal leaflets usually much larger than the lateral; filament-tube about 4 mm. long, only slightly shorter than the stipe of legume. 7. *D. laterale*
- 5B. Principal lateral nerves of leaflets reaching margin; stipules subulate, usually not exceeding 1 mm. wide at base, commonly early deciduous; flowers 3-4 mm. long.
- 8A. Leaflets broadest below the middle, ovate to oblong-ovate.
- 9A. Stipe of legume short, 1-3 mm. long; leaves sparse on the stem. 8. *D. oxyphyllum*
- 9B. Stipe of legume 5-7 mm. long; leaves approximate below middle of stem. 9. *D. fallax*
- 8B. Leaflets broadest at or above the middle, broadly obovate; leaves sparse on stem. 10. *D. podocarpum*

1. **Desmodium caudatum** (Thunb.) DC. *Hedysarum caudatum* Thunb.; *H. laburnifolium* Poir.; *Catenaria laburnifolia* (Poir.) Benth.; *D. laburnifolium* (Poir.) DC.; *C. caudata* (Thunb.) Schindl.—MISO-NAOSHI. Short-pilose shrub with ascending to spreading branches and branchlets; stipules subulate; petioles 3-5 cm. long, slightly flattened and without groove on upper side; leaflets broadly lanceolate, 7-12 cm. long, acute, the lateral ones slightly smaller, deep green on upper side, slightly glaucous and with slightly raised veinlets beneath; racemes terminal and axillary, in leafy panicles, the bracteoles lanceolate, subtending the calyx, 0.5-0.8 mm. long; flowers 5-6 mm. long; legumes 5-7 cm. long, flat, the joints 4-6, slightly contracted at each end, narrowly oblong, 8-13

mm. long, 7-8 mm. wide, with rusty-brown uncinuate hairs.—Aug.-Sept. Woods; Honshu (Suruga Prov. and Chūgoku Distr.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, China to India, and Malaysia.

2. **Desmodium microphyllum** (Thunb.) DC. *Hedysarum microphyllum* Thunb.; *D. parvifolium* DC.—HIME-NO-HAGI. Decumbent, herbaceous or suffrutescent, with slender, elongate, loosely branched stems; stipules thinly membranous, lanceolate; leaflets elliptic, 5-10 mm. long, the lateral ones slightly smaller, loosely appressed-pilose beneath; racemes very loosely few-flowered, 1-5 cm. long, the axis flexuous, slender, the pedicels slender, 5-8 mm. long, with scattered spreading glandular hairs, the bracts similar to the stipules,

deciduous; flowers 4-5 mm. long, reddish purple; legumes to 15 mm. long, sessile, the joints 3-4, minutely puberulous, elliptic, 3-4 mm. long, about 3 mm. wide.—Aug.-Oct. Honshu (centr. distr. and westw.), Shikoku, Kyushu; rare.—Ryukyus, Formosa, China, India to the Philippines.

3. *Desmodium heterocarpon* (L.) DC. *Hedysarum heterocarpon* L.; *D. buergeri* Miq.; *D. heterocarpon* var. *buergeri* (Miq.) Hosokawa—SHIBA-HAGI. Diffuse suffrutescent shrub with procumbent or ascending slender branches, sparsely appressed-pilose while young; stipules lanceolate, 8-12 mm. long, long-acuminate, many-nerved; leaflets rounded to re-tuse, the terminal obovate, 2.5-3 cm. long, 1.5-2 cm. wide, the lateral obovate to oblong, 1.5-2.5 cm. long, 1-1.5 cm. wide, pilose while young; racemes 6-8 cm. long, with spreading hairs, the bracts narrowly ovate, caducous; flowers reddish purple, 4-5 mm. long; calyx rather deeply lobed; legumes about 15 mm. long, erect, sessile, the joints 4-5, about 3 mm. long and as wide, flat, with minute uncinat whitish hairs.—Sept.-Oct. Grassy slopes and roadsides in lowlands; Honshu (centr. distr. and westw.), Shikoku, Kyushu; locally common.—Bonins, Korea (Quelpaert Isl.), Ryukyus, Formosa, China to India and Malaysia.

Var. *patulepilosum* (Ohwi) Ohwi. *D. buergeri* var. *patulepilosum* Ohwi. TACHIGE-SHIBA-HAGI. Hairs spreading on stems and branches.—Honshu (Kii Prov.).

4. *Desmodium oldhamii* Oliv. FUJI-KANZŌ. Puberulous and loosely hirsute, simple, erect perennial 50-120 cm. high; stipules linear-lanceolate, few-nerved; leaflets 5 or 7, ovate to oblong, 8-16 cm. long, 3-6 cm. wide, abruptly acuminate, the terminal slightly larger; racemes 1-5, terminal, elongate, sometimes to 30 cm. long, the bracts deciduous, the pedicels 7-12 mm. long; filament-tubes about 7 mm. long; legumes on a stipe 8-10 mm. long, the joints 1 or 2, broadly semi-obovate, 10-12 mm. long, with short uncinat pubescence on both surfaces.—Aug.-Sept. Thickets and woods; Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

5. *Desmodium laxum* DC. *D. podocarpum* var. *laxum* (DC.) Baker; *D. austrojaponense* Ohwi; *D. tashiroi* sensu auct. Japon., pro parte, non Matsum.; ? *D. laxum* var. *kianum* Matsum.; *D. gardneri* sensu auct. Japon., pro parte, non Benth.—ŌBA-NUSUBITO-HAGI, SAIKOKU-NUSUBITO-HAGI. Perennial herb slightly woody at base, 60-100 cm. high; stems erect, usually simple, slightly pilose; stipules lanceolate, 3- to 5-nerved, 3-5 mm. long, deciduous; leaves chartaceous, deep green on upper side, slightly paler beneath, with appressed hairs especially on midrib on upper side, the terminal leaflets ovate to broadly so, 6-10 cm. long, 3-5 cm. wide, acuminate, the lateral leaflets slightly smaller, rounded-truncate at base on outer margin; racemes loosely flowered, 10-30 cm. long, short-pilose, the bracts subulate, minute; flowers about 7 mm. long, reddish purple; calyx-lobes depressed; legumes with stipe 10-15 mm. long, the joints 2 or 3, semi-obovate, 8-13 mm. long, minutely pubescent.—Aug.-Oct. Woods; Honshu (Tōtomi Prov.), Shikoku, Kyushu; rare.—China and Formosa to India and Malaysia.

6. *Desmodium leptopus* A. Gray. *D. gardneri* Benth.;

D. tashiroi Matsum.—TOKIWA-YABU-HAGI. Closely allied to the preceding; leaflets glabrescent, with scarcely raised veinlets beneath; flowers slightly larger; legumes larger and the joints 13-16 mm. long.—Aug.-Oct. Kyushu (Yakushima and Tanegashima); rare.—Ryukyus, Formosa, China to India.

7. *Desmodium laterale* Schindl. *D. laxum* sensu auct. Japon., non DC.; *D. polycarpon* sensu auct. Japon., pro parte, non DC.—RYŪKYŪ-NUSUBITO-HAGI. Closely allied to No. 5 but smaller; leaves pale green and loosely short-pilose on the more prominently raised veinlets beneath, the terminal leaflets 5-10 cm. long, 1.5-3 cm. wide, the lateral $\frac{1}{2}$ - $\frac{3}{4}$ as long as the terminal, scarcely or much dilated on outer margin at base.—Kyushu (Osumi Prov. and southw.).—Ryukyus, Formosa, and China.

8. *Desmodium oxphyllum* DC. *Hedysarum racemosum* Thunb., non Aubl.; *D. racemosum* (Thunb.) DC.; *D. thunbergii* DC. pro parte; *D. podocarpum* var. *typicum*, var. *japonicum*, var. *polyphyllum*, var. *parvifolium* all of Maxim.; *D. japonicum* Miq., pro parte; *D. oxphyllum* var. *japonicum* Matsum.—NUSUBITO-HAGI. Perennial herb, 60-120 cm. high, ligneous at base, thinly pilose, remotely leafy throughout; stipules linear to lanceolate, 3-7 mm. long, long-acuminate; leaflets 3, thin, acute, paler beneath, the terminal ovate to broadly so, 4-8 cm. long, 2.5-4 cm. wide, broadly cuneate at base, the lateral slightly smaller; racemes loosely flowered, to 30 cm. long, often slightly branched at base, the bracts deciduous; flowers 3-4 mm. long; calyx-teeth short; legumes on a stipe 2-8 mm. long, the joints 1-3, broadly semi-obovate, 5-7 mm. long, minutely pubescent on both surfaces.—July-Oct. Woods and thickets in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China to N. India.

9. *Desmodium fallax* Schindl. *D. japonicum* Miq., pro parte; *D. japonicum* var. *ditlatum* Miq.; *D. podocarpum* var. *mandschuricum* Maxim.; *D. fallax* var. *mandschuricum* (Maxim.) Nakai; *D. fallax* var. *ditlatum* Nakai; *D. racemosum* var. *mandschuricum* (Maxim.) Ohwi; *D. racemosum* var. *ditlatum* (Nakai) Ohwi; *D. podocarpum* sensu auct. Japon., non DC.; *D. podocarpum* var. *membranaceum* Matsum.—YABU-HAGI. Closely resembles the preceding; leaves thinner, closely approximate near the middle of the stem, the leaflets narrowly ovate to ovate, less pubescent, prominently paler beneath.—Sept.-Oct. Woods and thickets in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, Ussuri, and China.

10. *Desmodium podocarpum* DC. *D. japonicum* Miq. pro parte; *D. podocarpum* var. *japonicum* (Miq.) Maxim., pro parte; *D. podocarpum* var. *indicum* Maxim., pro parte; *D. podocarpum* var. *latifolium* Maxim. ex Matsum.; *D. oxphyllum* var. *villosum* Matsum.; *D. racemosum* var. *villosum* (Matsum.) Ohwi; *D. maximowiczii* Makino—MARUBA-NUSUBITO-HAGI. Closely resembles No. 8; stems leafy throughout; leaves densely pubescent, the terminal leaflets broadly ovate.—Woods and thickets; Honshu, Shikoku, Kyushu; common.—Korea, Formosa, China to India.

17. SMITHIA Ait. SHIBA-NEMU ZOKU

Herbs with odd- or even-pinnate leaves, the leaflets small, exstipellate; stipules membranous, persistent, usually attached above the base and petiole; flowers yellowish or purplish, in axillary racemes, the bracts and bracteoles membranous or rather leaflike, persistent; calyx deeply 2-lobed, the upper lobes 2-toothed, the lower 3-toothed; legumes enclosed in the calyx, the joints few, strongly or slightly flattened, sometimes tuberculate.—Tropics of Asia and Africa.

1. *Smithia japonica* Maxim.—SHIBA-NEMU. Branched annual 30–50 cm. high; leaves ovate, 2–3 cm. long, the rachis ending in a short point, loosely hispid, the stipules pale brown, nerved, oblanceolate, petlate and attached near the center, the leaflets 8–14, membranous, oblanceolate, 5–12 mm. long, 2–4 mm. wide, rounded at apex, spine-tipped, loosely hispid on under side and margins; flowers bluish, on a short-peduncled

subcapitate raceme, the bracteoles oblong, 4–5 mm. long, green, hispid-ciliate; calyx-lobes 5–6 mm. long, hispid-ciliate, many-nerved, the nerves connate at apex, the upper lobes ovate; legumes 7-jointed, the joints nearly orbicular, 1–1.5 mm. across, loosely papillate on both sides.—Sept.–Oct. Honshu (Suwō and Kii Prov.), Shikoku, Kyushu; rare.—Ryukyus.

18. AESCHYNOMENE L. KUSA-NEMU ZOKU

Herbs or suffrutescent shrubs; stipules ovate to subulate; leaves sometimes odd-pinnate, the leaflets many, exstipellate; flowers yellow, in axillary racemes, the bracts similar to the stipules, the bracteoles appressed to the calyx; calyx 2-lipped, the upper lobe 2-fid, the lower 3-fid; flowers with orbicular standard, the keel navicular; stamens diadelphous in 2 sets of 5; legumes stiped, the joints many, flattened, smooth or tubercled on the center, usually indehiscent.—About 70 species, in the Tropics and subtropics.

1. *Aeschynomene indica* L. KUSA-NEMU. Green to somewhat glaucous, somewhat fleshy annual branched above, with scattered spreading hairs on stems, leaf-rachises, and peduncles, the hairs callose at base; stems erect, terete, green; leaves 5–10 cm. long, short-petioled, the stipules ovate to lanceolate, membranous, acuminate, attached slightly above the base, 7–12 mm. long, the leaflets 40–60, linear-oblong, 10–15 mm. long, 2–3.5 mm. wide, rounded at apex, glaucous beneath; racemes 2- or 3-flowered, loose, the bracts similar to the

stipules but smaller, the bracteoles at the base of the calyx narrowly oblong, green; flowers about 1 cm. long, pale yellow; calyx membranous, about 5 mm. long, 2-lobed nearly to the base; legumes usually glabrous, linear, flattened, 3–5 cm. long, 5 mm. wide, the stipe 7–8 mm. long, the joints 6–8, absolutely rugulose in the center on both sides.—July–Oct. Wet places near rivers and ponds in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Tropics of Asia, Africa, and Australia.

19. HEDYSARUM L. IWA-ŌGI ZOKU

Perennial herbs or suffrutescent shrubs; leaves odd-pinnate, the stipules membranous, the leaflets many, exstipellate, usually oblong; flowers reddish purple or pale yellow, in racemes, the bracts persistent or deciduous, the bracteoles linear, small; calyx-teeth equal or slightly unequal; keel nearly straight, obliquely truncate, unappended, longer than the wings; stamens diadelphous (9 and 1); legumes flat, several-jointed, the joints smooth or prickly, indehiscent.—About 70 species, mostly in cooler regions of the world.

1A. Flowers pale yellow; lateral teeth of calyx deltoid, $\frac{1}{3}$ – $\frac{1}{2}$ as long as the tube, the lower tooth shorter than the calyx-tube.

1. *H. vicioides*

1B. Flowers reddish purple; lateral teeth of calyx lanceolate, nearly as long as the tube, the lower tooth slightly longer than the calyx-tube.

2. *H. hedyaroides*

1. *Hedysarum vicioides* Turcz. *H. ussuriense* Schischk. & Komar; *H. esculentum* Ledeb.; *H. alpinum* var. *japonicum* B. Fedtsch.; *H. iwa-ōgi* Hara—IWA-ŌGI, IWA-ŌGI, TATEYAMA-ŌGI. Tufted, more or less pubescent perennial with thick erect caudex; stems 25–80 cm. long, nearly simple or sparsely branched above; leaves petioled, 8–15 cm. long, the lower ones reduced to sheathing stipules; stipules membranous, deciduous, brown, many-nerved, on the ventral margin connate to form a narrowly lanceolate blade 12–20 mm. long, the leaflets 11–25, herbaceous to chartaceous, narrowly ovate or broadly lanceolate, 1.5–3 cm. long, 5–10 mm. wide, obtuse to rounded and obscurely mucronate at apex, with closely spaced slender lateral nerves, nearly glabrous above, usually pubescent and obscurely glandular-dotted beneath; racemes axillary, 3–8 cm. long, one-sided, many-flowered, the peduncles to 15 cm. long, the bracts caducous, narrowly to broadly lanceolate, 3–8 mm. long, 1–3.5 mm. wide, the pedicels 3–7 mm. long, white-pubescent, the bracteoles persistent, linear, shorter than

the calyx; flowers 15–20 mm. long, pale yellow; keel longer than the standard and wings; legumes 3–4 cm. long, 3- or 4-jointed, the joints elliptic, flat, entire or obscurely undulate on margin, with reticulate venation on the faces, glabrous or minutely puberulous.—June–Aug. Sandy to gravelly slopes in high mountains, or in grassy places in lowlands in northern distr.; Hokkaido, Honshu (centr. distr. and northw.).—n. Korea to e. Siberia.

2. *Hedysarum hedyaroides* (L.) Schinz & Thell. *Asragalus hedyaroides* L.; *H. obscurum* L.; *H. sibiricum* Poir.; *H. neglectum* Ledeb.—CHISHIMA-GENGE, KARAFUTO-GENGE. Closely resembling the preceding, more prominently pubescent; leaflets slightly broader and fewer; flowers reddish purple; calyx-teeth longer; keel only slightly longer than the standard and wings; legumes glabrous to minutely pubescent.—July–Aug. Hokkaido (Rebun Isl.).—Cooler regions and high mountains of Eurasia.

20. VICIA L. SORA-MAME ZOKU

Annuals or perennials usually with tendrils; leaves even-pinnate, terminated by a tendril or a mucro, exstipellate, the stipules usually semisagittate; flowers reddish purple, rarely yellowish, fasciculate in axils or in axillary racemes, the bracts small, the bracteoles absent; calyx often oblique, 5-lobed or 5-toothed, the lowest lobe or tooth sometimes longer; wings adnate to the middle of the keel; stamens diadelphous (9 and 1), the tube oblique at apex; style filiform, hairy all around or on back at apex, sometimes bearded under the stigma; legumes flattened, 2-valved, dehiscent, 1-locular, 2- to several-seeded, the seeds globular.—About 150 species, in temperate northern regions of the N. Hemisphere and S. America.

- 1A. Flowers solitary or fasciculate in leaf-axils, usually without peduncles; style bearded below the stigma on outer side; stipules (in ours) with an obsolete depressed gland on the center.
- 2A. Annual herbs, rarely perennial; calyx-teeth elongate, nearly equal, almost as long as the tube.
- 3A. Leaflets of upper leaves obovate or oblong; flowers about 2 cm. long; legumes 5–8 cm. long. 1. *V. sativa*
- 3B. Leaflets of upper leaves linear to oblong; flowers about 15 mm. long; legumes 3–5 cm. long. 2. *V. angustifolia*
- 2B. Perennial herb; calyx-teeth short, unequal, $\frac{1}{3}$ – $\frac{2}{3}$ as long as the tube. 3. *V. sepium*
- 1B. Flowers in pedunculate racemes; styles short-pubescent all around; stipules not glandular.
- 4A. Racemes few-flowered; flowers small, 3–5 mm. long.
- 5A. Legumes glabrous, 3- to 6-seeded; racemes 1- to 3-flowered. 4. *V. tetrasperma*
- 5B. Legumes short-pilose, 2-seeded; racemes 3- to 7-flowered. 5. *V. hirsuta*
- 4B. Racemes many-flowered; flowers larger, 10–20 mm. long.
- 6A. Tendrils well developed, elongate; scandent or prostrate herbs.
- 7A. Leaflets 12–28; scandent herbs.
- 8A. Annuals; limb of the standard distinctly shorter than the claw.
- 9A. Plant soft-pubescent; flowers 15–17 mm. long; calyx-teeth subulate, the lower ones longer than the tube. 6. *V. villosa*
- 9B. Plant loosely pubescent to glabrous, slender, but stiffer; flowers 10–15 mm. long; calyx-teeth shorter than the tube. 7. *V. dasycarpa* var. *glabrescens*
- 8B. Perennials; limb of the standard as long as the claw.
- 10A. Plant dark reddish brown when dried; leaflets rather coriaceous, lanceolate to oblong, the lateral nerves forming an acute angle with the midrib; stipules firm and dentate. 8. *V. amoena*
- 10B. Plant green or yellowish green when dried; leaflets membranous to chartaceous; stipules rather soft, entire or bifid.
- 11A. Leaflets oblong to elliptic, chartaceous, the lateral nerves forming an angle of more than 40 degrees with the midrib.
- 12A. Leaflets soft-pubescent, pale green; calyx-teeth distinct, nearly deltoid. 9. *V. japonica*
- 12B. Leaflets nearly glabrous, yellowish green; calyx-teeth depressed. 10. *V. amurensis*
- 11B. Leaflets lanceolate to broadly linear, membranous, the lateral nerves ascending, forming an acute angle with the midrib. 11. *V. cracca*
- 7B. Leaflets 4–10, fulvous-green when dried, chartaceous, with raised reticulate veinlets beneath; decumbent or prostrate perennial herb; tendrils absent in lower leaves. 12. *V. pseudo-orobus*
- 6B. Tendrils absent or nearly so; erect or ascending herbs.
- 13A. Bracts not well developed or early deciduous.
- 14A. Leaflets 2, acute to obtuse, sometimes gradually acute, rather thick. 13. *V. unijuga*
- 14B. Leaflets more than 2.
- 15A. Leaflets 4–6, elliptic or oblong, broadest near the middle, rather thick; tendrils sometimes slightly developed. 14. *V. nipponica*
- 15B. Leaflets 8–12, ovate to narrowly so or broadly lanceolate, broadest below the middle, thin; tendrils not well developed. 15. *V. venosa* var. *cuspidata*
- 13B. Bracts ovate to broadly lanceolate, persistent, 3–5 mm. long; leaflets thin, long-acuminate.
- 16A. Leaflets 4–8. 16. *V. fawcii*
- 16B. Leaflets 2. 17. *V. bifolia*

1. *Vicia sativa* L. *Ō-YAHASU-ENDŌ*, ZADOWIKKEN. Similar to the following, but stouter; climbing or trailing, sparsely pubescent annual or biennial to more than 1 m. high; leaflets 12–14, obovate to oblong, 10–20 mm. long, truncate to retuse and mucronate at apex; flowers usually 2 cm. or more long; calyx-teeth nearly equal; legumes 5–8 cm. long.—Cultivated for green manure.—w. Asia and Europe and widely cultivated elsewhere.

2. *Vicia angustifolia* L. var. *segetalis* (Thuill.) C. Koch. *V. segetalis* Thuill.; *V. sativa* var. *segetalis* (Thuill.) Ser.; *V. angustifolia* forma *segetalis* (Thuill.) Thuill. ex H. Boiss.; *V. sativa* sensu auct. Japon., non L.—*YAHASU-ENDŌ*. Scandent, slightly pubescent annual; stems 60–150 cm. long; stipules bifid; leaflets 12–14, membranous, oblanceolate to broadly linear, 2–3 cm. long, 4–6 mm. wide, truncate to retuse and mucronate at apex, the lateral nerves forming an acute angle with the midrib; flowers reddish purple, 12–18 mm. long; calyx 8–12 mm. long, the teeth less than half as long as the tube, broadly linear, acuminate; legumes flat.—Common throughout Japan.—Forma *normalis* (Makino) Ohwi. *V. sativa* var. *normalis* Makino.—*TSURU-NASHI-YAHASU-ENDŌ*. Plant without tendrils. Rare in Japan.

Var. *minor* (Bertol.) Ohwi. *V. maculata* var. *minor* Bertol.; *V. angustifolia* var. *cordata* Boiss.; *V. angustifolia* sensu auct. Japon., non L.—*HOSOBAYAHASU-ENDŌ*. Of more slender habit; leaflets linear-lanceolate to nearly linear, 15–25 mm.

long, 2–5 mm. wide, rounded to truncate at apex, the lower ones usually obovate, 5–10 mm. long, retuse; flowers slightly smaller.—More rare in our area than the var. *segetalis*.—Apr.–June. Grassy places and waste ground in lowlands; Honshu, Shikoku, Kyushu; common. The typical phase occurs widely in temperate regions of the world.

3. *Vicia sepium* L. *KARASU-NO-ENDŌ*. Scandent perennial herb, with slender stolons; stems 60–120 cm. long, slightly pubescent; stipules dentate or bifid; leaflets 12–14, membranous, narrowly ovate, 15–30 mm. long, 10–15 mm. wide, obtuse to emarginate, indistinctly ciliate, the lateral nerves ascending and forming a rather acute angle with the midrib; flowers 1 or 2, 15–17 mm. long, violet-purple; calyx 7–8 mm. long, slightly pubescent, the lower tooth slightly elongate, lanceolate, $\frac{1}{3}$ – $\frac{2}{3}$ as long as the tube; legumes 3–4 cm. long, 8–9 mm. wide, glabrous.—May–July. Naturalized in Hokkaido and Honshu (Mount Ibuki in Oomi Prov.)—Europe.

4. *Vicia tetrasperma* (L.) Schreb. *Ervum tetraspermum* L.—*KASUMAGUSA*. Slender, slightly pubescent biennial; stems 30–60 cm. long; leaves nearly sessile, the stipules semi-sagittate, the leaflets 8–12, thin, linear-oblong, 12–17 mm. long, 2–4 mm. wide; peduncles axillary, 2–3 cm. long, slender, the bracts minute; flowers purple or bluish purple, about 5 mm. long; legumes oblong to elliptic, glabrous, 8–10 mm. long, about 4 mm. wide, 3- to 6-seeded.—Apr.–May. Waste

grounds and grassy places in lowlands; Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, Korea, China to Europe.

5. *Vicia hirsuta* (L.) S. F. Gray. *Ervum hirsutum* L.; *V. coreana* Lévl.; *V. taquetii* Lévl.—SUZUME-NO-ENDŌ. Loosely pubescent, scandent annual or biennial; stems 30–60 cm. long; leaves nearly sessile, the stipules bifid or dentate, the leaflets 12–14, thin, lanceolate, rounded to truncate at apex, 10–17 mm. long, 2–3 mm. wide; peduncles slender, 2–3 cm. long, loosely flowered; flowers pale bluish purple, 3–4 mm. long; legumes oblong, pubescent, about 8 mm. long, 3 mm. wide, 2-seeded.—Apr.–May. Waste grounds; Honshu, Shikoku, Kyushu; common.—Eurasia and N. Africa.

6. *Vicia villosa* Roth. BIRŌDO-KUSA-FUJI. Prominently pubescent, scandent annual or biennial; stems 80–120 cm. long; leaves very short-petioled, 8–12 cm. long, the stipules obliquely or semisagittate, the leaflets 16–24, oblong or elliptic to ovate, 15–20 mm. long, 7–10 mm. wide, soft; racemes 8–12 cm. long inclusive of the peduncle, densely many-flowered, one-sided; flowers about 15 mm. long, purple; calyx-teeth unequal, the lower elongate, linear, slightly longer than the tube; legumes flat, glabrous, narrowly oblong.—May–July. A European species, cultivated for green manure.

7. *Vicia dasycarpa* Tenore var. *glabrescens* (C. Koch) G. Beck. *V. villosa* var. *glabrescens* C. Koch.—NAYO-KUSA-FUJI. Resembles the preceding but a much more slender, less pubescent, scandent herb with rather stiffer and more slender stems and shorter calyx-teeth.—June–July. A European plant sometimes grown with the preceding.

8. *Vicia amoena* Fisch. *V. rapunculosa* Deb.; *V. amoena* var. *oblongifolia* Regel; *V. amoena* var. *lanata* Fr. & Sav.; *V. amoena* var. *sachalinensis* F. Schmidt ex Nakai.—TSURU-FUJI-BAKAMA. Thinly pubescent or glabrescent, a scandent perennial herb; stems 80–180 cm. long; leaves very short-petioled, 8–15 cm. long, the stipules coarsely dentate, rather large, the leaflets 10–16, oblong to lanceolate, 15–30 mm. long, 4–10 mm. wide, rounded to subacute; racemes 4–8 cm. long, densely many-flowered, one-sided, on peduncles 2–7 cm. long; flowers purple, 12–15 mm. long, the bracts minute; calyx-teeth unequal, the lower tooth broadly linear, shorter than to nearly as long as the tube; legumes narrowly oblong, flat, 2–2.5 cm. long, about 5 mm. wide; glabrous.—Aug.–Oct. Thickets in lowlands and low mountains; Hokkaido, Honshu, Kyushu; rather common.—Siberia, China, Korea, Manchuria, Sakhalin, and s. Kuriles.

9. *Vicia japonica* A. Gray. *V. japonica* var. *comosa* H. Boiss.; *V. pallida* var. *japonica* (A. Gray) Maxim. ex Matsum.—HIROHA-KUSA-FUJI. Allied to the preceding but slightly smaller and with more slender stems; stipules small, bifid; leaflets 10–14, elliptic to oblong, 10–20 mm. long, 6–10 mm. wide, rounded to retuse; racemes 2–3 cm. long, rather many-flowered; flowers pale bluish purple; calyx-teeth short; legumes 2–2.5 cm. long, about 6 mm. wide, several-seeded.—Apr.–Aug. Thickets and grassy places, seashores to the mountains; Hokkaido, Honshu; rather common.—Korea, Sakhalin, and s. Kuriles.

10. *Vicia amurensis* Oettingen. *V. pallida* Turcz., non Hook. & Arn.; *V. japonica* sensu Komar., non A. Gray; *V. vaniotii* Lévl.—NOHARA-KUSA-FUJI. Intermediate between the two preceding; scandent perennial herb; stems 80–150 cm. long, short-pubescent, glabrate; stipules dentate or bifid; leaflets 15–30 mm. long, 8–12 mm. wide; racemes 2–5 cm. long.

—July–Sept. Hills and low mountains; Honshu (Kai and Shinano Prov.), Kyushu; rather rare.—Korea, Manchuria, Amur, and Ussuri.

11. *Vicia cracca* L. *V. cracca* var. *canescens* Maxim. ex Fr. & Sav.; *V. cracca* var. *japonica* Miq.; *V. oiana* Honda—KUSA-FUJI. Rather soft, somewhat pubescent, vivid or gray-green perennial; stems scandent, 80–150 cm. long; leaves nearly sessile, 8–15 cm. long, the stipules bifid, lanceolate, the leaflets 18–24, lanceolate to broadly linear, 15–30 mm. long, 2–6 mm. wide; racemes densely many-flowered, 6–15 cm. long inclusive of the peduncle; flowers bluish purple, one-sided, 10–12 mm. long; lowest calyx-tooth shorter than the tube; legumes narrowly oblong, 2–3 cm. long, 6–7 mm. wide, glabrous, several-seeded.—May–July. Thickets and grassy places; Hokkaido, Honshu, Shikoku, Kyushu; common on hills. Widely distributed in temperate and cooler regions.

12. *Vicia pseudo-orobus* Fisch. & Mey. *V. pseudo-orobus* var. *tanaka* (Fr. & Sav.) Makino—ŌA-KUSA-FUJI. Slightly pubescent to glabrate, prostrate to procumbent perennial; stems 80–150 cm. long; leaves very short-petioled, the stipules semi-ovate, dentate or 2-fid, the leaflets 4–10, chartaceous, often subalternate on axis, ovate, 3–5 cm. long, 15–30 mm. wide, acute to obtuse, yellowish brown when dry, the tendrils sometimes simple; racemes 4–6 cm. long, rarely sparsely branched at base, many-flowered, long-peduncled; flowers bluish purple, 13–15 mm. long; calyx-teeth depressed, deltoid, the lowest ones 0.5–0.8 mm. long; legumes short-stiped, narrowly oblong, flat, 25–30 mm. long, 6–7 mm. wide, glabrous, several-seeded, the stipe 2–3 mm. long, included within the calyx.—Aug.–Oct. Hokkaido, Honshu, Shikoku, Kyushu.—n. China and e. Siberia.

13. *Vicia unijuga* A. Br. *Orobis lathyroides* L.; *Ervum unijugum* (A. Br.) Alef.; *Lathyrus messerschmidii* Fr. & Sav.; *V. austrohigoensis* Honda—NANTEN-HAGI. Perennial, slightly pubescent while young; stems erect to ascending, angular, 60–100 cm. long, branched above; leaves short-petioled, the stipules dentate or bifid, the leaflets 2, coriaceous to chartaceous, ovate to broadly lanceolate, 4–7 (–10) cm. long, (8–)15–40 mm. wide, gradually acute, sometimes subobtusate; racemes 2–4 cm. long, one-sided, the peduncles variable in length, to 6 cm. long, or absent, sometimes branched at base; flowers bluish purple, 12–15 mm. long, the bracts inconspicuous; calyx-teeth short; legumes broadly lanceolate, 2.5–3 cm. long, 5–6 mm. wide, nearly sessile, glabrous.—June–Oct. Thickets and grassy places in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—e. Siberia, China, Korea, and Sakhalin.—Forma *angustifolia* Makino. FUJIGAE-SŌ. Phase with narrow linear leaflets.

14. *Vicia nipponica* Matsum. *V. venosa* var. *capitata* Fr. & Sav.; *V. capitata* (Fr. & Sav.) Koidz., non Nakai—YOTSUBA-HAGI. Perennial herb, short-pubescent while young, the stems rather stiff, angular, ascending, 30–80 cm. long; leaves petioled, the stipules semi-ovate, dentate, rather large, the leaflets 4–6, firmly chartaceous, elliptic, 2.5–5 cm. long, 15–30 mm. wide, with prominently raised veinlets beneath, the tendrils simple, short, often reduced to a spinelike point; racemes densely flowered, 1–3 cm. long, often branched at base, on peduncles about 5 cm. long; flowers bluish purple, 10–12 mm. long; calyx-teeth depressed-deltoid; legumes as in the preceding species.—July–Oct. Hokkaido, Honshu, Shikoku, Kyushu.—Korea and China.

15. *Vicia venosa* (Willd.) Maxim. var. *cuspidata* Maxim. *V. sexajuga* Nakai; *V. deflexa* Nakai; *V. senanensis* Nakai; *V. subcuspidata* (Nakai) Nakai; *V. venosa* var. *subcuspidata* Nakai.—EBIRA-FUJI. Erect, slightly puberulous perennial; stems angular and sparsely branched above, 80–100 cm. long; leaves short-petioled, the stipules semi-ovate, dentate, or narrow and bifid, the leaflets 8–12, rather thin, lanceolate or narrowly ovate, 2.5–6 cm. long, 8–10 mm. wide, long-acuminate, the tendrils reduced to spines; racemes 2–4 cm. long, rather short-peduncled, one-sided, several to many-flowered; flowers 12–15 mm. long, bluish purple, the bracts inconspicuous; calyx-teeth short.—May–Sept. Woods; Honshu (centr. distr. and westw.), Kyushu (rare).—Forma *minor* (Nakai) Ohwi. *V. venosa* var. *minor* Nakai. With smaller ovate leaflets 10–25 mm. long, 8–15 mm. wide, acute.—Honshu (Chūgoku Distr.) and Kyushu. Intermediates often occur between the typical phase and var. *cuspidata*.—The typical phase occurs in e. Siberia, Manchuria, and Korea.

16. *Vicia fauriei* Franch. *V. venosa* var. *fauriei* (Franch.) Okuyama; *V. fauriei* var. *subsessilis* Nakai.—Tsu-

GARU-FUJI. Erect, slightly pubescent perennial herb; stems angular, 60–80 cm. long, often branched above; leaves very short-petioled, the stipules obliquely ovate or semi-ovate, dentate, the leaflets 4–8, thinly chartaceous, ovate to broadly lanceolate, 4–10 cm. long, 2–3 cm. wide, long-acuminate or very acute, with reticulate veinlets especially prominent beneath; racemes densely flowered, one-sided, 2–3 cm. long, often branched at base, the peduncles absent or to 6 cm. long, the bracts lanceolate to ovate, green, 5–8 mm. long, acuminate, often serrate; flowers bluish purple, 12–15 mm. long; calyx-teeth short; legumes glabrous.—July–Aug. Hokkaido, Honshu (Echigo Distr. and northw.).—China.

17. *Vicia bifolia* Nakai. *V. unijuga* var. *bracteata* Fr. & Sav.; *V. bracteata* (Fr. & Sav.) Koidz.; *V. fauriei* var. *unijuga* Matsum.—MIYAMA-TANI-WATASHI. Resembling *V. unijuga*, but the bracts narrowly ovate to lanceolate, acuminate, sometimes toothed, 3–8 mm. long; leaves thinner, the leaflets acuminate.—June–Aug. Mountains; Honshu (centr. distr.); rather rare.—Korea.

21. LATHYRUS L. RENRI-SŌ ZOKU

Erect or scandent herbs; leaves even-pinnate, the stipules often leaflike, sagittate, the rachis often ending in a tendril, the leaflets 2 to few, entire, rarely reduced; flowers usually showy, reddish purple, sometimes yellowish, in axillary racemes, the bracts minute, the bracteoles absent; wings nearly or completely free from the keel; stamens diadelphous (9 and 1), or sometimes monadelphous, the tube of the filaments scarcely oblique at apex; legumes flat, 2-valved, dehiscent, several to many-seeded.—About 100 species, in the temperate and cooler regions of the N. Hemisphere and S. America.

1A. Stems wingless, angular or ribbed.

2A. Leaflets 2; flowers clear yellow. 1. *L. pratensis*

2B. Leaflets 4–8, rarely 10.

3A. Flowers many, yellow, changing to brown; calyx-teeth depressed-deltoid, much shorter than the tube; legumes 8–10 cm. long.

2. *L. davidii*

3B. Flowers 3–6, purple; calyx-teeth (at least the lowest) as long as to longer than the tube; legumes 5–6 cm. long. ... 3. *L. maritimus*

1B. Stems winged.

4A. Stems erect; tendrils simple; leaflets rather coriaceous, with raised veinlets on both sides. 4. *L. quinquerivius*

4B. Stems often decumbent; tendrils usually branched; leaflets rather membranous, with raised veinlets only on the under side.

5. *L. palustris* var. *pilosus*

1. *Lathyrus pratensis* L. KIBANA-NO-RENRI-SŌ. Loosely pubescent to glabrous, rather slender perennial herb 50–100 cm. high; stems angular; stipules narrowly ovate, broadly lanceolate or semisagittate, acuminate, 15–30 mm. long; leaflets 2, oblong, subacute, 15–35 mm. long, 5–10 mm. wide, with palmate, nearly parallel nerves, the tendrils branched; racemes long-peduncled, 5- to 10-flowered, the bracts minute; flowers clear yellow, 15–20 mm. long; calyx-teeth rather equal, elongate-deltoid, as long as or slightly shorter than the tube; legumes broadly linear, 3–4 cm. long, about 6 mm. wide, glabrous.—Sparingly naturalized; Honshu (Mount Ibuki in Oomi Prov.).—Europe and nw. Asia.

2. *Lathyrus davidii* Hance. ITACHI-SASAGE. Nearly glabrous perennial herb; stems 80–120 cm. long, striate or obtusely angled in the upper part; leaves short-petioled, the stipules semisagittate, sometimes dentate, 15–30 mm. long, the leaflets 4–8, membranous, ovate or elliptic, obtuse, 3–8 cm. long, 2–4 cm. wide, nearly pinninerved, glaucous beneath, the tendrils 2- or 3-branched; racemes many-flowered, 5–15 cm. long, on peduncles 5–10 cm. long; flowers yellow, changing to brown, 15–18 mm. long, suddenly curved upward near the middle; calyx-teeth depressed-triangular; legumes linear, flat, 8–10 cm. long, 5–6 mm. wide, glabrous, many-seeded.—

July–Aug. Woods and thickets in mountains; Hokkaido, Honshu (centr. distr. and northw.), Kyushu.—n. China, Manchuria, Ussuri, and Korea.

3. *Lathyrus maritimus* (L.) Bigel. *Pisum maritimum* L.; *L. japonicus* Willd.—HAMA-ENDŌ. Glabrous to soft-pubescent, glaucous perennial; stems 20–60 cm. long, angular, ascending from long-creeping, slender rhizomes; leaves short-petioled, the stipules obliquely ovate or semisagittate, 15–25 mm. long, very acute, the leaflets 8–12, ovate to oblong or elliptic, 15–30 mm. long, 10–20 mm. wide, acute to obtuse, nearly pinninerved, the tendrils simple or 2- or 3-branched; racemes long-peduncled; flowers 25–30 mm. long, purple, rarely white; calyx-teeth lanceolate, the lower as long as to slightly longer than the tube; legumes narrowly oblong, about 5 cm. long, 1 cm. wide, glabrous, several-seeded.—Apr.–July. Sand dunes near seashores; Hokkaido, Honshu, Shikoku, Kyushu; common.—Throughout the N. Hemisphere.

4. *Lathyrus quinquerivius* (Miq.) Litv. *Vicia quinquerivius* Miq.; *L. palustris* var. *sericea* Franch.—RENRI-SŌ. Perennial herb short-pubescent while young; stems erect, 40–80 cm. long, 3-angled, the wings 1–2 mm. wide; leaves petioled, the stipules lanceolate, bifid, caudately long-acuminate, 10–25 mm. long, 1–3 mm. wide, the leaflets 2–6, linear to

linear-lanceolate, 6–10 cm. long, 4–7 mm. wide, with nearly parallel nerves, the tendrils nearly always simple; racemes on peduncles 10–15 cm. long, 5- to 8-flowered; flowers 15–20 mm. long, purple, the lowest calyx-tooth lanceolate, nearly as long as the tube.—May–June. Wet grassy places and thickets along rivers in lowlands; Honshu, Kyushu.—Korea, Manchuria, China, and c. Siberia.

5. *Lathyrus palustris* L. var. *pilosus* (Cham.) Ledeb. *L. pilosus* Cham.; *L. palustris* subsp. *pilosus* var. *macranthus* (C. T. White) Fern.; *L. myrtifolius* subsp. *macranthus* C. T. White; *L. ugoensis* Matsum.; *L. miyabei* Matsum.; *L. pilosus* var. *miyabei* (Matsum.) Hara; *L. palustris* subsp. *pilosus* var. *macranthus* forma *miyabei* (Matsum.) Hara—EZO-NO-RENRI

22. DUNBARIA Wight & Arn. NO-AZUKI ZOKU

Scandent or twining herbs with scattered sessile glands especially on leaves beneath; stipules deciduous; leaves pinnately 3-foliolate, exstipellate; flowers yellowish, in axillary racemes, solitary or in pairs on nodes, the bracts caducous, the bracteoles absent, sometimes minute; calyx-teeth unequal, elongate, the upper 2 connate; legumes broadly linear, flat, 2-valved, dehiscent.—Few species in tropical Asia.

1. *Dunbaria villosa* (Thunb.) Makino. *Glycine villosa* Thunb.; *D. subrhombica* (Miq.) Hemsl.; *Atylosia subrhombica* Miq.—NO-AZUKI, HIME-KUZU. Prominently soft-pubescent, twining perennial; stems slender, with spreading or reflexed pubescence; stipules narrowly ovate-triangular, acute, about 2 mm. long, recurved, pubescent; leaflets rather densely short ascending-pubescent, with reddish brown, sessile, discoid glands beneath, the terminal leaflet rather larger than the lateral ones, depressed-rhombic, abruptly acute with an obtuse tip, 2–3 cm. long and as wide, stipels minute; racemes axillary, short-peduncled, loosely 3- to 8-flowered; flowers solitary

so. Perennial herb pubescent while young; stems slender, ascending or decumbent at base, 40–80 cm. long, 3-angled, usually with a wing 0.5–2 mm. wide on 2 angles or nearly wingless; leaves short-petioled, the stipules lanceolate to narrowly ovate, bifid, the leaflets rather membranous, lanceolate to narrowly oblong, 3–5 cm. long, 8–15 mm. wide, pale green to glaucous and usually pubescent beneath, glabrous above, the tendrils 2- or 3-branched; flowers very similar to those of the preceding; legumes linear-oblong, flat, 4–5 cm. long, 7–8 mm. wide, glabrous.—May–Aug. Wet grassy places in lowlands; Hokkaido, Honshu, Kyushu (Tsushima).—Sakhalin, Kuriles, Korea, and widely distributed in the N. Hemisphere.

on each node of the raceme, 15–18 mm. across, yellow, the pedicels 6–8 mm. long; calyx about 10 mm. long, densely glandular-dotted and short-puberulent, sometimes loosely pilose, the lowest tooth longest, lanceolate, slightly longer than the tube; standard orbicular, short-clawed, with an obtuse tubercle on each side at base of limb, the keel semicircular and curved to the right, not spurred; legumes flat, broadly linear, 4.5–5 cm. long, about 8 mm. wide, short-pubescent, 6- or 7-seeded.—Aug–Sept. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—centr. China.

23. RHYNCHOSIA Lour. TANKIRI-MAME ZOKU

Twining to procumbent herb with scattered, yellowish brown, sessile, discoid glands; leaves pinnately 3-foliolate, stipellate, the stipules ovate or lanceolate; racemes axillary, the yellow flowers solitary or in pairs at each node, the bracts caducous; calyx 5-lobed; legumes flat, elliptic, 2-valved, dehiscent, 2-seeded.—About 100 species in Tropics.

- 1A. Terminal leaflet obovate, rounded at apex; lowest calyx-lobe longer than the tube. 1. *R. volubilis*
 1B. Terminal leaflet ovate, short-acuminate at apex; all calyx-lobes shorter than the tube. 2. *R. acuminatifolia*

1. *Rhynchosia volubilis* Lour. TANKIRI-MAME. Twining grayish green perennial; stems rather slender, densely recurved short-pubescent; leaves petioled, the stipules narrowly ovate, acuminate, 4–5 mm. long, brown, several-nerved, the leaflets herbaceous, with sessile, yellowish brown, discoid glands on under side, dull yellow-villous, the terminal leaflet obovate or broadly so, 3–5 cm. long, 2.5–4 cm. wide, the stipels filiform, 2–3 mm. long; racemes nearly sessile, 10- to 20-flowered, 2–4 cm. long, the bracts elliptic, mucronate, caducous, brownish, 4–6 mm. long; flowers yellow, 8–10 mm. across; calyx densely puberulent, glandular, 6–8 mm. long, the lower 3 lobes lanceolate, acuminate; legumes elliptic, flat, slightly inflated above the seeds, slightly constricted between the seeds,

12–13 mm. long, about 8 mm. wide, puberulent, rarely glabrous except the margin, reddish when mature.—July–Sept. Thickets in hills and lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather common.—Korea, China, Ryukyus, Formosa, and Philippines.

2. *Rhynchosia acuminatifolia* Makino. *R. volubilis* var. *acuminata* Maxim.—ŌBA-TANKIRI-MAME, TOKIRI-MAME. Closely resembles the preceding, but vivid green and more slender, less densely pubescent; leaves thinner, the terminal leaflets ovate to narrowly so, 4–8 cm. long, 3–5 cm. wide; bracts 2.5–3.5 mm. long; calyx 4–5 mm. long, the lobes triangular; legumes puberulent, 15–17 mm. long, nearly sessile.—Aug–Sept. Honshu (centr. distr. and westw.), Kyushu.

24. AZUKIA Takah. AZUKI ZOKU

Twining, rarely erect, more or less pilose annuals or perennials; leaves pinnately 3-foliolate, the stipules peltate, the stipels linear, sessile, the leaflets entire or 2- or 3-lobed; racemes axillary, the bracts similar to the bracteoles, caducous, the bracteoles membranous to herbaceous, the nodes of the raceme prominently thickened; flowers yellow, or slightly greenish; calyx-teeth short; standard orbicular, short-clawed, the wings oblong, the left one embracing the semicircular curved keel, the right one spreading by the support of the spur on the keel, the keel horizontal and dextrorsely curved, with a horn-shaped spur on the right

side; stamens diadelphous (9 and 1); style flattened, abruptly geniculate at the middle, fimbriate on one side below the stigma, extended beyond the discoid stigma into a subulate point; legumes linear or cylindric, sometimes rather flat, many-seeded.—More than 10 species, in c. and s. Asia.

1A. Bracteoles longer than the calyx-tube, 4–8 mm. long; hilum of the seeds flat.

2A. Terminal leaflets ovate to broadly so, broadest below the middle, abruptly acuminate; upper racemes very short-peduncled or subsessile; bracteoles 6–8 mm. long, about twice as long as the calyx-tube. 1. *A. angularis*

2B. Terminal leaflets narrowly ovate, broadest above the base, gradually acuminate; peduncles always distinct; bracteoles slightly longer than the calyx-tube, 4–5 mm. long. 2. *A. reflexopilosa*

1B. Bracteoles shorter than the calyx-tube, 2–2.5 mm. long; hilum of the seeds sulcate; very slender plants with the terminal leaflets 2–5 cm. long. 3. *A. nakashimae*

1. *Azukiia angularis* (Willd.) Ohwi. *Dolichos angularis* Willd.; *Phaseolus angularis* (Willd.) W. F. Wight—AZUKI. Erect or slightly twining annual; cotyledons hypogeal; primary leaves simple, long-petioled, cordate; stems 30–80 cm. long, sparsely branched above, sometimes slightly twining above; ordinary leaves petioled, spreading-pilose especially on under side, the terminal leaflets broadly ovate, usually 3-lobed, 6–10 cm. long, 5–8 cm. wide, the stipels lanceolate, acuminate; racemes short-peduncled or subsessile, sometimes long-peduncled, the bracteoles narrowly ovate, few-nerved, acute; flowers 15–18 mm. across; legumes pendulous, linear, 6–10 cm. long, nearly glabrous, slightly inflated above the ellipsoidal seeds, the hilum flat.—Aug.–Sept. Widely cultivated in our area.

Var. *nipponensis* (Ohwi) Ohwi. *Phaseolus nipponensis* Ohwi; *P. angularis* var. *nipponensis* (Ohwi) Ohwi—YABU-TSURU-AZUKI. Twining and more slender; terminal leaflets narrowly ovate; racemes pilose; legumes blackish, 4–5 cm. long, the valves thinner.—Aug.–Sept. Thickets and grassy places in lowlands; Honshu, Shikoku, Kyushu; rather common.

2. *Azukiia reflexopilosa* (Hayata) Ohwi. *Vigna reflexopilosa* Hayata; *Phaseolus reflexopilosus* (Hayata) Ohwi—ŌYABU-TSURU-AZUKI. Coarsely pilose twining annual, allied to the preceding variety, but slightly larger, with longer peduncles, and elongate racemes and smaller bracteoles; legumes pendulous, 5–6 cm. long, 4–5 mm. wide, nearly straight, dark brown, the seeds black with paler blotches, truncate at both ends, 3.5 mm. long, the hilum flat.—Kyushu (Hyuga Prov.); rare.—Ryukyus and Formosa.

3. *Azukiia nakashimae* (Ohwi) Ohwi. *Phaseolus nakashimae* Ohwi; *P. minimus* sensu auct. Japon., non Roxb.—

HIME-TSURU-AZUKI. Slender twining annual; stems elongate, retrorsely short-pilose while young; stipules small, 2–3 mm. long, the stipels acuminate, the terminal leaflets ovate, sometimes lanceolate, 2–5 cm. long, loosely appressed-pilose; racemes 2- to 5-flowered, long-peduncled, the bracteoles lanceolate, 1-nerved, acute, slightly shorter than the calyx-tube; flowers about 10 mm. across; legumes linear, 3–4 cm. long, smooth, the seeds ellipsoidal, dark brown.—July–Sept. Kyushu; rare.—Korea and Manchuria. The following are cultivated in our area.

Azukiia umbellata (Thunb.) Ohwi. *Dolichos umbellatus* Thunb.; *Phaseolus calcaratus* Roxb.—TSURU-AZUKI, KANIME. Stems strongly twining, slender, soft-pubescent; cotyledons hypogeal; primary leaves lanceolate, long-petioled; terminal leaflet of the ordinary leaves narrowly ovate; bracteoles linear, 1-ribbed, acuminate, about twice as long as the calyx; racemes elongate, long-peduncled; legumes narrow, slightly incurved, scarcely inflated over the seeds; seeds cylindric-oblong, the hilum sulcate.—Introduced from India.

Azukiia radiata (L.) Ohwi. *Phaseolus radiatus* L.; *P. aureus* Roxb.; *Rudua aurea* (Roxb.) F. Maekawa—BUNDŌ, YAE-NARI. Stems erect or slightly twining, yellowish brown hispid; cotyledons epigeal; primary leaves broadly lanceolate, short-petioled; terminal leaflet of ordinary leaves orbicular-ovate, hispid, dark brown when dried, the stipels caudate, the bracteoles deciduous, broadly ovate, obtuse, several-ribbed, shorter than the calyx-tube; legumes spreading, straight, slightly flattened, hispid to scabrous, the seeds rather small, ellipsoidal, green or dark brown, the hilum sulcate.—Introduced from India.

25. VIGNA Savi SASAGE ZOKU

Twining or trailing, sometimes erect herbs; leaves pinnately 3-foliolate, the stipules rather small, sometimes peltate; racemes axillary, with thickened nodes, the bracteoles small, deciduous; flowers yellow to reddish purple, sometimes white, in pairs; legumes linear, rather cylindric, often inflated at the seeds, dehiscent, 2-valved, the seeds several to many, nearly globose to reniform, with a short hilum.—About 60 species, widespread in warmer and tropical regions.

1A. Keel distinctly beaked and incurved; leaflets membranous, coarsely pilose, acuminate; flowers large, 25–30 mm. long and as wide, bluish purple, becoming reddish brown; calyx-teeth narrowly lanceolate, acuminate, as long as the tube. 1. *V. vexillata* var. *tsusimensis*

1B. Keel not beaked; leaflets rather thick, chartaceous or herbaceous, often glabrescent, acute to obtuse; flowers smaller, 15–18 mm. long and as wide; calyx-teeth strongly depressed-triangular, much shorter than the tube. 2. *V. marina*

1. *Vigna vexillata* (L.) Benth. var. *tsusimensis* Matsum. AKA-SASAGE. Twining perennial, the stems rather slender, spreading to reflexed brown-pilose; stipules broadly lanceolate, few-nerved, 3–4 mm. long, acuminate, attached slightly above the base; leaflets coarsely pilose on both sides, the terminal 6–10 cm. long, 3–4 cm. wide, the stipels small, linear; racemes very short, umbellike, 2- to 4-flowered, on a long pedun-

cle 10–20 cm. long, the bracteoles lanceolate, caducous, the pedicels very short; calyx short-hispid, 8–10 mm. long, the teeth rather equal; keel gradually curved; legumes densely brown-hispidulous.—Sept.–Oct. Kyushu; rare. A variable widespread plant of tropical regions.

2. *Vigna marina* (Burm.) Merr. *Phaseolus marinus* Burm.; *Dolichos luteus* Sw.; *V. lutea* (Sw.) A. Gray; *V.*

retusa Walp.; *D. repens* L.; *V. repens* (L.) O. Kuntze, non Baker—HAMA-AZUKI. Trailing perennial; stems slender, sparsely appressed retrorse-pilose while young, soon glabrous; stipules narrowly ovate, 2–4 mm. long, rather acute, basifixed, obscurely few-nerved; leaflets sparsely pilose only while young, ovate or nearly obovate, 3–5 cm. long, 2.5–3.5 cm. broad, the stipels narrowly ovate, acute, about 1 mm. long; racemes 1–2 cm. long, few-flowered, peduncled, the bracteoles minute,

ovate, acute, about 0.8 mm. long; calyx 2.5–3 mm. long, nearly glabrous, the teeth depressed-triangular, minutely ciliate; legumes broadly linear, spreading, 3–5 cm. long, nearly or quite glabrous, 5- or 6-seeded, slightly inflated over the seeds. —Apr.–Nov. Gravelly slopes near seashores; Kyushu (Yakushima); rare.—Ryukyus, Formosa, China, and tropical regions.

26. APIOS Moench. HODO-IMO ZOKU

Twining perennials; leaves petioled, pinnately compound, the stipules small, subulate, the leaflets 3–7, entire, the stipels linear or obsolete; flowers greenish yellow or purplish brown, in pairs or in 3's or 4's at each node of the axillary racemes, the bracteoles small, caducous; calyx campanulate, sometimes 2-lipped, the teeth obsolete; standard very broad, reflexed, the keel elongate, spirally coiled; stamens diadelphous; legumes broadly linear, 2-valved, dehiscent, straight or slightly curved, rather thick, many-seeded.—Few species in N. America, e. Asia, and India.

1. *Apios fortunei* Maxim. HODO-IMO. Tuberous-rooted twining perennial; stems slender, 100–150 cm. long, with scattered retrorsely appressed short hairs, soon glabrous; leaves petioled, the stipules broadly linear, 3–4 mm. long, 1-ribbed, deciduous, the leaflets 3 or 5, sparsely appressed-hispid on upper side, paler and nearly glabrous beneath, the terminal ovate, acuminate with an obtuse tip, 5–8 cm. long, 2.5–4 cm. wide; racemes 8–15 cm. long, peduncled, with

thickened nodes, the pedicels jointed at apex, the bracts broadly linear, 1.5–2 mm. long, the bracteoles lanceolate, acute, about 1 mm. long, caducous; flowers pale greenish yellow, recurved, rather small; calyx with undulate obsolete teeth; legumes about 5 cm. long.—July–Aug. Sunny thickets and forest-borders; Hokkaido, Honshu, Shikoku, Kyushu. —China.

27. DUMASIA DC. NO-SASAGE ZOKU

Twining herbs; leaves pinnately 3-foliolate, stipulate and stipellate; flowers pale yellow, solitary or in pairs at the nodes of axillary racemes, sometimes cleistogamous, the bracts narrow; calyx tubulose, oblique at truncate mouth, with 5 mucronate teeth; legumes sessile, broadly linear, 2-valved, dehiscent, inflated over the seeds.—Few species, in e. Asia, India, and N. America.

1. *Dumasia truncata* Sieb. & Zucc. NO-SASAGE. Cotyledons hypogaeal; rhizomes slender, creeping, elongate; stems slender, nearly glabrous or retrorsely appressed-pubescent while young; stipules broadly linear, 3-nerved, 3–4 mm. long, acute, the leaflets thin, glabrous above, whitish and loosely appressed short-pilose beneath, the terminal leaflet narrowly ovate, 6–10 cm. long, 3–4 cm. wide, obtuse to subacute, the

stipels subulate, about 1 mm. long; racemes peduncled, rather many-flowered, 2–5 cm. long, sometimes solitary or in pairs in axils; flowers 15–20 mm. long; calyx tubular, glabrescent, obliquely truncate at apex; legumes 3- to 5-seeded, oblanceolate, terete, 4–5 cm. long, 7–8 mm. across, glabrous, inflated over the seeds.—Aug.–Sept. Thickets and forest borders; Honshu, Kyushu.

28. MUCUNA Adans. TOBI-KAZURA ZOKU

Scandent, rarely erect, woody plants often with brownish stinging hairs; stipules present; leaflets petioled, pinnately 3-foliolate, usually stipellate; flowers in racemes, showy, purple or greenish yellow, pedicelled, usually in pairs, the racemes often cauline or on defoliated older branches, the bracts minute or caducous; calyx-tube short, the upper 2 teeth connate, the lowest longer than the others; standard short, the keel equal to or longer than the wing, beaked, incurved and cartilaginous above; stamens diadelphous, the anthers of 2 forms, the glabrous and basifixed ones alternate with the bearded versatile ones; ovary sessile; style filiform, the stigma terminal; legumes thick, ovate to linear, costate to winged.—About 30 species, widespread in the Tropics.

- 1A. Standard glabrous on margin; leaflets with prominent, finely reticulate elevated veinlets on both surfaces, appressed whitish pilose while young; lateral leaflets semicordate on the outer side at base; legumes about 40 cm. long. 1. *M. sempervirens*
 1B. Standard ciliate; leaflets with less prominent barely elevated reticulate veinlets beneath, with appressed rusty strigose hairs especially beneath while young; lateral leaflets semicordate to truncate, rarely shallowly semicordate on the outer margin at base; legumes about 20 cm. long, 5-seeded, scarcely constricted. 2. *M. irukanda*

1. *Mucuna sempervirens* Hemsl. *M. japonica* Nakai —AIRA-TOBI-KAZURA. Evergreen climber with woody stem, the branchlets glabrous, but with scattered pale yellow appressed hairs while very young; leaves petioled, the leaflets 3, deep green, lustrous, glabrous, but with scattered white appressed-hairs while young, with raised finely reticulate veinlets with a free veinlet within the network, the terminal

leaflet oblong to elliptic, 7–15 cm. long, 4–8 cm. wide, acuminate to acute with a mucro at apex, obtuse at base; racemes 3- to 20-flowered, on peduncles 3.5–6.5 cm. long, fuscous-velvety, with sparse stinging hairs; calyx densely fuscous-velvety and with sparse stinging hairs; petals dark purple, the keel 6–8 cm. long, incurved and acutely acuminate; legumes about 40 cm. long, 7-seeded, velvety-puberulent,

smooth on both surfaces, inflated on the seeds, both margins slightly thickened, not winged; seeds reniform, about 3 cm. long, flat on both surfaces.—May. Kyushu (Higo Prov.); very rare.—China.

2. *Mucuna irukanda* Ohwi. IRU-KANDA, UJIRU-KANDA. Woody climber; branches and leaves with rusty-brown retorsely appressed stinging hairs while young; leaves petiolate, the leaflets chartaceous, shortly caudate-acuminate, the terminal oblong, 8–11 cm. long, 4–5 cm. wide, obtuse at base, with very fine barely raised veinlets; racemes densely many-flow-

ered, about 15 cm. long, pendulous, subsessile to short-peduncled, rusty-brown velvety and with scattered brown stinging hairs, the pedicels 1–1.5 cm. long, usually in 3's at the nodes; flowers purple, with pale green standard, the wings dark purple, the keel 5–5.5 cm. long, cartilaginous, acute and white at apex, the remainder pale purple, paler toward base; legumes about 20 cm. long, 3 cm. wide, very shortly pilosulous, angled on each side near the margin, not winged, about 5-seeded.—May. Kyushu (Mageshima near Tanegashima); very rare.—Ryukyus.

29. CANAVALIA Adans. NATA-MAME ZOKU

Twining, rarely erect herbs; leaves pinnately 3-foliolate, the stipules small; flowers rather large, reddish or bluish purple or white, in axillary racemes, the nodes thickened, the bracts small, the bracteoles small and caducous; calyx campanulate, often 2-lipped, the teeth depressed; stamens diadelphous (9 and 1); legumes oblong, flat or rather inflated, 2-valved, dehiscent, ribbed or winged on outer edge.—About 30 species, widespread in the Tropics and subtropics.

1. *Canavalia lineata* (Thunb.) DC. *Dolichos lineatus* Thunb.—HAMA-NATA-MAME. Twining or prostrate perennial herb; stems much elongate, glabrate; leaves long-petiolate; stipules ovate, 4–5 mm. long, herbaceous, deciduous, the scar of stipule thickened and later becoming a gland; leaflets subcoriaceous to rigidly chartaceous, often with scattered appressed hairs, nearly glabrous and yellowish green beneath, the terminal leaflets rounded to broadly obovate, 5–10 cm. long, 5–8 cm. wide; racemes 10- or more-flowered, long-peduncled, the nodes thickened and with a sessile gland at each;

flowers in 2's or 3's, reddish purple, 25–30 mm. long, the bracts and bracteoles ovate, subobtusely, caducous, 2–3 mm. long; calyx about 1 cm. long, the teeth semirounded, the upper 2 larger, slightly connate; legumes puberulous at first, soon glabrous, oblong, rather flat, 5–6 cm. long, about 2.5 cm. wide, with 2 ridges along the outer suture.—July–Sept. Sandy beaches near seashores; Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu; rather common.—Ryukyus, Formosa, and China.

30. PUERARIA DC. KUZU ZOKU

Twining or trailing herbs; leaves pinnately 3-foliolate, the stipules leaflike, sometimes peltate, the leaflets stipellate, entire or 2- or 3-lobed; flowers reddish purple, rarely white, in peduncled, erect, sometimes branched racemes, the bracts caducous, the bracteoles minute, the nodes of the racemes thickened; calyx deeply 5-lobed, the 2 upper lobes more or less connate, the standard usually with a callose spur on each side near the base, about as long as the wings and keel; stamens monadelphous; style bearded; legumes elongate, flat, linear, 2-valved, many-seeded.—More than a dozen species, in the Tropics of Asia.

1. *Pueraria lobata* (Willd.) Ohwi. *Pachyrrhizus thunbergianus* Sieb. & Zucc. nom. superfl.; *Dolichos lobatus* Willd.; *Pueraria thunbergiana* (Sieb. & Zucc.) Benth.; *D. trilobus* Houtt., non L.; *Pueraria triloba* (Houtt.) Makino.—KUZU. Perennial coarse herbs with woody base; stems much elongate, twining or prostrate, whitish puberulent, with coarse spreading or reflexed brown hispid-hairs; stipules lanceolate, subacute, medifixed, 15–20 mm. long, green; leaflets green, loosely appressed-hirsute on upper side, densely whitish pubescent beneath, the terminal lobe rhombic-orbicular, 10–15 cm. long and as wide, abruptly acuminate, some-

times 3-lobed, the lateral lobes often bifid; racemes densely many-flowered, nearly sessile or short-peduncled, 10–20 cm. long; flowers reddish purple, rarely almost white, 18–20 mm. long, the bracts linear, 8–10 mm. long, 0.2–0.3 mm. wide, long-pilose, caducous, the bracteoles caducous, narrowly ovate or broadly lanceolate, acute; lowest calyx-lobe 1.5–2 times as long as the tube; legumes flat, densely dark brown spreading-hispid, linear, 6–8 cm. long, 8–10 mm. wide.—July–Sept. Thickets and thin woods; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Korea and China.

31. GLYCINE L. DAIZU ZOKU

Twining to trailing, rarely erect herbs, usually hairy on stems and leaves; leaves with small stipules, pinnately 3-foliolate, stipellate; flowers small, purplish to white, on short axillary racemes, the bracts and bracteoles subulate, small, free; petals nearly equal in length; legumes flat, 2-valved, dehiscent, slightly inflated over the seeds.—About 10 species, in tropical and warmer regions of Africa, Asia, and Australia.

- 1A. Twining, usually slender, annual vine; bracteoles 1–2 mm. long; flowers 5–8 mm. long; pods 20–25 mm. long, 3–5 mm. wide, dark brown at maturity; seeds of an oblong type, 3–5 mm. long, 2–3.5 mm. wide, dark brown; indigenous. 1. *G. soja*
 1B. Bushy, usually coarse and erect, annual herb; bracteoles 2.5–3.25 mm. long; flowers 6–7 mm. long; pods 25–75 mm. long, 8–15 mm. wide, yellowish brown at maturity; seeds of a globose or ovoid type, 6–11 × 5–8 mm., white to reddish black; cultivated.

2. *G. max*

1. *Glycine soja* Sieb. & Zucc. *G. ussuriensis* Regel & Maack; *G. javanica* Thunb. pro parte, non L.; *G. formosana* Hosokawa.—TSURU-MAME, NO-MAME. Twining annual; stems slender, elongate with retrorsely appressed to ascending brownish hispid hairs; leaves petioled, the stipules broadly lanceolate, slightly nerved, 2–3 mm. long, the leaflets 3, rarely digitately 5–7, entire, narrowly ovate to linear, 3–8 cm. long, 8–25 mm. wide, slightly paler beneath, loosely appressed-pilose, the stipels lanceolate, acuminate, 1.5–2 mm. long, 3-nerved; racemes axillary, few-flowered, sometimes very short; flowers pale purple, 5–8 mm. long; calyx-teeth nearly as long as the tube; legumes flat, linear-oblong, 2–2.5 cm. long, 4–5 mm.

wide, densely pale brown pilose, 2- or 3-seeded.—Aug.–Sept. Thickets in lowlands; Honshu, Shikoku, Kyushu; common.—Korea, China, Manchuria, e. Siberia, and Formosa.

2. *Glycine max* (L.) Merr. *Phaseolus max* L.; *Dolichos soja* L.; *Soja hispida* Moench; *S. japonica* Savi; *S. viridis* Savi; *S. angustifolia* Miq.; *G. hispida* (Moench) Maxim.; *S. max* (L.) Piper; *G. gracilis* Skvortz.—DAIZU. Bushy, generally rather coarse, annual herb; leaves and legumes larger than in the preceding; plant with long spreading hirsute to pilose pale hairs.—A cultigen allegedly derived from *G. soja* now very common in cultivation throughout our area; known as soybean in English speaking countries.

32. GALACTIA P. Br. HAGI-KAZURA ZOKU

Twining or trailing, rarely erect herbs or suffrutescent shrubs; leaves with small deciduous stipules, pinnately 3-foliolate, stipellate; flowers reddish purple or white, in axillary racemes, the bracts minute, setaceous, the bracteoles obsolete or minute; calyx-lobes acuminate, the upper 2 wholly connate, the lateral ones short, the lowest usually longer; standard ovate to orbicular, the wing adherent to the keel, which is nearly as long as the wing or longer, not beaked; stamens diadelphous or the upper one connate to the middle; ovary subsessile; style filiform, the stigma terminal; legumes linear, straight or incurved, flat, 2-valved, dehiscent.—About 50 species, in the warmer parts of the world especially in America.

1. *Galactia tashiroi* Maxim. *Galactia anisopoda* Ohwi.—YONAKUNI-HAGI-KAZURA, YAEYAMA-HAGI-KAZURA. Diffuse, procumbent perennial; stems slender, rather firm, sparsely branched, short spreading whitish pubescent; leaves petioled, the stipules ovate to oblong-ovate, acute, 1–1.5 mm. long, appressed, caducous, the stipels obsolete, the rachis 2–5 mm. long, the leaflets subcoriaceous, broadly obovate or elliptic, 2–2.5 cm. long, 13–30 mm. wide, rounded at both ends or retuse at apex, with slightly recurved margins, grayish pubescent; racemes few-flowered, 2–4 cm. long, loose, slender, spreading-pubescent, the bracts ovate, caducous, the pedicels

1.5–3 mm. long, the bracteoles at the base of the calyx, ovate, acute, about 1 mm. long; calyx 4–5 mm. long, 5-lobed, puberulous, the upper pair wholly connate, the lateral lanceolate, acute; petals 13–15 mm. long, pale reddish purple; legumes flat, short-beaked at apex, 2–3 cm. long, 6–7 mm. wide, appressed-puberulous, 3- to 4-seeded, the seeds ellipsoidal, slightly compressed, about 5 mm. long.—Aug. Sunny gravelly slopes near seashores; Kyushu (Tanegashima); very rare.—Ryukyus. The typical phase has the leaflets glabrous on the upper side.

33. AMPHICARPAEA Eil. YABU-MAME ZOKU

More or less pubescent, twining to trailing herb; leaves pinnately 3-foliolate, stipulate and stipellate; flowers of 2 forms, the chasmogamic reddish purple or white, in short axillary racemes, the cleistogamic borne on filiform creeping branches near the ground, without petals or nearly so, the bracts nerved, similar to the stipules, persistent, the bracteoles absent to minute, subulate; calyx tubular, oblique, the teeth 4 or 5, rather unequal; stamens diadelphous; legumes of the chasmogamic flowers broadly linear or linear-oblong, flat, 2-valved, dehiscent, those of the cleistogamic fleshy, subterranean, obovoid to ellipsoidal, indehiscent, usually with 1 large seed.—About 15 species, tropical and temperate America, Japan, and Himalaya.

1. *Amphicarphaea edgeworthii* Benth. var. *japonica* Oliv. *Falcata japonica* (Oliv.) Komar.; *F. comosa* var. *japonica* (Oliv.) Makino.—YABU-MAME. Slender annual, thinly retrorse-pilose on stems, petioles, and racemes; stems slender, twining; stipules narrowly ovate, rather obtuse, 3–4 mm. long, nerved, persistent, the terminal leaflets ovate or broadly so, 3–6 cm. long, 2.5–4 cm. wide, obtuse to acute, appressed-pilose on upper side, paler or whitish with ascending pubescence beneath, the midrib beneath with spreading hairs; racemes axillary, short-peduncled, several-flowered; flowers pale purple, 15–20 mm. long; calyx with ascending pubescence, the teeth shorter than the tube; legumes flat,

slightly curved, 2.5–3 cm. long, 7–8 mm. wide, glabrous but with appressed hairs on both margins.—Sept.–Nov. Woods and shaded places in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.

Var. *trisperma* (Miq.) Ohwi. *Shuteria trisperma* Miq.; *A. trisperma* (Miq.) Bak. ex Jacks.—USUBA-YABU-MAME. Plant uniformly appressed-pilose, with thinner leaves prominently whitish beneath; terminal leaflets slightly attenuate; flowers deeper purple.—Frequent in Hokkaido and n. Honshu, rare in Kyushu.—The typical phase and other variants occur from Korea, Manchuria, and Ussuri to the Himalayas.

34. INDIGOFERA L. KOMA-TSUNAGI ZOKU

Herbs or shrubs with modified hairs; leaves odd-pinnate, rarely 1- or 3-foliolate, the stipules usually linear, the leaflets entire, often stipellate; flowers reddish purple, sometimes white, in axillary racemes, the bracts minute, the bracteoles absent; calyx small, obliquely toothed; standard broad, the keel laterally gibbous or pouched; stamens 10, monadelphous, the anthers with the connective extended at apex; legumes terete or angular, globose to linear, septate.—About 350 species, chiefly in the Tropics.

- 1A. Flowers about 4 mm. long; racemes 4–10 cm. long. 1. *I. pseudotinctoria*
 1B. Flowers 12–18 mm. long.
 2A. Leaflets narrowly oblong, 2.5–4 cm. long; flowers 15–18 mm. long. 2. *I. decora*
 2B. Leaflets broadly ovate to elliptic, 1.5–2.5 cm. long; flowers 12–15 mm. long. 3. *I. kirilowii*

1. *Indigofera pseudotinctoria* Matsum. KOMA-TSU-NAGI. Appressed-pilose suffrutescent subshrub 30–50 cm. high, with many slender branches; leaves 4–8 cm. long; stipules minute, subulate, deciduous; leaflets oblong, 8–25 mm. long, 5–12 mm. wide, loosely appressed-pilose on both sides, glaucous beneath, the stipules minute; racemes short-peduncled, 4–10 cm. long inclusive of the peduncle, densely many-flowered; flowers about 4 mm. long, pale reddish to nearly white; calyx white-puberulous, about 2 mm. long; legumes narrowly cylindric, straight, slightly pendulous, 25–30 mm. long, 2.5–3 mm. wide, short appressed-pilosulous, the seeds several, ellipsoidal, greenish yellow.—July–Sept. Grassy slopes and riverbanks in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; very common.—centr. China.

2. *Indigofera decora* Lindl. *Hedysarum incarnatum* Willd., nom. superfl.; *I. incarnata* (Willd.) Nakai; *I. incanum* Thunb.—NIWA-FUJI. Subshrub with elongate, tufted, reddish, slender branches; leaves 7–20 cm. long inclusive of the short petiole; stipules linear, caducous; leaflets 9–13, thin, narrowly oblong, 2.5–4 cm. long, 1–1.5 cm. wide, acute,

vivid green and nearly glabrous on upper side, glaucous beneath, the stipules minute; racemes axillary, 10–20 cm. long, many-flowered, on erect peduncles 3–10 cm. long; flowers 15–18 mm. long, reddish purple, rarely white; calyx-teeth deltoid, minutely pilose; legumes cylindric, linear, 3–4 cm. long, glabrous, straight.—May–June. River banks and old stone walls; Honshu, Kyushu; rather common.—centr. China.

3. *Indigofera kirilowii* Maxim. *I. koreana* Ohwi—CHŌSEN-NIWA-FUJI. Small shrub much-branched from the base; branches slender, glabrous; leaves 8–15 cm. long, short-petiolate; leaflets 9–13, thinly herbaceous, broadly ovate to elliptic, 1.5–2.5 cm. long, with scattered appressed medifixed hairs, sometimes nearly glabrous, glaucous beneath, mucronate; stipules and stipels short, subulate, caducous; racemes 5–10 cm. long, densely many-flowered, erect, the peduncles usually shorter than the raceme; flowers rose-colored, 12–15 mm. long, short-pedicelled; standard erect, oblong or elliptic, sometimes paler in color than the other petals, the wing and keels rather acute.—May–June. Kyushu (n. distr.); rare.—Korea, Manchuria, and n. China.

35. WISTERIA Nutt. FUJI ZOKU

Twining woody vines; leaves odd-pinnate, the stipules linear, usually caducous, the leaflets entire, often stipellate; racemes terminal on short shoots, elongate, many-flowered, pendulous; flowers showy, purple or white, on long pedicels, the bracts caducous, the bracteoles absent; calyx campanulate, the lobes unequal, triangular, the upper 2 short, the others longer; standard rounded, with 2 callosities at the base, the keel falcate, the wing auricled at the base; stamens diadelphous; legumes large and elongate, thickened, broadly linear, stiped, 2-valved, dehiscent, the seeds large.—Few species, in e. Asia and N. America.

- 1A. Bracts lanceolate; leaflets 11–19, soon glabrous; racemes to 60 cm. long. 1. *W. floribunda*
 1B. Bracts ovate; leaflets 9–13, pubescent beneath even at maturity; racemes 10–20 cm. long. 2. *W. brachybotrys*

1. *Wisteria floribunda* (Willd.) DC. *Glycine floribunda* Willd.; *Dolichos japonicus* Spreng.; *Kraunhia floribunda* (Willd.) Taub.; *Milletia floribunda* (Willd.) Matsum.—FUJI. Dextrorsely twining woody vine more or less pubescent while young and soon glabrous; leaflets 11–19; racemes flowering from the base; flowers purplish, rather smaller than in the following species, the bracts small.—May–July. Thickets and woods in hills and mountains; Honshu, Shikoku, Kyushu; common. Many cultivars are grown in gardens.

2. *Wisteria brachybotrys* Sieb. & Zucc. *Kraunhia brachybotrys* (Sieb. & Zucc.) Greene; *K. sinensis* var. *brachybotrys* (Sieb. & Zucc.) Makino; *K. floribunda* var. *brachybo-*

trys (Sieb. & Zucc.) Makino—YAMA-FUJI. Sinistrorsely twining woody vine; stipules linear, about 8 mm. long, caducous; leaflets 9–13, narrowly ovate, 4–6 cm. long, 15–30 mm. wide, pubescent on both sides when young, persisting on lower side, the stipels obscure; racemes 10–20 cm. long, the bracts caducous, ovate, acuminate caudate, densely brown-pubescent outside; flowers purple, opening nearly at the same time; ovary villous.—May–July. Mountains and hills; Honshu (w. distr.), Shikoku, Kyushu; rather rare.—Cv. *Alba*. *Kraunhia sinensis* var. *brachybotrys* forma *albiflora* Makino; *W. venusta* Rehd. & Wils.; *W. brachybotrys* var. *alba* W. Mill.—SHIRA-FUJI. Flowers white. Cultivated.

36. MILLETIA Wight & Arn. NATSU-FUJI ZOKU

Twining or trailing shrubs; leaves usually evergreen, odd-pinnate, the stipules small, acicular or subulate, the leaflets entire, stipellate; racemes axillary or in a terminal panicle; flowers greenish white or purple, the bracts and bracteoles usually subulate; calyx broadly campanulate, truncate or with depressed teeth; ovary many-ovuled; legumes broadly linear, slightly compressed, coriaceous, 2-valved, tardily dehiscent.—About 100 species, in tropical Asia.

1. *Milletia japonica* (Sieb. & Zucc.) A. Gray. *Wisteria japonica* Sieb. & Zucc.; *Kraunhia japonica* (Sieb. & Zucc.) Taub.—NATSU-FUJI, DOYŌ-FUJI. Dextrorsely twining deciduous shrub loosely short-pubescent but soon glabrous; stipules subulate, persistent, the leaflets 11–17, ovate to narrowly so, 1.5–4 cm. long, 1–2 cm. wide, gradually narrowed to the obtuse apex, rounded at base, slightly paler beneath,

rather veiny on both surfaces, nearly glabrous, deep green above; racemes axillary, 10–20 cm. long inclusive of the short peduncle, rather densely many-flowered, nodding; flowers greenish white, pedicelled, about 15 mm. long; calyx about 4 mm. long, loosely appressed-puberulous, the teeth depressed-deltoid, the bracts and bracteoles acicular, less than 1 mm. long, persistent; ovary smooth, glabrous; legumes about 10 cm.

long, 8 mm. wide.—July–Aug. Thickets in lowlands; Honshu (centr. distr. and westw.), Shikoku, Kyushu; rather common.—Cv. *Microphylla*. *M. japonica* var. *microphylla*

Makino—HIME-FUJI, MEKURA-FUJI. A non-flowering cultivar, slightly pilose, with rather densely leafy branches and narrower leaflets than in the typical phase.

37. ROBINIA L. HARI-ENJU ZOKU

Shrubs or trees, often spiny; leaves odd-pinnate, the stipules spinelike or subulate, the leaflets entire, often stipellate; racemes axillary, pendulous; flowers showy, white or reddish purple, the bracts membranous, caducous; calyx-teeth short; standard reflexed, scarcely longer than the wing and keel; stamens diadelphous; legumes broadly linear, flat, narrowly winged on upper margin, 2-valved, dehiscent, several-seeded.—About 20 species, in N. and Centr. America.

1. *Robinia pseudoacacia* L. *Pseudacacia odorata* Moench—HARI-ENJU, NISE-AKASHIYA. Slightly pubescent to glabrate usually spiny tree; stipules often spiny, the leaflets 9–19, membranous, oblong, 2–5 cm. long, 1–2.5 cm. wide, rounded at apex, obtuse at base, glaucescent beneath; racemes

pendulous, 10–15 cm. long; flowers showy, white, fragrant, 18–20 mm. long; lowest calyx-teeth lanceolate, the others triangular; legumes glabrous, about 8 cm. long, 12–15 mm. wide.—May–June. Cultivated and sometimes naturalized.—Introduced from the United States.

38. LOTUS L. MIYAKOGUSA ZOKU

Herbs or shrubs; leaves odd-pinnate, the stipules minute or absent, the leaflets 5–7, entire, the upper 3 usually at the top of the rachis, the lower 2 basal and simulating the stipules; flowers yellow or white, sometimes reddish, in axillary umbellike racemes, usually without bracts and bracteoles; calyx 5-toothed; standard ovate to rounded, the keel incurved; stamens diadelphous; ovary sessile, the style glabrous, the ovules many; legumes sessile, usually linear, compressed or somewhat terete, the seeds several.—About 150 species, widespread in the temperate and warmer regions.

1. *Lotus corniculatus* L. var. *japonicus* Regel. *L. japonicus* (Regel) K. Larsen—MIYAKOGUSA. Perennial, glabrous, prostrate herb with slender stems; leaflets obovate, 7–10 mm. long, slightly glaucescent, rounded with a mucro at apex, the lowest pair subacute, the rachis 2–10 mm. long; racemes umbellike, long-peduncled, with a ternate involucre bract smaller than but similar to the leaves; flowers 1–3, short-

pedicelled, about 15 mm. long, yellow; calyx 6–7 mm. long, the lobes linear-lanceolate, longer than the tube.—Apr.–June. Fields and waste grounds; Hokkaido, Honshu, Shikoku, Kyushu; common.—Forma *versicolor* (Makino) Makino. *L. corniculatus* var. *versicolor* Makino—NISHIKI-MIYAKOGUSA. Flowers yellow at first, changing to reddish.—The typical phase occurs in Europe and Asia.

39. ASTRAGALUS L. GENGE ZOKU

Herbs or shrubs; leaves odd-pinnate, stipules often adnate to the base of the petiole, sometimes connate at the back, the leaflets entire, exstipellate; racemes on axillary or sometimes scapellike radical peduncles; flowers purple or yellowish, the bracts frequently small, membranous, the bracteoles minute or absent; calyx short-tubular, the teeth nearly equal; standard narrow, equaling to exceeding the wing and obtuse keel; stamens diadelphous; ovules many; legumes usually membranous, turgid, sometimes apparently 2-locular by intrusion of the suture.—About 1,500 species, in all temperate and cooler regions, except Australia.

1A. Flowers purple, rarely white; legumes apparently 2-locular.

2A. Flowers in umbellike racemes; legumes broadly linear; bracts minute; standard as long as the keel; slender biennial herb of cultivated fields with elongate peduncles longer than the leaves. 1. *A. sinicus*

2B. Flowers in more or less elongate racemes; legumes oblong; bracts prominent; standard longer than the other petals.

3A. Stipules connate on the inner margin; flowers 10–20, 12–15 mm. long; bracts 3–5 mm. long, less than 1 mm. wide, 1-nerved; legumes sessile, not inflated. 2. *A. adsurgens*

3B. Stipules free; flowers 5–10, rather large, 2–2.5 cm. long; bracts 7–10 mm. long, 2.5–3 mm. wide, few-nerved; legumes stipited, much inflated.

4A. Flowers about 2.5 cm. long; standard obovate. 3. *A. yamamotoi*

4B. Flowers about 2 cm. long; standard oblong. 4. *A. japonicus*

1B. Flowers yellow or greenish yellow.

5A. Legumes linear or lanceolate, 2–5 cm. long, 3.5–6 mm. wide, apparently 2-locular; calyx-teeth linear, the lowest about 3 mm. long, about half to nearly as long as the tube.

6A. Leaflets 13–19; racemes 2–3 cm. long; bracts very small, 1–2 mm. long, much shorter than the calyx; legumes broadly linear, erect, 3.5–4.5 cm. long. 5. *A. reflexistipulus*

6B. Leaflets 25–31; racemes very short, very densely flowered, about 1 cm. long; bracts lanceolate, about as long as the calyx; legumes lanceolate, spreading, gradually curved upward, 2–3.5 cm. long. 6. *A. sikokianus*

5B. Legumes elliptic or oblong, usually 1-locular; calyx-teeth short, usually triangular, much shorter than the calyx-tube.

7A. Legumes with a broad groove on back, reniform in cross section, about 13 mm. long, nearly sessile; flowers 12–14 mm. long; leaflets 10–15 mm. long, 4–6 mm. wide. 7. *A. shiroumensis*

7B. Legumes inflated, without a groove on back, oblong or lanceolate in cross section, about 3–5 cm. long, stipitate; flowers 15–20 mm. long; leaflets 15–30 mm. long, 5–20 mm. wide.

8A. Bracts linear, 3–5 mm. long, about 1 mm. wide; leaflets 17–21; legumes much-inflated. 8. *A. shinanensis*

8B. Bracts narrowly oblong, 5–10 mm. long, 2–4 mm. wide; leaflets 9–11; legumes only slightly inflated. 9. *A. secundus*

1. *Astragalus sinicus* L. *A. lotoides* Lam.; *Hedysarum japonicum* Basiner—GENGE, RENGE-SŌ. Biennial, soft, slightly pubescent herb; stems slender, ascending from a procumbent, branched base, 10–25 cm. long; leaves with petioles 2–5 cm. long, the stipules free, ovate, 3–6 mm. long, acute, the leaflets 9–11, thinly membranous, obovate to elliptic, 8–15 mm. long, rounded to emarginate; racemes umbellike, the peduncles 10–20 cm. long; flowers 7–10, about 12 mm. long, reddish purple, rarely white, the pedicels 1–2 mm. long; calyx about 4 mm. long, loosely white-pubescent, the teeth lanceolate, shorter than the tube; legumes erect or ascending in one direction, subsessile, blackish, 2–2.5 cm. long, about 4 mm. wide, glabrous, gradually beaked.—Apr.–June. Very commonly cultivated for green manure in rice-fields, occasionally naturalized in our area.—Formosa and China.

2. *Astragalus adsurgens* Pall. *A. fujiisanensis* Miyabe & Tatew.; *A. laxmannii* subsp. *fujiisanensis* (Miyabe & Tatew.) Kitag.—MURASAKI-MOMENZURU. Stems ascending from a procumbent base, 10–30 cm. long, tufted, the caudex thickened; leaves 5–15 cm. long, short-petioled, the stipules broadly lanceolate, acute, connate on lower half on dorsal margins, the leaflets 17–21, oblong to narrowly so, 7–20 mm. long, 3–8 mm. wide, subobtusate at apex, slightly glaucescent, glabrous on upper side, loosely appressed-pilose beneath; racemes on somewhat longer peduncles, short-cylindric, 3–6 cm. long, densely many-flowered; flowers ascending, purple, rarely white, 12–15 mm. long, rather narrow; calyx 5–6 mm. long, with appressed-white and black pubescence, the teeth linear, about half as long as the tube; standard oblong, longer than the wings and keel; legumes loosely white and black appressed-puberulous, ascending, sessile, oblong, 2-angled, 2-locular, abruptly beaked.—July–Aug. Gravelly or sandy slopes in mountains; Hokkaido (Mount Oohira in Shiribeshi), Honshu (centr. distr. and northw.); rare.—Korea, Manchuria, Mongolia, and e. Siberia.

3. *Astragalus yamamotoi* Miyabe & Tatew. KARIBADŌ. Stems rather stout, erect, thinly white-pubescent, 30–50 cm. long; leaves 8–10 cm. long, short-petioled, the stipules broadly lanceolate, free, obtuse, 6–10 mm. long, thinly membranous, the leaflets 9–13, oblong to narrowly ovate, 2–4 cm. long, 7–15 mm. wide, slightly retuse, slightly paler beneath, glabrescent; racemes 1.5–3 cm. long, 6- or 7-flowered, the bracts membranous; calyx 7–8 mm. long, glabrescent, the teeth elongate-triangular, 1–1.5 mm. long, slightly black-pubescent; standard narrowly obovate, keel nearly as long as the oblong wing, shorter than the standard; legumes ellipsoidal, glabrous, stipitate.—July. Hokkaido (Mount Kariba in Shiribeshi); rare.

4. *Astragalus japonicus* H. Boiss. *A. kurelensis* Matsum.—EZO-MOMENZURU, CHISHIMA-MOMENZURU. Stems rather stout, erect, 25–30 cm. long, thinly puberulous or glabrescent; stipules lanceolate or linear-lanceolate, acute to sub-obtusate, membranous, recurved above, pilose, the leaflets 7–15, oblong or elliptic, 2–3 cm. long, 7–13 mm. wide, retuse to rounded, glabrous above, pubescent beneath; racemes loosely 4- to 6-flowered, on peduncles about 10 cm. long, the bracts puberulous, twice as long as the pedicel; calyx obliquely campanulate, about 6 mm. long, white-pubescent, sparsely mixed with black hairs, the teeth very short; corolla about 2 cm. long, the standard oblong, emarginate, longer than the wing and the much shorter keel; legumes oblong, inflated,

stipitate, glabrous, pendulous, shallowly grooved on the ventral side, about 2 cm. long.—July. Grassy slopes in rocky places; Hokkaido (Mount Shari and Shiratoko Peninsula); very rare.—Kuriles (Etorofu and Uruppu).

5. *Astragalus reflexistipulus* Miq. *A. glycyphyllos* var. *reflexistipulus* (Miq.) Makino—MOMENZURU. Slightly white-pubescent perennial with thick caudex; stems procumbent, elongate, ascending above, 30–50 cm. long; leaves 15–30 cm. long, the petioles 1–2 cm. long, the stipules free, broadly lanceolate, 5–8 mm. long, the leaflets 13–19, thinly membranous, oblong or ovate, 2–5 cm. long, 1–2.5 cm. wide, rounded to obtuse, pale green and short appressed-pubescent beneath, glabrous above; racemes 2–3 cm. long, 8- to 15-flowered on peduncles 3–10 cm. long; flowers about 13 mm. long, the bracts linear, 1–2 mm. long; calyx-teeth linear, the lower nearly as long as the tube; standard narrowly ovate, longer than the wings and keel; legumes subsessile, curved upward and erect, puberulous, gradually attenuate at both ends, many-seeded.—June–Aug. Hokkaido, Honshu.

6. *Astragalus sikokianus* Nakai. NARUTO-ŌGI. Slightly pubescent with whitish medifixed hairs; stems terete, elongate, ascending above; leaves 20–25 cm. long, short-petioled, the stipules free, membranous, lanceolate-triangular, acuminate, 8–10 mm. long, the leaflets membranous, oblong, 15–25 mm. long, 7–10 mm. wide, rounded and retuse, nearly glabrous above; racemes about 1 cm. long, densely 10- to 20-flowered, on peduncles 2–4 cm. long, solitary in upper axils, the bracts lanceolate, nearly as long as the calyx; calyx loosely white-pubescent, the teeth 1/2–2/3 as long as the tube, linear; corolla slender, yellowish white, about 13 mm. long, the keel rather short; legumes somewhat coriaceous, minutely appressed-pilose, abruptly acuminate, rounded and sessile at base, rather coriaceous.—Near seashores; Shikoku (Awa); rare.

7. *Astragalus shiromiensis* Makino. *A. arakawensis* Takeda—SHIROUMA-ŌGI. Stems tufted, ascending from a stout caudex, 15–30 (–50) cm. long, with loose white and blackish brown pubescence; leaves 4–6 cm. long, petioled, the stipules nearly free, narrowly ovate, 3–5 mm. long, obtuse to acute, the leaflets 11–13, narrowly oblong, obtuse to rounded, glabrous on upper side, thinly white-pilose and with dark brown hairs on the midrib beneath; racemes rather densely 5- to 10 (–20)-flowered, on peduncles 5–8 cm. long, exceeding the leaves; flowers short-pedicelled; calyx about 4 mm. long, dark brown pubescent, the teeth short, triangular; legumes minutely appressed-puberulous with dark brown hairs, sometimes glabrescent, subsessile, pendulous.—July–Aug. Grassy and gravelly alpine slopes; central mountains of Honshu; very rare.

8. *Astragalus shinanensis* Ohwi. *A. frigidus* sensu aut. Japon., non A. Gray; *A. membranaceus* var. *obtus* Makino—TAI-TSURI-ŌGI. Stems tufted, erect from a stout caudex, 40–70 cm. long, sparsely branched, sparsely white-pubescent; leaves short-petioled, the stipules broadly lanceolate to linear, 5–10 mm. long, free, the leaflets narrowly ovate or oblong, 15–20 mm. long, 5–8 mm. wide, obtuse, glabrous on upper side, pubescent beneath; racemes 1.5–2.5 cm. long, densely 5- to 10-flowered, on peduncles 4–8 cm. long; flowers yellowish white, about 20 mm. long; calyx tubulose, 8–10 mm. long, brownish pubescent, the teeth short, triangular; legumes semirounded, pendulous, inflated, 3–4 cm. long inclusive of the stipe about 1 cm. long, about 15 mm. wide, with scattered

minute, appressed hairs.—Hokkaido (lowlands and high mountains), Honshu (high mountains of the centr. distr.); rare.

9. *Astragalus secundus* DC. *Phaca parviflora* Turcz.; *P. frigida* var. *parviflora* (Turcz.) Ledeb.; *A. frigidus* subsp. *parviflorus* (Turcz.) Hult.—RISHIRI-GEI. Slightly white-pubescent perennial; stems 20–30 cm. long, erect, simple; leaves 6–10 cm. long, on petioles to 2 cm. long, the stipules 10–20 mm. long, obtuse, membranous, green, the leaflets

rather thin, 7–11, oblong to narrowly ovate, obtuse, 2–3 cm. long, 1–1.5 cm. wide, obtuse, glabrous on upper side; racemes densely 5- to 10-flowered, 1–2 cm. long, on peduncles 5–10 cm. long; flowers about 15 mm. long, pale yellow; calyx about 7 mm. long, tubulose, brownish pubescent especially on upper side, the teeth very short, triangular; legumes oblong, puberulent, slightly inflated.—July–Aug. Grassy alpine slopes; Hokkaido, Honshu (centr. distr.); rare.—Kuriles, Kamchatka, and e. Siberia.

40. OXYTROPIS DC. OYAMA-NO-ENDŌ ZOKU

Dwarf shrubs or small tufted usually acaulescent herbs; leaves odd-pinnate, the stipules adnate to the base of the petiole or free, the stipels none; racemes elongate or sometimes umbellike, on an axillary, usually radical scape or peduncle; flowers reddish purple, purple, or yellowish white, the bracts membranous, small or minute, the bracteoles absent; calyx tubulose, the teeth rather equal; standard erect or spreading, the keel pointed at apex, longer or shorter than the wing; ovary sessile or stipitate, many-ovuled; legumes rather inflated, sometimes with an intruding suture.—About 250 species, in temperate to frigid regions of the N. Hemisphere, especially abundant in Siberia, China, and centr. Asia.

1A. Racemes 1- to 3-(-4)-flowered; stipules rounded to obtuse at apex.

2A. Legumes distinctly stiped; leaflets loosely pubescent. 1. *O. kudoana*

2B. Legumes nearly sessile.

3A. Appressed white-pubescent. 2. *O. japonica*

3B. Ascending to spreading white-villous. 3. *O. yezoensis*

1B. Racemes 5- to 15-flowered; stipules usually acuminate to acute at apex.

4A. Flowers purple, rarely white.

5A. Appressed-pubescent; standard entire at apex. 4. *O. megalantha*

5B. Ascending- to spreading-pubescent; standard more or less retuse at apex.

6A. Leaflets 11–17. 5. *O. hidakamontana*

6B. Leaflets 19–25. 6. *O. shokanbetsuensis*

4B. Flowers pale yellow or slightly greenish. 7. *O. rishiriensis*

1. *Oxytropis kudoana* Miyabe & Tatew. HIDAKA-GENGE. Acaulescent with appressed white-pubescent on petioles and lower part of peduncles; stipules softly scarious, rusty brown, 1- or 2-nerved, elliptic, rounded at apex, glabrescent, ciliate, the leaflets 9–15, obtuse, about 1 cm. long, 2–3 mm. wide; peduncles blackish pubescent on upper part, 2-flowered, the bracts narrowly ovate; flowers bluish purple; calyx blackish pubescent, the teeth lanceolate, about 3 mm. long, the tube about 6 mm. long; ovary with white hairs on the sides and black hairs on the ventral margin; legumes about 3 cm. long, about 1 cm. across, with a short included stipe.—July. Alpine regions; Hokkaido (Hidaka mountain range); rare.

2. *Oxytropis japonica* Maxim. OYAMA-NO-ENDŌ. Short-creeping, branched, dwarf suffrutescent subshrub; stems about 10 cm. long, densely covered at base with old scarious leaves; leaves mostly radical, petioled, 3–8 cm. long, the stipules about 5 mm. long, narrowly ovate, obtuse, loosely pubescent, 1-nerved, connate below on ventral margins, adnate on the lower half to the base of the petiole, the leaflets 9–15, broadly lanceolate or narrowly ovate, 5–10 mm. long, 2–4 mm. wide, nearly acute, with slightly involute margins, appressed-pubescent on both sides; peduncles or scapes 1–5 cm. long, with dense ascending white hairs; flowers 1 or 2 (3), purple, 17–20 mm. long, the pedicels short, the bracts broadly lanceolate, membranous, 2–3 mm. long; calyx 10–12 mm. long, the teeth 3–4 mm. long, linear; legumes broadly lanceolate, 3–3.5 cm. long, 7–10 mm. wide, beaked at apex, loosely brownish short-pubescent.—July–Aug. Sandy or gravelly alpine slopes; Honshu (centr. distr.).

3. *Oxytropis yezoensis* Nakai. *O. japonica* var. *sericea* Koidz.—EZO-OYAMA-NO-ENDŌ. Closely allied to the preced-

ing, differing in the ascending to spreading white-woolly pubescence on leaves and peduncles.—July–Aug. Sandy or gravelly alpine slopes; Hokkaido.

4. *Oxytropis megalantha* H. Boiss. REBUN-SŌ. Tufted perennial suffrutescent subshrub, with long dense ascending, white or grayish hairs; stems tufted, thick, short, ascending to short-creeping, from a stout often branched caudex; leaves radical, 5–8 cm. long, the stipules 15–20 mm. long, pubescent on the outside, the leaflets 8 to 11 pairs, rather thick, narrowly ovate-oblong to broadly ovate-lanceolate, 2–3 cm. long, 5–8 mm. wide, acute, with involute margins, less densely pubescent on upper side; peduncles or scapes about 20 cm. long, erect, about 7-flowered; flowers bluish purple, about 20 mm. long; calyx-tube about half as long as the corolla, with long white silky pubescence outside.—Hokkaido (Rebun Isl.); rare.

5. *Oxytropis hidakamontana* Miyabe & Tatew. HIDAKA-MIYAMA-NO-ENDŌ. Acaulescent, with spreading, long white pubescence on the petioles and peduncles; stipules 1-nerved, lanceolate, acuminate to very acute, pubescent on the outside, the leaflets 11–17, oblong, 8–12 mm. long, 2–4 mm. wide, acute to subobtusely, densely pubescent on upper side, glabrescent beneath; racemes about 5-flowered, the bracts linear; flowers bluish purple; calyx with white and blackish hairs, the teeth lanceolate or linear-lanceolate, about 3 mm. long, the tube about 12 mm. long; ovary subsessile, appressed white-pubescent.—July. Hokkaido (Hidaka mountain range); rare.

6. *Oxytropis shokanbetsuensis* Miyabe & Tatew. MASHIKE-GENGE. Tufted, dwarf suffrutescent subshrub with scattered ascending white hairs; stems 10–15 cm. long, branched,

short-creeping on the ground; leaves petioled, 6–10 cm. long, the stipules 12–15 mm. long, lanceolate, loosely white-pubescent, 1-nerved, connate on the front at base, adnate to the base of the petiole on lower half on dorsal side, the leaflets 19–26, broadly lanceolate to narrowly ovate, 10–15 mm. long, 2.5–4 mm. wide, acute, with slightly involute margins, glabrous on upper side, appressed-pubescent beneath; peduncles or scapes 5–10 cm. long, about 5-flowered, nearly umbellate, the bracts broadly linear, about 10 mm. long, 1–1.5 mm. wide, the pedicels short; flowers 2–2.3 cm. long, reddish purple; calyx about 12 mm. long, with white and brown hairs, the teeth short, 1.5–2 mm. long; standard distinctly longer than the other

petals, truncately bifid at apex.—Hokkaido (Mount Shokanbetsu in Teshio); rare.

7. *Oxytropis rishiriensis* Matsum. *O. campestris* sensu auct. Japon., non DC.—RISHIRI-GENGE. Short-creeping, lanate, suffrutescent subshrub; stems 10–15 cm. long; leaflets oblong, acute, the stipules adnate to the base of the petioles, ovate, acuminate, 1-nerved, pubescent; racemes rather many-flowered, the bracts lanceolate, much longer than the pedicel; flowers about 2 cm. long; calyx tubulose with short teeth; legumes sessile, acute, nearly glabrous, ascending.—Aug. Hokkaido (Mount Rishiri and Mount Yubari); rare.

41. TRIFOLIUM L. SHAJIKU-SŌ ZOKU

Annual or perennial herbs; leaves digitately 3- to 7-foliolate, the stipules adnate to the petiole, the leaflets dentate; flowers red, purplish, white, rarely yellow, in axillary peduncled umbels, racemes, or heads, the bracts small or absent, sometimes forming a toothed involucre; calyx-teeth subequal; petals persistent, the wing longer than the keel, the claw adnate to the staminal tube, the keel exposing the stamens; stamens diadelphous; legumes small, oblong, terete, cylindric or obovate and flat, small, usually membranous, indehiscent, few-seeded.—About 300 species, in temperate regions of the N. Hemisphere, few in the S. Hemisphere.

- 1A. Flowers nearly sessile, bractless, 10–12 mm. long, reddish or rarely white; erect or ascending herb with yellowish spreading hairs, 3-foliolate leaves and sessile terminal heads. 1. *T. pratense*
 1B. Flowers more or less distinctly pedicelled, with small bracts, white or reddish; heads peduncled.
 2A. Leaflets 4–7, rarely 3; petioles adnate to the stipules throughout their length; flowers deep red, rarely white, 15–18 mm. long; calyx 10 mm. long; stems erect or ascending from a thick caudex. 2. *T. lupinaster*
 2B. Leaflets 3; petioles adnate to the stipules only on the lower part; flowers 7–8 mm. long; calyx 3–3.5 mm. long.
 3A. Stems erect or ascending; petioles very unequal in length, the lower ones to 30 cm., the upper 1 to 2 cm. long; flowers reddish, rarely white. 3. *T. hybridum*
 3B. Stems long-creeping; petioles all elongate, nearly equal in length, usually 8–20 cm. long; flowers usually white. 4. *T. repens*

1. *Trifolium pratense* L. MURASAKI-TSUME-KUSA, AKATSUME-KUSA. More or less pubescent herb; stems branched, 30–60 cm. long; stipules membranous, appressed, caudate with a long setaceous tip, green, the leaflets ovate, elliptic, or oblong, 3–5 cm. long, often with a lunate band; heads rather large, globose to ovoid, subtended by a pair of leaves with much-dilated stipules at base; calyx-teeth subulate, unequal, not exceeding the corolla.—May–June. Naturalized in our area.—Europe and N. Africa.

2. *Trifolium lupinaster* L. SHAJIKU-SŌ. Perennial herb with a thickened caudex; stems firm, tufted, erect or ascending, 20–40 cm. long, usually simple, more or less soft-pubescent, several-leaved; petioles short, the stipules membranous, pale, acuminate; leaflets equal, oblanceolate, rarely narrowly obovate, 2–4 cm. long, 5–10 mm. wide; heads in upper axils, 10- to 20-flowered, the peduncles pubescent, 0.5–3 cm. long; flowers deep red; calyx-lobes subulate, the lowest longer.—June–Sept. Grassy slopes and rocky cliffs on volcanoes and near seashores; Hokkaido, Honshu (centr. distr. and northw.).—c. Europe to Asia.

3. *Trifolium hybridum* L. TACHI-ORANDA-GENGE. Nearly glabrous perennial; stems 30–50 cm. long, often branched, flexuous; stipules oblong, acuminate; leaflets ovate, 2–3.5 cm. long, 15–23 mm. wide, the petioles elongate; heads long-peduncled, axillary, globose, many-flowered; flowers pale reddish or white; calyx white, campanulate, the teeth subulate, nearly equal, green; legumes 2-seeded.—May–July. Naturalized in our area.—Europe, N. Africa, and w. Asia.

4. *Trifolium repens* L. SHIRO-TSUME-KUSA, ORANDA-GENGE. Glabrescent perennial with long-creeping entwined and matted branches; leaves radical, long-petioled, the stipules lanceolate, acuminate, membranous, greenish, the leaflets 3, obovate to obovate-orbicular, 15–25 mm. long, 10–25 mm. wide, emarginate and rounded at apex, green with a white band below the middle; peduncles or scapes longer than the leaves; heads many-flowered, globose, the pedicels recurved in fruit; flowers white with a greenish hue, sometimes reddish; legumes 4- to 6-seeded.—Apr.–July. Naturalized and very common in our area.—Europe, n. Africa, and w. Asia.

42. MEDICAGO L. UMAGOYASHI ZOKU

Herbs; leaves pinnately 3-foliolate, with lateral nerves ending in the teeth, the stipules adnate to the petiole; flowers small, yellow or violet, the bracts small or absent; calyx-teeth 5, nearly equal; keel obtuse, shorter than the wings, spreading and free from the stamens, exposing the anthers; anthers of 1 form; style subulate, glabrous, the stigma nearly capitate; legumes spirally coiled, curved or rarely falcate, often spiny, 1- to several-seeded.—About 50 species, in Europe, n. Africa, and w. Asia.

- 1A. Perennial herb; flowers violet, about 7 mm. long; legumes soft-pubescent, smooth. 1. *M. sativa*
 1B. Annuals or biennials; flowers yellowish, about 3 mm. long.
 2A. Legumes smooth, not spiny, about 2.5 mm. long, 1-seeded; flowers rather many. 2. *M. lupulina*
 2B. Legumes spiny, several-seeded; flowers few.
 3A. Glabrescent; stipules with laciniate margins, stems glabrous. 3. *M. hispida*
 3B. Pubescent; stipules entire or with few teeth; stems pubescent. 4. *M. minima*

1. *Medicago sativa* L. MURASAKI-UMAGOYASHI. Perennial slightly pubescent herb; stems erect, branched, 50-90 cm. long; stipules linear, dilated at base, nearly entire; leaflets elliptic to narrowly obovate, 2-3 cm. long, 6-10 mm. wide, cuneate at base, denticulate; racemes short and dense, axillary, peduncled, the bracts subulate; flowers violet; calyx 5-6 mm. long, the lobes linear, slightly longer than the tube; legumes 2- or 3-times coiled, 4-5 mm. across, slightly pilose, several-seeded.—Of e. Mediterranean origin, naturalized in our area.

2. *Medicago lupulina* L. KOMETSUBU-UMAGOYASHI. Short-pubescent annual or biennial 30-60 cm. high, with a branched procumbent base; stipules semioval, somewhat toothed, the leaflets broadly obovate, 7-17 mm. long, 6-15 mm. wide, denticulate on the upper half; heads ovoid, on peduncles longer than the petioles, the bracteoles minute and subulate, the pedicels very short; calyx 1.5 mm. long; legumes semicircular, smooth, nerved, black when mature.—European introduction, naturalized in our area.

3. *Medicago hispida* Gaertn. *M. denticulata* Willd.—UMAGOYASHI. Nearly glabrous annual, with procumbent stems; stipules laciniate, the leaflets broadly obovate, 1-2 cm. long, 7-15 mm. wide, retuse to rounded, cuneate at base, denticulate on upper half; heads rather few-flowered, axillary, the bracts minute, linear; calyx about 2 mm. long, the teeth subulate, incurved; legumes 2- to 3-times spirally coiled, 5-6 mm. across, nerved, with hooked spines on margins.—Widely naturalized in our area.—Europe and n. Africa.

4. *Medicago minima* (L.) L. *M. polymorpha* var. *minima* L.—KO-UMAGOYASHI. Pubescent annual 10-20 cm. high, with firm, prostrate stems; stipules semioval, entire or slightly toothed; leaflets obovate-cuneate, 7-10 mm. long, rounded at apex, denticulate on upper half; heads 2- to 5-flowered; calyx 2-2.5 mm. long; legumes 4- to 5-times spirally coiled, about 4 mm. across, spiny on the nerves and on margins.—Naturalized in our area.—Europe, Near East, and n. Africa.

43. MELILOTUS Juss. SHINAGAWA-HAGI ZOKU

Annual or biennial herbs; leaves pinnately 3-foliate, the stipules adnate to the petioles, subulate, the lateral nerves of the leaflets ending in the teeth; flowers small, yellow to white, rarely purple, in axillary racemes, the bracts small, the bracteoles absent; calyx-teeth nearly equal; petals deciduous, the standard usually longer than the keel and wings, the keel shorter than the wings, obtuse, not adnate to the stamens; stamens diadelphous; legumes short, ovate to nearly globose, few-seeded.—About 20 species, in warmer and temperate regions of Eurasia.

1. *Melilotus suaveolens* Ledeb. SHINAGAWA-HAGI. Short-pubescent or nearly glabrous annual or biennial; stems erect, 50-90 cm. long, branched above; leaflets narrowly elliptic to broadly lanceolate, 1.5-3 cm. long, obtuse at apex, cuneate at base, toothed, glabrous; racemes axillary, 3-5 cm. long, rather densely flowered, elongate after anthesis, the peduncles 2-4 cm. long, the bracts linear-subulate, about 1 mm. long, slightly longer than the pedicels; flowers pale yellow, 3-4

mm. long; calyx thinly puberulent, 1.5 mm. long, teeth subulate; standard slightly longer than the wings and keel; legumes elliptic, about 3 mm. long, nearly smooth.—Waste ground and fields in lowlands; Honshu, Shikoku, Kyushu; rather common.—Korea, China, Indochina, and Siberia.

Melilotus indica (L.) All. KO-SHINAGAWA-HAGI. Flowers smaller, about 2 mm. long, with triangular-lanceolate calyx-teeth.—Naturalized in our area.

44. CROTALARIA L. TANUKI-MAME ZOKU

Herbs or shrubs; leaves simple or digitately 3(-7) foliolate, stipules free; flowers purplish or yellow, in terminal racemes or rarely solitary, rather large; calyx 5-lobed; standard large, the keel beaked; stamens monadelphous, the anthers of 2 forms, the larger basifixed ones alternate with the smaller versatile ones; legumes ellipsoidal, inflated, many-seeded.—About 350 species, in tropical and warmer regions.

1. *Crotalaria sessiliflora* L. *C. eriantha* Sieb. & Zucc.—TANUKI-MAME. Erect annual, usually branched, long-appressed brown-villous except on upper side of leaves; stems 20-70 cm. long, terete; leaves 1-foliate, nearly sessile, broadly linear to lanceolate, 4-10 cm. long, 3-10 mm. wide, acute to obtuse, the stipules linear, 3-5 mm. long; flowers blue, in terminal spikes, the bracts linear, 5-8 mm. long; calyx rusty-brown villous, accrescent after anthesis, ovoid, 10-15 mm. long; petals about 10 mm. long, slightly shorter than the calyx,

the standard rounded-obovate, clawed, the limb with deeper colored striations on lower half near the middle, the wing horizontal, the keel white with a blue beak, convex on back below the middle, brownish villous on margin, 7-8 mm. long; style straight, with short, appressed hairs on one side; legumes enclosed in the calyx, oblong, 10-12 mm. long, glabrous, dehiscent.—July-Sept. Grassy places in lowlands; Honshu, Shikoku, Kyushu.—Korea, Manchuria, China, Ryukyus, Formosa to Malaysia, and India.

Fam. 106. GERANIACEAE FŪRO-SŌ KA Geranium Family

Mostly herbs, sometimes shrubs; leaves alternate or opposite, stipulate, dentate or lobed, rarely entire; peduncles axillary, 1- to many-flowered; flowers rather large, bisexual, actinomorphic or more or less zygomorphic; calyx usually persistent, of 4 or 5 usually imbricated sepals; petals 4 or 5, usually imbricate; stamens 2 or 3 times as many as the sepals, the anthers versatile, 2-locular; carpels adnate to the axis, with a long beak at apex; ovules solitary or sometimes 2 in each locule, pendulous; fruit 3- to 5-lobed, each lobe with 1 or 2 seeds, dehiscing suddenly and spirally coiled.—About 11 genera, with about 650 species, chiefly in temperate regions.

1. GERANIUM L. FŪRO-SŌ ZOKU

Herbs with palmately or ternately divided or lobed leaves; peduncles axillary, 1- or 2-flowered; flowers actinomorphic, 5-merous; sepals and petals 5, the glands 5, alternate with the petals; stamens 10, perfect; ovary 5-lobed, the ovules 2 in each locule; seeds solitary in each carpel, the endosperm scanty or absent.—About 250 species, in the temperate regions and in high mountains of the Tropics.

- 1A. Flowers 2–3 cm. across; free portion of the styles 3–6 mm. long.
 2A. Column of the style distinctly longer than the free portion.
 3A. Stems, petioles, and pedicels with long spreading hairs; leaves rather shallowly lobed. 1. *G. eriostemon* var. *reini*
 3B. Stems, petioles, and pedicels with recurved hairs; leaves finely and deeply lobed. 2. *G. erianthum*
 2B. Column of style short, nearly as long as to $\frac{1}{2}$ as long as the free portion.
 4A. Pedicels erect in fruit. 3. *G. soboliferum*
 4B. Pedicels reflexed to spreading in fruit.
 5A. Stipules rather leaflike, small; petals usually pale rose with deeper colored striations.
 6A. Free portion of the styles 5–6 mm. long. 4. *G. krameri*
 6B. Free portion of the styles about 3 mm. long. 5. *G. yoshinoi*
 5B. Stipules rather broad, usually connate; petals rose-purple, rarely white, without deeper colored striations.
 7A. Petals white-pilose at base, on nerves above, and on margins; stipules connate or free; leaves deeply lobed, often with retrorse, appressed short hairs on stems and petioles. 6. *G. yessoense*
 7B. Petals white-pilose only on margin near base; stipules usually connate, broad; leaves less finely lobed, often spreading-hirsute or pilose on stems and petioles. 7. *G. shikokianum*
 1B. Flowers about 1.5 cm. across or less; free portion of styles 1–3 mm. long.
 8A. Perennials.
 9A. Thickened root solitary; flowers usually solitary, pedunculate. 8. *G. sibiricum* var. *glabrius*
 9B. Thickened roots few; flowers usually 2 on each peduncle.
 10A. Leaves deeply lobed.
 11A. Leaves deeply 5-lobed, the lobes obovate, obtuse. 9. *G. thunbergii*
 11B. Leaves deeply 3-lobed except the lower ones, the lobes ovate, acute. 10. *G. wilfordii*
 10B. Leaves 3-parted. 11. *G. tripartitum*
 8B. Annual or biennial; leaves 3- or 5-parted, finely lobed. 12. *G. robertianum*

1. *Geranium eriostemon* Fisch. var. *reini* (Fr. & Sav.)

Maxim. *G. reinii* Fr. & Sav.; *G. japonicum* Fr. & Sav.—GUNNAI-FŪRO. Rhizomes short, thick, with thickened roots; stems erect, 30–50 cm. long, with spreading somewhat reflexed hairs; radical and lower cauline leaves long-petiolate, 8–12 cm. across, deeply cordate at base, deeply 5- to 7-lobed, the lobes rhombic-obovate, acute, irregularly incised and loosely serrate; stipules free or connate, brown, membranous; flowers terminal, the pedicels erect, with long, spreading, gland-tipped hairs; sepals oblong, with spreading hairs; petals rose-purple, 12–15 mm. long; filaments long-hairy on lower half; free portion of styles 3–4 mm. long.—June–Aug. Mountains; Hokkaido, Honshu (centr. and northw.); rather rare.—Forma *onoiei* (Fr. & Sav.) Hara. *G. onoiei* Fr. & Sav.; *G. eriostemon* var. *onoiei* (Fr. & Sav.) Nakai—TAKANE-GUNNAI-FŪRO. Stems lower; flowers deeper colored; leaves pilose chiefly on nerves beneath.—Alpine.

The typical phase occurs in Korea, China, and e. Siberia.

2. *Geranium erianthum* DC. *G. subumbelliforme* R. Knuth—CHISHIMA-FŪRO. Perennial with thick, short rhizomes; stems erect, 30–40 cm. long, retrorsely short-pubescent; radical and lower cauline leaves depressed-orbicular, deeply 5-lobed nearly to the base, 6–10 cm. wide, deeply cordate, pubescent on both sides, the lobes narrowly rhombic-obovate, acute to acuminate, irregularly incised and coarsely toothed; flowers rather numerous, terminal, 2.5–3 cm. across, bluish purple, on short pedicels; sepals densely pubescent with long spreading, glandular hairs; filaments loosely long-pilose.—July–Aug. Grassy slopes near seashores; Hokkaido, Honshu (n. distr. and alpine region of Mount Hayachine in Rikichu).—e. Siberia, Sakhalin, Kuriles, Alaska, and N. America.

3. *Geranium soboliferum* Komar. *G. hakusanense* Matsum.; *G. soboliferum* var. *hakusanense* (Matsum.) Makino

—ASAMA-FŪRO. Stems 60–80 cm. long, retrorsely short-pilose; radical and lower cauline leaves long-petiolate, 7–10 cm. wide, 5- to 7-parted nearly to the base, the lobes rhombic or rhombic-cuneate, deeply lobed on upper half, acute, appressed-pilose above and on the nerves and nervules on under side; flowers rose-purple, about 3 cm. across, the pedicels retrorsely appressed-pilose; petals loosely white-pilose near base; free portion of styles about 6 mm. long.—Aug.–Sept. Grassy slopes in mountains; Honshu (centr. distr.); rare.—Korea and Manchuria.

Var. *kiusianum* (Koidz.) Hara. *G. kiusianum* Koidz.—TSUKUSHI-FŪRO. Leaves short-pilose beneath.—Wet places in mountains; Kyushu.

4. *Geranium krameri* Fr. & Sav. *G. sieboldii* Maxim.; *G. japonicum* sensu auct. Japon., non Fr. & Sav.—TACHI-FŪRO. Stems 60–80 cm. long, often decumbent at base, with retrorsely spreading hairs; leaves 7–10 cm. wide, rounded-cordate, deeply 5-parted, the lobes rhombic, bifid or 3-fid, incised and coarsely serrate, subacute, pilose especially on the nerves beneath, the stipules free, rather leaflike, narrow; peduncles 2-flowered, retrorsely spreading-hairy; flowers 2.5–3 cm. across, rose; petals with deeper colored striations, densely pilose at base; free portion of styles 5–6 mm. long.—Aug.–Sept. Honshu, Kyushu.—Korea, Manchuria, and Amur.—Forma *adpressipilosum* (Hara) Hara. *G. japonicum* var. *adpressipilosum* Hara—FUSHIGE-TACHI-FŪRO. Stems and petioles with retrorsely appressed hairs.—Honshu (centr. distr.), Kyushu.

5. *Geranium yoshinoi* Makino. BITCHŪ-FŪRO. Stems 40–70 cm. long, retrorsely appressed-pilose; radical leaves long-petiolate, the lower cauline 5-angled, rounded, depressed-cordate, 5–8 cm. wide, 5-parted to below the middle, the lobes rhombic-cuneate, 3-fid, with 2 or 3 coarse teeth, acute to sub-

obtuse, appressed short-pilose above and on nerves beneath; stipules usually connate, small, rather leaflike; peduncles and pedicels retrorsely appressed short-pilose; flowers about 2 cm. across, rose; petals with deeper colored striations; loosely long-hairy near base on upper side; free portion of style 3–3.5 mm. long.—Honshu (Chûgoku Distr.).

6. *Geranium dahuricum* Fr. & Sav. *G. dahuricum* sensu auct. Japon., non DC.—Ezo-Fûro. Rhizomes short, with thickened roots; stems 30–80 cm. long, from a decumbent base, retrorsely pilose; lower cauline leaves petiolate, 5-angled, orbicular, somewhat depressed, cordate at base, 5–10 cm. wide, deeply 5-parted nearly to the base, the lobes rhombic-obovate, 3-fid again and with a few deep incisions, obtuse to subacute, spreading-pilose; stipules free or connate, brown, membranous; flowers rose-purple, 2.5–3 cm. across; sepals with long spreading hairs; petals densely white hairy near base inside; free portion of style about 5 mm. long.—July–Aug. Hokkaido, Honshu (Mount Ibuki in Oomi, and eastw.); rather variable.

Var. *nipponicum* Nakai. HAKUSAN-FÛRO, AKANUMA-FÛRO. Less pubescent with shorter, appressed hairs on stems and petioles; sepals usually without long hairs.—Rather common in high mountains of Honshu (centr. and n. distr.).

Var. *pseudopalustre* Nakai. *G. miyabei* Nakai—HAMA-FÛRO. Similar to the preceding variety but the leaves shallowly incised, the lobes broader; sepals often sparsely long spreading-hairy.—Near seashores of Hokkaido and n. distr. of Honshu.—Kuriles.

7. *Geranium shikokianum* Matsum. IYO-FÛRO, SHIKOKU-FÛRO. Stems 30–70 cm. long, coarsely pilose with recurved spreading hairs; lower cauline leaves petiolate, 5-angled, rounded, slightly depressed, 5–10 cm. wide, deeply 5-lobed to below the middle, the lobes rhombic-obovate, irregularly incised, subacute to acute, appressed short-pilose on upper side, with spreading hairs beneath especially on nerves; stipules broad, connate, scarious, brown; flowers rose-purple, 2.5–3 cm. across, the pedicels with short retrorsely curved hairs on upper part; sepals loosely long-pilose; free portion of styles 5–6 mm. long.—July–Sept. Honshu (Suruga Prov. and Chûgoku Distr.), Shikoku, Kyushu; rather variable.

Var. *kaimontanum* (Honda) Honda & Hara. *G. kaimontanum* Honda—KAI-FÛRO. Less pubescent; lobes of leaves acute; sepals without long hairs.—Honshu (Kai Prov.).

Var. *yamatense* Hara. YAMATO-FÛRO. Leaves deeply lobed and incised.—Mountains; Honshu (Yamato Prov.).

Var. *yoshiianum* (Koidz.) Hara. *G. yoshiianum* Koidz. YAKUSHIMA-FÛRO. Dwarf phase, 15–30 cm. high; leaves more densely pilose, 1–3 cm. across; pedicels nearly glabrous; flowers 2–2.5 cm. across.—High mountains of Yakushima in Kyushu.

8. *Geranium sibiricum* L. var. *glaberrimum* (Hara) Ohwi. *G. sibiricum* forma *glaberrimum* Hara—ICHIGE-FÛRO. Stems prostrate or long-decumbent, ascending, 30–80 cm. long, with scattered, retrorse, appressed hairs; cauline leaves rather thin, petiolate, 5-angled, orbicular, 4–7 cm. wide, cordate at base, 5-lobed to below the middle, the lobes narrowly rhombic, acute, 3-fid, irregularly incised and few-toothed, appressed-pilose on upper side, ascending-pilose beneath especially on nerves; stipules free, narrow; flowers solitary, rarely paired, pale rose to white, about 8 mm. across; sepals short-pilose; free portion of styles about 1 mm. long.—July–Sept. Grassy

places in lowlands; Hokkaido, Honshu (n. distr.).—A variable plant occurring widely in Korea, China, Sakhalin, Kuriles, and Siberia.

9. *Geranium thunbergii* Sieb. & Zucc. *G. nepalense* var. *thunbergii* (Sieb. & Zucc.) Kudo—GEN-NO-SHÔKO, FÛRO-SÔ. Decumbent or prostrate at base, then ascending to erect, 30–50 cm. high, softly pubescent; leaves petiolate, depressed-orbicular, 3- to 5-lobed to below the middle, the lobes obovate, obtuse, shallowly 3-fid, irregularly few-toothed, appressed-pilose above, with curved ascending hairs on nerves beneath, the stipules free, narrow; flowers in pairs, 1–1.2 cm. across, pale rose or rose-purple, short-pubescent, with long spreading glandular hairs on sepals and pedicels; free portion of styles about 2 mm. long.—July–Oct. Grassy places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Kuriles, Ryukyus, Formosa, Korea, and China.

10. *Geranium wilfordii* Maxim. *G. iinumae* Nakai; *G. krameri* var. *iinumae* (Nakai) Nakai; *G. iinumae* var. *asiaticum* Koidz.—MITSUBA-FÛRO, FUSHIDAKA-FÛRO. Stems 40–80 cm. long, decumbent, with short, retrorsely appressed hairs; cauline leaves petiolate, 3- to 5-lobed to below the middle, shallowly cordate, 5–8 cm. wide, the lobes nearly rhombic, acute to acuminate, irregularly incised, appressed-pilose on the upper side and on the nerves beneath; stipules free, narrow; flowers in pairs, 1–1.5 cm. across; sepals short-pilose; petals pale rose with deeper colored nerves; free portion of styles about 3 mm. long.—July–Oct. Lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu.—Korea.

Var. *hastatum* (Nakai) Hara. *G. hastatum* Nakai, non Andr.—HOKAGATA-FÛRO. Lobes of upper leaves narrower, ovate-lanceolate to narrowly ovate, gradually narrowed at tip, with nearly equal teeth, the lateral lobes spreading; sepals loosely long-pilose.—Near Nikko in Honshu.—Korea, Manchuria, Amur, and China.

Var. *yezoense* Hiyama. EZO-MITSUBA-FÛRO. Leaves with appressed short pilose hairs beneath.—Hokkaido.

11. *Geranium tripartitum* R. Knuth. *G. robertianum* var. *glabrum* Fr. & Sav.; *G. wilfordii* Maxim., pro parte—KO-FÛRO. Stems 30–50 cm. long, decumbent, loosely and retrorsely pilose; leaves petiolate, 3-sected, loosely pilose on upper side and on nerves beneath, the segments 2–4 cm. long, rhombic-ovate, obtuse to subacute, the lateral segments obliquely ovate, often 2-fid, coarsely few-toothed, the petioles with retrorsely appressed and recurved short hairs, the stipules free and narrow; flowers in pairs, pale rose, 1.2–1.5 cm. across, the pedicels retrorsely short-pilose; sepals loosely long-pilose; free portion of styles about 1.5 mm. long.—Aug.–Sept. Honshu, Shikoku, Kyushu.—Korea (Quelpaert Isl.).

12. *Geranium robertianum* L. HIME-FÛRO, SHIO-YAKI-FÛRO. Rather soft, erect annual with spreading long soft hairs, becoming glandular in the upper ones; stem-leaves petiolate, 5-angled, 3(–5)-sected, soft, 3–6 cm. wide, the median segments broadly ovate, obtuse to acute, rather pinnately dissected, narrowed to a petiolelike base, the lobes finely dissected and incised; stipules free, small, membranous; peduncles 2-flowered, with long spreading glandular hairs; flowers pale rose, 8–12 mm. across; petals 8–10 mm. long, narrowed to the base; free portion of style about 0.8 mm. long.—May–Aug. Mountains; Honshu (Mount Ibuki in Oomi), Shikoku.—Formosa, China, Himalayas, Europe, N. Africa, and N. America.

Fam. 107. **OXALIDACEAE** KATABAMI KA Sorrel Family

Herbs, rarely shrubs, sometimes with bulbous rhizomes, the juice acid; leaves usually ternate, rarely pinnate or simple, the leaflets usually obcordate; stipules formed by the slightly swollen bases of the petioles one on each side; flowers bisexual, in umbels or dichotomous cymes, sometimes solitary, actinomorphic, sometimes cleistogamous; sepals 5; petals 5, white, rose-purple or yellow, contorted in bud; stamens 10–15; ovary 5-lobed, the styles free or connate, the ovules 1 to several in each locule; capsules globose to cylindric, loculicidally dehiscent; embryo erect in a fleshy endosperm.—About 5 genera, with more than 300 species, in the Tropics and subtropics, especially abundant in S. Africa and S. America.

1. **OXALIS** L. KATABAMI

Characters of the family.

- 1A. Acaulescent; leaves and peduncles radical; flowers solitary, white or rose.
 2A. Scapes few-flowered; naturalized plant growing in waste grounds and cultivated fields. 1. *O. martiana*
 2B. Scapes 1-flowered; indigenous plants growing in woods.
 3A. Leaflets obcordate or obtriangular, with obtuse or rounded angles; capsules ovoid-globose or oblong, 4–12 mm. long, with 1 or 2 seeds in each locule.
 4A. Plant smaller than the following, with slender rhizomes and the leaflets with more strongly rounded margins; petals 10–15 mm. long; capsules ovoid-globose, 4–6 mm. long. 2. *O. acetosella*
 4B. Plant larger than the preceding with stouter, thicker rhizomes and the margins of the leaflets less rounded; petals 15–18 mm. long in both chasmogamic and cleistogamic flowers; capsules oblong, 1–1.2 cm. long, or in cleistogamic flowers ovoid and 5–6 mm. long. 3. *O. griffithii*
 3B. Leaflets obtriangular, with rather acute angles; capsules cylindric, about 2 cm. long, with 4 or 5 seeds on each locule; plant larger. 4. *O. obtriangularata*
 1B. Caulescent; flowers yellow, 1 to several, in an axillary, nearly umbellate inflorescence.
 5A. Stems tufted, from a tap root, sometimes long-creeping; stipules small, but distinct, auriclelike; inflorescence subumbellate, the flowers 1–8; pedicels downwardly flexuous; seeds 1–1.5 mm. across. 5. *O. corniculata*
 5B. Stems distant, erect from slender elongate creeping rhizomes; stipules indistinct; inflorescence cymose, the flowers 1–2(–3); pedicels spreading or erect; seeds 1.5–2 mm. across. 6. *O. fontana*

1. ***Oxalis martiana*** Zucc. MURASAKI-KATABAMI. Weedy herb with a tap-root and numerous brownish bulbils; leaves all radical, thinly pubescent, petiolate, the leaflets 3, thin, obcordate, 2–4 cm. wide, broadly cuneate at base; scapes 10–20 cm. long, slender, thinly pubescent; flowers 5–10, umbellate on the scape, 5-merous, nodding in bud, the pedicels slender, 1–3 cm. long; sepals with a pair of brownish glands; petals 12–15 mm. long, obovate-spatulate, rose-purple.—Naturalized; Honshu, Shikoku, Kyushu.—Introduced from S. America.

2. ***Oxalis acetosella*** L. KO-MIYAMA-KATABAMI. Thinly pubescent to nearly glabrous, delicate perennial with slender, elongate, few-scaled rhizomes; leaves all radical, the petioles 3–10 cm. long, jointed 2–3 mm. above the base, the stipules broadly ovate, the leaflets sessile, obcordate, 4–20 mm. long, 7–30 mm. wide, retuse, with rounded angles, often glabrous on upper side; scapes 5–8 cm. long, with a pair of small membranous bracts at or slightly above the middle; sepals narrowly ovate, obtuse, shorter than the stamens; petals white or pale rose-purple, 9–14 mm. long, narrowly obovate; capsules ovoid-globose, 4–6 mm. long.—May–June. Coniferous woods; Hokkaido, Honshu (centr. distr. and northw.).—Europe and Asia.

3. ***Oxalis griffithii*** Hook. f. & Edgew. *O. acetosella* subsp. *griffithii* (Hook. f. & Edgew.) Hara; *O. acetosella* var. *vegeta* Tatew.; *O. japonica* sensu auct. Japon., non Fr. & Sav.; *O. acetosella* var. *japonica* Makino, excl. basionym.—MIYAMA-KATABAMI. Larger; leaflets obcordate to depressed-obtriangular, 1–2.5 cm. long, 2–4 cm. wide; petals 15–18 mm. long; capsules oblong, 1–1.2 cm. long, or in cleistogamic flowers ovoid and 5–6 mm. long.—Apr.–May. Mountain

woods; Honshu, Shikoku, Kyushu; rather common.—Formosa, China, and N. India.

4. ***Oxalis obtriangularata*** Maxim. ŌYAMA-KATABAMI. Similar to the preceding but larger; rhizomes thickened above with densely imbricate scales; leaves long-petioled, the leaflets obtriangular, about 2.5 cm. long, 4 cm. wide, truncate and retuse at apex; scapes bracteate on upper part; sepals oblong, longer than the filaments; capsules lanceolate-cylindric, acuminate, about 2 cm. long.—Mountain woods; Honshu, Shikoku.—Korea, Manchuria, and Ussuri.

5. ***Oxalis corniculata*** L. KATABAMI. Thinly pubescent perennial herb with acid juice; stems long-creeping from a thickened tap-root; leaves alternate, long-petioled, the leaflets depressed-obcordate, 1–2.5 cm. wide, retuse; stipules minute but distinct; peduncles erect, with linear or lanceolate bracts at apex, (1–)2- to 8-flowered; flowers yellow, about 8 mm. across; capsules cylindric, 1.5–2.5 cm. long, many-seeded; seeds broadly ovate, lenticular, transversely rugulose.—May–Sept. Waste grounds and roadsides in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common; variable.—Cosmopolitan in all temperate and warm areas.

6. ***Oxalis fontana*** Bunge. *O. stricta* L. pro parte; *O. europaea* Jord.—EZO-TACHI-KATABAMI. Closely related to the preceding species; rhizomes elongate, very slender, loosely and minutely scaly; stems 20–40 cm. long, usually simple; leaves long-petioled; stipules indistinct; inflorescence cymose; flowers 1 or 2, rarely 3, pedicellate, the bracts small; seeds rather large, 1.5–2 mm. across.—July–Oct. Thickets and thin woods; Hokkaido, Honshu (centr. distr. and northw.).—Temperate Asia and N. America, introduced in Europe.

Fam. 108. **LINACEAE** AMA KA Flax Family

Herbs or shrubs; leaves alternate or opposite, simple, entire, the stipules absent or glandlike; flowers bisexual, actinomorphic; sepals 4 or 5, free or partly connate, imbricate; petals contorted, often clawed; stamens as many as the petals and alternate with

them, sometimes with intervening staminodes, the filaments connate at base; ovary superior, 3- to 5-locular, the locules often divided, with 2 ovules in each locule, the styles 3-4, free, filiform; capsules loculicidally dehiscent; seeds flat, the endosperm copious or absent, the embryo erect, the cotyledons flat.—About 6 genera, with about 150 species, chiefly in temperate regions.

1. LINUM L. AMA ZOKU

Herbs, sometimes woody, glabrous or rarely hairy; stipules absent or glandlike; leaves alternate or opposite, narrow, 1- to many-nerved; flowers yellow, blue, rose or white, in axillary or terminal racemes or loose racemelike cymes; sepals 5, entire, persistent; petals 5, deciduous; stamens 5, connate at base, usually alternating with small staminodes; glands 5, small, at the base of the filaments and opposite the petals; ovary 5-locular, with 2 ovules in each locule, the styles 5; capsules 5-valved; seeds with scanty endosperm, the embryo straight.—About 90 species, chiefly in the temperate and warmer regions.

1A. Sepals elliptic or broadly ovate, abruptly acute, 3-3.5 mm. long, with a few projecting black glands on margin; flowers about 1 cm. across; capsules 3.5-4 mm. across. 1. *L. stelleroides*

1B. Sepals ovate-oblong, acuminate, 5-7 mm. long, eglandular; flowers 1.5-2 cm. across; capsules about 7 mm. across. ... 2. *L. usitatissimum*

1. *Linum stelleroides* Planch. MATSUBA-NINJIN. Glabrous annual; stems terete, 40-60 cm. long, branched above; leaves broadly linear, 1-3 cm. long, 2-3 mm. wide, obtuse and mucronate or acute, 3-nerved, entire, slightly narrowed at base, sessile; flowers rose-colored, in loose racemes on branchlets, the pedicels 1-1.5 cm. long, erect; sepals elliptic or broadly ovate, 3-3.5 mm. long, abruptly acute, obsoletely 3-nerved at base, green with a few black projecting glands on the rather membranous margins; petals obovate; stigma terminal, capitate; capsules globose, 3.5-4 mm. across; seeds oblong, flat, brown, lustrous, about 2 mm. long.—Aug.-Sept. Grassy slopes in mountains; Hokkaido, Honshu, Shikoku, Kyushu;

rather rare.—China, Korea, Manchuria, and e. Siberia.

2. *Linum usitatissimum* L. AMA. Glabrous annual; stems terete, 30-100 cm. long, often branching; leaves flat, broadly linear, 2-3.5 cm. long, 2-4 mm. wide, acute to acuminate, gradually and slightly narrowed at base, glaucous, sessile; flowers white or blue, the pedicels 2-4 cm. long; sepals ovate-oblong, 5-7 mm. long, entire, eglandular, acuminate, 3-nerved; petals obovate, about 10 mm. long; stigma decurrent along the inner side of styles; capsules globose, about 7 mm. across.—June-Aug. Widely cultivated and sometimes sparsely naturalized in our area.—Centr. Asia.

Fam. 109. ZYGOPHYLLACEAE HAMABISHI KA Caltrop Family

Shrubs or herbs woody at the base; branches often jointed at nodes; leaves opposite or alternate, pinnate or bifoliate, the stipules persistent, often spinelike; flowers bisexual, actinomorphic or zygomorphic, white, red, or blue, rarely yellow; sepals 5, rarely 4, imbricate, rarely valvate; petals 4 or 5, rarely absent, imbricate or contorted, rarely valvate; disc usually present; stamens as many or 2 or 3 times as many as the petals, free, often with scales on inner side; ovary superior, usually 4- or 5-locular, rarely to 12-locular; style simple; ovules usually 2 in each locule, sometimes many; fruit various, but not a berry; seeds usually with endosperm.—About 21 genera, with about 160 species, in sandy areas and deserts of the Tropics and warmer regions.

1. TRIBULUS L. HAMABISHI ZOKU

Herbs with usually long-creeping branches; leaves even-pinnate, stipulate, opposite or one of each of the pairs reduced, thus appearing alternate; flowers solitary, pedunculate, axillary, white to yellow; sepals 5, often persistent, imbricate; petals 5, imbricate; disc annular, 10-lobed; stamens 10, at the base of the disc, the outer 5 slightly longer, opposite the petals, the inner with a gland outside at base; ovary sessile, 5- to 12-locular, the style short, the stigmas 5-12; ovules 1-5 in each locule; fruit 5-angled, indehiscent, separating into 5-12 horny or bony nutlets at maturity, with wings, spines, or tubercles on back; seeds without endosperm, the testa membranous.—More than a dozen species, in the Tropics and subtropics, especially abundant in Africa.

1. *Tribulus terrestris* L. HAMABISHI. Annual or biennial, coarsely hirsute and puberulous on stems, leaf-rachis, and peduncles; stems branched, elongate, long-creeping, to 1 m. long, striate; leaves 1-6 cm. long including the short-petiole, the stipules free, lanceolate, about 3 mm. long, the leaflets of 4-8 pairs, oblong, 8-15 mm. long, 3-4 mm. wide, subobtusely, oblique at base, entire, white-pubescent especially on under side; peduncles 1-2 cm. long; sepals ovate-oblong, 4-5 mm.

long, gradually acute, deciduous, densely pilose on back; petals yellow, slightly exceeding the sepals; ovary densely pubescent; fruit about 1 cm. across, separating into 5 woody nutlets, each with firm tubercles and 2 thick spines on back.—July-Oct. Sandy seashores; Honshu (Kantō Distr. and Wakasa Prov. and westw.), Shikoku, Kyushu.—Widespread in all tropical regions.

Fam. 110. RUTACEAE MIKAN KA Citrus Family

Shrubs or trees, sometimes herbs, with pellucid glands; leaves simple or compound, exstipulate; flowers bisexual, sometimes unisexual; sepals 4 or 5, imbricate; petals imbricate, free; stamens as many or twice as many as the petals, sometimes more numerous; disc usually present on the inner side of the stamens; ovary superior, the carpels 4 or 5, connate to free; ovules often 2 in each locule; fruit a berry, drupe, or capsule; seeds sometimes with endosperm, the embryo straight or curved.—About 100 genera, with about 1,000 species in warm temperate and tropical regions, especially abundant in Australia and S. Africa.

- 1A. Ovary 2- to 5-parted to the base or nearly so; style and stigma often connate; fruit a capsule or follicle or consisting of nutlets.
- 2A. Ligneous; carpels usually with 2 ovules.
- 3A. Inflorescence axillary or terminal; leaves usually pinnate.
- 4A. Leaves alternate. 1. *Zanthoxylum*
- 4B. Leaves opposite. 2. *Evodia*
- 3B. Inflorescence supra-axillary; leaves simple, alternate. 3. *Orixa*
- 2B. Herbaceous; carpels usually with 6-8 ovules. 4. *Boenninghausenia*
- 1B. Ovary connate or only slightly 2- to 5-lobed; style simple, terminal; fruit an indehiscent drupe or berry.
- 5A. Fruit a drupe, with 2-5 stones.
- 6A. Trees; leaves deciduous, pinnately compound, opposite. 5. *Phellodendron*
- 6B. Shrubs; leaves evergreen, simple, alternate. 6. *Skimmia*
- 5B. Fruit a berry.
- 7A. Stamens 10, free; ovules solitary in each locule; styles very short, not jointed with the ovary, persistent. 7. *Glycosmis*
- 7B. Stamens 20-30, often connate; ovules many in each locule; styles jointed with the ovary, deciduous. 8. *Citrus*

1. ZANTHOXYLUM L. SANSHŌ ZOKU

Shrubs or trees sometimes prickly, sometimes dioecious; leaves alternate, odd-pinnate, rarely 1- or 3-foliate, the leaflets entire or obtusely toothed; inflorescence often panicleate-cymose; flowers small, green or greenish white, polygamous or unisexual; calyx 3- to 5-lobed, small, imbricate; petals 3-5 or absent; staminate flowers without a disc, the stamens 3-5; pistillate flowers with a small disc, the stamens absent or scalelike; carpels 1-5, each 1-locular, free; styles free or connate, the stigma capitate; ovules 2 in each locule, parallel; fruitlets 1-5, dehiscent, 1-seeded; seeds ellipsoidal, black, lustrous, the endosperm fleshy. —About 150 species, chiefly in warmer regions.

- 1A. Flowers apetalous; branchlets usually with a large prickle on each side of the leaf-base; stamens alternate with the calyx-lobes.
- 2A. Evergreen shrub with prickles much flattened laterally; petioles winged; leaflets 3-7, 3-8 cm. long. 1. *Z. planispinum*
- 2B. Deciduous shrub with prickles thickened at base; petioles wingless; leaflets 11-19, 1-3.5 cm. long. 2. *Z. piperitum*
- 1B. Flowers with petals; branchlets irregularly prickly; stamens alternate with the petals.
- 3A. Shrubs with slender branches; leaflets 1.5-5 cm. long, nearly destitute of pellucid glands except on the margins, not glaucous. 3. *Z. schinifolium*
- 3B. Trees with rather thick branchlets; leaflets (3.5-)-5-12 cm. long, with pellucid glands, usually glaucescent beneath.
- 4A. Leaves 15-30 cm. long; leaflets 3.5-8 cm. long; branches of inflorescence glabrous or loosely puberulous. 4. *Z. fauriei*
- 4B. Leaves 30-80 cm. long; leaflets 5-15 cm. long; branches of inflorescence rather densely puberulous on one side. 5. *Z. ailanthoides*

1. *Zanthoxylum planispinum* Sieb. & Zucc. *Z. alatum* Roxb. var. *planispinum* (Sieb. & Zucc.) Rehd. & Wils.; *Z. alatum* var. *subtrifoliatum* Franch.—FUZYUANSHŌ. Dioecious shrub; prickles on branches at base of each leaf 2, spreading, 1.2-1.5 cm. long, prominently flattened and dilated at base; petioles 1-3 cm. long, winged; leaves pinnately 3- to 5(-7)-foliate, the leaflets sessile, broadly lanceolate to narrowly oblong, 3-7 cm. long, 1-2.5 cm. wide, acute to acuminate, often emarginate, glabrous or spreading-pilose on the midrib beneath, with pellucid glands on margins, entire or obtusely toothed; inflorescence a nearly sessile axillary raceme often branched at base, 1-3 cm. long; flowers pale yellow.—May. Low mountains; Honshu (Kantō and westw.), Shikoku, Kyushu.—Ryukyu, Formosa, China, and Korea.

2. *Zanthoxylum piperitum* (L.) DC. *Fagara piperita* L.—SANSHŌ. Dioecious shrub; prickles on branches at base of leaves 2, 5-8 mm. long; leaves puberulous while young, 5-15 cm. long, short-petiolate, the leaflets 11-19, sessile, broadly lanceolate to ovate, 1-3.5 cm. long, 6-12 mm. wide, emarginate, cuneate to obtuse at base, obtusely toothed with pellucid glands in the sinus; inflorescence terminal on short branches, pedunculate, many-flowered; flowers greenish yellow, small.—Apr.-May. Hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common and frequently cultivated.—Korea, Manchuria, and China.—Forma *inermis* (Makino) Makino. *Z. piperitum* var. *inermis* Makino—ASAKURAZANSHŌ. Unarmed. The seeds and young leaves are used as a spice and the plant is often planted for this purpose.—Forma *brevispinosa* Makino. YAMA-ASAKURAZANSHŌ. Prickles short. Intermediate between the typi-

cal phase and the preceding form.—Forma *ovalifoliolatum* (Nakai) Makino. *Z. ovalifoliolatum* Nakai—RYUJIN-ZANSHŌ. Leaflets 3-5, ovate.—Rarely cultivated.

3. *Zanthoxylum schinifolium* Sieb. & Zucc. *Z. mantchuricum* Benn.; *Fagara schinifolia* (Sieb. & Zucc.) Engl.; *F. mantchurica* (Benn.) Honda—INUZANSHŌ. Deciduous dioecious shrub with loosely prickly branches; leaves 8-20 cm. long, short-petiolate, the leaflets 13-23, sessile, broadly lanceolate to narrowly ovate, 1.5-4(-5) cm. long, 6-15 mm. wide, emarginate, sometimes minutely pubescent, obtusely toothed with a pellucid gland in each sinus; inflorescence a dense many-flowered cyme, terminal on branchlets; calyx-lobes minute; petals oblong, about 2 mm. long, greenish.—Aug. Low mountains; Honshu, Shikoku, Kyushu; common and variable.—Korea, China, and Manchuria.

4. *Zanthoxylum fauriei* (Nakai) Ohwi. *Fagara fauriei* Nakai; *F. shikokiana* Makino; ? *Z. ailanthoides* × *Z. schinifolium*—KO-KARASUZANSHŌ. Dioecious tree; branches thick, reddish when young, often glaucescent, loosely or densely and irregularly prickly; leaves glabrous, 15-30 cm. long, the petioles about 3 cm. long, the leaflets subsessile, broadly lanceolate, 3.5-8 cm. long, 1-1.5(-2) cm. wide, gradually narrowed to an emarginate apex, pellucid-dotted, minutely toothed with a pellucid gland in each sinus; inflorescence a dense many-flowered terminal cyme; calyx-lobes minute; petals oblong, about 2 mm. long.—Aug. Honshu (Tōkaidō and Kinki Distr.), Shikoku, Kyushu; rare.—s. Korea.

5. *Zanthoxylum ailanthoides* Sieb. & Zucc. *Fagara ailanthoides* (Sieb. & Zucc.) Engl.—KARASUZANSHŌ. Glabrous dioecious tree with thick, prickly branches; leaves 30-80

cm. long, petiolate, the leaflets 19-23, subsessile, broadly lanceolate, acuminate, emarginate, rounded at base, obtusely serrulate with a pellucid gland in each sinus; inflorescence a dense many-flowered terminal cyme; calyx-lobes minute, semi-

rounded; petals greenish yellow, about 2.5 mm. long.—July-Aug. Mountains; Honshu, Shikoku, Kyushu; rather common.—s. Korea, China, Ryukyus, and Formosa.

2. EVODIA Forst. GOSHUYU ZOKU

Unarmed trees or shrubs; leaves opposite, odd-pinnate, ternate or simple, entire, pellucid-dotted; cymes axillary, often compound in a terminal panicle; flowers unisexual, small; sepals 4 or 5, imbricate; petals 4 or 5, valvate or slightly imbricate; disc urceolate, with 4 or 5 undulate teeth; stamens 4 or 5, inserted on the base of the disc; ovary 4- or 5-parted, 4- or 5-locular; style cylindric, simple, the stigma 4-lobed; ovules 2 in each locule; fruitlets 4 or 5, coriaceous, dehiscent, 2-valved, 1(-2)-seeded; seeds ellipsoidal, the embryo straight, embedded in a fleshy endosperm.—About 50 species, in e. and s. Asia, Australia, and Polynesia.

1. *Evodia glauca* Miq. *E. meliaefolia* sensu auct. Japon. non Benth.—HAMA-SENDAN, SHIMA-KUROKI, URAJIRO-GOSHUYU.

Diocious tree with appressed-puberulous, rather thick branches; leaves 15-30 cm. long, on petioles 4-6 cm. long, the leaflets 11-19, petiolulate, obliquely ovate or narrowly ovate, 4-7 cm. long, appressed-puberulous on upperside while young, glaucous beneath, caudate, with an obtuse tip, entire, rounded on outer margin and acute on inner margin at base; cymes

terminal, densely many-flowered, puberulous; flowers small; sepals 5, broadly ovate, ciliolate; petals 5, pubescent inside; filaments in staminate flowers hairy at base on outer side; ovary in pistillate flowers deeply 4- or 5-lobed, the style short and puberulous, the stigma rather large, with 4 or 5 undulate teeth; fruitlets densely white-puberulous inside; seeds ellipsoidal, about 3 mm. long.—Honshu (Nagato Prov.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

3. ORIXA Thunb. KO-KUSAGI ZOKU

Deciduous, unarmed, dioecious shrub; leaves alternate, short-petiolate; flowers pale green, small, 4-merous, solitary or in racemes; sepals ovate, connate at base; petals elliptic, imbricate; disc 4-lobed in staminate flowers; stamens 4; ovary in pistillate flowers deeply 4-lobed, with a short common style and 4-lobed stigma; fruitlets 4, each 1-seeded and dehiscent, 2-valved; seeds black, globose.—One species in e. Asia.

1. *Orixa japonica* Thunb. *Othera orixa* (Thunb.) Lam.; *Celastrus orixa* (Thunb.) Sieb. & Zucc.; *Evodia ramiflora* A. Gray; *C. japonicus* (Thunb.) K. Koch; *C. dilatatus* Thunb.—KO-KUSAGI. Erect foetid shrub with grayish branches, slightly puberulous while young; leaves alternate, two together on one side, the petiole 5-10 mm. long, the blade obovate, rhombic-ovate or elliptic, 5-12 cm. long, 3-7 cm. wide, abruptly acute with an obtuse tip, puberulous especially on nerves while young, entire or with a few irregular sinuses

on margin; inflorescence axillary on the branches of the preceding year, the staminate inflorescences in few-flowered racemes, 2-3 cm. long, the bracts elliptic, membranous, deciduous, 3-5 mm. long, the pedicels 3-6 mm. long, the pistillate flowers solitary, the pedicels 1-2 cm. long; petals spreading, about 3 mm. long, greenish; fruitlets obliquely ellipsoidal, 8-10 mm. long, transversely nerved; seeds about 4 mm. long.—Apr.-May. Woods and thickets in low mountains; Honshu, Shikoku, Kyushu; common.—s. Korea and China.

4. BOENNINGHAUSENIA Reichenb. MATSU-KAZE-SO ZOKU

Slender, thin perennials with pellucid glands; stems terete, branched; leaves alternate, ternately 2- to 3-pinnate, the leaflets entire; panicles compound, leafy at base; flowers white, bisexual; sepals small, 4, connate at base, persistent; petals 4, imbricate; disc urceolate; stamens 6-8, inserted on the base of the disc; ovary stipitate, 4-lobed, 4-locular, the style short, connate, deciduous; ovules 6-8 in each locule; fruitlets free, 4, dehiscent ventrally, the seeds few in each fruitlet, black, tubercled, reniform, the embryo fleshy.—Two species, India and e. Asia.

1. *Boenninghausenia japonica* Nakai. *Ruta japonica* Sieb. ex Miq. in syn.; *B. albiflora* sensu auct. Japon. non Reichenb.; *B. albiflora* var. *japonica* (Nakai) S. Suzuki.—MATSU-KAZE-SO. Glaucous, glabrous, flaccid perennial; stems erect, 40-80 cm. long, branched above; leaves deltoid, the petioles 5-10 cm. long, the leaflets obovate or elliptic, 1-2.5 cm. long, 7-20 mm. wide, rounded to emarginate, cuneate, acute or obtuse at base, pellucid-dotted, entire, white beneath; panicles terminal,

large, the bracts narrowly obovate, 4-6 mm. long, simple; flowers white, on delicate pedicels; sepals oblong, about 1 mm. long; petals ascending-spreading, oblong, about 4 mm. long; stamens exserted; fruit on a stipe about 2 mm. long, the fruitlets ovoid, ascending, about 3 mm. long, the seeds dark brown, reniform, about 1.5 mm. long, tubercled.—Aug.-Oct. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.

5. PHELLODENDRON Rupr. KIHADA ZOKU

Unarmed, deciduous, dioecious trees; leaves opposite, odd-pinnate, the leaflets petiolulate, ovate, with pellucid glands, nearly entire; cymes terminal, peduncled; flowers small, yellowish green; sepals 5-8, ovate, small; petals as many as and much longer than the sepals, oblong; stamens 5-6, exserted, reduced to staminodes in the pistillate flowers; ovary short-stipitate, 5-locular, the style short, the stigma 5-lobed; drupe black, nearly globose, the drupelets 5, each with a single seed, the endosperm scanty.—Few species, in e. Asia.

1. *Phellodendron amurense* Rupr. KIHADA. Tree with rather thick branches; leaves 20–40 cm. long, petiolate, the leaflets 5–13, membranous, narrowly ovate or ovate-oblong, 5–10 cm. long, 3–5 cm. wide, caudate-acuminate, rounded at base, usually ciliate while young or slightly pubescent beneath near base, deep green, glaucous beneath; cymes rather large, 5–7 cm. across, puberulous; flowers on short pedicels; sepals ovate-triangular, about 1 mm. long; petals narrowly oblong, pubescent inside, about 4 mm. long; fruit nearly globose, about 1 cm. across.—July. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, n. China, Manchuria, Ussuri, and Amur. Variable.

Var. *sachalinense* F. Schmidt. *P. sachalinense* (F. Schmidt) Sarg.—HIRO-HA-NO-KIHADA. Bark thin; leaflets slightly broader, nearly destitute of marginal hairs; cymes nearly glabrous.—Hokkaido, Honshu.

Var. *japonicum* (Maxim.) Ohwi. *P. japonicum* Maxim.; *P. nikkomontanum* Makino—ŌBA-NO-KIHADA. Leaflets 9–15, rather smaller, spreading-pubescent beneath especially on nerves; cymes puberulous.—Honshu, Shikoku, Kyushu.

Var. *lavalleyi* (Dode) Sprague. *P. lavalleyi* Dode—MIYAMA-KIHADA. Similar to the preceding variety, but with thicker, corky bark; leaflets broadly cuneate at base.—Hokkaido, Honshu.

6. SKIMMIA Thunb. MIYAMA-SHIKIMI ZOKU

Glabrous, unarmed, evergreen shrubs; leaves simple, entire, alternate, short-petiolate, with pellucid glands; cymes terminal; flowers bisexual or polygamous, white, small, 4- or 5-merous; sepals imbricate; petals oblong, valvate or slightly imbricate, longer than the sepals; sterile carpels connate at base; pistillate flowers with 4–5 staminodes; ovary of 2–5 completely connate carpels, each with a single ovule; style short, the stigma 2- to 5-lobed; drupe obovoid or globose, with 2–4 stones, the endosperm fleshy.—About 10 species, in e. Asia and the Himalayas.

1. *Skimmia japonica* Thunb. *S. oblata* Moore; *S. fragrantissima* Moore—MIYAMA-SHIKIMI. Dioecious shrub to 1.5 m. high, glabrous except for the puberulous inflorescence, the branches ascending, grayish; leaves often falsely verticillate, narrowly oblong to narrowly obovate, 6–12 cm. long inclusive of the short petioles, 2.5–3.5 cm. wide, abruptly acute and ending in an obtuse tip, gradually narrowed to the base, entire, lustrous on upper side, yellowish beneath; cymes 4–8 cm. across; flowers 4-merous, small, 5–6 mm. across, on puberulous pedicels; sepals and bracts minute, broadly triangular, minutely ciliate; petals narrowly oblong, 4–5 mm. long, with pellucid glands; stamens as long as the petals; fruit globose, about 7 mm. across, red, the style deciduous, 0.8 mm. long, with a somewhat capitate 4-fid stigma.—Apr. Woods in mountains; Honshu (Kantō Distr. and westw.), Shikoku,

Kyushu; rather common.—Ryukyus, Formosa, and ? China. —Forma *rugosa* (Yatabe) Ohwi. *S. japonica* var. *rugosa* Yatabe; *S. rugosa* (Yatabe) Makino—UCHI-DASHI-MIYAMA-SHIKIMI. Nerves of leaves impressed on upper side.

Var. *intermedia* Komar. *S. repens* var. *intermedia* (Komar.) Nakai; *S. japonica* var. *repens* forma *rugata* Ohwi—KARAFUTO-SHIKIMI, UCHIKOMI-MIYAMA-SHIKIMI. Low shrub with ascending branches often creeping at base; leaves with impressed nerves on upper side.—A rare variant first found in Sakhalin; also occurs in Hokkaido and Honshu (centr. & n. distr.). —Forma *repens* (Nakai) Hara. *S. repens* Nakai; *S. japonica* var. *repens* (Nakai) Ohwi—MIYAMA-SHIKIMI. The leaves flat.—Hokkaido, Honshu, Shikoku, Kyushu; common in mountains.—Sakhalin and s. Kuriles.

7. GLYCOSMIS Correa HANA-SHIMBŌGI ZOKU

Unarmed trees or shrubs; leaflets 1–7, alternate, entire or serrate; panicles axillary, rarely terminal; flowers small, bisexual; calyx 5-parted, the segments broad, imbricate; petals 5, free, oblong to rounded, imbricate; stamens 10, free, the filaments subulate, dilated at base, the anthers small, often with a gland at the apex or on the back; disc stipelike or cup-shaped; ovary 2- to 5-locular, the style very short, the ovules solitary in each locule; berry juicy, 1- to 3-seeded, the seeds oblong, the testa membranous, the endosperm absent.—About 10 species, in se. Asia and Australia.

1. *Glycosmis pentaphylla* (Retz.) Correa. *Limonia pentaphylla* Retz.; *G. citrifolia* (Willd.) Lindl.; *L. citrifolia* Willd.; *L. parviflora* Sims—HANA-SHIMBŌGI, GEKKITSU-MODOKI. Large evergreen shrub with minute brown hairs while young; petioles 1–2 cm. long, the leaf-rachis short, the leaflets 1–3, alternate, sessile, narrowly oblong, 7–12 cm. long,

2–3.5 cm. wide, obtuse to acute; panicles axillary, densely flowered; flowers small, short-pedicelled, 5-merous; petals about 3 mm. long; stamens 10, as long as the petals, glabrous; ovary glabrous.—Kyushu (southern distr., possibly not indigenous).—s. China, India, Indochina, and Malaysia.

8. CITRUS L. MIKAN ZOKU

Usually armed, evergreen shrubs or trees; leaves alternate, simple, entire or obtusely toothed, coriaceous, lustrous, with pellucid glands, the petioles often winged; flowers bisexual, axillary, solitary, fascicled or in short panicles, white, fragrant; calyx cup-shaped or urceolate, 3- to 5-lobed; petals 4–8, narrowly oblong, imbricate; stamens 15 or more, in a few fascicles; disc large, cup-shaped or annulate; ovary 8- to 15-locular; style long, deciduous, the stigma capitate, the ovules several in each locule; berry large, globose, with several segments filled with juicy pulp composed of stalked pulp-vesicles; seeds 1–8 in each locule, without endosperm.—Many species in India and se. Asia.

1. *Citrus tachibana* (Makino) T. Tanaka. *C. aurantium* var. *tachibana* Makino—TACHIBANA. Large glabrous shrub; branches 3-angled, with scattered spines 2-20 mm. long; leaves chartaceous, narrowly ovate, 3-8 cm. long, 1.5-3.5 cm. wide, acute with an emarginate tip, obtuse to broadly cuneate at base, entire, the petioles 5-12 mm. long, narrowly winged; flowers solitary or in pairs, terminal and axillary, the pedicels

about 5 mm. long; calyx cup-shaped, the lobes depressed 3-angular; petals 5, ascending, white, narrowly obovate-oblong, about 12 mm. long, acute; stamens about 20; fruit depressed-globose, yellow when mature, 2-2.5 cm. across.—June. Honshu (Izu, Kii, and Nagato Prov.), Shikoku, Kyushu.—Korea (Quelpaert Isl.), Ryukyus, and Formosa.

Fam. 111. SIMAROUBACEAE NIGAKI KA Quassia Family

Trees or shrubs usually with bitter bark; leaves commonly alternate, pinnate, rarely simple, without pellucid glands; flowers bisexual or unisexual, actinomorphic, usually small, in panicles or spikes; sepals 3-5, more or less connate at base; petals 3-5 or absent; stamens twice as many as the sepals; ovary superior, surrounded by a prominent disc; carpels 2-5, free at base; style or stigma variously connate to the base; ovules 1 to several in each locule; fruit a drupe, rarely a berry or samara, the seeds with or without a scanty endosperm.—About 28 genera, with about 150 species, chiefly in the Tropics.

1. PICRASMA BL. NIGAKI ZOKU

Deciduous trees; leaves alternate, odd-pinnate, fasciculate toward the top of the branchlets; flowers polygamous, small, in pedunculate, axillary cymes; sepals 4 or 5, small, ovate, persistent; petals as many as the sepals, oblong, nearly valvate; stamens as many as the petals and longer, inserted at the base of a 4- or 5-lobed disc; carpels 2-5, free, with a connate common style at the apex; fruit of 1-5 globose-obovoid drupelets, the seeds without endosperm.—About 8 species, in the Tropics and subtropics.

1. *Picrasma quassioides* (D. Don) Benn. *Simaba quassioides* D. Don; *Rhus ailanthoides* Bunge; *P. ailanthoides* (Bunge) Planch.; *P. japonica* A. Gray—NIGAKI. Glabrescent tree; leaves 20-30 cm. long, the petioles 2-4 cm. long, the stipules caducous, small, lanceolate, the leaflets subsessile, oblique, narrowly ovate to broadly lanceolate or oblong, 4-10 cm. long, 1.5-3 cm. wide, long-acuminate with an obtuse tip, acute to broadly cuneate at base, obtusely toothed, glabrous or

nearly so; cymes axillary, on peduncles 4-10 cm. long, puberulous, loosely many-flowered, 4-7 cm. across; flowers yellowish green; sepals ovate; petals obovate, persistent, spreading, 3-4 mm. long; drupelets obovoid-globose, 6-7 mm. long.—May-June. Woods in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, Korea, China, and India.

Fam. 112. MELIACEAE SENDAN KA Mahogany Family

Trees or shrubs, rarely herbs; leaves usually alternate, pinnate, rarely simple, exstipulate; flowers bisexual, rarely unisexual, actinomorphic, commonly in axillary cymes; sepals 4-6, usually connate at base, imbricate, as many as the petals; stamens usually twice as many as the petals, commonly connate at base into a tube; ovary superior, 2- to 5-locular, with a disc at base, with 1 or 2 ovules in each locule; fruit a berry, drupe or capsule; seeds sometimes winged, the endosperm present or absent.—About 50 genera, with about 800 species, chiefly in the Tropics.

1. MELIA L. SENDAN ZOKU

Deciduous trees or shrubs; leaves alternate, twice-pinnate, the leaflets entire or toothed; flowers bisexual, in axillary panicles; calyx 5- or 6-parted, the segments small; petals 5 or 6, free, imbricate; stamens 10-12, the filaments connate into a tube, the anthers attached on the inner side above and alternate with the lobes at the summit of the tube; ovary on a short disc, 5- to 8-locular, terminated by a cylindrical style, the ovules 2 in each locule; fruit a drupe, with fleshy exocarp.—About 10 species, in s. Asia and Australia.

1. *Melia azedarach* L. *M. azedarach* var. *japonica* (G. Don) Makino; *M. japonica* G. Don—SENDAN. Tree with fine stellate pubescence when young; branches thick; leaves alternate, petiolate, large, bipinnate, tripinnate, or rarely pinnate, the leaflets petioluled, ovate or ovate-elliptic, 3-7 cm. long, 1.2-2.5 cm. wide, chartaceous, abruptly acuminate or caudate with an obtuse point, oblique at base, green on upper side, yellowish beneath; panicles axillary, 10-15 cm. long (inclusive of the peduncles 5-10 cm. long), 5-7 cm. wide, loosely

many-flowered; flowers pale purple or rarely white, on short pedicels; sepals ovate-oblong, 2-2.5 mm. long; petals oblong-oblancheolate, 1-1.2 cm. long, spreading; stamens about 7 mm. long, the tube about 2 mm. across; drupes ellipsoidal, yellowish brown when mature, about 17 mm. long.—May-June. Thickets in lowlands and hills; Shikoku, Kyushu; widely planted in our area for ornamental purposes.—Bonins, Ryukyus, Formosa, c. and w. Asia.

Fam. 113. POLYGALACEAE HIME-HAGI KA Milkwort Family

Herbs or shrubs, sometimes small trees; leaves alternate, simple, exstipulate; flowers bisexual, zygomorphic; sepals 5, free, imbricate, the inner 2 larger, sometimes petallike; petals 3-5, the outer 2 free or connate with the lowest one, the upper 2 free, scalelike or absent; stamens 8 or 4 or 5, monadelphous, connate to above the middle, rarely free, often adnate to the petals;

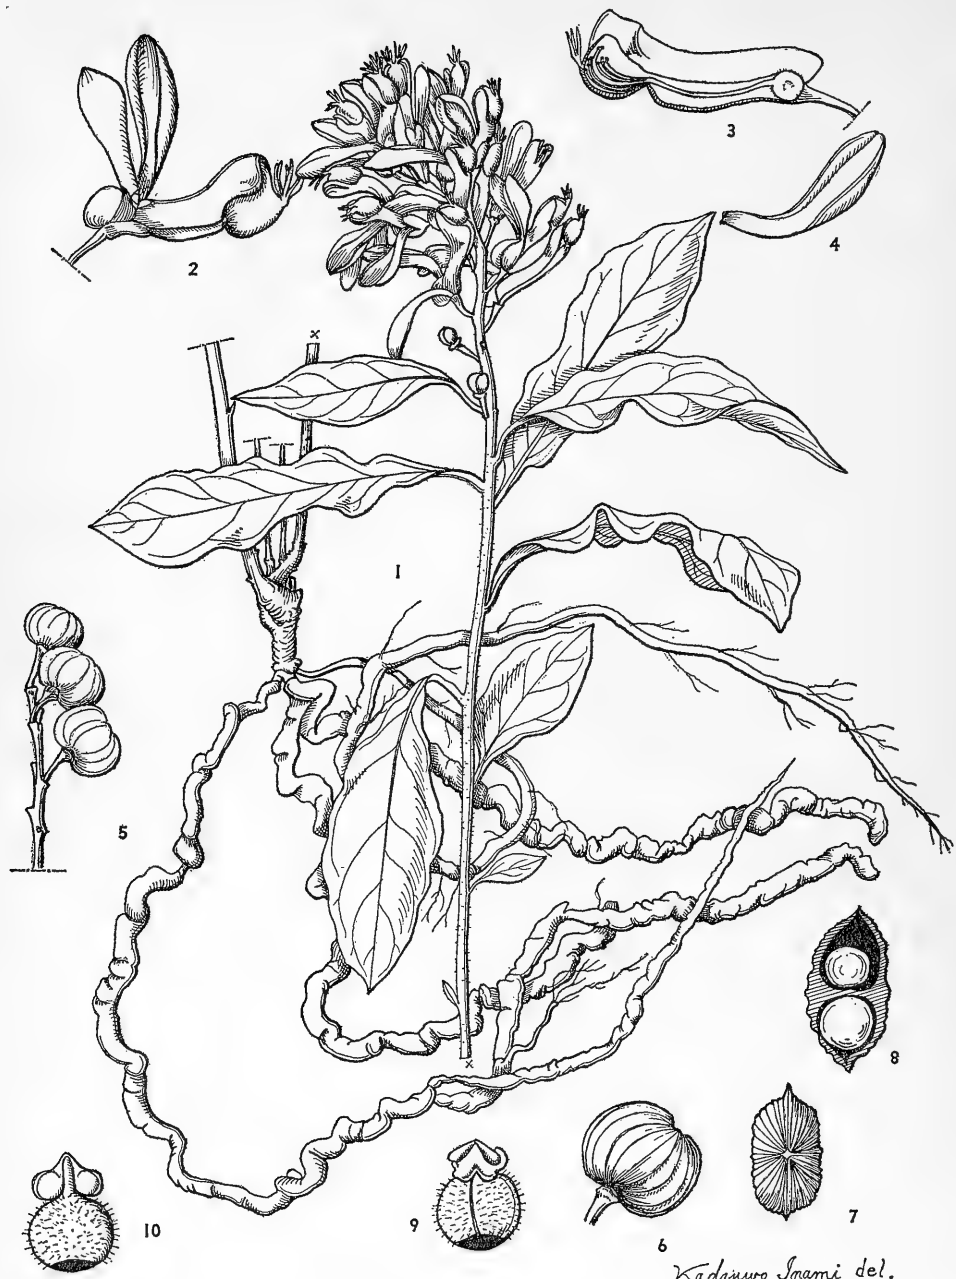

FIG. 10.—*Polygala reinii* Fr. & Sav. 1, Habit; 2, flower; 3, longitudinal section of same, the lateral sepals removed; 4, lateral sepal; 5, fruiting raceme; 6, capsule; 7, the same, seen from the apex; 8, fruit transverse section; 9, 10, seeds.

anthers opening by terminal pores; ovary superior, usually 2-locular, the styles simple, the ovule usually solitary in each locule; fruit a capsule or drupe, the seeds often pilose and strophiolate, the endosperm present, the embryo straight.—About 10 genera, with about 700 species, in tropical to temperate regions.

- 1A. Sepals unequal, 2 larger and winglike; stamens 8; flowers relatively large. 1. *Polygala*
 1B. Sepals slightly unequal; stamens 4; flowers small or minute. 2. *Salomonina*

1. POLYGALA L. HIME-HAGI ZOKU

Herbs, shrubs, or rarely small trees; leaves usually exstipulate; flowers usually in racemes, yellow or purple; sepals 5, unequal; petals 3, unequal, adnate to each other and to the stamen-tube, the lowest clawed; stamens 8 or very rarely fewer; ovary 2-locular, with one ovule in each locule; capsules loculicidally dehiscent, 2-seeded, the seeds ovoid or globose.—About 450 species, chiefly in temperate regions, the woody species chiefly in the warmer regions of the world.

- 1A. Sepals persistent; small perennial. 1. *P. japonica*
 1B. Sepals deciduous after anthesis.
 2A. Annual with leaves 1–3 cm. long; flowers about 2 mm. long. 2. *P. tatarinowii*
 2B. Perennial with leaves 8–12 cm. long; flowers about 2 cm. long. 3. *P. reinii*

1. *Polygala japonica* Houtt. *P. sibirica* var. *japonica* (Houtt.) T. Itô ex T. Itô & Matsum.; *P. hondoensis* Nakai—HIME-HAGI. Small perennial; roots elongate; stems 10–30 cm. long, slender, green, prostrate or decumbent from a short caudex, ascending above, tufted, with scattered minute curved hairs; leaves chartaceous, very short petiolate, elliptic to ovate or broadly lanceolate, 1–2.5(–3) cm. long, 3–12 mm. wide, acute to subobtusate at both ends, vivid green, slightly puberulous or glabrate, with a raised midrib beneath, the reticulated veins rather prominent above; racemes loosely few-flowered, 1–3 cm. long, the peduncles short, supra-axillary; flowers purple; lateral sepals ovate, obtuse, rather petalike, 5–7 mm. long, accrescent after anthesis, to 10 mm. long, becoming green in fruit, the remaining sepals lanceolate, 3–4 mm. long; petals connate, spreading above, 6–7 mm. long, the lowest one with a fimbriate appendage at apex; capsules flat, winged on the margins, rounded-cordate, retuse, 7–8 mm. wide, membranous, glabrous; seeds ellipsoidal, brown, about 2.5 mm. long, white-pilose, strophiolate on upper margin.—Apr.–July. Grassy slopes in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common.—Ryukyus, Formosa, China, Korea, Manchuria, and Ussuri.

2. *Polygala tatarinowii* Regel. *P. triphylla* Hamilt., non Burm.; *P. sieboldiana* Miq.—HINA-NO-KINCHAKU. Nearly glabrous, erect, delicate, green annual; stems 4–12 cm. long, angular, often branched at base; leaves several, orbicular-ovate to elliptic, 1–3 cm. long, acute to obtuse, abruptly narrowed to a winged petiolelike short base, entire, ciliate; racemes terminal, elongate after anthesis, to 8 cm. long, the

peduncles about 1 cm. long; flowers many, small, pale purple, about 2 mm. long, one-sided, densely disposed on the axis, the pedicels 1–1.5 mm. long; capsules rounded, flat, about 3 mm. wide, wingless; seeds ellipsoidal, 1–1.2 mm. long, puberulous, with a small strophiole at apex.—July–Oct. Honshu, Shikoku, Kyushu; rather rare.—Korea, n. China, e. Siberia, and India.

3. *Polygala reinii* Fr. & Sav. KAKI-NO-HA-GUSA. FIG. 10. Soft, puberulous to glabrous green perennial with thick roots and rather thick woody rhizomes; stems 20–35 cm. long, erect, usually simple, green, terete, rather thick; leaves thin, few, mostly toward the top of the stems, obovate-oblong to oblong, 8–17 cm. long, 3–7 cm. wide, abruptly acute to abruptly acuminate, acute or gradually narrowed at base, short-petiolate, thin, soft, green, slightly paler beneath; racemes solitary, terminal, about 10-flowered, 2–5 cm. long, erect; flowers short-pedicelled, yellow, about 2 cm. long, the 2 lateral sepals larger, broadly oblanceolate, obtuse, as long as the petals, the 2 smaller sepals oblong, obtuse to rounded, ciliate, the upper one rather longer, bowed out on the back, about 7 mm. long; petals 3, connate, about 2 cm. long, the lowest with a fimbriate appendage at apex; fruit depressed-orbicular, glabrous, about 10 mm. long, longitudinally ribbed; seeds about 4 mm. long, reddish brown.—Woods in hills and low mountains; Honshu (Tōkaidō and Kinki Distr.); rather common.—Forma *angustifolia* (Makino) Ohwi. *P. reinii* var. *angustifolia* Makino.—NAGABA-KAKI-NO-HA-GUSA. Leaves narrow, lanceolate.

2. SALOMONIA Lour. HINA-NO-KANZASHI ZOKU

Small herbs with alternate often much-reduced scalelike leaves; flowers minute, in terminal spikes; sepals nearly equal or the inner 2 larger; petals 3, connate into a corolla split above, unappended; stamens 4 (–5), the anthers opening by pores; ovary 2-locular; capsules membranous, flat, transversely oblong to orbiculate, often ciliate, loculicidally dehiscent, the seeds globose, without endosperm, the strophioles minute or absent.—About 10 species, in the Tropics of Asia and Australia.

1. *Salomonina oblongifolia* DC. *S. stricta* Sieb. & Zucc.—HINA-NO-KANZASHI. Glabrous, delicate annual; stems 8–25 cm. long, slender, striate, simple or with ascending branches; leaves nearly sessile, oblong or elliptic, 3–8 mm. long or the upper lanceolate ones to 12 mm. long, 1.5–4 mm. wide, mucronate, entire or with few spinules on the upper margin; spikes many-flowered, at first short and dense, later

elongating, 2–6 cm. long; flowers sessile, rose-purple, about 2 mm. long; sepals lanceolate, less than 1 mm. long; lateral petals shorter than the lower; capsules less than 2 mm. wide, glabrous, reniform, flat, with a few spines on the margins, the seeds about 0.8 mm. long, ellipsoidal, dull.—Aug.–Sept. Wet places in lowlands; Honshu, Shikoku, Kyushu; rare.—Formosa, s. Korea, India, Malaysia, and Australia.

Fam. 114. EUPHORBIACEAE TōDAIGUSA KA Spurge Family

Herbs or shrubs, sometimes trees, usually with milky juice; leaves alternate, rarely opposite or verticillate, simple or compound, usually stipulate; flowers unisexual; sepals imbricate or valvate, sometimes absent; petals sometimes absent; stamens 1 to many, free or connate, the anthers 2 (-4)-locular; ovary usually 3-locular, the styles free or connate at base, the ovules 1 or 2 in each locule, pendulous; fruit a capsule or drupe, the seeds often with a distinct hilum, the endosperm fleshy, the embryo straight.—About 280 genera, with about 8,000 species, chiefly in the Tropics.

- 1A. Fruit a drupe; ovary incompletely 2- to 4-locular, with 2 ovules in each locule; evergreen trees or shrubs. 1. *Daphniphyllum*
 1B. Fruit a capsule, rarely a drupe; ovary completely 3- to many-locular or 1-locular in *Antidesma*.
 2A. Inflorescence various, but not a cyathium.
 3A. Ovules 2 in each locule.
 4A. Inflorescence an axillary fascicle; ovary 3- to many-locular.
 5A. Styles slender; herbs or shrubs.
 6A. Staminate flowers without a reduced pistil.
 7A. Flowers with a disc. 2. *Phyllanthus*
 7B. Flowers without a disc. 3. *Glochidion*
 6B. Staminate flowers with a reduced pistil. 4. *Securinega*
 5B. Styles dilated; evergreen tree. 5. *Putranjiva*
 4B. Inflorescence a spike or raceme; ovary 1-locular; fruit a 1-seeded, indehiscent drupe. 6. *Antidesma*
 3B. Ovules solitary in each locule.
 8A. Sepals of staminate flowers valvate; stamens usually many.
 9A. Herbs.
 10A. Leaves alternate; anthers cylindric-oblong, usually curved. 7. *Acalypha*
 10B. Leaves opposite; anthers nearly globose. 8. *Mercurialis*
 9B. Trees; anthers oblong. 9. *Mallotus*
 8B. Sepals of staminate flowers imbricate; stamens 2 or 3; trees. 10. *Sapium*
 2B. Inflorescence a cyathium, consisting of much-reduced unisexual flowers surrounded by a cuplike involucre. 11. *Euphorbia*

1. DAPHNIPHYLLUM BL. YUZURI-HA ZOKU

Glabrous, evergreen, dioecious trees or shrubs; leaves alternate, entire, petiolate, exstipulate; flowers small, apetalous, in axillary racemes; sepals 3-8, minute; stamens 5-18, the filaments short, the anthers conspicuous; ovary incompletely 2- to 4-locular, with 2 ovules in each locule, the styles 2-4, short, reflexed; fruit an ellipsoidal drupe; endosperm abundant, the embryo minute, straight, at the top of the seed.—About 25 species, in e. and se. Asia.

- 1A. Sepals fully evident; staminodes in pistillate flowers distinct, sometimes with reduced anthers; veinlets of leaves rather scattered, scarcely raised beneath. 1. *D. macropodium*
 1B. Sepals very small, less evident but distinct; staminodes in pistillate flowers scarcely developed; veinlets of leaves rather dense, often reticulate, raised beneath. 2. *D. teijsmannii*

1. *Daphniphyllum macropodium* Miq. YUZURI-HA. Evergreen, glabrous tree with thick green branchlets; leaves coriaceous, fasciated at the tips of branchlets, narrowly oblong or narrowly obovate-oblong, 15-20 cm. long, 4-7 cm. wide, abruptly acute, acute to obtuse at base, entire, deep green and lustrous on upper side, glaucous beneath, the lateral nerves 16-19 pairs, the petioles reddish, 4-6 cm. long; racemes axillary, 4-8 cm. long; flowers yellowish green, pedicellate, the staminate with about 10 stamens; ovary in the pistillate flowers ellipsoidal to broadly ovoid, about 2 mm. long, surrounded at the base by a series of staminodes, the styles 2(-4); drupe ellipsoidal, dark blue, about 1 cm. long.—May-June. Woods; Honshu (centr. distr. and westw.), Shikoku, Kyushu. —s. Korea.—Cv. *Variegatum*. *D. macropodium* forma *variegatum* (Bean) Rehd.; *Tetranthera lhuysii* Carr.; *D. macropodium* var. *variegatum* Bean; *D. macropodium* var. *lhuysii* (Carr.) Nakai; *D. macropodium* forma *lhuysii* (Carr.) Ohwi.—FUJIRI-YUZURI-HA. Leaves variegated.—Cultivated. —Forma *viridipes* (Nakai) Ohwi. *D. macropodium* var. *viridipes* Nakai.—Aojiku-YUZURI-HA, INU-YUZURI-HA. Petioles green, not reddish.

Var. *humile* (Maxim.) Rosenth. *D. humile* Maxim.; *D. jesoense* Bean—Ezo-YUZURI-HA. Shrub, branched at base; leaves 10-15 cm. long, thinner, with 12-15 pairs of lateral nerves.—Woods; Hokkaido, Honshu (Japan Sea side of centr. distr. and northw.).—Korea.

2. *Daphniphyllum teijsmannii* Zoll. *D. roxburghii* sensu auct. Japon., non H. Baill.; *D. buergeri* Muell.-Arg.; *D. glaucescens* sensu auct. Japon., non Bl.—HIME-YUZURI-HA. Evergreen, glabrous tree with thick branchlets; leaves coriaceous, oblong or narrowly so, 6-12 cm. long, abruptly acute to rounded at base, glaucous beneath, with 8-10 pairs of lateral nerves, the petioles 1.5-3 cm. long; racemes 4-8 cm. long, several-flowered; flowers pedicellate, the staminate with about 8-stamens; ovary in pistillate flowers broadly ovoid; fruit ellipsoidal, 8-10 mm. long.—May. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Ryukyus and Formosa.

Var. *hisautii* Hurusawa. SURUGA-HIME-YUZURI-HA. Leaves thinner, chartaceous, with petioles 3-5 cm. long; fruiting racemes pendulous. With the typical phase.

2. PHYLLANTHUS L. KO-MIKAN-SŌ ZOKU

Dioecious or monoecious herbs or shrubs; leaves usually small, entire, often distichous, although arranged like leaflets of a pinnate leaf; flowers unisexual, with a well-developed disc; sepals 4-6, in two cycles, sometimes petallike; stamens in staminate

flowers usually 3, sometimes 2 to 5, the filaments free or connate; ovary in pistillate flowers 3- to several-locular, the styles sometimes bifid; fruit a capsule, sometimes fleshy; seeds 3-angled in cross section, rounded on back.—About 500 species, chiefly in the Tropics and subtropics, few in temperate regions.

1A. Monoecious annuals.

- 2A. Capsules nearly sessile, transversely rugose; stems without ordinary leaves except at base, these on the branches, obovate-oblong or narrowly oblong, rounded, mucronate. 1. *P. urinaria*
 2B. Capsules short-pedicellate, smooth; stems and branchlets leafy; leaves broadly lanceolate or narrowly oblong, rather obtuse. 2. *P. matsumurae*

3. *P. flexuosus*

1B. Dioecious shrub; leaves elliptic or ovate, obtuse to subobtusely; fruit pedicellate, berrylike, smooth. 3. *P. flexuosus*

1. *Phyllanthus urinaria* L. *P. lepidocarpus* Sieb. & Zucc.—KO-MIKAN-SŌ. Glabrous, monoecious annual often reddish in sunny places; stems erect, 5–30 cm. long, branched, with few ordinary leaves at bases of stems, and scale-leaves on stems subtending the branches, the branchlets ascending-spreading, slightly flattened, narrowly winged, 5–12 cm. long; leaves on branches obovate-oblong or narrowly oblong, 7–17 mm. long, 3–7 mm. wide, rounded, mucronate, obliquely rounded and subsessile at base, entire, minutely scabrous on margins, whitish beneath; flowers subsessile, about 4 mm. across; sepals 6, oblong; stamens 3, the anthers splitting transversely, the filaments connate; capsules depressed-globose, about 2.5 mm. across, pendulous, transversely rugose with raised, red-brown lines, the styles free, minute, bifid; seeds transversely rugose, about 1.2 mm. across.—July–Oct. Waste places and fields; Honshu, Shikoku, Kyushu; common.—Widely scattered in the Tropics and subtropics.

2. *Phyllanthus matsumurae* Hayata. HIME-MIKAN-SŌ. Glabrous, monoecious annual; stems slender, sparsely branched at base, the branches narrowly winged or striate on one side; leaves broadly lanceolate to narrowly oblong, sometimes elliptic, 7–20 mm. long, 3–6 mm. wide, subacute to obtuse, rarely rounded at apex, obtuse and subsessile at base, entire, smooth, whitish beneath; flowers pale green, small; sepals of pistillate flowers 6, minute, oblong, reflexed in fruit; cap-

sules pendulous, short pedicellate, depressed-globose, pale yellowish green, smooth, about 2.5 mm. across, the styles 3, free, short bifid; seeds yellowish brown, about 1.2 mm. long, irregularly and longitudinally striate with dark brown minute dots.—Aug.–Oct. Thickets and grassy, and waste places in lowlands; Honshu, Shikoku, Kyushu; common but not abundant.

3. *Phyllanthus flexuosus* (Sieb. & Zucc.) Muell.-Arg. *Cicca flexuosa* Sieb. & Zucc.; *Glochidion flexuosus* (Sieb. & Zucc.) Fr. & Sav.; *Hemicicla japonica* H. Baill.; *P. japonicus* (H. Baill.) Muell.-Arg.; *H. flexuosa* (Sieb. & Zucc.) Huru-sawa—KOBAN-NO-KI. Glabrous, dioecious, low shrub; branchlets 8–15 cm. long, deciduous; leaves alternate, elliptic or ovate, 2–4.5 cm. long, 1–2.5 cm. wide, obtuse to broadly so, rounded at base, entire, smooth, vivid green to glaucous on upper side, glaucous or whitish beneath, the petioles 2–3 mm. long; flowers about 3.5 mm. across, the staminate short-pedicellate; sepals 4, rounded, dark reddish; disc annular; stamens 2, rarely 3, the anthers ellipsoidal, longitudinally dehiscent; pistillate flowers pale green, the pedicels 1–1.5 cm. long, gradually thickened on upper part; sepals 3, deciduous, elliptic; fruit depressed globose, about 6 mm. across, becoming berry-like when mature; styles connate and short-cylindric, deeply 3-lobed, the stigma entire; seeds about 3 mm. long.—May. Thickets in mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—China.

3. GLOCHIDION Forst. KANKO-NO-KI ZOKU

Shrubs, trees or herbs; leaves alternate, often regularly arranged on branchlets in one plane; flowers unisexual, usually 5- to 6-merous, without a disc; sepals of staminate flowers 3–8, more or less connate at base, the connective exerted at tip; ovary in pistillate flowers 3- to several-locular, the styles usually connate in a short, thick column; fruit a capsule; seeds not arillate.—About 150 species, in tropical Asia, the Pacific Islands, and Malaysia.

- 1A. Branches, underside of leaves especially on nerves, and flowers distinctly pubescent. 1. *G. triandrum*
 1B. Branches and other parts glabrous.

- 2A. Leaves obovate to cuneate-obovate, 2.5–8 cm. long, 1.2–3 cm. wide, cuneate at base. 2. *G. obovatum*
 2B. Leaves ovate-oblong to ovate, 7–18 cm. long, 4–8 cm. wide, rounded at base. 3. *G. hongkongense*

1. *Glochidion triandrum* (Blanco) C. B. Robinson. *Kirganelia triandra* Blanco; *G. bicolor* Hayata, excl. syn.; *G. hypoleucum* Hayata, non Boerl.; *G. hayatae* Croizat & Hara—URAJIRO-KANKO-NO-KI. Shrub with slender grayish brown branches with grayish hairs; leaves chartaceous, broadly oblanceolate to obovate, 5–8 cm. long, 1.5–2.5 mm. wide, glabrous or nearly so, green above, paler or becoming purplish brown when dry, with spreading to ascending curved whitish hairs especially on nerves beneath, the nerves and veinlets slightly raised beneath, the petioles 1–2 mm. long, pubescent; flowers in few-flowered axillary fascicles, small, the pedicels to 5 mm. long; sepals 6, about 1.5 mm. long, narrowly cuneate-obovate, rounded; stigmas about 6, connate; ovary white-pubescent.—Kyushu (Hizen Prov.); rare.—Formosa and China to Philippines.

2. *Glochidion obovatum* Sieb. & Zucc. *Phyllanthus*

obovatus (Sieb. & Zucc.) Muell.-Arg.—KANKO-NO-KI. Densely branched, dioecious, glabrous shrub with branchlets often becoming spinelike; leaves obovate to broadly cuneate, 2.5–8 cm. long, 1.2–3 cm. wide, rounded, obtuse or abruptly acute with obtuse tip, long-cuneate at base, whitish and becoming brownish when dry beneath, the petioles 1–3 mm. long; flowers several, fasciculate, axillary, short-pedicellate; sepals 6, about 1.5 mm. long; capsules depressed-globose, 6–8 mm. across, 4- or 5-locular; styles short, cylindric.—July–Oct. Honshu (Kii and Ise Prov. and Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus.

3. *Glochidion hongkongense* Muell.-Arg. *Phyllanthus hongkongensis* (Muell.-Arg.) Muell.-Arg.—KAKIBA-KANKO-NO-KI. Glabrous shrub with thick elongate branches; leaves obovate, ovate, or elliptic-oblong, sometimes ovate, 7–18 cm. long, 4–6 cm. wide, acute with an obtuse tip, obliquely

rounded at base, green above, pale green or purplish brown beneath when dry, the petioles 4–6 mm. long; flowers in fascicles on short slightly supra-axillary peduncles, the pedicels short; sepals of pistillate flowers 5 or 6; capsules depressed-

globose, 8–12 mm. across, about 6-locular, the style obtusely angled, cylindric.—Sept.–Oct. Thickets in lowlands; Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, China, and Indochina.

4. SECURINEGA Juss. HITOTSUBA-HAGI ZOKU

Shrubs with alternate, entire, rather small leaves; flowers in axillary fascicles, unisexual, the staminate small, subsessile, the sepals 5, the stamens 5 or fewer, free, the anthers longitudinally dehiscent, the abortive pistils small, these sometimes 2- or 3-fid at the apex; pistillate flowers on distinct pedicels; ovary 3-locular, the styles free, the ovules 2 in each locule; capsules sometimes slightly fleshy, 3-valved, the valves bifid.—More than 10 species, in temperate and warmer regions.

1. *Securinega suffruticosa* (Pall.) Rehd. var. *japonica* (Miq.) Hurusawa. *S. japonica* Miq.; *Phyllanthus fluggeoides* (Muell.-Arg.) Muell.-Arg.; *Flueggea japonica* (Miq.) Pax —HITOTSUBA-HAGI. Dioecious, branching, glabrous shrub with slender green branchlets; leaves oblong or elliptic, sometimes obovate, 2–4 cm. long, 1.2–2.5 cm. wide, subacute to very obtuse, acute to broadly cuneate at base, entire, green on upper side, whitish beneath, the stipules less than 1 mm. long, deciduous; staminate flowers many, axillary, about 3 mm. across, greenish, on short pedicels 2–3 mm. long; sepals and stamens 5; pistillate flowers few or solitary, axillary, the pedi-

cels 5–10 mm. long; capsules depressed-globose, about 4 mm. across, green, the styles 3, bifid, the lobes short, flat, broadly linear, retuse to obtuse; seeds slightly lustrous.—July. Thickets and grassy slopes in lowlands; Honshu, Shikoku, Kyushu; common.

Var. *amamiensis* Hurusawa. *Phyllanthus trigonocladus* Ohwi —AMAMI-HITOTSUBA-HAGI. Branchlets obtusely but distinctly trigonous, slightly thicker; leaves thicker; capsules depressed.—s. Kyushu (Mageshima near Tanegashima).—Ryukyus, Formosa. The typical phase with larger, thinner leaves occurs in Korea, China, and e. Siberia.

5. PUTRANJIVA Wall. TSUGE-MODOKI ZOKU

Trees with thick, entire, alternate leaves; flowers axillary, unisexual; sepals 3–6, slightly connate at base, the staminate numerous, on very short pedicels, the stamens 2 or 3 (–6), the filaments free or connate at base, the anthers erect, with distinct, parallel, longitudinally dehiscent locules, the ovary wholly reduced; pistillate flowers ovoid, with 2- or 3-locular ovaries; styles short, spreading, lobed or dentate; ovules 2 in each locule; drupe ovoid or globose, with a single ovoid seed, the endosperm fleshy.—Several species in s. Asia.

1. *Putranjiva matsumurae* Koidz. *P. roxburghii* sensu auct. Japon., non Wall.; *Drypetes matsumurae* (Koidz.) Kaneh.; *Liodendron matsumurae* (Koidz.) H. Keng —TSUGE-MODOKI. Branches yellowish gray, lenticellate, the branchlets puberulous while young, slightly flattened and with raised striations; leaves alternate, in one plane, coriaceous, oblong or ovate, 5–10 cm. long, 2.5–4 cm. wide, short-caudate, obtusely tipped, oblique at base, obtusely and obscurely toothed, soon becoming glabrous, the veinlets reticulate,

raised, the petioles 6–10 mm. long; inflorescence axillary; staminate flowers numerous, in racemes or spikes about 1 cm. long, the stamens 3; pistillate flowers 1 to few, on pedicels 6–12 mm. long; sepals 3 or 4, oblong to elliptic, obtuse, about 1.5 mm. long; drupes narrowly ovoid-oblong, about 2 cm. long, 1 mm. across, rather densely puberulous, the persistent styles 3 or 4, entire, grooved above.—Reported to occur in Kyushu (Osumi Prov.).—Ryukyus.

6. ANTIDESMA L. YAMA-HIHATSU ZOKU

Dioecious trees or shrubs with alternate leaves; inflorescence a raceme or spike, solitary in axils or compound in terminal panicles; flowers and bracts small; sepals 3–5, small; stamens in staminate flowers 2–5, opposite the sepals, the ovary reduced; ovary of the pistillate flowers usually 1-locular, the styles 3, very short, often bifid at apex, the ovules 2 in each locule; drupe small, often oblique, 1-seeded; endosperm fleshy.—About 100 species, in the Tropics of Australia, Asia, and Africa.

1. *Antidesma japonicum* Sieb. & Zucc. YAMA-HIHATSU. Glabrous much-branched shrub with slender branches loosely puberulent while young; leaves broadly oblanceolate to narrowly obovate, 5–8 (–10) cm. long, 2–4 cm. wide, acuminate, slightly oblique and acute to obtuse at base, entire, sometimes with scattered minute hairs on the midrib beneath, the lateral nerves 5–7 pairs, arcuate above, the petioles 3–5 mm. long;

racemes nearly sessile, 4–6 cm. long, at first puberulent; staminate flowers nearly sessile, about 2 mm. across; sepals 3- to 5-lobed, the segments deltoid; stamens 2–5; pistillate flowers on spreading pedicels 2–4 mm. long; drupe obliquely ellipsoidal, red, about 5 mm. long, the persistent styles 3–4, short, spreading.—Honshu (Kii Prov.), Shikoku, Kyushu. —Ryukyus and Formosa.

7. ACALYPHA L. ENOKIGUSA ZOKU

Herbs or trees; leaves alternate, serrate, 3-, 5- or penni-nerved; flowers small, unisexual, in spikes, these sometimes compounded into panicles, the pistillate on the lower part of the spikes, the bracts often accrescent after anthesis; staminate flowers with the calyx connate in bud, 3-lobed at anthesis, the stamens many, usually 8; calyx of pistillate flowers of 3 or 4 sepals; ovary 3-locular; styles free, slender, often lacerate; ovules solitary in each locule; capsules small, the 3 valves bifid; seeds globose, with fleshy endosperm.—About 300 species, widespread in the tropics and in warmer regions.

1. *Acalypha australis* L. *A. virgata* sensu Thunb., non L.; *A. pauciflora* Hoffm.; *A. chinensis* Roxb.—ENOKIGUSA. Annual with short ascending hairs; stems erect, branched, 30–50 cm. long; leaves membranous, ovate to narrowly so, sometimes broadly lanceolate, 3–8 cm. long, 1.5–3.5 cm. wide, acute, rounded at base, coarsely toothed, sparsely appressed-pilose on upper side, pilose especially on nerves beneath, 3(–5)-nerved; inflorescence spicate, short-pedunculate, 1–5 in leaf-axils, 1–2 cm. long; pistillate flowers at base of the spike and

surrounded by a cordate, obtusely toothed sessile bract 1–2 cm. long; staminate flowers small, naked, nearly sessile; capsules about 3 mm. across, pilose, nearly sessile; seeds broadly ovoid, dark brown, smooth, 1.5 mm. long.—Aug.–Nov. Waste places and cultivated fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ussuri, Korea, Manchuria, China, and Philippines.—Forma *velutina* (Honda) Ohwi. *A. australis* var. *velutina* Honda—BIRŌDO-ENOKIGUSA. With longer spreading hairs on all parts.

8. MERCURIALIS L. YAMA-AI ZOKU

Pilose to glabrous herbs with usually serrate, penninerved, opposite leaves; inflorescence an axillary spike or raceme; pistillate flowers few, subsessile, in leaf-axils or at the base of staminate inflorescence; staminate flowers with a 3-lobed membranous calyx, stamens many, free; pistillate flowers with 3 sepals and 2 scales at base; ovary 2-locular; style nearly free, entire; capsules dehiscent, 2-valved; seeds ovoid, smooth or tubercled, with fleshy endosperm.—Few species, in Europe and e. Asia.

1. *Mercurialis leiocarpa* Sieb. & Zucc. YAMA-AI. Nearly glabrous perennial with long-creeping slender rhizomes; stems erect, simple, with a few pairs of leaves, the lower 2 or 3 nodes naked; leaves rather unequal in the pair, thin, ovate-oblong or oblong, 7–12 cm. long, 2.5–5 cm. wide, acute, rounded at base, obtusely toothed, with scattered coarse pubescence above and on nerves beneath, the petioles 1.5–3 cm. long, the stipules free, membranous, rather persistent, re-

curved, lanceolate, 3–4 mm. long; spikes axillary, peduncled, few together, the staminate in the lower axils, loosely flowered with many stamens, the pistillate in upper axils, few-flowered; capsules 2-valved, green, the valves subglobose, about 4 mm. across, bifid, with few callose tubercles on the surface.—Apr.–July. Woods in low mountains; Honshu, Shikoku, Kyushu; rather common.—Korea, Formosa, China, and India.

9. MALLOTUS Lour. AKAME-GASHIWA ZOKU

Trees or shrubs often with lepidote or stellate hairs throughout; leaves alternate or opposite, entire or dentate, sometimes 3-lobed, flat, petiolate, penninerved or 3- to 7-nerved, sometimes with 2 sessile glands at base; spikes simple or compounded into panicles; staminate flowers small, fasciculate on the nodes of the rachis, the calyx 3- or 4-lobed, the stamens many, free; pistillate flowers few, solitary in the axil of a bract, the calyx 3- to 5-lobed; ovary 3-locular; styles free or connate at base; ovules solitary in each locule; capsules globose, hairy, tubercled, or glandular-lepidote, 3-valved, dehiscent, the valves bifid; seeds ovoid or globose, with fleshy endosperm.—About 80 species, in the Tropics of the Old World.

1. *Mallotus japonicus* (Thunb.) Muell.-Arg. *Croton japonicum* Thunb.—AKAME-GASHIWA. Deciduous tree, with dense reddish stellate scales while young, grayish afterward, the branches rather thick; leaves rounded-obovate to broadly ovate, 10–20 cm. long, 6–15 cm. wide, acute, rounded at base, shallowly 3-fid, sometimes entire or undulate, 3-nerved, with parallel veinlets, pale yellowish green beneath with yellow sessile glands, 2 glands just above the base, the petioles rather long; inflorescence a panicle, 8–20 cm. long, the branches elongate in the staminate; staminate flowers with

calyx about 3 mm. long and numerous stamens 6–7 mm. long; pistillate flowers short-pedicellate on shorter branches of the panicles; capsules trigonous-globose, about 7 mm. across, densely lepidote and with yellowish brown glandular dots, and sparsely armed with soft spinelike protuberances, densely stellate-pilose while young, 3-valved, the valves bifid; seeds dark brown, about 4 mm. long, obscurely tuberculate.—June. Thickets and thin woods in lowlands; Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, China, and Korea.

10. SAPIUM R. Br. SHIRAKI ZOKU

Usually glabrous trees or shrubs; leaves alternate, petiolate, flat, penninerved, usually 2-glandular at base of the blades or on the upper part of the petioles; spikes or racemes terminal, simple or rarely in panicles; staminate flowers many, small, the calyx 2- or 3-lobed, toothed, membranous, the stamens 2 or 3, free; pistillate flowers 1 to few on the lower part of the otherwise staminate inflorescence, the calyx 2- or 3-lobed; ovary 3-locular; styles sometimes connate at base, entire, reflexed; ovules solitary in each locule; fruit fleshy or berrylike, sometimes a capsule; seeds globose, arillate or not, with fleshy endosperm.—About 100 species, in the Tropics of the Old World.

1. *Sapium japonicum* (Sieb. & Zucc.) Pax & Hoffm. *Stillingia japonica* Sieb. & Zucc.; *Excoecaria japonica* (Sieb. & Zucc.) Muell.-Arg.; *Triadica japonica* (Sieb. & Zucc.) H. Baill.; *Shirakia japonica* (Sieb. & Zucc.) Hurusawa—SHIRAKI. Glabrous small tree with pale grayish branches; leaves broadly ovate, 7–15 cm. long, 5–10 cm. wide, abruptly acuminate to acute, rounded and with a pair of glands at base, vivid to deep green, entire, glaucous beneath, the petioles 2–3 cm. long, the stipules lanceolate, scarious, deciduous, 7–12 mm. long;

racemes short-pedunculate, 5–10 cm. long; staminate flowers numerous, short-pedicellate; pistillate flowers on the lower part of the spikes or racemes, the pedicels 1–2 cm. long, the calyx membranous, 3-parted, about 3 mm. long; capsules depressed-globose, about 8 mm. across, yellow with brown blotches.—May–July. Thin woods in lowlands and mountains; Honshu, Shikoku, Kyushu; rather common.—China, Korea, and Ryukyus.

11. EUPHORBIA L. TÔDAIGUSA ZOKU

Herbs or shrubs of various habit, with milky juice; leaves alternate or the upper opposite or verticillate, entire or lobed; inflorescence a cyathium composed of a cup-shaped glandular or lobed involucre that surrounds a few much-reduced staminate flowers and a central pistillate flower; staminate flowers with a single anther supported by a jointed filament and a linear or subulate sometimes obsolete bracteole; pistillate flowers with a single ovary on an accrescent stipe and sometimes with 3 scale-like perianth segments; ovary 3-locular; styles 3, free or connate at base, entire or bifid above; ovules solitary in each locule; capsules 3-valved, dehiscent, the valves bifid, the central column persistent; seeds with endosperm.—About 1,600 species, chiefly in warmer regions; sometimes split into several smaller genera.

- 1A. Glands of involucre with a petallike appendage; leaves opposite, small, the sides unequal; stipules small; seeds without appendage.
 2A. Perennial, glabrous, with thick caudex; stems tufted; leaves entire. 1. *E. atoto*
 2B. Annual, pubescent; stems single, simple or branched from base; leaves toothed.
 3A. Erect or ascending herb.
 4A. Capsules glabrous.
 5A. Leaves ovate-oblong, 4–12 mm. wide; cyathium on upper part of the branches. 2. *E. maculata*
 5B. Leaves linear, 4–6 mm. wide; cyathium axillary, with whitish glands. 3. *E. vachellii*
 4B. Capsules pilose. 4. *E. hirta*
 3B. Prostrate herbs, much-branched from the base.
 6A. Capsules glabrous. 5. *E. pseudochamaesyce*
 6B. Capsules pilose. 6. *E. supina*
 1B. Glands of involucre without petallike appendage; leaves alternate except beneath inflorescence, the sides equal; stipules absent; seeds with an appendage or caruncle.
 7A. Annuals or biennials without rhizomes.
 8A. Glands of involucre entire, transversely elliptic; seeds reticulate. 7. *E. helioscopia*
 8B. Glands of involucre lunate; seeds foveolate. 8. *E. peplus*
 7B. Perennials with rhizomes.
 9A. Glands of involucre entire.
 10A. Capsules smooth, glabrous; staminate flowers without bracteoles; rhizomes long-creeping. 9. *E. ebracteolata*
 10B. Capsules verrucose, sometimes long-pilose; staminate flowers with bracteoles at base; rhizomes short.
 11A. Involucres with 4 glands.
 12A. Capsules glabrous, verrucose.
 13A. Leaves acute to obtuse; glands flat; capsules about 3.5 mm. across. 10. *E. pekinensis*
 13B. Leaves rounded to very obtuse; glands depressed; capsules about 6 mm. across. 11. *E. jolkini*
 12B. Capsules pilose to subglabrous, obsolete verrucose. 12. *E. togakusensis*
 11B. Involucres with 5 glands; capsules verrucose, glabrous. 13. *E. adenochlora*
 9B. Glands of involucre retuse or with projections on each side.
 14A. Glands with short obtuse projections on both sides.
 15A. Stems thick, 40–60 cm. long; leaves 5–8 cm. long, green. 14. *E. sendaica*
 15B. Stems slender, 10–30 cm. long; leaves 3–4 cm. long, the upper ones yellowish. 15. *E. esula*
 14B. Glands with long acute projections on both sides. 16. *E. sieboldiana*

1. *Euphorbia atoto* Forst. f. HAMA-TAIGEKI, SUNA-TAIGEKI. Glabrous perennial with thick roots; stems many from the stout caudex, much branched, with thickened nodes; leaves thick, ovate-oblong or narrowly ovate, 2–3 cm. long, 1–1.5 cm. wide, obtuse to mucronate, obliquely rounded to shallowly cordate at base, entire; cyathia in terminal and dense axillary cymes, the branches transversely oblong; capsules about 3 mm. across, smooth, glabrous; seeds smooth, tetrahedral-ellipsoidal, about 1.5 mm. long.—Sept.–Oct. Grassy slopes near seashores; Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, s. China, India, Malaysia, and Pacific Isls.

2. *Euphorbia maculata* L. *E. hypericifolia* sensu auct. Japon., non L.; *Chamaesyce maculata* (L.) Small; *C. hyssopifolia* sensu auct. Japon., non Small.—Ô-NISHIKI-SÔ. Erect annual; stems 40–60 cm. long, terete, branched and short-puberulent, on one side in upper part; leaves rather thin, ovate-oblong or narrowly oblong, 1–3 cm. long, 3(–5)-nerved, obtuse, obliquely rounded at base, toothed, sparsely long-pilose beneath; cyathia few on the upper part of the branchlets, the glands transversely elliptic; capsules smooth, glabrous, about 1.7 mm. across, trigonous; seeds tetrahedral-ovoid, 1–1.2 mm. long, dark brown, with 2 or 3 transverse wavy lines.—Aug.–Sept. Naturalized in lowlands; Honshu.—N. America; naturalized in Europe.

3. *Euphorbia vachellii* Hook. & Arn. *E. serrulata* Reinw., non Thuill.; *Chamaesyce vachellii* (Hook. & Arn.) Hara.—MIYAKOJIMA-NISHIKI-SÔ, AWAYUKI-NISHIKI-SÔ. Glabrous annual; stems erect, branched from base, 30–50 cm. long; leaves broadly linear or linear-lanceolate, 2–4 cm. long, 4–6 mm. wide, obtuse to subacute, obliquely rounded at base, toothed, the midrib prominently raised beneath, impressed above, the lateral nerves pinnate, inconspicuous; cymes axillary, dense, the cyathia glabrous, the glands white, semirounded; capsules glabrous, smooth, slightly less than 2 mm. across, obtusely angled, the styles short, erect; seeds obovoid, about 1 mm. long, obtusely 3-ridged, with about 3 transverse wavy lines.—July–Oct. Waste grounds and cultivated fields in lowlands; Kyushu (Tanegashima).—Ryukyus, Formosa, s. China, and Malaysia.

4. *Euphorbia hirta* L. *Chamaesyce hirta* (L.) Millsp.; *E. pilulifera* sensu auct., non L.; *E. pilulifera* var. *hirta* (L.) Thell. SHIMA-NISHIKI-SÔ, TAIWAN-NISHIKI-SÔ. Ascending or erect annual; stems often branched from base, 20–40 cm. long, puberulent and pilose with multicellular spreading hairs; leaves narrowly ovate-triangular, oblong-ovate or narrowly ovate, 2.5–4 cm. long, 8–15 mm. wide, subacute, obliquely cuneate to rounded at base, obtusely serrulate, 3- or 4-nerved, loosely short-pilose on upper side, yellowish, puberulent and

pilose beneath; cymes dense, axillary, the cyathia many, the glands transversely elliptic; capsules trigonous, 1.3 mm. across, short-puberulent; seeds 0.7–0.8 mm. long, ovoid, 3-ridged, with transverse wavy lines on the face.—Aug.–Oct. Waste places and cultivated fields in lowlands; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyu, Formosa, China, and the Tropics and subtropics generally.

5. *Euphorbia pseudocharmae* Fisch., Mey., & Lallém. *E. humifusa* sensu auct. non Willd.; *Chamaesyce humifusa* sensu auct. Japon., non Prokhan.; *C. pseudocharmae* (Fisch., Mey., & Lallém.) Komar.; *E. thymifolia* sensu Thunb., non L.—NISHIKI-SŌ. Procumbent, diffuse, branched, delicate annual 10–30 cm. long, usually slightly white-pubescent; leaves obliquely oblong or obovate-oblong, 7–15 mm. long, 3–7 mm. wide, rounded at apex, obliquely rounded at base, serrulate; cymes terminal or axillary, often leafy, the cyathia few, the glands transversely elliptic; capsules glabrous, about 1.3 mm. across, trigonous, smooth; seeds grayish brown, ovoid, 0.7 mm. long, smooth.—July–Nov. Waste grounds and fields in lowlands; Honshu, Shikoku, Kyushu; common.—Ryukyu, China, Korea, Manchuria, and temperate Asia.

6. *Euphorbia supina* Raf. *Chamaesyce supina* (Raf.) Moldenke; *E. littoralis* Raf.; *E. maculata* sensu auct., non L.—KO-NISHIKI-SŌ. Procumbent, diffuse, pubescent annual 10–30 cm. long, much branched from the base; leaves oblong, elliptic or obovate-oblong, 7–10 mm. long, 2.5–4.5 mm. wide, nearly rounded to obtuse, obliquely rounded at base, serrulate, usually with a reddish brown spot in the center; cymes axillary, dense, the cyathia few, short-pilose; capsules puberulous, exerted, about 1.8 mm. across, obtusely angled; seeds tetrahedral-ellipsoidal, about 0.6 mm. long, with 3 ridges and a few transverse wavy lines on the face.—July–Nov. Waste grounds and cultivated fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; very common.—N. America.

7. *Euphorbia helioscopia* L. *Tithymalus helioscopius* (L.) Hill; *Galarhoeus helioscopius* (L.) Haw.—TŌDAIGUSA. Green biennial; stems sparsely branched at base, sparsely pubescent in upper part; leaves spatulate-obovate to obovate-cuneate, 1–3 cm. long, 6–20 mm. wide, rounded at apex, obtusely serrulate, green, the upper leaves similar, relatively large, the involucre leaves obovate or broadly so, relatively small, green; cyathia many, dense, the glands transversely elliptic, about 1 mm. long, yellowish green; capsules smooth, about 3 mm. across; seeds obovoid, brown, with raised reticulations, about 1.8 mm. across.—Apr. Waste grounds and riverbanks, sometimes cultivated fields in lowlands; Honshu, Shikoku, Kyushu; common.—Warmer regions of Eurasia.

8. *Euphorbia peplus* L. CHABO-TAIGEKI. Slender, glabrous biennial with fibrous roots; stems 10–20 cm. long, sometimes branched at base; leaves rather loose, thin, broadly ovate to elliptic, 1–2 cm. long, 7–12 mm. wide, obtuse, narrowed below to a petiolelike base, entire, green, the midrib slender, the upper (verticillate) leaves similar and slightly larger, the involucre leaves broadly ovate, 1–1.2 cm. long; cyathia pale yellow, the gland lunate, about 1 mm. wide; capsules about 2 mm. across, smooth, 3-angled; seeds about 1.5 mm. long, impressed-punctate.—May. Naturalized; Kyushu (Nagasaki).—s. Europe and the Mediterranean region.

9. *Euphorbia ebracteolata* Hayata. *Galarhoeus ebracteolatus* (Hayata) Hara; *Tithymalus ebracteolatus* (Hayata) Hara.—MARUMI-NOURUSHI. Stems erect, thick, terete, 40–

50 cm. long, the upper portions sparsely white-pubescent; leaves rather numerous, soft, broadly oblanceolate or obovate-oblong, 5–10 cm. long, 1.5–2.5 cm. wide, obtuse to rounded, gradually narrowed toward the base, entire, the midrib thick and slightly raised, sparsely white-pubescent beneath, the lateral nerves slender, the verticillate leaves similar but slightly shorter and broader, often dilated at base, the involucre leaves deltoid to ovate-deltoid, 2–3 cm. long, 1–2 cm. wide, obtuse, usually truncate at base; inflorescence rather loose, the glands of the involucre rounded-cordate, dark brown, about 2.5 mm. wide, the filaments much exerted; capsules smooth; styles slender about 3 mm. long, retuse, connate nearly to the middle.—Apr. Mountains; Hokkaido, Honshu, and (?) Kyushu.

10. *Euphorbia pekinensis* Rupr. *Galarhoeus pekinensis* (Rupr.) Hara; *Tithymalus pekinensis* (Rupr.) Hara; *E. lasiocaula* Boiss.; *E. onoei* Fr. & Sav.; *E. pekinensis* var. *japonensis* Makino; *E. pekinensis* var. *onoei* (Fr. & Sav.) Makino; *G. lasiocaula* (Boiss.) Hurusawa; *E. watanabei* Makino; *G. watanabei* (Makino) Hara; *G. lasiocaula* var. *watanabei* (Makino) Hurusawa.—TAKA-TŌDAI, IBUKI-TAIGEKI, FUJI-TAIGEKI. Stems erect from thick caudex, terete, often branched at base, 20–80 cm. long, usually white-pubescent with long curved hairs; leaves many, lanceolate to oblong, 2.5–8 cm. long, 6–12 mm. wide, obtuse or subacute, narrowed gradually toward the base, minutely toothed or nearly entire, deep green, glabrous, the involucre leaves broadly ovate, triangular-ovate, or ovate-obovate, 5–12 mm. long; inflorescence loose or rather dense, the glands of the involucre oblong, dark brown or dark purple, about 1.5 mm. across; capsules about 3.5 mm. across, with 3 or 6 longitudinal series of tubercles; seeds broadly ellipsoidal, smooth, about 1.8 mm. long.—June–July. Grassy places in lowlands and mountains; Honshu, Shikoku, Kyushu; common and variable.—Korea, China, and Manchuria.

11. *Euphorbia jolkini* Boiss. *Galarhoeus jolkini* (Boiss.) Hara; *Tithymalus jolkini* (Boiss.) Hara.—IWA-TAIGEKI. Glabrous perennial; stems erect, thick, terete, 40–80 cm. long, often branched at base; leaves numerous, rather dense, oblanceolate to linear-oblanceolate, 4–7 cm. long, 8–12 mm. wide, rounded to very obtuse at apex, entire and gradually narrowed toward the base, green, the midrib prominently raised beneath, the verticillate leaves similar, the involucre leaves oblong or elliptic, 1–2 cm. long, 6–12 mm. wide, yellowish; glands of involucre transversely flabellate-elliptic, yellowish, depressed; capsules densely tuberculate, about 6 mm. across; seeds subglobose, about 3 mm. long, smooth.—Apr.–May. Rocky places near seashores; Honshu (Awa Prov. and westw.), Shikoku, Kyushu.—s. Korea, Ryukyu, and Formosa.

12. *Euphorbia togakusensis* Hayata. *Galarhoeus togakusensis* (Hayata) Hara; *Tithymalus togakusensis* (Hayata) Hara.—HAKUSAN-TAIGEKI, MIYAMA-NOURUSHI. Stems erect, few, from a short-creeping rhizome, 40–80 cm. long, glabrous; leaves rather many, narrowly oblong or oblong-lanceolate, 5–7 cm. long, 1–2 cm. wide, obtuse or subacute, entire, glabrous, the midrib rather thick, slightly raised beneath, the verticillate leaves yellowish, rounded-ovate, 1–2 cm. long; inflorescence rather loose, the glands of the involucre transversely reniform-elliptic, brown, about 2 mm. wide; capsules about 5 mm. across, obsoletely verrucose, pilose to subglabrous; seeds subglobose, about 2.5 mm. long, smooth.—June–July. High mountains; Honshu (centr. and n. distr.).

13. *Euphorbia adenochlora* Morr. & Decne. *Galarhoeus adenochlorus* (Morr. & Decne.) Hara; *Tithymalus adenochlorus* (Morr. & Decne.) Hara; *E. palustris* sensu auct. Japon., non L.; *E. rochebrunii* Fr. & Sav.; *E. japonica* Boiss.—NOURUSHI. Stems thick, terete, erect, 40–50 cm. long, often with loosely scattered long white hairs on upper part; leaves soft, broadly oblanceolate to oblong, 5–8 cm. long, 1–2 cm. wide, obtuse to rounded, entire, the midrib thick and slightly raised beneath, the lateral nerves slender, the verticillate leaves similar but shorter, the involuclal leaves rounded to broadly ovate, 7–20 mm. long, rounded; inflorescence rather dense, yellowish, the glands of involuclres reniform, about 2 mm. wide, yellowish; capsules about 6 mm. across, verrucose; seeds subglobose, smooth, about 3 mm. long.—Apr.–May. Grassy places near rivers in lowlands; Hokkaido, Honshu, Kyushu; common.

14. *Euphorbia sendaica* Makino. *Galarhoeus sendaicus* (Makino) Hara; *Tithymalus sendaicus* (Makino) Hara.—SENDAI-TAIGEKI. Rhizomes slender, long-creeping; stems erect, about 40 cm. long, glabrous; leaves rather loose, lanceolate or oblong-lanceolate, 5–8 cm. long, 1–2 cm. wide, obtuse, glabrous, the midrib rather thick and slightly raised beneath, the verticillate leaves rather small, the involuclal leaves orbicular- or cordate-triangular, 6–15 mm. long, truncate at base; inflorescence loose, the glands of the involuclres lunate-reniform, both ends extended and obtuse, about 2.5 mm. wide; capsules smooth.—May. Honshu (Kantō Distr. and northw.); rare.

15. *Euphorbia esula* L. *Galarhoeus esula* (L.) Rydb.; *E. nakaiana* Lévl.; *G. nakaii* Hurusawa; *Tithymalus nakaianus* (Lévl.) Hara.—HAIGIKU-SŌ. Roots rather thick, elongate; stems glabrous, erect, 15–30 cm. long, terete, rather slender; leaves rather numerous, densely arranged, oblanceolate to

linear-oblanceolate, sometimes spatulate, 2–3 cm. long, 3–5 (–7) mm. wide, rounded or very obtuse, glabrous, entire, the upper leaves of sterile stems fasciculate, the verticillate leaves oblong, elliptic or ovate, rather short, broad, the involuclal leaves yellow, cordate to reniform, 5–10 mm. long, 7–15 mm. wide, truncate at base; inflorescence rather dense, the glands of the involuclres reniform, both ends slightly extended and obtuse; capsules 3–3.5 mm. across, smooth; styles short; seeds 1.7 mm. long, ovoid.—Apr.–May. Near seashores; Honshu (Tōkaidō), Kyushu.—Korea, Manchuria, Amur, Siberia, and Europe.

16. *Euphorbia sieboldiana* Morr. & Decne. *E. guilielmii* A. Gray; *E. taquetii* Lévl. & Van't; *Galarhoeus sieboldianus* (Morr. & Decne.) Hara; *E. tsukamotoi* Honda; *Tithymalus sieboldianus* (Morr. & Decne.) Hara; *E. tsukamotoi* Honda; *T. sieboldianus* (Morr. & Decne.) Hara.—NATSU-TŌDAI. Glabrous perennial with slender, creeping rhizomes; stems erect, 20–40 cm. long; leaves rather loosely arranged, soft, narrowly oblong to broadly oblanceolate, 3–6 cm. long, 7–20 mm. wide, obtuse to very obtuse, gradually narrowed toward base, entire, the midrib slender and slightly raised beneath, the lateral nerves very slender, the verticillate leaves similar but slightly larger, the involuclal leaves green, deltoid-ovate to ovate, sometimes deltoid, 1–4 cm. long, 8–25 mm. wide, obtuse to acute; inflorescence loose, the glands of involuclres reniform, with an outward pointing caudate projection at each end, dark brown or dark purple, about 3 mm. wide; capsules about 3 mm. across, smooth; seeds broadly ovoid, about 2.3 mm. long, smooth.—Apr.–July. Grassy places and thickets in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; very variable and rather common.—s. Sakhalin, s. Kuriles, Korea, and Manchuria.

Fam. 115. CALLITRICHACEAE

AWAGOKE KA Water Starwort Family

Soft, delicate herbs of wet places or aquatic; leaves opposite, linear to obovate, entire, without stipules; flowers unisexual, small, axillary, solitary or one of each sex in pairs; calyx and petals none; stamen 1 with 2 bracteoles, the filament long and slender, the anthers 2-locular; ovary sessile, 4-lobed, 4-locular; styles 2, elongate, free; ovules solitary in each locule, pendulous from the top of the locule; fruit small, 4-lobed, the lobes with acute or winged margins; seeds with a membranous testa, the endosperm fleshy, the embryo cylindric, terete, erect.—A single genus.

1. CALLITRICHÉ L. AWAGOKE ZOKU

Characters of the family. About 30 species, in wet places or aquatic; of worldwide distribution.

- 1A. Leaves obovate, small; fruit cordate-orbicular, retuse; styles very short, rather persistent, reflexed, not exceeding the sinus of the fruit; filaments much shorter than the fruit, slightly longer than the style. 1. *C. japonica*
 1B. Leaves often dimorphic, spatulate-obovate or obovate in the aerial, linear in immersed ones; fruit elliptic, scarcely retuse; styles slender and erect, as long as the fruit; filaments slightly longer than the fruit. 2. *C. verna*

1. *Callitriche japonica* Engelm. AWAGOKE. Glabrous annual; stems procumbent and diffuse, branched from the base, 1–4 cm. long, slender, densely leafy; leaves obovate or ovate-orbicular, 3–6 mm. long, 2–3 mm. wide, rounded to obtuse, abruptly narrowed to a petiolelike base, entire, slenderly 3-nerved; filament about 0.3 mm. long, the anthers yellowish, minute; fruit brown, orbicular-cordate, retuse, less than 1 mm. long, wing-margined, the styles 2, slender, reflexed.—May–June. Wet places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Ryukyus, and Formosa.

2. *Callitriche verna* L. *C. jallax* Petrov.; *C. palustris* L., pro parte; *C. stagnalis* sensu auct. Japon., non Scop.; *C. elegans* Petrov.—MIZU-HAKOBE. Annual, often growing in stagnant water; stems slender, often much elongate and loosely

leaved; immersed leaves linear, 7–15 mm. long, 1–1.5 mm. wide, truncate to emarginate, 1-nerved, the floating or aerial leaves spatulate-obovate or obovate, sometimes oblong, 6–12 mm. long, 3–5 mm. wide, rounded to emarginate, cuneate or gradually narrowed to the base, 3-nerved; filament very slender, 2–3 mm. long, the anthers cordate, yellowish; fruit elliptic to obovate-elliptic, less than 1 mm. long, scarcely emarginate, very weakly winged on margins, the styles erect, very slender, deciduous, as long as or slightly longer than the fruit; bracteoles white, 1/2–2/3 as long as the fruit.—May–Nov. Ditches and paddy fields in lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Kuriles, Sakhalin, Kamchatka, New Guinea, and widely distributed in the N. Hemisphere.

Fam. 116. BUXACEAE TsUGE KA Boxwood Family

Evergreen shrubs or small trees; leaves opposite or alternate, exstipulate; flowers unisexual, small, apetalous, without a disc; calyx 4-lobed or in pistillate flowers sometimes to 12-lobed, sometimes absent; stamens 4, opposite the calyx-lobes, or many, the anthers basifixed; ovary superior, 3-locular, rarely 2- or 4-locular, the ovules 2 in each locule, collateral, rarely solitary, pendulous; fruit a capsule or fleshy and indehiscent; seeds with endosperm.—About 6 genera, with about 50 species in the Tropics, a few in temperate regions.

- 1A. Leaves alternate, dentate, usually 3-nerved; procumbent subshrub with spicate inflorescence; pistillate flowers below. . . 1. *Pachysandra*
 1B. Leaves opposite, entire, penninerved; small to large shrubs with fasciculate flowers; pistillate flowers terminal. 2. *Buxus*

1. PACHYSANDRA Michx. FUKKI-SŌ ZOKU

Procumbent or ascending suffrutescent subshrubs; stems rather thick; leaves thick, alternate, 3-nerved, dentate; flowers unisexual, white, in erect spikes; pistillate flowers below the staminate; staminate flowers of 4 sepals and stamens, the filaments thick, longer than the sepals; pistillate flowers with 4 or more sepals; ovary 2- or 3-locular, the ovules 1 or 2 in each locule; styles 2 or 3, spreading; fruit a drupe or composed of 2- or 3-horned dehiscent capsules.—About 5 species, in e. Asia and N. America.

1. *Pachysandra terminalis* Sieb. & Zucc. FUKKI-SŌ. Stems elongate, sparsely branched, creeping and ascending, 20–30 cm. long, green, at first puberulent; leaves fasciculate and falsely verticillate, deep green, coriaceous, thick, lustrous, rhombic-obovate, 5–10 cm. long inclusive of the petiole, 2–4 cm. wide, cuneate at base, with rather acute coarse teeth on upper margin, 3-nerved, puberulous on nerves above; spikes terminal, erect, sessile, 2–4 cm. long, often becoming lateral by the elongation of the lateral shoots; bracts and sepals broadly

ovate, ciliate, 2.5–3.5 mm. long; stamens usually 4, sometimes 3, about 8 mm. long; pistillate flowers short-pedicelled; fruit a glabrous ovoid drupe, white when mature, about 1.5 cm. long, the stones ovoid, about 5 mm. long, the styles 2, persistent, thick, suberect, with minute tubercles or papillae inside.—Apr.–May. Woods in lowlands and low mountains; Hokkaido, Honshu, Shikoku, Kyushu; frequently cultivated in gardens.—China.

2. BUXUS L. TSUGE ZOKU

Evergreen shrubs or trees with scaly buds; leaves opposite, short-petiolate, entire, coriaceous, slenderly penninerved, usually glabrous, lustrous; inflorescence fasciculate, axillary and terminal on the branches with a small apetalous pistillate flower in the center surrounded by several staminate ones; pistillate flowers with 6 sepals, apetalous; ovary 3-locular; styles 3; capsules globose or obovoid, 3-valved, loculicidally dehiscent, each valve terminated by the 2 hornlike persistent lobes of the styles; seeds 2 in each locule, lustrous, oblong.—About 30 species, in Eurasia and Centr. America, abundant in se. Asia.

1. *Buxus microphylla* Sieb. & Zucc. *B. sempervirens* var. *microphylla* (Sieb. & Zucc.) Makino; *B. japonica* var. *microphylla* (Sieb. & Zucc.) Muell.-Arg.—HIME-TSUGE. Erect shrub much branched from the base, to 60 cm. high, the branches slender; leaves narrowly obovate or narrowly oblong, 1.2–2 cm. long, 4–7 mm. wide, cuneate at base, slightly thinner than in the following varieties.—Mar.–Apr. Cultivated only, not known in the wild state.

Var. *japonica* (Muell.-Arg.) Rehd. & Wils. *B. japonica* Muell.-Arg.; *B. sempervirens* var. *suffruticosa* sensu Sieb., non L.; *B. sempervirens* var. *japonica* (Muell.-Arg.) Makino.—TSUGE, ASAMA-TSUGE. Erect shrub or small tree about 1–3 m. high, with a main trunk and grayish, glabrous branches, the branchlets 4-angled; leaves coriaceous, opposite, obovate, broadly obovate or oblong, 15–25 (–30) mm. long, 7–13 (–15) mm. wide, rounded, obtuse or retuse, acute at base, nearly sessile, entire, glabrous, lustrous, green above, paler beneath, the midrib raised on both surfaces, the lateral nerves faint,

ascending, more distinct on the upper side, simple or sometimes forked; flowers pale yellow, several in axillary sessile fascicles; sepals 4, elliptic, membranous, small, about 2.5 mm. long, obtuse; stamens 4, 6–7 mm. long, the anthers pale yellow, about 1 mm. long, oblong; capsules ellipsoidal, about 1 cm. long, 3-fid; styles rather thick, persistent, ascending, each bifid when the capsules split; valves of capsule with two hornlike appendages at apex formed from the split styles; seeds black, oblong, 3-angled, smooth.—Mar.–Apr. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; local and rare; sometimes cultivated.

Var. *riparia* (Makino) Makino. *B. sempervirens* var. *riparia* Makino; *B. riparia* (Makino) Makino.—KO-TSUGE. Stems often procumbent; branches rather slender; leaves small, oblong or obovate-oblong, 1–2 cm. long, 5–8 mm. wide.—Rocks along rivers in mountains; Honshu (Kii Prov. and Chūgoku Distr.).

Fam. 117. EMPETRACEAE GANKŌ-RAN KA Crowberry Family

Shrubs; leaves evergreen, alternate, small, densely covering the branchlets, with a pulvinus at the base, exstipulate; flowers unisexual or bisexual, small, in axillary or terminal heads; sepals 4–6, subpetaloid, nearly arranged in 2 cycles; petals absent; stamens 2–4, free, the anthers small, 2-locular, longitudinally dehiscent; disc absent; ovary sessile, globose; style short, variously lobed or divided; ovules solitary in each locule, campylotropous; fruit subglobose, drupe-like, juicy, the stones 2 or more, each with a single seed; seeds with abundant endosperm, the embryo straight, the cotyledons small.—Three genera, with about seven species, in boreal and alpine regions of the N. Hemisphere and high mountain areas of S. America.

1. EMPETRUM L. GANKŌ-RAN ZOKU

Small dioecious or monoecious evergreen shrubs with long procumbent stems and branches with globose winter-buds; leaves small, linear-oblong or linear, obtuse, thick, revolute on margins, densely covering the branchlets; flowers axillary, with scaly bracts at base; sepals 3, small, rather petaloid; stamens 3, with slender filaments; styles very short; stigma 6- to 9-toothed; fruit a berrylike drupe, with 6-9 stones.—Arctic, northern, and alpine regions of the N. Hemisphere and in the alpine regions of S. America; about 5 species.

1. *Empetrum nigrum* L. var. *japonicum* K. Koch. *E. nigrum* sensu auct. Japon., non L.; *E. nigrum* var. *asiaticum* Nakai; *E. kurlense* Vass.; *E. albidum* Vass.—GANKŌ-RAN. Procumbent shrub about 10-20 cm. high, very densely branched, densely white-puberulent while young; leaves thick, coriaceous, lustrous, broadly linear, 5-6 mm. long, 0.7-0.8 mm. wide, obtuse to subrounded, spreading, slightly deflexed when old, the margins revolute and covering the under surface, both ridges slightly scabrous; flowers axillary, small, sessile, bisex-

ual or polygamous; filaments very slender, the anthers broadly ovate; fruit globose, sweet to taste, dark purple or blackish, about 6 mm. across, the stones several, semiglobose, about 1.5 mm. long, with a thick rounded back.—June-July. Forming broad, dense mats in alpine regions; Hokkaido, Honshu (centr. distr. and northw.); common. The typical phase and some other variants occur in the arctic, northern, and alpine regions of the N. Hemisphere.

Fam. 118. CORIARIACEAE DOKU-UTSUGI KA Coriaria Family

Shrubs with angular branches and scaly winter-buds; leaves opposite or verticillate, exstipulate; flowers bisexual or unisexual, small, greenish, solitary or in racemes, axillary; sepals 5, imbricate; petals small, keeled on inner side; stamens 10, free, or half of them adnate to the keel of the petals, the anthers large, longitudinally splitting; carpels 5-10, free, each 1-locular, the styles free, elongate, the ovules solitary in each locule, pendulous from the top of the locule, anatropous; fruitlets covered with the accrescent, juicy, persistent petals; seeds flat, the endosperm scanty, with a straight embryo in the center.—A single genus, in the temperate regions of e. Asia, New Zealand, the Mediterranean region, and Central and South America.

1. CORIARIA L. DOKU-UTSUGI ZOKU

The characters of the family; 8 or 9 species.

1. *Coriaria japonica* A. Gray. DOKU-UTSUGI. Glabrous, deciduous shrub; branches rather thick, elongate, the branchlets 4-angled; leaves nearly sessile, opposite, in 2 rows on branchlets (appearing as though the branchlets were pinnate leaves), ovate, or ovate-oblong, 6-8 cm. long, 2-3.5 cm. wide, gradually acuminate, rounded at base, 3-nerved; racemes pistillate and staminate, arising from lateral buds of the preceding year's growth, without subtending normal leaves; staminate racemes 2-3 cm. long, the bracts and 1 or 2 pairs of scalelike leaves above, membranous, 3-5 mm. long, the

pedicels about half as long as the bracts; sepals about 3.5 mm. long, membranous; stamens 8-10; pistillate racemes 8-15 cm. long, including the peduncles, the scalelike leaves rounded, sometimes green and somewhat leaflike, the bracts greenish, recurved, the pedicels 7-10 mm. long, spreading; petals accrescent after anthesis and enclosing the fruit, 5-6 mm. long, juicy, becoming dark reddish purple; fruitlets obliquely ovate, rather thick, 4 mm. long, with few longitudinal striations on the back.—May. Thickets in mountains and hills; Hokkaido, Honshu (Kinki Distr. and eastw.); locally abundant.

Fam. 119. ANACARDIACEAE URUSHI KA Sumac Family

Trees or shrubs; leaves alternate or rarely opposite, usually odd-pinnate, without stipules; flowers bisexual or unisexual, actinomorphic; sepals variously lobed; petals 3-7 or absent, free, rarely connate; disc present; stamens usually twice as many as the petals, rarely as many or numerous, the anthers 2-locular, longitudinally dehiscent; ovary superior, 1-locular, rarely 2- to 5-locular; styles 1-3; ovules solitary in each locule, pendulous; fruit usually a drupe; seeds without endosperm or endosperm very scanty, the cotyledons fleshy.—About 70 genera, with about 600 species, chiefly in the Tropics.

- 1A. Styles 3; ovary 1-locular, 1-ovuled; fruit 1-seeded. 1. *Rhus*
 1B. Styles 5; ovary 5-locular, 5-ovuled; fruit 3- to 5-seeded. 2. *Choerospondias*

1. RHUS L. URUSHI ZOKU

Deciduous or evergreen, dioecious or polygamous, trees or shrubs, sometimes scandent, with naked winter-buds; leaves alternate, ternate or odd-pinnate, rarely simple; flowers small, in axillary or terminal panicles; sepals 4-6, small, connate at base, persistent, imbricate; petals 4-6, imbricate; disc annular; stamens 4-6, at the base of the disc, free; ovary sessile; styles 3, free or connate, the stigma capitate; ovules solitary; fruit a small, slightly depressed drupe, the stones coriaceous or horny; cotyledons flat.—About 150 species, in temperate and tropical regions.

- 1A. Scandent woody plants with 3-foliolate leaves; inflorescence axillary. 1. *R. ambigua*
 1B. Erect trees with odd-pinnate leaves, the leaflets more than 3.

2A. Panicles axillary; leaf rachis wingless; fruit whitish.

3A. Fruit glabrous.

4A. Branchlets and leaves glabrous.

4B. Branches and under side of leaflets on nerves pubescent.

5A. Leaflets to 16 cm. long, 7 cm. wide; lateral nerves rather distant, more than 5 mm. apart. 2. *R. succedanea*

5B. Leaflets to 12 cm. long, 4 cm. wide; lateral nerves close together, about 5 mm. or less apart. 3. *R. verniciflua*

3B. Fruit hispid; leaflets 4–10 cm. long, pubescent beneath. 4. *R. sylvestris*

2B. Panicles terminal; leaf rachis winged; fruit red when mature, hairy. 5. *R. trichocarpa*

2B. Panicles terminal; leaf rachis winged; fruit red when mature, hairy. 6. *R. javanica*

1. *Rhus ambigua* Lavall. ex Dipp. *R. orientalis* (Greene) C. K. Schn.; *R. toxicodendron* var. *radicans* sensu auct. Japon., non A. Gray; *R. toxicodendron* var. *hispid* Engl.; *Toxicodendron orientale* Greene—TSUTA-URUSHI. Woody dioecious vine with aerial climbing roots; branchlets with short, appressed brown puberulence; leaves with petioles 3–6 cm. long, the leaflets 3, elliptic or ovate, 5–15 cm. long, 3–8(–10) cm. wide, abruptly acuminate, obtuse to subacute at base, the terminal one short-petioled, the lateral ones nearly sessile, entire in the adult, often appressed-pubescent on nerves, with persistent axillary tufts of hairs beneath, glabrous on upper side; inflorescence axillary, 3–5 cm. long; flowers short-pedicellate, the petals pale yellow, about 3 mm. long, oblong, recurved above; fruit pale yellow, obliquely depressed-globose, 5–6 mm. long, glabrous or sparsely spiny-hispid.—May–June. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common; poisonous.—Sakhalin, s. Kuriles, China, and Formosa.—Forma *rishiriensis* (Nakai) Hara. *R. rishiriensis* Nakai.—RISHIRI-TSUTA-URUSHI. Stems to 2 m. long, scarcely scandent.—Reported from Hokkaido.

2. *Rhus succedanea* L. *R. succedanea* var. *japonica* Engl.; *Toxicodendron succedaneum* (L.) O. Kuntze.—HAZE, RYŪKYŪ-HAZE, HAZE-NO-KI. Deciduous, dioecious tree, glabrous except for yellowish brown pubescence on the margins and inner sides of the bud-scales; branches rather thick; leaves odd-pinnate, 25–35 cm. long inclusive of the petioles 6–8 cm. long, the leaflets 9–15, broadly lanceolate or narrowly oblong, 5–9 cm. long, 18–30 mm. wide, long-acuminate, acutish on inner side, semirounded on outer side at base, entire, sometimes glaucous beneath, the lateral nerves close together, 4 mm. or less apart, the rachis terete, wingless; panicles axillary, peduncled, 10–20 cm. long inclusive of the peduncles; flowers small, yellowish green; fruit depressed-globose, 8–10 mm. across, slightly flattened, lustrous, glabrous, smooth, pale yellow.—May–June. Honshu, Shikoku, Kyushu; often planted for yielding wax.—Ryukyus, Formosa, China, Malaysia, and India.

3. *Rhus verniciflua* Stokes. *R. vernicifera* DC.; *R. kamperleri* Sweet.—URUSHI. Deciduous, dioecious tree; branches thick, with numerous, prominently raised lenticels, with yellowish brown hairs while young; leaves 10–30 cm. long, on petioles 4–10 cm. long, the leaflets 9–11, ovate-oblong, sometimes ovate or oblong, 7–15 cm. long, 3–6 cm. wide, abruptly acuminate, subobtusate at base, slightly oblique in the lateral ones, entire, often pilose on upper side, spreading-pubescent at least on nerves beneath; panicles 15–30 cm. long,

with spreading yellowish brown hairs; flowers yellowish green; fruit slightly flattened, 6–8 mm. long, pale yellow, smooth, lustrous.—May. Cultivated in the warmer parts of our area for the production of lacquer.—China and India. Poisonous.

4. *Rhus sylvestris* Sieb. & Zucc. *Toxicodendron sylvestre* (Sieb. & Zucc.) O. Kuntze.—YAMA-HAZE, HAZE. Deciduous tree; branches thick, densely yellowish brown pubescent; leaves 25–40 cm. long inclusive of the petiole, the leaflets 9–13, yellowish brown pubescent, broadly lanceolate to narrowly oblong, 7–12 cm. long, 2–4 cm. wide, short- or abruptly acuminate, obliquely rounded to broadly cuneate at base, entire, the lateral nerves numerous, rather densely parallel, slightly arcuate above; inflorescence a panicle 8–15 cm. long, spreading-pilose; fruit yellow-brown, rather flat, compressed-globose, 8–10 mm. across, glabrous.—May–June. Low mountains; Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China, and Korea.

5. *Rhus trichocarpa* Miq. *Toxicodendron trichocarpum* (Miq.) O. Kuntze.—YAMA-URUSHI. Deciduous, dioecious tree; branches thick, yellowish brown pubescent; leaves 25–45 cm. long inclusive of the petiole, the leaflets 13–17, ovate, obovate-elliptic or elliptic, 5–10 cm. long, 3–5 cm. wide, abruptly acute, slightly oblique at base, entire or coarsely toothed, yellowish brown pubescent beneath; panicles axillary, 15–30 cm. long inclusive of the peduncle, yellowish brown pubescent; flowers yellowish green, small, short-pedicellate; filaments slender, longer than the petals; fruit obliquely compressed-globose, 5–6 mm. across, yellowish, short-hispid, the exocarp easily peeled off and exposing the whitish mesocarp.—May–June. Hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—s. Kuriles, Korea, and China.

6. *Rhus javanica* L. *R. chinensis* Mill.; *R. semialata* Murr.; *R. semialata* var. *osbeckii* DC.; *R. osbeckii* (DC.) Decne. ex Steud.—NURUDE, FUSHI-NO-KI. Deciduous, dioecious tree; branches rather thick, densely yellowish brown pubescent when young; leaves 25–40 cm. long inclusive of the petiole, the rachis winged, the leaflets 7–13, oblong to ovate-oblong, 5–12 cm. long, 2.5–6 cm. wide, abruptly acuminate, cuneate to rounded at base, coarsely toothed, glabrate on upper side, brownish pubescent beneath; panicles terminal, broad, 15–30 cm. long, brownish pubescent; flowers yellowish, small; filaments nearly as long as the petals; fruit subglobose, reddish yellow, densely yellowish brown puberulent, about 4 mm. across.—Aug.–Sept. Hills, lowlands, and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Ryukyus, Formosa, Korea, Manchuria, and China to Malaysia.

2. CHOEROSPONDIAS Burtt & A. W. Hill CHANCHIN-MODOKI ZOKU

Polygamodioecious trees; leaves odd-pinnate, the leaflets 7–15, entire, the lateral nerves spreading; staminate flowers in panicles, the pistillate solitary or few; calyx cup-shaped, obtusely 5-lobed; petals 5, free, imbricate; stamens 10, the filaments connate and adnate to the 10-lobed disc at the base; ovary superior, ovoid, 5-locular; styles 5, free just below the apex, the stigma capitate; ovules solitary in each locule, pendulous; fruit ovoid, drupe-like, the stone surrounding the seeds horny, 5-locular, each with a membranous pore at apex.—A single species.

1. **Choerospondias axillaris** (Roxb.) Burt & A. W. Hill var. *japonica* (Ohwi) Ohwi. *Poupartia jordii* var. *japonica* Ohwi; *P. jordii* sensu auct. Japon., non Hemsl.; *C. axillaris* sensu auct. Japon., non Burt & A. W. Hill; *P. axillaris* sensu auct. Japon., non King & Prain—CHANCHIN-MODOKI. Deciduous apparently dioecious tree, with glabrous rather thick branches; leaves fasciculate at the ends of the branches, the leaflets 7-9, prominently petioluled, rather membranous, ovate to ovate-oblong, 4-8 cm. long, 1.5-3 cm. wide, acuminate, rounded to abruptly acute at base, entire, sparsely furfuraceous-

puberulous on upper side while young, soon glabrous, slightly glaucescent and with sparse axillary tufts of hairs beneath; flowers chocolate-brown, the staminate many, in panicles, about 3 mm. across, the petals oblong, obtuse, 3 mm. long, recurved above, the stamens 10; pistillate flowers solitary in leaf-axils, about 8 mm. across, the peduncle with 2 caducous, membranous, narrow, ciliate bracts at or above the middle, the petals about 7 mm. long, the staminodes 10, glabrous; fruits ellipsoidal, about 2.5 cm. long, edible.—May. Kyushu; rare. —The typical phase occurs in China and India.

Fam. 120. AQUIFOLIACEAE MOCHI-NO-KI KA Holly Family

Trees or shrubs; leaves deciduous or evergreen, alternate, simple, exstipulate; flowers actinomorphic, bisexual or unisexual, in cymes, fascicles, or solitary; calyx-lobes imbricate; petals 4 or 5, free or connate at base, imbricate; stamens as many as the petals or rarely more, free, the anthers 2-locular, splitting longitudinally; disc absent; ovary with 3 or more locules, the style simple, sometimes absent, the ovules 1 or 2 in each locule, pendulous; fruit a drupe, with 3 or more 1-seeded stones; seeds with abundant endosperm, the embryo small, straight.—Three genera, with about 300 species, in the N. Hemisphere, a few in the Tropics, especially in America.

1. ILEX L. MOCHI-NO-KI ZOKU

Dioecious or polygamous trees or shrubs; leaves alternate, entire or toothed; peduncles axillary, few-flowered, sometimes branched; flowers whitish, small, usually unisexual; calyx-lobes 4 or 5, small; corolla rotate, the petals 4 or 5; stamens as many as the petals; ovary 4 or 5 (-8)-locular; style short, thick or none; drupe globose, with 4-8 horny or crustaceous stones (pyrenes). —About 300 species in temperate regions and in tropical and subtropical America.

- 1A. Leaves membranous, deciduous.
 - 2A. Pyrenes sulcate on back; leaves and flowers often fasciculate at ends of short spurlike branches. 1. *I. macropoda*
 - 2B. Pyrenes not sulcate, smooth; short spurs absent; leaves alternate on the elongate branches.
 - 3A. Fruit pendulous on slender peduncles 2-3.5 cm. long. 2. *I. geniculata*
 - 3B. Fruit on short peduncles, not pendulous.
 - 4A. Leaves rounded at base, 8-13 cm. long exclusive of the 2-3 cm. long petioles. 3. *I. micrococca*
 - 4B. Leaves cuneate to acute at base, the petioles 2-13 mm. long.
 - 5A. Leaves broadly oblanceolate, 4-13 cm. long, prominently cuneate at base; petioles 8-12 mm. long. 4. *I. nipponica*
 - 5B. Leaves elliptic to oblong, 2.5-8 cm. long, acute or subcuneate at base; petioles 4-8 mm. long. 5. *I. serrata*
- 1B. Leaves coriaceous, usually lustrous, evergreen.
 - 6A. Peduncles in axils of the current year's branches, 1- to few-flowered.
 - 7A. Leaves serrate. 6. *I. chinensis*
 - 8A. Leaves 8-15 cm. long, obtusely appressed-serrate.
 - 8B. Leaves usually not exceeding 4 cm. long.
 - 9A. Leaves without glandular dots beneath; fruit red when mature, the peduncles 1.5-4 cm. long. 7. *I. sugerokii*
 - 9B. Leaves glandular spotted beneath; fruit black when mature, on peduncles less than 1.5 cm. long. 8. *I. crenata*
 - 7B. Leaves entire.
 - 10A. Peduncles 3-5 cm. long, with 1-3 ripe fruits. 9. *I. pedunculosa*
 - 10B. Peduncles 1-2 cm. long, with 3-8 ripe fruits. 10. *I. rotunda*
- 6B. Peduncles in axils of the preceding year's branches, short or very short.
- 11A. Leaves with impressed veinlets on upper side; stems low, creeping, sparsely branched, the branches angular.
- 12A. Leaves 2-4 cm. long. 11. *I. rugosa*
- 12B. Leaves 5-7 cm. long. 12. *I. × makinoi*
- 11B. Leaves flat or with scarcely impressed or raised veinlets.
- 13A. Leaves entire or nearly so.
- 14A. Shrub, long-creeping at base, with ascending branches; leaves 8-15 cm. long. 13. *I. leucoclada*
- 14B. Trees; leaves 2.5-6 cm. long.
- 15A. Fruit about 1 cm. across; leaves 5-8 cm. long. 14. *I. integra*
- 15B. Fruit about 3 mm. across; leaves 3-6 cm. long. 15. *I. goshiensis*
- 13B. Leaves toothed, sometimes obsoletely so.
- 16A. Leaves 10-20 cm. long, thick-coriaceous, with distinct, mucronate teeth. 16. *I. latifolia*
- 16B. Leaves 3-8 cm. long, thinner, the teeth obscure or confined to the upper half.
- 17A. Pedicels 1-3 mm. long; petioles 4-8 mm. long. 17. *I. buergeri*
- 17B. Pedicels 10-15 mm. long; petioles 10-16 mm. long. 18. *I. liukiuensis*

1. **Ilex macropoda** Miq. *I. dubia* var. *macropoda* (Miq.) Loesen.; *I. monticola* var. *macropoda* (Miq.) Rehd.; *I. montana* var. *macropoda* (Miq.) Fern.; *I. macropoda* var. *stenophylla* Koidz.—AO-HADA. Glabrous tree with grayish

branches; leaves membranous, ovate or broadly so, 4-7 cm. long, 2.5-4 cm. wide, abruptly or shortly acuminate, acute to rounded at base, mucronate, serrate, sparsely puberulous or nearly glabrous on upper side, with spreading pubescence

especially on nerves beneath, pale green and lustrous beneath, the petioles 1-2 cm. long; flowers on short spurs, greenish white, about 4 mm. across, the pedicels slender, 6-12 mm. long; calyx 4- to 5-lobed, ciliate; petals elliptic, about 2.5 mm. long; stamens 4 or 5; fruit globose-ellipsoidal, about 7 mm. long, red, the pyrenes shallowly grooved.—Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea and China.—Forma *pseudomacropoda* (Loesen.) Hara. *I. dubia* var. *pseudomacropoda* Loesen.; *I. macropoda* var. *pseudomacropoda* (Loesen.) Nakai—KE-NASHI-OK-HADA. Leaves glabrous beneath. Occurs with the typical phase.

2. *Ilex geniculata* Maxim. FÜRIN-UME-MODOKI. Glabrous deciduous tree, with grayish brown slender branches; leaves membranous, elliptic, ovate, or oblong, 4-10 cm. long, 2.5-5 cm. wide, acuminate or abruptly so, rounded at base, with short obtuse and mucronate teeth on margin, sparsely puberulous on upper side, paler and often spreading-pilose, especially on the nerves beneath, the petioles 7-10 mm. long; flowers white, 1-3 on slender peduncles 2.5-3.5 cm. long, the pedicels 1-2 cm. long; calyx-lobes semirounded, ciliate; petals about 2 mm. long; stamens shorter than the petals; fruit pendulous, globose, about 4 mm. across, the pyrenes smooth.—June-Aug. Mountains; Honshu, Shikoku, Kyushu.

Var. *glabra* Okuyama. OKUNO-FÜRIN-UME-MODOKI. Leaves glabrous beneath.—Honshu (n. distr.).

3. *Ilex micrococca* Maxim. TAMA-MIZUKI. Glabrous, deciduous tree with rather stout grayish brown branchlets; leaves chartaceous, ovate-oblong or oblong, 8-13 cm. long, 3-4.5 cm. wide, abruptly acuminate and somewhat obtuse at tip, rounded to subacute at base, shallowly mucronate-toothed, yellowish green beneath, the costa impressed above, the veins slightly raised beneath, the petioles 2-3 cm. long, reddish; cymes axillary, rather densely many-flowered, the peduncle 1-1.5 cm. long; pistillate flowers about 3.5 mm. across; petals and reduced stamens 6-8; drupe globose, short pedicellate, red, about 3 mm. across.—May. Mountains; Honshu (Tōtōmi, Mino, and westw.), Shikoku, Kyushu.

4. *Ilex nipponica* Makino. *I. spathulata* Koidz.; *I. nemotoi* sensu Ohwi, non Makino; *I. serrata* var. *nipponica* (Makino) Ohwi—MIYAMA-UME-MODOKI, HOSOKA-UME-MODOKI. Deciduous shrub with nearly glabrous branches; leaves rather thick-membranous, broadly oblanceolate to obovate, 4-13 cm. long, acuminate to rounded at apex, cuneate at base, with short mucronulate scattered teeth, slightly puberulous on both surfaces while young, the petioles 8-12 mm. long; pistillate flowers white, 3-7, clustered, about 0.7 mm. long, about 5 mm. across, on a short peduncle, the pedicels 4-8 mm. long; calyx-lobes triangular to semirounded, obtuse, ciliate; fruit globose, red, about 6 mm. across.—May-June. Wet places in mountains; Honshu (Hokuriku Distr. and northw.).

5. *Ilex serrata* Thunb. *I. serrata* var. *sieboldii* (Miq.) Rehd.; *I. sieboldii* Miq.; *I. subtilis* Miq.; *I. serrata* var. *subtilis* (Miq.) Yatabe; *I. serrata* forma *subtilis* (Miq.) Ohwi; *I. nemotoi* Makino—UME-MODOKI. Much-branched dioecious shrub with slender grayish brown branches puberulous while young; leaves oblong to elliptic or obovate-elliptic, 4-8 cm. long, abruptly acuminate to acute, acute to subcuneate at base, with minute mucronate teeth, puberulous on both surfaces, paler beneath, the petioles 4-8 mm. long; flowers pale purple to white, about 3.5 mm. across, the pistillate 1-7, the staminate 7-15, fasciculate on very short axillary peduncles, the pedicels 2-4

mm. long; fruit red, globose, about 5 mm. long.—June. Wet places in mountains; Honshu, Shikoku, Kyushu; common; variable.

Var. *argutidens* (Miq.) Rehd. *I. argutidens* Miq.—INU-UME-MODOKI. Leaves and branches glabrous. With the typical phase.

Frequently cultivated are:—Cv. *Xanthocarpa*. *I. serrata* forma *xanthocarpa* (Rehd.) Rehd.; *I. serrata* var. *xanthocarpa* Rehd.—KIMI-NO-UME-MODOKI. Fruit yellow.—Cv. *Leucocarpa*. *I. serrata* forma *leucocarpa* Beissn.—SHIRO-UME-MODOKI. Fruit white.

6. *Ilex chinensis* Sims. *I. purpurea* Hassk.; *I. oldhamii* Miq.; *I. purpurea* var. *oldhamii* (Miq.) Loes.—NANAMI-NO-KI, NANAME-NO-KI. Nearly glabrous dioecious evergreen tree dark brown when dried, the branches dark gray; leaves rather coriaceous, oblong or narrowly so, 7-12 cm. long, 2.5-5 cm. wide, caudately elongate with an acute to subobtusate tip, with scattered short teeth, the petioles 1-1.5 cm. long; inflorescence solitary in axils of the current year's shoots, the peduncles 5-10 mm. long, rather thick and flat, the pedicels 2-7, 4-6 mm. long; flowers about 5 mm. across; calyx-lobes semirounded to deltoid, ciliate; petals slightly reflexed; stamens 4; fruit globose, red, about 6 mm. across.—June. Mountains and hills; Honshu (Suruga Prov. and westw.), Shikoku, Kyushu.—China.

7. *Ilex sugerokii** Maxim. var. *brevipedunculata* (Maxim.) S. Y. Hu. *I. sugeroki* forma *brevipedunculata* Maxim.; *I. sugeroki* subsp. *brevipedunculata* (Maxim.) Makino—AKAMI-NO-INU-TSUGE. Evergreen shrub with pale brown branches and often glabrous branchlets, spreading-puberulent while young; leaves coriaceous, many, ovate, oblong, or oblong-obovate, 2-3.5 cm. long, 1-2 cm. wide, acute with an obtuse tip, acute to obtuse at base, with short obtuse teeth on upper margin, lustrous, glabrous, deep green above, paler beneath, the midrib slightly raised on both surfaces, the lateral nerves obsolete, the petioles 2-4 mm. long, reddish; inflorescence glabrous, axillary on lower part of the branchlets, the pedicels 1-1.5 cm. long; pistillate flowers solitary, the staminate 1-3; stamens 4-5; fruit globose, red, about 7 mm. across.—July. High mountains; Hokkaido, Honshu (centr. distr. and northw.); locally abundant.

Var. *longipedunculata* (Maxim.) Makino. *I. sugeroki* forma *longipedunculata* Maxim.; *I. sugeroki* subsp. *longipedunculata* (Maxim.) Makino; *I. sugeroki* var. *longipedunculata* Koidz.—USHI-KABA, KURO-SOYOGO, ABURAGI. Small tree; leaves elliptic, oblong, or ovate, 3-4 cm. long, 1.5-2.5 cm. wide; pedicels 2-3 cm. long.—July. Honshu (Mikawa and Shinano Prov. and westw.).

8. *Ilex crenata* Thunb. *Celastrus adenophylla* Miq.; *I. crenata* var. *typica* forma *genuina* Loes.—INU-TSUGE. Evergreen shrub or small tree with densely and repeatedly ramulose grayish branches, the branchlets minutely puberulous; leaves elliptic, oblong, or narrowly obovate, 1.5-3 cm. long, 6-20 mm. wide, acute or obtuse, acute or cuneate at base, with appressed teeth, glabrous, lustrous and deep green above, paler and with scattered sessile pellucid glands beneath, the midrib raised beneath, the lateral nerves obsolete, the petioles 1-5 mm. long, usually puberulous; staminate flowers

* Spelling "sugerokii" is based upon the recommendation in the International Code of Botanical Nomenclature in the use of "ii." The specific name is based on the personal name, Sukeroku Mizutani or Sugeroku Mizutani.

few, fasciculate, sometimes on very short peduncles, the pedicels 3-5 mm. long, the pistillate solitary; petals white, about 2 mm. long; stamens 4; fruit globose, black, about 6 mm. across.—June-July. Thickets and wet places in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable; often planted as a hedge, with a few cultivars in gardens.

Var. *fukasawana* Makino. TSUKUSHI-INU-TSUGE. Branches prominently angled; leaves chartaceous, oblong, 2.5-4 cm. long.—Kyushu. (?) Amami-Oshima.

Var. *mutchagara* (Makino) Ohwi. *I. mutchagara* Makino—SHIMA-INU-TSUGE. Larger shrub with prominently angled branches; leaves thinner, broadly lanceolate to obovate-oblong, 2.5-5 cm. long, 1-1.5 cm. wide, usually obtuse, cuneate at base; pedicels of fruit 7-10 mm. long.—Kyushu (s. distr. and Yakushima).—Ryukyus and Formosa.

Var. *paludosa* (Nakai) Hara. *I. radicans* Nakai; *I. crenata* subsp. *radicans* Tatew.; *I. crenata* var. *radicans* (Nakai) Ohwi; *I. radicans* var. *paludosa* Nakai—HAI-INU-TSUGE, YACHI-INU-TSUGE. Similar to the typical phase but with low creeping stems and branches.—Wet, swampy places; Hokkaido, Honshu (Japan Sea side).—s. Kuriles and s. Sakhalin.

9. *Ilex pedunculosa* Miq. *I. pedunculosa* forma *genuina* Loesen.; *I. fujisanensis* Sakata—Soyogo. Glabrous evergreen shrub or small tree with grayish branches; leaves rather coriaceous, ovate-elliptic, 4-8 cm. long, 2.5-3 cm. wide, acuminate to abruptly cuspidate, entire, deep green and lustrous on upper side, dark-brown when dried, the midrib raised beneath, the lateral nerves obsolete, the petioles reddish, 1-2 cm. long; flowers white, about 4 mm. across, the peduncles 2-5 cm. long, the pedicels 1-5, umbellate, 1-2 cm. long; fruit red, globose, nodding, about 7 mm. across.—June. Mountains; Honshu (Shinano and Kai Prov. and westw.), Shikoku, Kyushu.—Forma *aurantiaca* (Koidz.) Ohwi. *I. pedunculosa* var. *aurantiaca* Koidz.—KIMI-SOYOGO. Fruit yellow.—Forma *variegata* (Nakai) Ohwi. *I. pedunculosa* var. *variegata* Nakai—FURI-SOYOGO. Leaves variegated.

Var. *senjoensis* (Hayashi) Hara. *I. senjoensis* Hayashi—TAKANE-SOYOGO. Low shrub with low creeping sparsely branching stems and 6-merous flowers.—High mountains of Honshu (Mount Senjo in Shinano Prov.).

10. *Ilex rotunda* Thunb. KUROGANE-MOCHI. Glabrous evergreen tree with dark brown branches; leaves coriaceous, elliptic to broadly elliptic, 5-8 cm. long, 3-4 cm. wide, entire, acute or acute with an obtuse tip, obtuse at base, brownish when dried, the midrib raised beneath, narrowly grooved on upper side, the petioles 1.5-2.5 cm. long; inflorescence few-flowered, the peduncles 7-10 mm. long, the pedicels shorter than the peduncles; flowers about 4 mm. across; petals elliptic, about 3 mm. long, reflexed; stamens 4 or 5, slightly longer than the petals; fruit globose or broadly ellipsoidal, red, 5-8 mm. long.—June. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; frequently cultivated in gardens.—Ryukyus, Formosa, China, and Korea.

11. *Ilex rugosa* F. Schmidt. TSURU-TSUGE. Dwarf, long-creeping, glabrous shrub, sparsely branched, angled, punctulate, green; leaves densely disposed, coriaceous, broadly lanceolate to ovate-oblong, 2-3.5 cm. long, 5-15 mm. wide, obtuse to acute with an obtuse tip, obtuse at base, obtusely serrate, lustrous, deep-green, paler beneath, dark brown when dry, the midrib, lateral nerves, and veinlets impressed on upper side, slightly raised beneath, the petioles 2-5 mm. long; flowers

white, about 5 mm. across, 1 to few, fasciculate, axillary, the pedicels 3-7 mm. long; fruit red, globose, about 5 mm. across.—June. Coniferous woods; Hokkaido, Honshu (Yamato Prov. and eastw.), Shikoku, Kyushu.—Sakhalin and s. Kuriles.

Var. *vegeta* Hara. MARUBA-TSURU-TSUGE. Larger leaves to 4 cm. long, 2.3 cm. wide.—Western (Kinki Distr. and westw.).

Var. *stenophylla* (Koidz.) Sugimoto. *I. stenophylla* Koidz.—HOSABA-TSURU-TSUGE. Leaves usually narrower, usually lanceolate to broadly linear.—Honshu, Shikoku, Kyushu.

12. *Ilex* × *makinoi* Hara. *I. rugosa* var. *jauriei* Loesen.; *I. jauriei* (Loes.) Makino, non Gand.—Ō-TSURU-TSUGE. Alleged hybrid of *I. leucoclada* × *I. rugosa*, differing from *I. rugosa* in the larger parts, scarcely punctulate branches, narrowly oblong, subacute leaves 5-7 cm. long, becoming grayish to brownish green when dried, and by the less prominently impressed nerves and veinlets.—Hokkaido, Honshu (n. distr.).

13. *Ilex leucoclada* (Maxim.) Makino. *I. integra* var. *leucoclada* Maxim.—HIME-MOCHI. Small evergreen, glabrous shrub with thick, elongate, terete, grayish branches ascending from a long creeping base; leaves somewhat coriaceous, narrowly oblong, broadly oblanceolate or narrowly obovate-oblong, 8-15 cm. long, 2-4 cm. wide, acute with an obtuse tip, entire or crenate-serrate on upper margin, flat and deep green on upper side, paler beneath, brownish when dried, the midrib raised beneath, the lateral nerves and veinlets slender, obsolete to only slightly raised on both surfaces, the petioles 1-1.5 cm. long, often glaucous; flowers white, about 7 mm. across, few, axillary, the peduncle nearly obsolete, the pedicels 1.2-2 cm. long in fruit; petals about 4 mm. long; fruit globose, red, about 10 mm. across.—May-June. Woods in mountains; Hokkaido (sw. distr.), Honshu (Japan Sea side as far west as Chūgoku Distr.).

14. *Ilex integra* Thunb. *Othra japonica* Thunb.; *I. othra* (Thunb.) Spreng.; *I. asiatica* Spreng.; *I. integra* var. *typica* Loes.—MOCHI-NO-KI. Small, glabrous, evergreen tree with thick, terete branches; leaves coriaceous, 5-8 cm. long, 2-3.5 cm. wide, abruptly acute, with an obtuse tip, acute to cuneate at base, entire, deep-green, lustrous, pale yellowish green with the midrib prominently raised beneath, the lateral nerves sometimes slightly distinct beneath, the petioles 7-12 mm. long; flowers yellowish green, about 8 mm. across, the pistillate 1 or 2, axillary, the staminate few, the pedicels 5-10 mm. long; petals spreading, oblong, 3.5-4 mm. long; stamens 4; fruit globose, red, about 1 cm. across.—Apr. Thickets and woods on low mountains especially near the sea; Honshu, Shikoku, Kyushu.—Ryukyus, Formosa, and China.—Forma *ellipsoidea* (Y. Okamoto) Ohwi. *I. ellipsoidea* Y. Okamoto—INU-MOCHI. A rare spontaneous phase with ellipsoidal fruit.—Cv. *Xanthocarpa*. *I. integra* forma *xanthocarpa* (Matsum. & Nakai) Ohwi; *I. integra* var. *xanthocarpa* Matsum. & Nakai—KIMI-NO-MOCHI-NO-KI. Fruit yellow; cultivated.

15. *Ilex goshiensis* Hayata. *I. hanceana* sensu auct. Japon., non Maxim.; *I. hanceana* forma *goshiensis* (Hayata) Yamamoto; *I. hayataiana* Loes.—TSUGE-MOCHI. Small tree, the branches slender, much-branched, the branchlets, petioles, inflorescence, and calyx puberulous while young; leaves coriaceous, elliptic to obovate or oblong, 3-6 cm. long, 1.5-2.5 cm. wide, acute or obtuse with an obtuse tip, entire,

grayish green when dried, flat and scarcely lustrous on upper side, the petioles 4-7 mm. long, often reddish, winged in upper part; inflorescence fasciculate, 2- to 7-flowered, the peduncles nearly obsolete, the pedicels 2-3 mm. long; calyx-lobes short, semirounded, puberulous and ciliate; fruit globose, red, about 3.5 mm. across.—Honshu (Ise and Kii Prov.), Shikoku, Kyushu.—Ryukyus and Formosa.

16. *Ilex latifolia* Thunb. *I. macrophylla* Bl.; *I. tarajo* Hort. ex Goepf.—TARA-YŌ. Evergreen glabrous tree, the branches thick, terete, the branchlets green, densely elevate-punctulate; leaves firmly coriaceous, oblong to narrowly so, 12-17 cm. long, 4-8 cm. wide, acute to acuminate with an obtuse tip, rounded to obtuse at base, callosely mucronate-serrate, deep green and lustrous above, yellowish green beneath, the midrib impressed above, raised beneath, the lateral nerves slightly distinct above, the petioles thick, 2-2.5 cm. long, green; flowers many, fasciculate, axillary, yellowish green, the pedicels 7-12 mm. long; stamens 4, about 3 mm. long, as long as to slightly longer than the recurved petals; fruits globose, red, about 8 mm. across.—May. Honshu (s. Kinki Distr. and westw.), Shikoku, Kyushu; frequently cultivated around temples.

17. *Ilex buergeri* Miq. *I. subpuberula* Miq.; *I. buergeri* var. *subpuberula* (Miq.) Loes.—SHII-MOCHI, HIZEN-MOCHI. Small evergreen tree with rather slender, much ramulose and slightly angled branches, puberulous when young; leaves rather thinly coriaceous, oblong to narrowly so, or ovate-

oblong, 4-8 cm. long, 1.5-3 cm. wide, caudately acuminate to abruptly acute with an obtuse tip, acute or broadly cuneate at base, remotely obtuse-toothed sometimes on upper half, greenish yellow when dried, lustrous on upper side, the midrib prominently impressed above, raised beneath, the lateral nerves indistinct, the petioles rather slender, 4-8 mm. long; flowers about 6 mm. across, few to rather numerous, axillary, the peduncles absent, the pedicels 1-3 mm. long; petals recurved, 2.5-3 mm. long; stamens 4 or 5, erect, longer than the petals; fruits few, globose, red, 5-6 mm. across.—Apr.-May. Honshu (Chūgoku Distr.), Kyushu; rare.

Ilex × *kiusiana* Hatusima, NARIHIRA-MOCHI, is a hybrid allegedly of *I. buergeri* × *I. integra*. Shrub about 4 m. high, the leaves 6-9 cm. long, the inflorescence peduncled, the pedicels 6-8 mm. long.—Reported from n. Kyushu (Fukuoka).

18. *Ilex liukuensis* Loes. *I. mertensii* sensu auct. Japon., non Maxim.—RYŪKYŪ-MOCHI. Glabrous tree; leaves coriaceous, obovate to oblong-elliptic, 3-7.5 cm. long, 2-3.5 cm. wide, obtuse to rounded, sometimes retuse or broadly short-acuminate, acute at base, nearly entire or remotely crenate on the recurved and thickened margin, dark brown when dry, the midrib raised beneath, the lateral nerves reticulate beneath, the petioles 1-1.6 cm. long; pistillate flowers 2-4 in axillary fascicles, the pedicels 9-14 mm. long; calyx-lobes 4-5, rounded, ciliate; fruit globose, 6 mm. across.—Reported from Kyushu (Yakushima and Tanegashima).—Ryukyus.

Fam. 121. CELASTRACEAE NISHIKIGI KA Spindle-Tree Family

Trees, shrubs, or sometimes scandent vines; leaves opposite or alternate, simple, the stipules small, deciduous or absent; flowers usually in cymose inflorescences or fasciculate, usually bisexual, actinomorphic, small; calyx 4- or 5-lobed, imbricate; petals 4 or 5, imbricate, rarely valvate; stamens 4 or 5, alternate with the petals, usually on a flat disc or under the margin of the disc; ovary superior, sometimes adnate to the disc, 1- to 5-locular; style short, 3- to 5-lobed, the ovules usually 2 on the inner angle of each locule; fruit various, forming a loculicidal dehiscent capsule or an indehiscent dry fruit, drupe or berry; seeds usually with abundant fleshy endosperm, the embryo straight, the cotyledons flat, leaflike.—About 45 genera, with about 500 species, in temperate and tropical regions.

1A. Leaves alternate; scandent, deciduous shrubs.

2A. Fruit a 3-winged samara; inflorescence a terminal panicle; seeds without an aril. 1. *Tripterygium*

2B. Fruit a dehiscent capsule; inflorescence a terminal or axillary cyme, raceme, or panicle; seeds with an aril. 2. *Celastrus*

1B. Leaves opposite; erect or scandent trees or shrubs; fruit a capsule.

3A. Flowers usually unisexual; petals usually connate at base, ascending and spreading above; capsules 1-locular and 1-seeded, dehiscent into 2 valves; leaves entire. 3. *Microtropis*

3B. Flowers bisexual; petals free, horizontally spreading; capsules 3- to 5-locular with 1 or 2 seeds in each locule; leaves usually serrate.

4. *Euonymus*

1. TRIPTERYGIUM Hook. f. KURUZURU ZOKU

Scandent shrubs; leaves alternate, large, petiolate, deciduous, serrate, the stipules linear, caducous; flowers polygamous, small, whitish, in rather large terminal panicles; calyx 5-lobed; petals 5; stamens 5 on margin of cup-shaped disc; ovary superior, trigonous, incompletely 3-locular, with a short style at apex; ovules 2 in each locule, erect; fruit a 3-winged samara with an erect, linear, exarillate seed, the embryo small.—Few species in E. Asia.

1A. Panicles puberulous; leaves 5-15 cm. long, rounded at base; flowers 5-6 mm. across; fruit cordate at base. 1. *T. regelii*

1B. Panicles glabrous; leaves 5-10 cm. long, usually broadly cuneate at base; flowers 4-5 mm. across; fruit truncate to rounded at base.

2. *T. doianum*

1. *Tripterygium regelii* Sprague & Takeda. *T. wilfordii* sensu auct. Japon., non Hook. f.; *T. wilfordii* var. *regelii* (Sprague & Takeda) Makino—KURUZURU. Scandent shrub; branches reddish brown, prominently warty, slightly angled, glabrous; leaves ovate to broadly so, or elliptic, 5-15 cm. long, 4-10 cm. wide, abruptly acuminate to acute, rounded

at base, obtusely serrate, vivid green, glabrous on upper side, sometimes papillose-pilose on nerves beneath, the petioles 1.5-3 cm. long; panicles 10-25 cm. long, the branches and branchlets papillose-puberulous; flowers greenish white, 5-6 mm. across; calyx-lobes obtusely deltoid; petals elliptic, nearly as long as the stamens; fruit broadly lanceolate, with 3 elliptic or cor-

date wings, 12–18 mm. long and as wide inclusive of the wing, retuse to cordate at both ends, pale green, glabrous.—July–Aug. Mountains; Honshu (Japan Sea side from centr. distr. northw., and Kii Prov.), Shikoku, Kyushu.—Korea and Manchuria.

2. *Tripterygium doianum* Ohwi. *T. regelii* var. *doianum* (Ohwi) Masam.—KOBANO-KUROZURU. Similar to but slightly smaller than the preceding, glabrous in all parts; branches less prominently warty, rather slender; leaves ovate to

broadly so, or elliptic, 5–10 cm. long, 3–5 cm. wide, acuminate, broadly cuneate at base, serrulate, the petioles 1.5–2 cm. long; panicles 6–10 cm. long, 4–5 cm. wide, the pedicels slender; flowers 4–5 mm. across, greenish white; calyx-lobes semi-ovate; stamens as long as the petals; fruit with 3 broad wings, elliptic to ovate-orbicular inclusive of the wings, 8–12 mm. long, 6–19 mm. wide, retuse, rounded to truncate at base, pale green.—July–Aug. Kyushu (s. distr., incl. Yakushima).

2. CELASTRUS L. TSURU-UME-MODOKI ZOKU

Deciduous or evergreen, dioecious or polygamous, usually scandent shrubs; leaves petiolate, alternate, serrate, the stipules small; flowers small, greenish or white, 5-merous, in axillary cymes or terminal panicles; calyx 5-lobed; petals oblong-ovate; disc entire or undulate ovary superior; style rather short, the stigma 3-lobed; fruit a dehiscent capsule, 3-valved, few-seeded; seeds covered with a fleshy orange or red aril.—About 30 species, in e. and s. Asia, Australia, and America.

1A. Stipules deciduous; leaves 5–12 cm. long.

2A. Branches and inflorescence glabrous; leaves glabrous or papillose-scarious beneath. 1. *C. orbiculatus*

2B. Branches, inflorescence, and under side of leaves short-pilose, at least when young. 2. *C. stephanotiifolius*

1B. Stipules becoming spiny, persistent; leaves 2–5 cm. long. 3. *C. flagellaris*

1. *Celastrus orbiculatus* Thunb. *C. articulatus* Thunb.; *C. tatarinowii* Rupr.; *C. crispulus* Regel.—TSURU-UME-MODOKI. More or less scandent, deciduous, dioecious shrubs with glabrous, terete, grayish brown branches; leaves orbicular, obovate, or elliptic, 5–10 cm. long, 3–8 cm. wide, rounded and apiculate to obtuse at apex, broadly cuneate to abruptly acute at base, glabrous, with appressed obtuse teeth, paler beneath, the petioles 1–2 cm. long; inflorescence cymose, axillary, 1- to many-flowered on a short peduncle, cymose, glabrous, the pedicels slender, 3–5 mm. long; flowers pale green, 5-merous; petals narrowly oblong, about 4 mm. long; stamens half as long as the petals; fruit globose, pale greenish yellow, glabrous, about 8 mm. across, 3-valved, dehiscent, exposing the seeds, these covered with an orange-red aril; style persistent, 2–3 mm. long.—May–June. Thickets and grassy slopes in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and often planted as a hedge.—s. Kuriles, Korea, Manchuria, Sakhalin, China, and Ussuri.—Forma *aureoarillatus* (Honda) Ohwi. *C. orbiculatus* var. *aureoarillatus* Honda.—KIMINO-TSURU-UME-MODOKI. Aril yellow.

Var. *punctatus* (Thunb.) Rehd. *C. punctatus* Thunb.; *C. kiusianus* Fr. & Sav.; *C. articulatus* var. *punctatus* (Thunb.) Makino; *C. articulatus* var. *humilis* Matsum.—TERI-HA-TSURU-UME-MODOKI. Leaves smaller, thicker, elliptic, more or less lustrous, 3–5 cm. long, the petioles shorter, 5–10 mm. long.—A southern phase, abundant usually near seashores, although transitional with the typical phase.

Var. *papillosus* (Nakai) Ohwi. *C. articulatus* var. *papillosus* Nakai; *C. lancifolius* Nakai; *C. strigillosus* Nakai—

INU-TSURU-UME-MODOKI. Leaves papillose beneath on nerves and veinlets.—Honshu (centr. distr. and northw.), Hokkaido.

2. *Celastrus stephanotiifolius* (Makino) Makino. *C. articulatus* var. *pubescens* Makino and var. *stephanotiifolius* Makino; *C. insularis* sensu Ohwi, non Koidz.—Ô-TSURU-UME-MODOKI, SHITAKI-TSURU-UME-MODOKI. Closely resembles the preceding; branches brownish, lenticellate, the young parts pilosulous; leaves elliptic to broadly so, sometimes orbicular or ovate-orbicular, 6–10 cm. long, 5–8 cm. wide, abruptly cuspidate to acute, rounded to acute at base, obtusely serrate, glabrous on upper side, paler and with short yellowish curved hairs on nerves and veinlets beneath, the petioles 2–3 cm. long; inflorescence few-flowered, the short peduncle and pedicels pilosulous; fruit globose, 5–6 mm. across.—May–June. Honshu (Kantô Distr. and westw.), Kyushu.—s. Korea.

3. *Celastrus flagellaris* Rupr. *C. ciliidens* Miq.—IWA-UMEZURI. Scandent shrub; branches slender, with reddish brown exfoliating bark, the young parts minutely papillose; stipules becoming spiny; leaves broadly elliptic to ovate, 2–5 cm. long, 1.8–4 cm. wide, abruptly acuminate to acute, acute or broadly cuneate at base, with small spine-pointed teeth, sparsely scarious on upper side, the veinlets distinct, the petioles 1–3 cm. long, slender; flowers 1–3, in axillary sessile cymes, the pedicels 2–6 mm. long; fruit globose, about 6 mm. across, the aril orange-red.—June. Mountains; Honshu (Kantô Distr. and westw.), Kyushu; rather rare.—Korea, Manchuria, Amur, and n. China.

3. MICROTROPIS Wall. MOKU-REISHI ZOKU

Evergreen trees or shrubs; leaves opposite, petiolate, exstipulate, entire, coriaceous; flowers usually unisexual, small, whitish, in sessile or peduncled axillary cymes or fascicles; calyx of 5 imbricate, persistent sepals; petals 5 or none, imbricate, usually connate at base, rounded, rather thick, flat; disc absent or annular or of separate segments, sometimes adnate to the petals; ovary free, ovoid, 2- or 3-lobed, the style thick, the stigma small, 2- to 4-lobed, the ovules 2 in each locule; capsules ellipsoidal, coriaceous, 1-locular, 2-valved, 1-seeded; seed erect, stipled, oblong, the testa smooth, brown or red, sometimes fleshy outside, the endosperm copious, fleshy, the cotyledons leaflike.—About 70 species, in mountains of tropical Asia and e. Asia.

1. *Microtropis japonica* (Fr. & Sav.) H. Hallier. *Elaeodendron japonicum* Fr. & Sav.; *Cassine japonica* (Fr. & Sav.) O. Kuntze; *Otherodendron japonicum* (Fr. & Sav.) Makino

—MOKU-REISHI. A large, glabrous, evergreen, dioecious shrub with brownish gray branches; leaves coriaceous, elliptic or ovate, sometimes ovate-oblong, 5–10 cm. long, 2.5–4.5 cm.

wide, obtuse or obtusely acute, sometimes emarginate, abruptly acuminate at base, entire, with slightly recurved margins, deep green and lustrous above, the midrib rather slender, the lateral nerves slender, both slightly raised, the petioles 7–12 mm. long; flowers 5-merous, sessile, few, on a short peduncle 7–12 mm. long, pale green, about 5 mm. across, with 2 small bracteoles just beneath the calyx; calyx-lobes rounded, minutely

toothed; petals orbicular, about 3 mm. long; disc cup-shaped; filaments short, borne on the margin of the disc, as long as the pale yellow anthers; capsules ellipsoidal, 1.5–2 cm. long, smooth, dehiscent and exposing a large red seed.—Mar.–Apr. Woods and thickets near seashores; Honshu (Izu, Awa, Sagami Prov.), Kyushu.—Ryukyus and Formosa.

4. EUONYMUS L. NISHIKIGI ZOKU

Evergreen or deciduous, erect or scandent shrubs or trees; leaves opposite, rarely alternate, entire or serrate; flowers small, bisexual or a few unisexual, in axillary cymes or solitary; calyx-lobes 4 or 5; petals attached below the disc, usually entire; stamens as many as the petals and calyx-lobes, opposite the latter, the filaments sometimes absent; disc discoid, 4- or 5-lobed; ovary below the disc and adnate to it, 3- to 5-locular; style short; ovules 2, rarely few in each locule; capsules 3- to 5-valved, sometimes winged, rarely spinose, with 1 or 2 seeds in each locule, the seeds entirely or partially enclosed in an aril, the endosperm fleshy.—About 150 species, in temperate to warmer regions of Asia, Europe, N. and Centr. America.

- 1A. Fruit divided nearly to the base into 1–4 lobes.
 - 2A. Deciduous, the leaves thin, membranous. 1. *E. alatus*
 - 2B. Evergreen, the leaves deep green, chartaceous to thinly coriaceous. 2. *E. lutchuensis*
- 1B. Fruit entire, not lobed, sometimes winged or sulcate.
 - 3A. Evergreen.
 - 4A. Fruits globose, not winged nor angular; branches terete.
 - 5A. Erect tree with smooth branches. 3. *E. japonicus*
 - 5B. Woody climber with obsoletely punctulate branches. 4. *E. fortunei*
 - 4B. Fruits angled, rather large.
 - 6A. Branches 4-angled. 5. *E. chibae*
 - 6B. Branches terete. 6. *E. tanakae*
 - 3B. Deciduous (apparently evergreen, leaves 7–12 cm. long in *E. lanceolatus*).
 - 7A. Filaments longer than the anthers; petioles 8–20 mm. long; peduncles short. 7. *E. sieboldianus*
 - 7B. Filaments very short; petioles 3–10 mm. long; peduncles elongate.
 - 8A. Branches warty; winter-buds short; inflorescence just above the leaves; fruit 4-angled, narrowed toward the base. 8. *E. oligospermus*
 - 8B. Branches nearly smooth; winter-buds elongate; inflorescence under the leaves; fruit rounded at base.
 - 9A. Flowers 4-merous.
 - 10A. Fruit with 4 broad wings; leaves obovate, 6–12 cm. long, 3–7 cm. wide; young branchlets pale green. ... 9. *E. macropterus*
 - 10B. Fruit globose, without wings or angles; leaves narrowly ovate, 6–8 cm. long, 2–3 cm. wide; young branchlets often whitish with waxy excrecence. 10. *E. yakushimensis*
 - 9B. Flowers 5-merous.
 - 11A. Ovary and fruit 5-locular.
 - 12A. Calyx-teeth denticulate; flowers purplish; fruit globose, wingless.
 - 13A. Stems erect; leaves ovate, thinly chartaceous, 3–8 cm. long. 11. *E. melananthus*
 - 13B. Stems creeping; leaves broadly oblanceolate, somewhat coriaceous, 7–12 cm. long. 12. *E. lanceolatus*
 - 12B. Calyx-teeth entire; flowers white to pale purple.
 - 14A. Fruit globose, wingless. 13. *E. oxyphyllus*
 - 14B. Fruit with 5 short deltoide wings. 14. *E. planipes*
 - 11B. Ovary and fruit 3- or rarely 4-locular; fruit with 3 or 4 rather broad, falcately deltoid wings near base; leaves rugulose on upper side in life; flowers purple, with 5 calyx-teeth and petals. 15. *E. tricarps*

1. *Euonymus alatus* (Thunb.) Sieb. *Celastrus alatus* Thunb.; *E. alatus* var. *typicus* Regel; *E. striatus* var. *alatus* (Thunb.) Makino.—NISHIKIGI. Horizontally spreading, much-branched, deciduous shrub, the branches green, glabrous, with 4 corky wings; leaves short-petiolate, membranous, obovate to broadly oblanceolate, 1.5–7 cm. long, 1–4 cm. wide, acuminate to acute at both ends, glabrous, finely serrulate; cymes 1- to few-flowered, on slender peduncles about 2 cm. long, the pedicels short; flowers 4-merous, pale green, about 6 mm. across; calyx-teeth depressed-rounded, with minute teeth on margin; petals orbicular; fruiting carpels usually 1 or 2, narrowly obovoid, about 8 mm. long, pale red, 1-seeded; seeds ellipsoidal, 4–6 mm. long, enclosed in an orange-vermilion aril.—May–June. Thickets and woods in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.—Korea, Sakhalin, s. Kuriles, Ussuri, Manchuria and China.—Forma *subtriflorus* (Bl.) Ohwi. *E.*

subtriflorus (Bl.) Ohwi. *Celastrus striatus* Thunb.; *E. alatus* var. *subtriflorus* (Bl.) Fr. & Sav.—KO-MAYUMI. Branches wingless; leaves glabrous.—Forma *pilosus* (Loes. & Rehd.) Ohwi. *E. alatus* var. *pilosus* Loes. & Rehd.; *E. thunbergianus* Bl.—KE-NISHIKIGI. Branches winged; leaves pilose on under side.—Forma *apterus* (Regel) Rehd. *E. alatus* var. *apterus* Regel; *E. alatus* var. *pubescens* Maxim., pro parte.—KE-KO-MAYUMI. Branches wingless; leaves pilose on under side.

2. *Euonymus lutchuensis* T. Ito. RYŪKYŪ-MAYUMI. Glabrous small evergreen tree with slender, green, 4-angled branchlets; leaves thinly coriaceous, broadly lanceolate, 3–7 cm. long, 1–3 cm. wide, long-acuminate, obtuse to acute at base, remotely and obtusely serrate, the lateral nerves obsolete, the petioles slender, 2–3 mm. long; inflorescence 2.5–5 cm. long, 1- to 3-flowered, the peduncles very slender; flowers 4-merous, about 6 mm. across, pale green; calyx-teeth de-

pressed-rounded, minutely denticulate on margin; petals orbicular; carpels 1 or 2, rarely 3, oblong, about 8 mm. long; seeds enclosed in a yellowish aril.—Kyushu (s. distr.).—Ryukyus.

3. *Euonymus japonicus* Thunb. *E. japonicus* var. *typicus* Regel—MASAKI. Large, glabrous, evergreen shrub or small erect tree with green, smooth, rather thick terete branches; leaves thick-coriaceous, elliptic or obovate, sometimes oblong, 3-7(-10) cm. long, 2-4(-6) cm. wide, acute to obtuse, cuneate to acute at base, obtusely serrate, lustrous, the lateral nerves not prominent, the petioles 8-15(-20) mm. long, green; inflorescence 4-7 cm. long, densely rather many-flowered, on thick, rather flattened peduncles 2-5 cm. long; flowers 4-merous, pale green, about 5 mm. across; calyx-teeth semirounded, entire; petals elliptic; filaments longer than the anthers; fruit globose, about 7 mm. across, the aril orange-red.—June-July. Thickets and woods, especially common on slopes near the sea; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable and much-planted.—Ryukyus, Korea, and China.

Var. *longifolius* Nakai. *E. yoshinagae* Makino—NAGABAMA-SAKI. Leaves narrower, oblanceolate, 7-10 cm. long, 1.5-2 cm. wide.

Var. *macrophyllus* Regel. *E. japonicus* var. *obovatus* Nakai—ŌBA-MASAKI. Leaves much broader.

4. *Euonymus fortunei* (Turcz.) Hand.-Mazz. var. *radicans* (Sieb.) Rehd. *Masakia radicans* (Sieb.) Nakai; *Euonymus radicans* Sieb. ex Miq.; *E. japonicus* var. *radicans* Miq.; *E. repens* Carr.—TSURU-MASAKI. Evergreen glabrous climber, often creeping on the ground, with green, terete, obscurely elevated-punctate branchlets; leaves somewhat coriaceous, elliptic to oblong, 1-4 cm. long, obtuse to subacute, acute to cuneate at base, obtusely serrate, the petioles 5-10 mm. long; inflorescence 2-5 cm. long, few-flowered, on rather slender peduncles; flowers pale green; fruit 5-6 mm. across, globose.—June-July. Woods and thickets on low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable, with cultivars in gardens.—Korea, China, and Ryukyus.

Var. *villosus* (Nakai) Hara. *E. radicans* var. *villosus* Nakai—KE-TSURU-MASAKI. Leaves pubescent.

5. *Euonymus chibae* Makino. HIZEN-MAYUMI. Evergreen glabrous tree with 4-angled branches; leaves thinly coriaceous, elliptic or oblong, 6-8 cm. long, 2-5 cm. wide, abruptly acuminate to abruptly acute, abruptly acute at base, loosely and appressed obtuse-serrate, lustrous, the lateral nerves very weak, the petioles 1-1.5 cm. long; inflorescence few-flowered, on flat peduncles 2-4 cm. long; fruit obovoid-globose, 4-angled, 15-18 mm. long, 1-1.5 cm. across, pale brown when dry, with few seeds in each locule, the aril reddish brown.—Kyushu (Hizen and Satsuma Prov.).—Ryukyus and s. Korea.

6. *Euonymus tanakae* Maxim. *Genitia tanakae* (Maxim.) Nakai—KOKUTENGI. Evergreen glabrous small tree or large shrub with rather thick branches; leaves often falsely verticillate, somewhat coriaceous, narrowly obovate-oblong to obovate, 7-15 cm. long, 2.5-4.5 cm. wide, acute, abruptly acute, or rounded, cuneate to acute at base, minutely toothed, paler beneath, the nerves very weak, the petioles 1-2.5 cm. long; inflorescence 5-10 cm. long, rather densely few- to many-flowered, the peduncles 4-7 cm. long; flowers 4-merous, about 10 mm. across, greenish white; calyx-teeth very short, depressed; petals thick, orbicular, about 5 mm. long; filaments

longer than the anthers, inserted on the disc; fruit globose, with 4 prominent ridges, 1-1.5 cm. long and as wide; seeds few in each cell.—June. Near seashores; Kyushu; rare.—Ryukyus and Formosa.

7. *Euonymus sieboldianus* Bl. *E. vidalii* Fr. & Sav.; *E. yedoensis* Koehne; *E. hians* Koehne; *E. semierectus* Koehne; *E. dorsicostatus* Nakai; *E. maackii* var. *stenophyllus* Koidz.; *E. maackii* sensu auct. Japon., non Rupr.; *E. hamiltonianus* sensu auct. Japon., non Wall.—MAYUMI. Glabrous deciduous shrub with terete branches; leaves oblong, sometimes elliptic or ovate-oblong, 5-12 cm. long, 2-6 cm. wide, acuminate to abruptly acute, rounded to abruptly acute at base, minutely serrulate, green and scarcely lustrous on upper side, the lateral nerves slightly evident beneath, the petioles 8-20 mm. long; inflorescence 3-6 cm. long, loosely several-flowered with spreading pedicels 2-4 cm. long; flowers pale green, about 8 mm. across; calyx-lobes rounded, entire; petals oblong, about 4 mm. long, densely and minutely papillose inside; filaments 3 or 4 times as long as the dark purple anthers; fruit obtriangular-cordate, with 4-ridges, cuneately narrowed toward the base, 8-10 mm. long and as wide at apex.—May-June. Mountains and hills; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.—Korea, Manchuria, China, Sakhalin, and s. Kuriles.

Var. *nikoensis* (Nakai) Ohwi. *E. nikoensis* Nakai; *Euonymus hamiltonianus* var. *nikoensis* (Nakai) Blakel.—YUMOTO-MAYUMI. Leaves puberulous with papillose hairs especially on the nerves beneath, the fruit, and on the petioles.

8. *Euonymus oligospermus* Ohwi. *E. pauciflorus* sensu auct. Japon., non Maxim.; *E. pauciflorus* subsp. *oligospermus* (Ohwi) Okuyama; *E. pauciflorus* var. *japonicus* Koidz.—ITO-MAYUMI, ANDON-MAYUMI. Deciduous shrub with rather slender, glabrous, densely warty, dark brown branches; leaves membranous, oblong to ovate-oblong, 6-10 cm. long, 2.5-4 cm. wide, caudately short-acuminate, acute to subrounded at base, obtusely and minutely toothed, glabrous and dull on upper side, pale green and pubescent especially on nerves beneath, the petioles 4-7 mm. long; inflorescence 4-5 cm. long in fruit, the peduncles slender, bearing 1 or 2 fruits; calyx-teeth rounded, nearly entire; fruit 4-angled, about 10 mm. long, dilated and winged toward apex, obtriangular on the sides, deeply depressed.—Mountains; Honshu (Hinoemata near Ose in Iwashiro); very rare.

9. *Euonymus macropterus* Rupr. *E. ussuriensis* Maxim.—HIRO-HA-TSURIBANA. Glabrous, deciduous shrub with rather thick, terete branches; leaves obovate to broadly so, 6-12 cm. long, 3-7 cm. wide, abruptly acuminate or abruptly acute, broadly cuneate to rounded at base, obtusely toothed, pale green and the lateral nerves rather prominent beneath, the petioles 4-8 mm. long; inflorescence 7-12 cm. long including the long peduncles, umbellately branched and rather many-flowered; flowers 4-merous, pale green, about 6 mm. across; calyx-teeth depressed-rounded, entire; petals orbicular; fruit depressed, 4-ridged, about 1 cm. long, 2-2.5 cm. wide with 4 horizontally spreading wings broadest about the middle, the aril orange-red, the seeds reddish brown.—June-July. Woods and thickets in mountains; Hokkaido, Honshu (centr. dist. and eastw.), Shikoku.—s. Kuriles, Sakhalin, Korea, Manchuria, Ussuri, and Amur.

10. *Euonymus yakushimensis* Makino. AO-TSURIBANA. Glabrous deciduous shrub, the branches green, often whitish waxy, terete; leaves membranous, broadly lanceolate to ovate-

oblong, 5–13 cm. long, 2–4 cm. wide, long-acuminate, acute to subrounded at base, minutely and obtusely toothed, pale green and the lateral nerves slightly raised beneath, the petioles 3–5 mm. long; inflorescence 5–10 cm. long, few-flowered on slender peduncles; flowers 4-merous, purplish; calyx-teeth depressed-rounded, entire; petals orbicular, about 5 mm. long; filaments very short; fruit pendulous, globose, smooth, 8–10 mm. across, the aril red; seeds yellow-brown.—Mountains; Kyushu (Yakushima); very rare.

11. *Euonymus melananthus* Fr. & Sav. SAWADATSU, AO-JIKU-MAYUMI. Rather small, deciduous, glabrous shrub with green, slenderly 4-riate branches; leaves chartaceous to membranous, ovate, sometimes broadly lanceolate, 3–8 cm. long, 1.5–3.5 cm. wide, abruptly acuminate and subacute, rounded to broadly cuneate at base, mucronate-serrulate, the nerves raised beneath, the petioles 2–3 mm. long; inflorescence 2–3 cm. long, 1- to 3-flowered, the peduncles slender and pendulous; flowers 5-merous, purplish, about 7 mm. across; calyx-teeth semirounded, minutely toothed on margins; petals orbicular; fruit globose, about 1 cm. across, smooth.—June–July. Woods in mountains; Honshu, Kyushu.

12. *Euonymus lanceolatus* Yatabe. MURASAKI-MAYUMI. Small, creeping, sparsely branched, glabrous shrub, the branches elongate, green, terete, obscurely 4-riate; leaves rather thick, broadly oblanceolate to broadly lanceolate, rarely nearly oblong, 7–12 cm. long, 1–3(–5) cm. wide, long-acuminate, acute to obtuse at base, obsoletely serrulate, deep green on upper side, the nerves not prominent, the petioles 4–7 mm. long; inflorescence 3 or 4 cm. long, loosely few-flowered on slender peduncles; flowers 5-merous, purplish, about 8 mm. across; calyx-teeth semirounded, minutely toothed on margin; petals orbicular; fruit globose, about 8 mm. across, smooth.—July. Woods in mountains; Honshu.

13. *Euonymus oxyphyllus* Miq. *E. nipponicus* Maxim.; *E. yesoensis* Koidz.; *E. oxyphyllus* var. *magnus* Honda; *E. oxyphyllus* var. *yesoensis* (Koidz.) Blakel. and var. *nipponicus* (Maxim.) Blakel.; *Turibana oxyphylla* (Miq.) Nakai; *T. yesoensis* (Koidz.) Nakai; *T. nipponica* (Maxim.) Nakai; *Kalonymus yesoensis* (Koidz.) Prokhan.—TSURIBANA. Large deciduous glabrous shrub with terete branches; leaves

membranous, ovate or obovate, sometimes elliptic or narrowly obovate-oblong, 5–10 cm. long, 2–5 cm. wide, acuminate, acute to rounded at base, obtusely serrulate, with raised nerves beneath, the petioles 3–6 mm. long; inflorescence 7–15 cm. long, loosely flowered, the peduncles slender; flowers more than 10, umbellate on the peduncles, 5-merous, white or pale purple, about 7 mm. across; calyx-teeth much depressed, entire; petals orbicular; fruit globose, 10–12 mm. across, smooth.—May–June. Thickets and woods in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable.—s. Kuriles, Korea, and centr. China.

14. *Euonymus planipes* (Koehne) Koehne. *E. latifolius* var. *planipes* Koehne; *E. oxyphyllus* var. *kuenbergii* Honda; *E. robustus* Nakai; *Turibana planipes* (Koehne) Nakai.—ÖTSURIBANA. Large deciduous glabrous shrub with terete, green, rather thick branches; leaves obovate, elliptic, or oblong, 7–13 cm. long, 4–6 cm. wide, abruptly acuminate to abruptly acute, broadly cuneate to abruptly acute at base, obtusely serrulate, the nerves especially raised on the under side, the petioles 5–12 mm. long, inflorescence 7–15 cm. long, loosely umbellate, the peduncles slender; flowers more than 10, white to pale green, about 8 mm. across; calyx-teeth short, entire; petals orbicular; fruit globose, with 5 narrow wings about the middle.—May–June. Hokkaido, Honshu (centr. distr. and northw.).—Korea, Manchuria, Ussuri, and s. Kuriles.

15. *Euonymus tricarpos* Koidz. *E. sachalinensis* sensu auct. Japon., non Maxim.; *E. sachalinensis* var. *tricarpos* (Koidz.) Kudo.—KURO-TSURIBANA. Glabrous, deciduous shrub with terete, green branches later becoming dark reddish brown; leaves membranous, rugulose in life, elliptic or obovate, 6–10(–12) cm. long, 3–4(–5) cm. wide, abruptly acute, rounded to acute at base, obtusely serrulate, the petioles 8–12 mm. long; inflorescence 5–7 cm. long, 2- or 3-flowered on pendulous, slender peduncles; flowers dark purple, about 8 mm. across; calyx-teeth 5, broadly ovate; petals 5, orbicular; fruit cordately globose, 1–1.2 cm. long, 1.2–1.5 cm. across, truncate at base, rounded at apex, with 3 falcately recurved obtuse wings toward the base.—July. Thickets in high mountains; Hokkaido, Honshu (centr. distr. and northw.).—Sakhalin.

Fam. 122. STAPHYLEACEAE MITSUBA-UTSUGI KA Bladdernut Family

Trees or shrubs; leaves opposite, 3-foliolate or odd-pinnate, the stipules paired; flowers bisexual or unisexual, actinomorphic; sepals imbricate; petals inserted on the disc or on its margin, imbricate; stamens 5, free, alternate with the petals; carpels 2 or 3, connate at base, 2- or 3-locular, forming a lobed ovary; styles free or connate; ovules many, in 1 or 2 series on the ventral suture; fruit an inflated, bladderlike capsule dehiscent on the upper part, or a berry; seeds few, the endosperm scanty, the embryo straight, the cotyledons flat.—About 5 genera, with about 30 species, chiefly in the temperate regions of the N. Hemisphere.

1A. Deciduous trees; fruit dehiscent.

- 2A. Fruit an inflated lobed capsule; lateral leaflets sessile; seeds without an aril. 1. *Staphylea*
 2B. Fruit a follicle; lateral leaflets petiolulate; seeds with a thin fleshy aril. 2. *Encaphia*
 1B. Evergreen trees; fruits fleshy and indehiscent; seeds without an aril. 3. *Turpinia*

1. STAPHYLEA L. MITSUBA-UTSUGI ZOKU

Shrubs or trees; leaves opposite, the stipules deciduous, the leaflets 3 (to 7 in exotic species), stipellate; flowers white, bisexual, in terminal panicles; sepals 5, deciduous; petals 5, erect; disc connate with the base of the sepals, free on the margin; stamens 5, erect; carpels 2 or 3, connate at base; styles free or connate at apex; ovules many, in 2 series on ventral sutures of the carpels, ascending, anatropous; capsules inflated, membranous, 2- or 3-lobed in upper part, 2- or 3-locular, with a few seeds in each locule, dehiscent on the inner side; seeds globose, exarillate, the endosperm fleshy.—About 8 species, in the temperate regions of the N. Hemisphere.

1. *Staphylea bumalda* (Thunb.) DC. *Bumalda trifolia* Thunb.—MITSUBA-UTSUGI. Shrub with spreading to ascending branches, the branches terete, grayish brown, glabrous; leaves trifoliate, on petioles 2–3 cm. long, the lateral leaflets sessile, ovate or ovate-elliptic, 3–7 cm. long, 1.5–3 cm. wide, acuminate, acute or acuminate at base, mucronate-serrate, the terminal one attenuate on a petiolelike base, paler and glabrous (var. *glabra* Nakai) or pubescent on midrib beneath; inflorescence a racemelike panicle, terminal on young branch-

lets, 5–8 cm. long; flowers white, the pedicels 8–12 mm. long; calyx-segments linear-oblong or oblanceolate, obtuse, erect, 7–8 mm. long, greenish white; petals simulating the sepals and as long, white; capsules slightly inflated, short-stiped, shallowly and broadly 2-fid, 2–2.5 cm. wide, the stigma at first connate; seeds lustrous, pale yellow, obovoid, about 5 mm. long.—May–June. Woods in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

2. *EUSCAPHIS* Sieb. & Zucc. GONZUI ZOKU

Small trees; leaves opposite, odd-pinnate, stipulate, the leaflets serrate, stipellate; flowers 5-merous, bisexual, small, in terminal panicles; ovary 2- or 3-locular, with an annular disc at base, the stigma connate; fruit of 1–3 coriaceous dehiscent follicles, each 1- to 3-seeded; seeds enclosed in a thin aril.—A single species in e. Asia.

1. *Euscaphis japonica* (Thunb.) Kanitz. *Sambucus japonica* Thunb.; *E. staphyleoides* Sieb. & Zucc.; *Hebokia japonica* (Thunb.) Raf.—GONZUI. Small deciduous tree with glabrous, rather thick branches; leaves opposite, the petioles 4–6 cm. long, the axis nearly terete, 15–30 cm. long, the leaflets 7–11, rather thick, narrowly ovate or broadly lanceolate, 4–8 cm. long, 2–4 cm. wide, gradually acuminate, rounded to broadly cuneate at base, appressed-serrate, deep green and lustrous on upper side, often white-pubescent on midrib beneath near base, the petiolules 2–8 mm. long; inflorescence a

long peduncled broadly pyramidal panicle 8–15 cm. across, many-flowered; flowers pale green, 4–5 mm. across; sepals and petals elliptic, persistent; follicles 1–3, ellipsoidal, arcuately spreading, acute, 1.5–2 cm. long, longitudinally ribbed, the seeds nearly globose, black, shining, about 5 mm. across.—May–(June). Thickets and thin woods in lowlands and low mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; very common.—Korea, Ryukyus, Formosa, and China.

3. *TURPINIA* Vent. SHÖBEN-NO-KI ZOKU

Glabrous trees or shrubs with terete branches; leaves opposite, exstipulate, odd-pinnate, sometimes trifoliate or unifoliate, the leaflets serrate, coriaceous; panicles terminal and axillary; flowers small, white, bisexual; sepals and petals 5, imbricate; disc convex, toothed; stamens 5, free; ovary 3-locular and 3-lobed, the styles 3, often connate, the ovules ascending, anatropous; fruit ellipsoidal or nearly globose, fleshy or leathery, 3-locular; seeds angular, flat.—More than 10 species, in e. Asia, Malaysia, India, and America.

1. *Turpinia ternata* Nakai. *T. pomifera* sensu auct. Japon., non DC.—SHÖBEN-NO-KI. Evergreen glabrous tree with terete, red-brown branches; leaves with petioles 3–5 cm. long, the leaflets 3 or sometimes 1 or 2, thick-coriaceous, deep green, abruptly acuminate with an obtuse tip, appressed serrate, oblong or narrowly so, 7–12 cm. long, 2.5–5 cm. wide, the midrib raised beneath, the lateral leaflets slightly smaller, on petiolules 5–10 mm. long, the terminal leaflets on petiolules

1–3 cm. long; inflorescence pedunculate, terminal on young branchlets, 10–20 cm. long, many-flowered, puberulous; flowers pale green, about 5 mm. across; sepals elliptic; petals obovate, white, about 3.5 mm. long, slightly longer than the sepals; fruit fleshy, subglobose, 7–10 mm. across, becoming orange-red when mature; seeds few, grayish brown, with small elevated spots, 5–6 mm. long.—May–June. Shikoku, Kyushu.—Ryukyus and Formosa.

Fam. 123. ICACINACEAE KUROTAKE-KAZURA KA Icacin Family

Trees or shrubs, sometimes scandent; leaves usually alternate, simple, exstipulate; flowers 4- or 5-merous, bisexual or unisexual, actinomorphic; calyx small, 4- to 5-lobed, the lobes imbricate, rarely valvate; petals 4 or 5, imbricate, rarely valvate, free or connate, rarely absent; stamens as many as the petals and alternate with them; disc sometimes developed; ovary 1-locular, rarely 3- to 5-locular, the ovules usually 2, pendulous from the top of the locule; style very short; fruit a 1-locular, 1-seeded drupe, rarely winged; seeds usually with endosperm, the embryo usually small and straight.—About 38 genera, with about 200 species, in the warmer parts of the world.

1. *HOSIEA* Hemsl. & Wils. KUROTAKE-KAZURA ZOKU

Deciduous, sometimes dioecious woody climber; leaves membranous, alternate, long-petiole, ovate-cordate; inflorescence a loose cyme or sometimes a compound axillary panicle, often reduced to a few flowers, flowers polygamous or unisexual; sepals 5, small, much shorter than the petals; corolla of 5 united petals, subrotate, the lobes caducate; stamens 5, alternate with the petals, the filaments shorter than the petals; disc of 5 fleshy and rounded scales; ovary ovoid, 1-locular, the ovules 2, pendulous; style short, simple, columnar, with a 5-lobed stigma; fruit fleshy, slightly flattened, ellipsoidal, 1-seeded; endosperm scanty, the cotyledons elliptic.—Two species, in e. Asia.

1. *Hosiea japonica* (Makino) Makino. *Natsiatum japonicum* Makino; *N. sinense* sensu auct. Japon., non Oliv.—KUROTAKE-KAZURA. Dioecious woody climber with grayish brown, loosely lenticellate, elongate branches, yellowish retrorse-pubescent; leaves thin, ovate-cordate, 8–18 cm. long, 5–12 cm. wide, acuminate with a mucro or short awn at apex, cordate to nearly truncate at base, irregularly and coarsely dentate with short-aristate teeth, pale yellow appressed-pubescent, the lateral nerves and chief veinlets ending in the teeth, the petioles 4–8 cm. long; flowers in axillary cymes, on slender

pedicels 1–2.5 cm. long, about 8 mm. across, pendulous, pale yellow; calyx-lobes ovate, about 1 mm. long; corolla with a short tube at base, the lobes broadly lanceolate, recurved from the middle, caudate, papillose inside; filaments erect, about 3 mm. long, slightly longer than the corolla-tube; fruit rather flat, pendulous, about 1.5 cm. long, elliptic, red, the stone solitary, with raised reticulations on both sides.—May–June. Woods in mountains; Honshu (Chūgoku Distr.), Shikoku, Kyushu; rare.

Fam. 124. ACERACEAE

KAEDE KA

Maple Family

Trees and shrubs, monoecious or sometimes dioecious; leaves simple or compound, opposite, exstipulate; flowers bisexual or unisexual, small, actinomorphic, in terminal or axillary racemes, fascicles, or panicles; sepals 4 or 5, imbricate, rarely connate; petals 4 or 5, imbricate or absent; disc usually flat, rarely absent; stamens 4–10; ovary superior, 2-locular, 2-lobed; style simple, the stigma 2-fid; ovules 2 in each locule; fruit a pair of 1-seeded, broadly winged samaras, separating at maturity; seeds without endosperm, the testa thin.—Two genera, with about 100 species, chiefly in the temperate regions of the N. Hemisphere.

1. ACER L.

KAEDE ZOKU

Deciduous or rarely evergreen trees or shrubs; leaves simple with palmately or rarely pinnately arranged nerves, or 3- to 7-foliate flowers 5- or rarely 4-merous, in racemes, fascicles, panicles, or corymbs; disc usually annular and prominent, rarely absent; stamens 4–10, usually 8; styles or stigmas 2.—Nearly 100 species, in Eurasia, n. Africa, and N. America.

1A. Leaves simple

2A. Inflorescence terminal on young leafy branches.

3A. Inflorescence a corymb or panicle, sometimes racemlike with short branches on lower part.

4A. Inflorescence corymbose or paniculate with short axis.

5A. Leaves distinctly toothed.

6A. Leaves palmately lobed.

7A. Petioles and peduncles pubescent at least while young.

8A. Flowers yellowish with scabrous anthers; petioles $\frac{1}{2}$ to nearly as long as the leaves; leaves finely toothed.1. *A. sieboldianum*8B. Flowers purplish with smooth anthers; petioles $\frac{1}{4}$ – $\frac{1}{2}$ as long as the leaves; leaves incised-toothed. 2. *A. japonicum*

7B. Petioles and peduncles glabrous from the first.

9A. Leaves thinly chartaceous, glabrous or nearly so; ovary glabrous or thinly pubescent.

10A. Leaves 9- to 13-lobed, cordate-rounded, slightly depressed. 3. *A. shirasawanum*10B. Leaves 5- to 7 (-9)-lobed, cordate-rounded. 4. *A. palmatum*9B. Leaves nearly membranous, usually loosely white-pilose on nerves beneath. 5. *A. tenuifolium*6B. Leaves undivided or shallowly 3-lobed with short lateral lobes. 6. *A. ginnala*

5B. Leaves entire or with few coarse teeth.

11A. Lobes of leaf acuminate with a short awned tip, glabrous or pubescent; ovary and fruit glabrous. 7. *A. mono*11B. Lobes of leaf elongate with an obtuse tip, pubescent on both sides, ovary and fruit pubescent. 8. *A. miyabei*

4B. Inflorescence a racemlike panicle with elongate axis.

12A. Leaves undivided, orbicular-cordate or broadly ovate, with appressed short teeth. 9. *A. distylum*

12B. Leaves palmately lobed, sharply toothed.

13A. Leaves irregularly and coarsely toothed; samara 1.5–2 cm. long, short-pubescent. 10. *A. ukurunduense*13B. Leaves finely and sharply toothed; samara 3–4 cm. long, with rusty brown, dusty puberulence. 11. *A. nipponicum*

3B. Inflorescence a raceme with elongate axis.

14A. Leaves undivided, penninerved with about 20 pairs of closely parallel lateral nerves. 12. *A. carpinifolium*

14B. Leaves lobed, if undivided, with less than 10 pairs of lateral nerves.

15A. Leaves of fertile branches ovate or ovate-triangular, with or without a small lateral lobe on each side.

16A. Leaves 3–6 cm. long; petioles 1–3 cm. long. 13. *A. crataegifolium*

16B. Leaves 8–12 cm. long; petioles 3–6 cm. long.

17A. Pedicels 5–10 mm. long; leaves glabrous or nearly so beneath, ovate or ovate-triangular, if 3-lobed, the lateral lobes near the base. 14. *A. capillipes*17B. Pedicels 2–4 cm. long; leaves rusty brown-pubescent when young, 3-lobed with lateral lobes on the upper part. 15. *A. rufrinerve*

15B. Leaves of fertile branches palmately 5- to 9-lobed.

18A. Leaves softly white-pubescent beneath; flowers 4-merous. 16. *A. argutum*

18B. Leaves glabrous or rusty brown-pubescent on nerves or on axils beneath.

19A. Racemes about 10-flowered; pedicels 8–15 mm. long; petals and stamens about 4 mm. long. 17. *A. tschonoskii*19B. Racemes about 20-flowered; pedicels 4–6 mm. long; petals and stamens 1.5–2 mm. long. 18. *A. micranthum*

2B. Inflorescence from lateral leafless buds precocious.

- 20A. Inflorescence corymbose, with a short axis; leaves and petioles pubescent; lobes of leaves acuminate with an obtuse tip. 19. *A. diabolicum*
- 20B. Inflorescence a fascicle, without an axis and peduncle; leaves and petioles pubescent only while young; lobes of leaves acuminate. 20. *A. pycnanthum*
- 1B. Leaves compound, 3-(5)-foliolate.
- 21A. Flowers fasciculate, terminal on the branches; young branches, underside of leaves, and inflorescence coarsely pilose; petioles 2-3 cm. long. 21. *A. nikense*
- 21B. Flowers in slender racemes; leaves glabrous to pubescent; petioles 5-8 cm. long.
- 22A. Leaflets 3, all alike; ovary glabrous or loosely pubescent; flowers 4-merous. 22. *A. cissifolium*
- 22B. Leaflets 3-5, the terminal one larger; ovary pubescent; flowers 5-merous. 23. *A. negundo*

1. *Acer sieboldianum* Miq. *A. japonicum* var. *sieboldianum* (Miq.) Fr. & Sav.; *A. sieboldianum* var. *typicum* Maxim.

—KO-HAUCHIWA-KAEDÉ, ITAYA-MEIGETSU. Tree with the young branches, inflorescence, and petioles white-pubescent; leaves chartaceous, rounded, 6-8 cm. wide, palmately 7- to 11-lobed, sometimes to the middle, shallowly cordate to truncate at base, white-pubescent while young, later nearly glabrous, the lobes narrowly ovate to broadly lanceolate, acuminate, sharply toothed, the petioles 3-4 cm. long; inflorescence a many-flowered compound pendulous corymb, the peduncles 3-5 cm. long; flowers small, pale yellow, 5-merous; sepals about 3 mm. long, pubescent on the outside; ovary white-pubescent; samaras nearly glabrous, the wings ascending, 1.5-2 cm. long inclusive of the nutlets.—May. Woods and thickets in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common. Many cultivars are grown in gardens.

Var. *microphyllum* Maxim. HIME-UCHIWA-KAEDÉ. Leaves smaller. Occurs with the typical phase.

2. *Acer japonicum* Thunb. *A. monacarpum* Nakai—HAUCHIWA-KAEDÉ. Tree with glabrous branches; leaves orbicular-cordate, 7-12 cm. wide, palmately 9-(7-11)-lobed, shallowly so, cordate at base, duplicate- or incised-toothed, with long scattered white hairs while young, soon glabrate except for an axillary tuft beneath, the lobes narrowly ovate, acuminate, the petioles 2-3.5 cm. long, pubescent while young; inflorescence corymbose, few-flowered, pendulous, white-pubescent while young; flowers 10-15 mm. across, 5-merous; sepals elliptic or oblong, dark reddish purple; samaras pendulous, pubescent while young, often glabrate, the wings ascending, 2-2.5 cm. long inclusive of the nutlets.—May. Woods and thickets on mountains; Hokkaido, Honshu; rather common and frequently planted; many cultivars are grown in gardens.

—Cv. *Aconitifolium*. *A. japonicum* forma *aconitifolium* (Meehan) Rehd. *A. japonicum* var. *aconitifolium* Meehan; *A. circumlobatum* var. *heyhachii* (Matsum.) Makino; *A. heyhachii* Matsum.—MAI-KUJAKU. Leaves dissected almost to the base with deeply incised, rhombic-oblancheolate lobes.

Var. *insulare* (Pax) Ohwi. *A. circumlobatum* Maxim.; *A. circumlobatum* var. *insulare* Pax; *A. japonicum* var. *circumlobatum* (Maxim.) Koidz.—Ô-MEIGETSU, SHINANO-HAUCHIWA. Wings of samaras horizontally spreading.—Honshu.

Var. *kobakoense* (Nakai) Hara. *A. kobakoense* Nakai—KOBAKO-HAUCHIWA. Leaf-lobes simply and coarsely toothed.—Hokkaido.

3. *Acer shirasawanum* Koidz. Ô-ITAYA-MEIGETSU. Tree with glabrous branches; leaves chartaceous, orbicular, 6-10 cm. wide, palmately 9- to 11-lobed, shallowly so, somewhat cordate at base, rather prominently duplicate-serrate, white-pubescent on both sides while young, soon glabrous except for an axillary tuft beneath, the lobes ovate, acuminate, the petioles 3-8 cm. long, rather slender, glabrous; inflorescence a more than 10-flowered compound corymb, the peduncles 4-6

cm. long, glabrous; flowers pale yellow, 6-8 mm. across; sepals broadly lanceolate, about 4 mm. long; ovary with a few long hairs; samaras glabrous, the wings ascending, about 2 cm. long including the nutlets.—May-June. Mountains; Honshu, Shikoku.

4. *Acer palmatum* Thunb. *A. polymorphum* Sieb. & Zucc., non Spach; *A. polymorphum* var. *palmatum* (Thunb.) K. Koch; *A. formosum* Carr.; *A. palmatum* var. *thunbergii* Pax; *A. eupalmatum* Koidz.; *A. palmatum* var. *quinquelobum* K. Koch; *A. palmatum* forma *genuina* Miq.—IROHA-MOMIJI, TAKAO-KAEDÉ, MOMIJI. Tree, with the young buds loosely yellowish brown pubescent, soon glabrous; leaves chartaceous, suborbicular, 4-7 cm. wide, cordate-truncate or subcordate at base, glabrous, palmately 5- to 7-lobed often to the middle, the lobes lanceolate to broadly so, acuminate, rather prominently duplicate-serrate, the petioles glabrous, slender, 3-5 cm. long, reddish; inflorescence a glabrous, pendulous, more than 10-flowered compound corymb, the slender peduncles 3-4 cm. long; flowers dark red, 4-6 mm. across; sepals oblanceolate, about 3 mm. long, loosely brown-pubescent at apex; ovary glabrous or with few rusty brown soft hairs; samaras glabrous, ascending or spreading, the wing about 1.5 cm. long.—Apr.-May. Woods and thickets in lowlands and mountains; Honshu, Shikoku, Kyushu; very common and variable, with numerous cultivars grown in gardens.—Korea.

Var. *amoenum* (Carr.) Ohwi. *A. amoenum* Carr.; *A. sanguineum* var. *amoenum* (Carr.) Koidz.; *A. palmatum* subsp. *amoenum* (Carr.) Hara; *A. palmatum* subsp. *septemlobum* Koidz., excl. syn.; *A. euseptemlobum* Koidz.—Ô-MOMIJI. Leaves larger, 6-10(-12) cm. wide, palmately 7-(9)-lobed, sometimes to the middle, the lobes rather regularly serrulate; wings of samara 2-2.5 cm. long inclusive of the nutlets.—Apr.-May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; very variable and frequently planted in gardens.—Forma *latilobum* (Koidz.) Ohwi. *A. palmatum* var. *latilobum* Koidz.—HIRO-HA-MOMIJI. Lobes of the leaves broader, deltoid or deltoid-ovate.—Western part of Honshu and Shikoku.

Var. *matsumurae* (Koidz.) Makino. *A. palmatum* subsp. *matsumurae* Koidz.; *A. matsumurae* (Koidz.) Koidz.; *A. ornatum* var. *matsumurae* (Koidz.) Koidz.—YAMA-MOMIJI. Leaves 5-8(-10) cm. wide, 7(5-9)-lobed to the middle, the lobes narrowly ovate to broadly lanceolate, prominently duplicate- or incised-serrate; wings of samaras 15-25 mm. long inclusive of the nutlets.—May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable; many cultivars of this variety are grown in gardens.

5. *Acer tenuifolium* (Koidz.) Koidz. *A. shirasawanum* var. *tenuifolium* Koidz.; *A. dissectum* var. *tenuifolium* (Koidz.) Koidz.—HINA-UCHIWA-KAEDÉ. Tree with glabrous branches; leaves membranous-chartaceous, thin, ovate-orbicular, 4-7 cm. wide, cordate at base, (5-)-7- to 9-lobed,

sometimes to the middle, sparsely white-pubescent, soon becoming glabrous except in the axils, or with very sparse persistent pubescence on nerves beneath, the lobes lanceolate, rhombic-lanceolate, or narrowly rhombic-ovate, acuminate, incised and doubly serrate acute-toothed, the petioles slender, 2–5 cm. long, glabrous or nearly so; inflorescence corymbose, pendulous, more than 10-flowered, on slender peduncles 1.5–4 cm. long; flowers pale yellow with a red-purple hue, about 5 mm. across; sepals oblong, about 3 mm. long; ovary rather densely white-pubescent; samaras loosely pubescent or glabrous, the wings ascending, about 2 cm. long including the nutlets.—May–June. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

6. *Acer ginnala* Maxim. *A. tataricum* var. *ginnala* (Maxim.) Maxim.; *A. tataricum* var. *aidzuense* Franch.; *A. aidzuense* (Fr.) Nakai.—KARA-KOGI-KAEDE. Shrub or small tree with glabrous branches; leaves thick-chartaceous, elliptic-ovate, triangular-ovate or ovate, 3–6 cm. wide, often shallowly 3-fid, 5–10 cm. long, caudately acuminate with a subobtusate tip, glabrous on upper side, thinly pubescent on nerves beneath, the lateral lobes short, ascending, acute, incised and doubly serrate, the petioles 2–5 cm. long, glabrous; inflorescence loosely branched, compound-corymbose, rather many-flowered, the peduncles 2–3 cm. long, often with scattered sessile glands; flowers greenish yellow, small; sepals about 2.5 mm. long; samaras glabrous or nearly so, erect or slightly ascending, the wings 25–35 mm. long.—May. Wet places; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and e. Siberia.

7. *Acer mono* Maxim. *A. pictum* Thunb. 1784, non Thunb. 1783; *A. pictum* var. *mono* (Maxim.) Maxim.; *A. laetum* var. *parviflorum* Regel; *A. pictum* var. *parviflorum* (Regel) C. K. Schn.—ITAYA-KAEDE. Tree, usually with glabrous branches; leaves depressed-obcordate, 7–15 cm. wide, deeply to rather shallowly 5- to 7-lobed, cordate to somewhat truncate at base, usually glabrous on upper side, short-pubescent to glabrous except for the axillary tufts of hairs beneath, the lobes deltoid to lanceolate, entire or with few coarse teeth, acuminate and awn-tipped, the petioles 4–12 cm. long, glabrous to short-pubescent; inflorescence on short peduncles, corymbose, 4–6 cm. across; flowers yellowish green, small, 5–7 mm. across; sepals oblong; petals broadly oblanceolate; samaras glabrous or short-pubescent while young, nearly erect to ascending, 2–3 cm. long inclusive of the wing.—Apr.–May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common and very variable.—Korea, Manchuria, Amur, Sakhalin, and China.

Var. *mayrii* (Schwerin) Koidz. ex Nemoto. *A. mayrii* Schwerin; *A. pictum* var. *mayrii* (Schwerin) Henry.—AKA-ITAYA, BENI-ITAYA. Bark smooth; leaves reddish while young, depressed reniform-obcordate, shallowly 5-lobed, glabrous, the lobes short, broad; flowers larger; samaras often erect.—Hokkaido, Honshu (n. distr.).

8. *Acer miyabei* Maxim. *A. shibatae* Nakai; *A. miyabei* var. *shibatae* (Nakai) Hara.—KUROBI-ITAYA. Tree, the branches grayish white, sometimes short-pubescent while young; leaves depressed, 5-angled, 8–15 cm. wide, 5-lobed, often beyond the middle, cordate at base, short-pubescent on both sides especially on nerves, the lobes 5-angled, caudately acuminate with an obtuse tip, usually with a small obtuse lobe on each side near the middle, the petioles 4–15 cm. long, pubescent with spreading, short hairs; inflorescence paniculately corymbose on short peduncles with 10 or more flowers; flowers greenish yellow, about 8 mm. across; sepals oblong,

about 4 mm. long; petals as long as the sepals, linear-oblongeolate; stamens slightly exserted; samaras usually yellowish pubescent, horizontally spreading, 2–3 cm. long.—May. Hokkaido, Honshu (centr. distr. and northw.); rare.

9. *Acer distylum* Sieb. & Zucc. HITOTSUBA-KAEDE, MARUBA-KAEDE. Tree, the branches with pale brown crisped appressed hairs; leaves simple, ovate-cordate, 10–17 cm. long, 6–12 cm. wide, abruptly caudately-acuminate with an obtuse tip, deeply cordate at base, glabrous on upper side, rusty-pubescent beneath while young, appressed and obtusely toothed, the petioles 3–5 cm. long, appressed-pubescent while young; inflorescence pendulous, racemose, with short branches on lower part, 7–10 cm. long inclusive of the peduncles 3–5 cm. long, pale brown appressed-pubescent, the pedicels to 1 cm. long; flowers yellowish, 3–4 mm. across; sepals oblong, appressed-pubescent externally; petals as long as the sepals, oblanceolate; stamens longer than the sepals; samaras nearly erect to ascending, pale brown-villous while young, about 3 cm. long.—June. Mountains; Honshu (Kinki Distr. and eastw.), Kyushu.

10. *Acer ukurunduense* Trautv. & Mey. *A. dedyle* Maxim.; *A. spicatum* var. *ukurunduense* (Trautv. & Mey.) Maxim.; *A. caudatum* var. *ukurunduense* (Trautv. & Mey.) Rehd.—OGARABANA, HOKAKI-KAEDE. Tree, the branches yellowish puberulent; leaves orbicular and 5-angled, 8–13 cm. long, 8–15 cm. wide, cordate at base, often whitish and with dull yellowish pubescence beneath, palmately 5(–7)-lobed on outer third, the lobes ovate-triangular, acuminate, sharply serrate and incised, the petioles 6–12 cm. long; inflorescence an erect raceme, 10–15 cm. long inclusive of the peduncles 3–5 cm. long, densely many-flowered, with pale brown soft hairs, the pedicels about 10 mm. long; flowers yellowish; sepals broadly lanceolate, about 1 mm. long; petals narrowly oblanceolate, about 2 mm. long; samaras loosely short-pubescent or glabrous, ascending, 1.5–2 cm. long.—July–Aug. High mountains; Hokkaido, Honshu (centr. distr. and northw.), Shikoku.—Sakhalin, Korea, Manchuria, e. Siberia, and Kuriles.—Forma *pilosum* Nakai. USUGE-OGARABANA. Leaves less prominently pubescent beneath.—Occurs with the species.

11. *Acer nipponicum* Hara. *A. parviflorum* Fr. & Sav., non Ehrh.; *A. pennsylvanicum* subsp. *parviflorum* (Fr. & Sav.) Wessm.; *A. brevilibum* Hesse.—TETSU-KAEDE. Tree, the young branches rusty-brown soft pubescent; leaves large, rather thin, cordate, 5-angled, depressed, 10–15 cm. long, 12–20 cm. wide, glabrous or nearly so on upper side, often thinly rusty brown curled-pubescent, persistently so on the nerves beneath, shallowly 5-lobed, the lobes broadly deltoid, often shallowly 3-fid, sharply double-serrate, acuminate, the petioles 8–17 cm. long, with persistent sparse brown pubescence on upper part; inflorescence erect, rather densely many-flowered, 10–20 cm. long, on a short peduncle 1–1.5 cm. long, short-branched in lower part, densely rusty-brown pubescent, the pedicels spreading, 4–7 mm. long; flowers 3–4 mm. across; sepals ovate, 1 mm. long; petals small; stamens 3 mm. long; samaras ascending to obliquely spreading, rusty brown pubescent, 3.5–4 cm. long.—June–July. Mountains; Honshu, Shikoku, Kyushu; rare.

12. *Acer carpinifolium* Sieb. & Zucc. CHIDORI-NO-KI. Dioecious tree with glabrous branches; leaves thin, ovate-oblong, 8–15 cm. long, 3.5–7 cm. wide, acuminate, cordate or shallowly so at base, regularly and sharply double-serrate, short-pubescent, often with long persistent appressed hairs on nerves beneath, the 18–23 pairs of lateral nerves ascending-

parallel, the petioles 1–1.5 cm. long; inflorescence nearly glabrous, racemose, pendulous, loosely few to rather many-flowered, 5–8 cm. long, on short peduncles, the pedicels 1–2.5 cm. long in fruit; flowers pale green, 1–1.2 cm. across; sepals 4, narrowly elliptic, long-pubescent, 5–6 mm. long; petals in pistillate flowers narrowly ovate, about as long as the sepals, often absent in staminate flowers; stamens 5–6; samaras soon glabrous, ascending, 2.5–3 cm. long inclusive of the wing.—Valleys and ravines in mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

13. *Acer crataegifolium* Sieb. & Zucc. URI-KAEDE, ME-URI-NO-KI. Large dioecious shrub with glabrous branches; leaves ovate or broadly so, undivided or shallowly 3-fid near the base, 4–7 cm. long, 3–4 (–7) cm. wide, long-acuminate, shallowly cordate at base, rather irregularly toothed, short rusty brown pubescent while young, paler beneath, the petioles glabrous, 1–2 cm. long; inflorescence a glabrous raceme 3–5 cm. long, about 10-flowered, the peduncles 1–1.5 cm. long, the pedicels slender, 4–10 mm. long; flowers yellowish green, about 8 mm. across; sepals narrowly oblong, ascending, about 4 mm. long; petals spatulate-obovate, slightly longer than the sepals; stamens about 8, about one-half as long as the sepals; samaras glabrous, horizontally spreading to ascending, about 2 cm. long.—May. Woods and thickets in low mountains; Honshu, Shikoku, Kyushu; common.

14. *Acer capillipes* Maxim. HOSO-E-KAEDE. Tree, glabrous except the branches and leaves which are rusty-brown crisped-pubescent while young; leaves thick-chartaceous, ovate to broadly so, 3-angled, undivided or shallowly 3-fid and 5-angled, 8–13 cm. long, 4–6 (–10) cm. wide, long-acuminate, cordate or rounded at base, irregularly and acutely serrulate, often glaucous beneath, the lateral lobes if present small, the petioles 3–5 cm. long; inflorescence racemose, densely many-flowered, about 10 cm. long, on short peduncles, the pedicels 4–8 mm. long, ascending; flowers pale green, 7–8 mm. across; sepals 5, narrowly oblong, 3–4 mm. long; petals and stamens equaling the sepals; samaras glabrous, nearly horizontally spreading, about 15 mm. long.—May–June. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

Var. *morifolium* (Koidz.) Hatus. *A. morifolium* Koidz.; *A. insulare* sensu Ohwi, pro parte, non Makino.—YAKU-SHIMA-OGARABANA. Leaves broadly ovate, without axillary tufts of hairs on the under surface.—Kyushu (Yakushima).

15. *Acer rufinerve* Sieb. & Zucc. URI-HADA-KAEDE. Tree with greenish glabrous branches; leaves rather thick, flabellately 5-angled, 8–15 cm. long and as wide, shallowly 3-fid on upper part, with the central lobes broadly deltoid, acuminate, the lateral lobes acuminate, ascending, smaller, often with an accessory smaller obsolete lobe on the outer side near the base, sharply double-serrulate, the blade shallowly cordate to rounded at base, with rusty brown long pubescence on the nerves beneath while young; inflorescence a rather densely many-flowered raceme, short-pedunculate, 5–10 cm. long, the pedicels rather erect, 2–5 mm. long, rusty-brown pubescent; flowers pale green, 8–10 mm. across; sepals 4, oblong, as long as to slightly shorter than the petals; stamens about 8; samaras ascending, 2.5–3 cm. long.—Woods and thickets in mountains; Honshu, Shikoku, Kyushu; common.

16. *Acer argutum* Maxim. ASA-NO-HA-KAEDE. Small dioecious tree with white-puberulent branchlets; leaves orbicular, thin-membranous, palmately 5 (–7)-lobed, cordate at base, 5–10 cm. long and as wide, white-puberulent at first beneath,

persistent on the nerves, the lobes broadly ovate, caudately acuminate, rather regularly double-toothed, the petioles 3–10 cm. long, slender; inflorescence a few-flowered raceme, 3–6 cm. long, thinly white-puberulent, the pedicels ascending, glabrous, about 3 mm. long; petals short; stamens about 4, longer than the sepals; samaras glabrous, nearly horizontally spreading, 2–2.5 cm. long.—May–June. Mountains; Honshu (Kantō Distr. to s. Kinki Distr.), Shikoku.

17. *Acer tschonoskii* Maxim. MINE-KAEDE. Shrub or small tree with glabrous branches; leaves 5-angled, nearly orbicular, 5–9 cm. long, 5–10 cm. wide, cordate to nearly rounded at base, while young rusty-brown pubescent beneath, on nerves near base, and on petioles, soon glabrous, palmately 5-lobed on outer half, the lobes rhomboid to rhombic-ovate, long-acuminate, often with a short lobe on each side near base, incised and doubly serrate, the petiole glabrous, 2–5 cm. long, reddish; inflorescence loosely few-flowered, short-pedunculate, 2–5 cm. long, slightly rusty-brown pubescent on the nodes, the pedicels ascending, 8–15 mm. long; flowers 8–10 mm. across, pale yellow; sepals and petals nearly alike, spreading, linear-ob lanceolate, about 4 mm. long; stamens about 8, as long as the petals; samaras glabrous, ascending to obliquely spreading, 2.5–3 cm. long.—June–July. Coniferous forests to the lower alpine regions; Hokkaido, Honshu (centr. distr. and northw.).—s. Kuriles.

18. *Acer micranthum* Sieb. & Zucc. KO-MINE-KAEDE. Small tree or shrub with glabrous branches; leaves nearly orbicular, 5–8 cm. long and as wide, palmately 5-lobed, beyond the middle, cordate at the base, with rusty-brown curled pubescence on nerves beneath while young, the lobes rhombic-ovate to ovate, caudately long-acuminate, incised and doubly serrate, the petioles 3–5 cm. long, glabrous; inflorescence a rather dense, more than 10-flowered raceme, 4–7 cm. long, on short peduncles, brownish pubescent on the nodes, the pedicels 4–7 mm. long, spreading to ascending; flowers small, about 4 mm. across, pale green; sepals oblong, about 1 mm. long; petals oblong, about 2 mm. long; stamens 8, as long as the petals; samaras glabrous, nearly horizontally spreading, 1.5–2 cm. long.—Mountains; Honshu, Shikoku, Kyushu.

19. *Acer diabolicum* Bl. *A. purpurascens* Fr. & Sav.; *A. diabolicum* var. *purpurascens* (Fr. & Sav.) Rehd.—KAJI-KAEDE, ONI-MOMIJI. Dioecious tree, the branches grayish, lenticellate, white-pilulous when young; leaves orbicular, depressed-cordate, 7–15 cm. long, 8–16 cm. wide, 5-lobed, sometimes to the middle, glabrous on upper side, pilulous beneath, truncate to shallowly cordate at base, the terminal lobe ovate, 5-angled, shallowly 3-fid on upper part, abruptly acuminate with an obtuse tip, with few obtuse coarse teeth, the outermost pair of lobes very short and small; inflorescence a loose few-flowered, sessile corymb, 2–5 cm. long, glabrate, the pedicels 1–2 cm. long, nearly erect; flowers 5-merous, pale green; sepals and petals similar, oblong, suberect, 5–6 mm. long; stamens 8; samaras appressed-pilulous, erect or slightly ascending, 3–4 cm. long.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu.

20. *Acer pycnanthum* K. Koch. *A. rubrum* sensu auct. Japon., non L.; *A. rubrum* var. *pycnanthum* (K. Koch) Makino.—HANA-NO-KI, HANA-KAEDE. Tree, the branches glabrous, the nodes sparsely rusty-brown pubescent while young; leaves ovate to orbicular, 3-fid, 4–7 cm. long, 3–6 (–8) cm. wide, rounded to shallowly cordate at base, glabrous, deep green on upper side, glaucous beneath, the lobes 3-angled or ovate-tri-

angular, acuminate, irregularly serrate, the petioles glabrous, 3–6 cm. long; inflorescence fasciculate, few-flowered, from lateral winter-buds developing before the leaves, the pedicels elongate, glabrous, to 5 cm. long, pendulous; sepals of pistillate flowers 5, broadly lanceolate to narrowly ovate, about 3 mm. long, reddish; petals smaller; samaras glabrous, about 2 cm. long, nearly erect.—Apr. Wet places in mountains; Honshu (w. part of Tōkaidō and Shinano); rare; sometimes planted.

21. *Acer nikoense* Maxim. *A. maximowiczianum* Miq. ex Koidz.; *Negundo nikoense* (Maxim.) Nichols., non Miq. —MEGUSURI-NO-KI. Tree, coarsely grayish spreading-hirsute on young branches, under side of leaves, pedicels, and petioles; leaves 3-foliolate, the petioles 2–3 cm. long, the lateral leaflets sessile, narrowly ovate to narrowly elliptic, 5–12 cm. long, 2–6 cm. wide, acute with an obtuse tip, slightly oblique at base, remotely obtuse-serrate except near base or subentire, glabrous on upper side when mature, glaucescent beneath, the 10–15 pairs of lateral nerves parallel, the terminal leaflet on a petiolule 5–10 mm. long; inflorescence about 3-flowered in a terminal fascicle; the pedicels 1–1.5 cm. long; sepals 5, as long as the petals; stamens about 10; samaras large, yellowish villous, ascending to obliquely spreading, 4–5 cm. long.—May. Mountains; Honshu, Shikoku, Kyushu.

22. *Acer cissifolium* (Sieb. & Zucc.) K. Koch. *Negundo cissifolium* Sieb. & Zucc.; *N. nikoense* Miq. —MITSUDE-KAEDE.

Dioecious tree, white-puberulent on young branches; leaves 3-foliolate, the leaflets nearly all alike, on petiolules 5–10 mm. long, rather thinly membranous, ovate-elliptic or oblong, 5–8 cm. long, 2–3.5 cm. wide, caudately long-acuminate, cuneate at base, coarsely acute-serrate on upper half, thinly white appressed-puberulent especially on the nerves beneath, and with axillary tufts of white hairs, the lateral nerves 10–12 pairs; inflorescence racemose, pendulous, loosely white-pubescent, the racemes 4–15 cm. long, on peduncles 2–4 cm. long, the pedicels spreading to ascending, 4–6 mm. long; flowers small, about 5 mm. across, 4-merous; sepals about 1 mm. long; petals about 2.5 mm. long; stamens 4, slightly shorter than the petals, the filaments broadened at base; samaras glabrous or short-puberulent while young, nearly erect to ascending, 2.5–3 cm. long.—Apr.–May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

23. *Acer negundo* L. *Negundo aceroides* Moench; *A. fauriei* Lév. & Van't.—TONERIKOBA-NO-KAEDE. Dioecious tree with glabrous branches; leaves pinnately 3- to 5(-7)-foliolate, on petioles 5–8 cm. long, the leaflets ovate-elliptic, 5–10 cm. long, acuminate, coarsely serrate, glabrous or slightly pubescent beneath; staminate flowers in corymbs, the pistillate in racemes; ovary pubescent; samaras glabrous, ascending, 2.5–3.5 cm. long.—Apr. Widely cultivated in our area.—N. America.

Fam. 125. HIPPOCASTANACEAE

TOCHI-NO-KI KA

Horsechestnut Family

Trees and shrubs with palmately or pinnately compound, exstipulate, opposite leaves; flowers polygamous, zygomorphic, in terminal panicles; sepals 4 or 5, free or connate, imbricate in bud; petals 4 or 5, unequal, clawed; stamens 5–9, free; disc on outer side of the stamens; ovary superior, 3-locular, with 2 ovules in each locule; style and stigma simple; fruit usually 1-locular, 3-valved, dehiscent, usually 1-seeded; seeds large, with a large hilum, the endosperm absent.—Two genera, with about 25 species, in the temperate regions of the N. Hemisphere and S. America.

1. AESCULUS L.

TOCHI-NO-KI ZOKU

Deciduous trees or shrubs, with large sometimes resinous winter-buds; leaves long-petiolate, palmately 5- to 9-foliolate, serrate; flowers many, in erect terminal panicles; calyx campanulate or tubular, with 4 or 5 teeth; petals long-clawed at base.—About 24 species, in Europe, e. Asia, India, and N. America.

1. *Aesculus turbinata* Bl. *A. dissimilis* Bl.—TOCHI-NO-KI. Tree, with rusty-brown, long, curled, soft hairs while young, soon glabrate, the buds ovoid, resinous; leaves 5- to 7-foliolate, the leaflets narrowly obovate-oblong, the median largest, 20–35 cm. long, about 12 cm. wide, abruptly acuminate, gradually narrowed from above the middle to the sessile base, obtusely toothed, pubescent on nerves and in axils beneath, the lateral nerves about 20 pairs; inflorescence erect, narrow, 15–25 cm. long, 6–10 cm. across, with short spreading pubescence; flowers pinkish, rather dense, on one side of the panicle

branches, numerous, about 1.5 cm. across, the pedicels 3–5 mm. long; calyx-teeth 5, unequal, depressed-rounded; petals 4, recurved, on a short claw, pubescent; stamens exerted, 15–17 mm. long, arcuate; fruit obovoid-globose, about 3 cm. across, 3-valved, dehiscent; seeds chestnut-brown, lustrous, the hilum occupying about half of the surface of the seed.—May–June. Mountains, especially in ravines; Hokkaido, Honshu, Shikoku, Kyushu; common.—Forma *pubescens* (Rehd.) Ohwi. *A. turbinata* var. *pubescens* Rehd.—URAGE-TOCHI-NO-KI. Leaves soft-pubescent beneath.

Fam. 126. SAPINDACEAE

MUKUJOJI KA

Soapberry Family

Trees, rarely herbs; leaves alternate or opposite, usually odd-pinnate, sometimes bipinnate or ternate, exstipulate; flowers unisexual or polygamous, actinomorphic or zygomorphic, small, usually in panicles; sepals 4 or 5, imbricate in bud, rarely valvate; petals 4 or 5, rarely absent, usually hairy or scaled near the base within; disc prominent, on outer side of the stamens; stamens usually 8 or 10 in 2 cycles, rarely 6 or 7, more or less connate below; ovary superior, usually 3-locular, deeply 3-lobed, the ovules usually solitary in each locule; style simple; fruit a capsule, berry, drupe, nut, or a samara; seeds without endosperm.—About 120 genera, with about 1,000 species, chiefly in the Tropics, a few in temperate regions.

- 1A. Leaflets entire; flowers small, actinomorphic; fruit berrylike. 1. *Sapindus*
 1B. Leaflets toothed or pinnately lobed; flowers zygomorphic, rather large; fruit a capsule. 2. *Koeleruteria*

1. *SAPINDUS* L. MUKUROI ZOKU

Trees; leaves alternate, deciduous or evergreen, leaflets entire; flowers small, actinomorphic, unisexual, in large axillary or terminal panicles; sepals and petals 4 or 5; petals with 1 or 2 scales on the claw; disc annular; stamens 8-10; carpels 3, only one maturing into a drupe; seeds solitary, usually globose and arillate.—About 15 species, chiefly in the Tropics.

1. *Sapindus mukorossi* Gaertn. *S. abruptus* Lour.—MUKUROI. Large glabrous tree; leaves petiolate, odd-pinnate, the leaflets 8-12, rather coriaceous, ovate or lanceolate, 7-15 cm. long inclusive of the petiolules, 3-4.5 cm. wide, gradually acuminate with an obtuse tip, obliquely acute at base, entire, prominently reticulate-veined; panicles terminal, 20-30 cm. long, puberulous; flowers 4-5 mm. across, yellowish green;

calyx-lobes and petals 4 or 5, the outer side of the latter and the lower half of the stamens pubescent; fruit globose, about 2 cm. across, glabrous, yellowish brown, lustrous, with the abortive carpels persistent on one side at base.—June. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, China to India.

2. *KOELREUTERIA* Laxm. MOKUGENJI ZOKU

Deciduous trees; leaves alternate, odd-pinnate, sometimes bipinnate, the leaflets toothed; flowers yellow, rather large, zygomorphic, in large terminal panicles; calyx unequally 5-lobed; petals 4, lanceolate, turned upward, clawed, the limb with 2 upwardly turned appendages at the cordate base; disc undulate-toothed on upper margin; stamens 8; style trifid; fruit a bladderlike inflated capsule, loculicidally dehiscent; seeds globose, black, hard.—Few species in e. Asia.

1. *Koelreuteria paniculata* Laxm. *Sapindus chinensis* Murray; *K. paullinoides* L'Hérit.—MOKUGENJI. Young branches often puberulous; leaves 25-35 cm. long, the petioles 3-8 cm. long, puberulent beneath while young, the leaflets sessile, herbaceous, ovate, 4-10 cm. long, 3-5 cm. wide, acuminate to acute, coarsely and irregularly toothed or incised, often pinnately lobed; inflorescence paniculate, 25-35 cm. long, the racemose branches elongate, spreading-puberulous; flowers

about 1 cm. across, yellow, short-pedicelled; calyx-lobes oblong, about 2 mm. long; petals obtuse, about 8 mm. long, reddish at base; stamens slightly shorter than the petals, erect, the filaments loosely pubescent on lower half; capsules chartaceous, 3-angled, 3-valvate, dehiscent, ovoid, acute, rounded at base, glabrous, 4-5 cm. long, 2.5-3 cm. across; seeds about 7 mm. across.—July. Often naturalized near seashores and sometimes planted around temples of Honshu.—Korea and China.

Fam. 127. *SABIACEAE* AWABUKI KA *Sabia* Family

Erect or scandent woody plants; leaves alternate, simple or pinnate, exstipulate; flowers bisexual or unisexual, in cymes or panicles; sepals 4 or 5, sometimes 3, often connate at base, imbricate, unequal; petals 5, rarely 4, imbricate, the inner 2 often small and scalelike; stamens 5, opposite the petals, perfect or the outer 3 reduced to staminodes; ovary superior, usually with a disc at base, 2(-3)-locular, the ovules 2 or 1 in each locule; fruit indehiscent, 1(-2)-locular; seeds solitary, the endosperm absent.—Four genera, with about 70 species, in tropical Asia and America.

- 1A. Stamens all perfect; flowers solitary or in axillary cymes; scandent shrubs with simple entire leaves. 1. *Sabia*
1B. Inner 2 stamens perfect; flowers in terminal panicles; erect trees with simple or pinnate, toothed or entire leaves. 2. *Meliosma*

1. *SABIA* Colebr. AO-KAZURA ZOKU

Evergreen or deciduous climbers; leaves simple, entire; flowers bisexual, rarely polygamous, small, in axillary cymes or solitary; calyx deeply 4- or 5-lobed, the lobes imbricate; petals 5 or 4, nearly opposite the calyx-lobes, but longer; stamens 5 or 4, the anthers globose ovary with 5 acutely margined discs at base; style slender; fruit 1-seeded and entire or 2-seeded and deeply 2-lobed, the exocarp slightly fleshy, the mesocarp rather woody, reticulate.—About 20 species, in e. and s. Asia.

1. *Sabia japonica* Maxim. AO-KAZURA. Deciduous, scandent shrub, the branches deep green, the young branchlets puberulent; leaves ovate-elliptic or ovate-oblong, 5-7 cm. long, 2-4 cm. wide, acute with an obtuse tip, acute to rounded at base, deep green on upper side, whitish and with finely reticulate veinlets beneath, thinly spreading-pubescent on the midrib beneath, the petiole bases persistent, spinelike; flowers yellow, precocious, 5-merous, solitary in axils, peduncled, cup-shaped,

nodding, 5-6 mm. across; peduncles slender, 1.5-2.5 cm. long in fruit; calyx minute; petals obovate, about 3.5 mm. long; stamens erect, slightly shorter than the petals; ovary 1; style gradually thickened at base, about 3 mm. long; fruit with 1 or 2 carpels, blue, about 6 mm. across, slightly flattened, with raised reticulate veinlets when dry.—Mar. Shikoku, Kyushu.—China.

2. *MELIOSMA* Bl. AWABUKI ZOKU

Evergreen or deciduous trees or shrubs with naked buds; leaves simple or pinnate; flowers bisexual, rarely polygamous, in terminal or axillary panicles, relatively small; sepals 5 or 4; petals 5, unequal, the outer 3 rounded, imbricate, the inner 2 minute and often bifid or scalelike, sometimes adnate with the perfect stamens; stamens 5, the outer reduced to cuplike staminodes, the inner perfect, the anthers surrounded by a cup formed by the apex of the filaments; style short; fruit a small drupe, with a solitary 1-seeded stone.—About 50 species, in e. and s. Asia and tropical America.

1A. Leaves simple.

- 2A. Leaves evergreen, coriaceous, entire or remotely serrate near tip, with prominently raised reticulated veinlets beneath, the lateral nerves 10-14 pairs, densely rusty-brown pubescent while young except the upper side; panicles erect. 1. *M. rigida*
- 2B. Leaves deciduous, membranous to chartaceous, distinctly toothed, with slender, not prominently raised reticulate veinlets.

- 3A. Leaves chartaceous, 10-25 cm. long, the lateral nerves 20-27 pairs, ending in short-awned teeth; panicles erect, broadly pyramidal, densely flowered, larger. 2. *M. myriantha*

- 3B. Leaves membranous, 8-15 cm. long, the lateral nerves 7-10 pairs, ending in undulate or obtusely 3-angled teeth; panicles nodding, small, narrow. 3. *M. tenuis*

1B. Leaves pinnate.

- 4A. Fruit red at maturity. 4. *M. oldhamii*

- 4B. Fruit black-purple at maturity. 5. *M. hachijoensis*

1. *Meliosma rigida* Sieb. & Zucc. YAMA-BIWA. Small evergreen tree, the branchlets, under side of leaves, petioles, and inflorescence densely rusty- to yellow-brown soft woolly-pubescent; leaves simple, obovate-oblong, 12-20 cm. long, 4-6 cm. wide, shortly to abruptly acuminate, gradually cuneate from above the middle to the base, subentire or with few coarse short awned teeth, the lateral nerves 10-14 pairs, ending in the teeth, slightly curved upward, the veinlets prominently raised-reticulate beneath, the petioles 2-4 cm. long; panicles pyramidal, leafy below, 15-20 cm. long and as wide; flowers sessile, about 4 mm. across; sepals suborbicular, the 3 outer petals rounded-cordate, about 2.5 mm. across; fruit globose, black.—June. Woods and thickets in low mountains; Honshu (Tōkaidō and s. Kinki Distr.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

2. *Meliosma myriantha* Sieb. & Zucc. AWABUKI. Deciduous tree, the young branches with dull yellow short hairs, also the under side of the leaves especially the lateral nerves, the lenticels elliptic; leaves simple, chartaceous, narrowly cuneate-obovate to oblong, 10-25 cm. long, 4-8 cm. wide, short-acuminate, cuneate to obtuse at base, with short-awned teeth, glabrous on upper side, paler beneath, the lateral nerves 20-27 pairs, parallel, slightly arcuate at tip, the secondary nerves perpendicular to the lateral nerves, slender, the petioles 1-1.5 cm. long; inflorescence broadly pyramidal, 15-25 cm. long and as wide, densely branched, spreading; flowers very numerous, yellowish green, about 3 mm. across, short-pedicelled; sepals nearly orbicular; petals 1.5 mm. long, orbicular; perfect stamen solitary; fruit obliquely globose, with a persistent style-base, about 4 mm. across, red.—June. Thickets in low mountains; Honshu, Shikoku, Kyushu.—Korea.

3. *Meliosma tenuis* Maxim. *M. tenuiflora* Miq.—Miyama-Hahaso. Large shrub, the branches slender, dark brown, with scattered pale brown ascending hairs while young; leaves simple, membranous, obovate, 8-15 cm. long, abruptly and broadly caudate and short-awned, acute and often decurrent to the petiole at base, coarsely deltoid- or undulate-toothed,

with scattered multicellular hairs on upper side, pale green and with ascending pubescence on nerves and with axillary tufts of hairs beneath, the lateral nerves 7-10 pairs, ending in awns of the teeth, the petioles 1-1.5 cm. long; inflorescence narrowly pyramidal, nodding, 10-15 cm. long, 5-10 cm. across, acute at apex, short-pubescent, the rachis slender, more or less flexuous; flowers short-pedicelled, about 4 mm. across, yellow; sepals obtusely deltoid; petals orbicular, 2.5-3 mm. long; perfect stamens 2; fruit obliquely globose, about 4 mm. across, dark purple.—May-June. Thickets and woods in mountains; Honshu, Shikoku, Kyushu; rather common.

4. *Meliosma oldhamii* Miq. *M. rhoifolia* Maxim.; *Fraxinus fauriei* Lévl.—FUSHI-NO-HA-AWABUKI, RYŪKYŪ-AWABUKI. Tree, with robust branches, golden-brown pubescent while young; leaves pinnate, the leaflets 9-15, chartaceous to membranous, very short-petiolate, ovate to ovate-lanceolate, 5-10 cm. long, 2-3.5 cm. wide, long-acuminate, cuneate to acute at base, with remote short-awned teeth, loosely pubescent on both sides, more densely so on the nerves beneath, the secondary nerves ending in the teeth; panicles large, the branches elongate, composed of numerous short few-flowered racemes; flowers short-pedicelled; petals 3 times as long as the sepals, orbicular; ovary villous; fruit red at maturity.—June. Honshu (Suwo Prov.), Kyushu (Tsushima); rare.—Ryukyus, Formosa, China, and s. Korea.

5. *Meliosma hachijoensis* Nakai. SAKU-NO-KI. Tree, pubescent with yellowish brown hairs; branches stout; leaves pinnate, 25-40 cm. long, densely pubescent, the petioles 4-6 cm. long; leaflets 13-19, thinly chartaceous, ovate to narrowly oblong, 7-12 cm. long, 2.5-5 cm. wide, acuminate, obliquely cuneate to obliquely rounded at base, with appressed acute teeth or entire, short-pilose on nerves above and near margin, paler beneath; panicles large, terminal and axillary, pubescent; flowers small, short-pedicelled; sepals 5, minutely ciliate, broadly ovate to elliptic, 0.3-1 mm. long; ovary pubescent; fruit subglobose, about 6 mm. long, glabrescent, black-purple when mature.—Honshu (Hachijo Isl.).

Fam. 128. BALSAMINACEAE

TSURI-FUNE-SŌ KA Balsam Family

Soft, juicy herbs; leaves alternate or opposite, simple, penninerved, exstipulate; flowers zygomorphic, bisexual, solitary, racemose, or nearly umbellate; sepals 3, rarely 5, imbricate, unequal, the lowest with a spur; stamens 5, the filaments short, connate at the tip; ovary superior, 3-locular; stigmas 1-5, sessile; ovules many; fruit a juicy 5-valved capsule which suddenly explodes at maturity, casting the seeds for a considerable distance; seeds without endosperm, the embryo straight.—Two genera, with about 400 species, chiefly in tropical Asia and Africa, a few in temperate regions.

I. IMPATIENS L.

TSURI-FUNE-SŌ ZOKU

Soft juicy annual herbs, sometimes somewhat woody at the base; leaves alternate, opposite, or radical, serrate, often with glands near base of the petioles; peduncles axillary, solitary or in fascicles; flowers on slender pedicels, zygomorphic, usually large and showy, purple, yellow, or white; sepals 3, rarely 5, often colored, the lateral 2 reduced, the lower one largest, spurred; petals 3, the lateral ones bifid; capsules loculicidally dehiscent.—About 400 species, chiefly in tropical Asia and Africa, a few in e. Asia, Europe, and N. America.

- 1A. Flowers pale yellow; plant glabrous; leaves oblong to ovate, rounded to acute at base, obtusely toothed; pedicels very slender. 1. *I. noli-tangere*
- 1B. Flowers reddish purple, rarely white; plant sparsely hirsute on upper side of leaves and on peduncles; leaves rhombic-ovate to lanceolate, cuneate at base, those near the inflorescence rounded to cordate at base, rather densely serrate; pedicels rather thick.
- 2A. Spur circinnate; peduncles ascending to suberect, widely spaced above and not subtending the leaves; leaves cuneate at base. 2. *I. textori*
- 2B. Spur curved forward; peduncles spreading, subtending the leaves; leaves gradually narrowed to the base, those near the inflorescence rounded, cordate, or obtuse at base. 3. *I. hypophylla*

1. ***Impatiens noli-tangere*** L. KI-TSURI-FUNE. Glau-
cous and glabrous, the stems terete, much-branched, 30–60 cm.
long; leaves with slender petioles progressively shorter toward
the summit, the blades oblong to ovate, 4–8 cm. long, 2.5–4
cm. wide, obtuse to subacute, acute at base or the upper ones
rounded to shallowly cordate at base, coarsely and obtusely
serrate, mucronate-tipped, the basal teeth filiform; inflorescence
nodding, on a slender peduncle, 1- to 5-flowered, in corymbose
racemes, the bracts linear, small; flowers pale yellow, with
reddish brown blotches inside, about 2 cm. across, with a
gently and downwardly curved spur at base, often cleisto-
gamous late in the season.—Wet shaded places in mountains;
Hokkaido, Honshu, Shikoku, Kyushu; rather common.—
Europe, Siberia, e. Asia, and w. N. America.

2. ***Impatiens textori*** Miq. *I. japonica* Fr. & Sav.—
TSURI-FUNE-SO. Stems much-branched, 40–80 cm. long, usu-
ally reddish; leaf-blades rhombic-ovate to narrowly rhomboidal,
6–15 cm. long, 3–7 cm. wide, acuminate, cuneate at base,
vivid green, short awn-toothed, the upper leaves smaller,
nearly sessile and rarely obtuse at base; peduncles ascending,
elongate, straight, with fleshy spreading reddish hairs, the
bracts lanceolate to deltoid-ovate, spreading, small, the pedicels
1–2 cm. long; flowers purplish red, with purple spots, about

3 cm. across, the spur prominently circinnate; fruit oblongeo-
late, 1–2 cm. long.—July–Sept. Wet shaded places on low
mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather com-
mon.—Korea.

3. ***Impatiens hypophylla*** Makino. HAGAKURE-TSURI-
FUNE. Stems branched; leaves rhombic-elliptic to narrowly
rhomboidal, 8–20 cm. long, 3–8 cm. wide, acuminate, gradually
narrowed to the petiole, obtusely deltoid-toothed and mucro-
nate-tipped, with scattered white multicellular curled hairs on
upper side, and on nerves beneath, the upper leaves short-peti-
olate, rounded, subcordate to truncate at base; inflorescence
racemously few-flowered, on long peduncles placed just beneath
the leaves, usually with whitish multicellular curled hairs on
the lower part, arcuate above, the pedicels to 1.5 cm. long,
slender, the bracts broadly lanceolate to deltoid-ovate; flowers
purplish red, about 2 cm. across, with deeper colored spots, the
spur forwardly curved; fruit linear-lanceolate.—July–Oct.
Honshu (Kinki Distr.), Shikoku, Kyushu.

Var. ***microhypophylla*** (Nakai) Hara. *I. microhypophylla*
Nakai.—ENSHŪ-TSURI-FUNE-SO. Flowers smaller, about 1
cm. across, without purple spots, the pedicels less than 1 cm.
long.—Honshu (Tōtōmi Prov.).

Fam. 129. RHAMNACEAE KURO-UME-MODOKI KA Buckthorn Family

Trees, often spiny, sometimes scandent, or herbs; leaves alternate, rarely opposite, simple, usually stipulate; flowers actinomor-
phic, bisexual or unisexual, green or white, in cymes, fascicles, or panicles; flowers 5- or 4-merous; calyx-lobes valvate; petals
sometimes absent; stamens opposite the petals; receptacle cup-shaped, the disc distinct; ovary 2- or 3-locular, rarely 1- or 4-
locular, superior or inferior, with 1 or sometimes 2 ovules in each locule; styles 2–4, connate at base; fruit a drupe or capsule,
sometimes winged; endosperm scanty or absent.—About 45 genera, with about 550 species, widespread in temperate and
warmer regions.

- 1A. Stipules often spinelike; leaves 3-nerved.
- 2A. Fruit dry, winged. 1. *Paliurus*
- 2B. Fruit a fleshy drupe. 2. *Zizyphus*
- 1B. Stipules not spinelike; branchlets often abbreviated and spinelike; leaves penninerved or 3-nerved.
- 3A. Leaves penninerved; peduncles and pedicels not fleshy-thickened.
- 4A. Leaves entire or nearly so. 3. *Berberia*
- 4B. Leaves serrulate.
- 5A. Flowers nearly sessile, in spikes or panicles; leaves partly opposite; branches partly abbreviated and spinelike. 4. *Sageretia*
- 5B. Flowers pedicelled, usually in axillary fascicles or cymes.
- 6A. Ovary incompletely 2-locular; flowers bisexual; fruit with 1 or rarely 2 stones. 5. *Rhamnella*
- 6B. Ovary 2- to 4-locular; fruit with 2–4 stones; flowers bi- or unisexual. 6. *Rhamnus*
- 3B. Leaves 3-nerved; peduncles thickened and fleshy in fruit. 7. *Hovenia*

1. PALIURUS Mill. HAMA-NATSUME ZOKU

Deciduous trees or shrubs, often procumbent or creeping; leaves alternate, in 2 rows, 3-nerved, entire or serrulate; flowers
bisexual, 5-merous, small, in axillary or terminal cymes; stipules often spinose; ovary 2- or 3-locular, adnate to the disc; fruit
2- or 3-locular, woody, depressed, with a broad transverse wing above, with 1 seed in each locule.—Few species, in s. Europe
and e. Asia.

1. ***Paliurus ramosissimus*** (Lour.) Poir. *Aubletia ramo-*
ssima Lour.; *P. aubletia* (Lour.) Schult.—HAMA-NATSUME.
Deciduous much-branched shrub with grayish brown branches,

often spiny in young individuals, the branchlets densely brown-
ish-puberulent; leaves thinly coriaceous, broadly ovate, elliptic,
or ovate-orbicular, 4–6 cm. long inclusive of the densely soft-

puberulous petioles, obtuse to rounded at both ends, obtusely serrulate, pale green beneath, soft-pubescent especially on nerves beneath when young, 3-nerved, the secondary nerves slender and ascending; cymes axillary, on the upper part of the branchlets, short-peduncled, densely brownish pubescent; flowers few, about 5 mm. across, pale green; calyx-lobes del-

toid; petals broadly ovate, shorter than the sepals, less than 1 mm. long; fruit suborbicular, with a 3-lobed, dentate, broad wing at the margin of the broadly truncate apex, soft brownish puberulent.—Aug.-Sept. Near seashores; Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

2. ZIZYPHUS Mill. NATSUME ZOKU

Deciduous or evergreen shrubs or trees; leaves alternate, short-petiolate, entire or serrulate, 3- to 5-nerved from the base, the stipules usually spinelike; flowers bisexual, 5-merous, usually yellow, small, in axillary cymes; ovary 2- to 4-locular; styles simple, 2-parted at tip; fruit a fleshy drupe, nearly globose to oblong.—About 40 species, in tropical and warmer regions of both hemispheres.

1. *Zizyphus jujuba* Mill. *Rhamnus zizyphus* L.; *Z. sativa* Gaertn.; *Z. vulgaris* Lam.; *Z. vulgaris* var. *spinosa* Bunge —SANEBUTO-NATSUME. Small deciduous tree or shrub, glabrous except sometimes thinly pubescent on the tips of the young branchlets and on the nerves of the leaves beneath, the branchlets often fascicled and partly deciduous in autumn; leaves ovate, 2.5-4 cm. long inclusive of the short petioles, 1-2.5 cm. wide, obtuse to subacute, rounded at base, obtusely serrulate, lustrous, the stipules often spinelike; cymes small,

about 10-flowered, axillary and terminal; flowers pale green, 5-6 mm. across; calyx-lobes acute; petals small and recurved at tip; drupe ellipsoidal to globose, 1.5-2.5 cm. in diameter, glabrous, lustrous, smooth, dark reddish brown.—Apr.-May. Spontaneous in se. Europe, s. Asia; often cultivated and semi-naturalized in our area.

Var. *inermis* (Bunge) Rehd. *Z. vulgaris* var. *inermis* Bunge.—NATSUME. Spineless cultivated phase.

3. BERCHEMIA Neck. KUMA-YANAGI ZOKU

Scandent or suberect, deciduous shrubs; leaves alternate, petiolate, entire or nearly so, penninerved, with arcuate parallel lateral nerves, the stipules not spinelike, slender, connate; flowers bisexual, 5-merous, greenish yellow, small, in terminal panicles or racemes, or sometimes in axillary cymes; calyx-lobes deltoid, erect; petals small; ovary 2-locular; style bifid; fruit an ellipsoidal or short-cylindric smooth drupe with a 2-locular stone.—About 10 species, in Asia, e. Africa, and N. America.

1A. Scandent or bushy shrubs with smooth greenish branches; stipules connate almost to the apex.

2A. Racemes simple or with few branches at base.

3A. Inflorescence 1-2.5 cm. long, simple; leaves 2.5-4 cm. long. 1. *B. pauciflora*

3B. Inflorescence 5-8 cm. long, simple or with few branches at base; leaves 5-10 cm. long. 2. *B. longeracemosa*

2B. Racemes many, spreading, in a terminal panicle. 3. *B. racemosa*
1B. Erect tree with a main stem; branches reddish brown, with scattered raised lenticels; stipules free. 4. *B. berchemiaefolia*

1. *Berchemia pauciflora* Maxim. MIYAMA-KUMA-YANAGI. Slightly scandent shrub elongate and much-branched, glabrous, green, becoming yellowish brown with age; leaves membranous, ovate or elliptic, 2.5-4 cm. long, 1.5-2.5 cm. wide, very obtuse at both ends or rounded at base, entire, glabrous and deep green on upper side, often yellowish and nearly glabrous except for yellowish brown thin pubescence on the nerves and with axillary tufts of hairs beneath, the petioles 5-10 mm. long, sparsely short-pubescent near point of attachment; racemes 1-2.5 cm. long, about 10-flowered, glabrous, the pedicels 2-3 mm. long; flowers about 3 mm. across; calyx-lobes deltoid, rather obtuse; fruit narrowly oblong, 7-8 mm. long.—Aug. Mountains; Honshu (Kantō Distr., Kai and s. Shinano Prov.); rare.

2. *Berchemia longeracemosa* Okuyama. HO-NAGA-KUMA-YANAGI. Shrub with green glabrous branches; leaves membranous, ovate to broadly so, sometimes elliptic, 5-10 cm. long, 3.5-6 cm. wide, very obtuse or subrounded at both ends, entire, glabrous on upper side, yellowish and with axillary tufts of hairs beneath, the lateral nerves 7-11 pairs, the petioles 8-20 mm. long, glabrous; racemes terminal, simple or often with a few branches at base, densely many-flowered, glabrous, 5-8 cm. long, erect, the pedicels 3-4 mm. long; calyx-lobes deltoid, rather acute.—July-Aug. Mountains bordering Japan Sea side of Honshu from Uzen to Tajima Prov.

3. *Berchemia racemosa* Sieb. & Zucc. KUMA-YANAGI.

Subscandent, glabrous shrub; leaves ovate or oblong-ovate, 4-6 cm. long, 2.5-3 cm. wide, acute to subobtusely, rounded at base, glabrous and deep green on upper side, whitish or yellowish and glabrous except for axillary tufts or hairs beneath, the lateral nerves 7-8 pairs, the petioles 1-1.5 cm. long, reddish, glabrous; racemes many, spreading, many-flowered, glabrous, in terminal panicles 10-25 cm. long, the pedicels 2-3 mm. long; flowers greenish; calyx-lobes deltoid, acuminate; fruit oblong, 5-7 mm. long, reddish, black at maturity.—Aug. Thickets in low mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.

Var. *magna* Makino. *B. magna* (Makino) Koidz.—Ō-KUMA-YANAGI. Leaves large, 5-10 cm. long; calyx-lobes shorter, acute.—Mountains; Shikoku, Kyushu; rather rare.—Forma *pubescens* (Ohwi) Nemoto. *B. magna* var. *pubescens* Ohwi; *B. jagifolia* Koidz.—KE-KUMA-YANAGI. Leaves with scattered pubescence beneath.—Honshu (Kinki Distr.), Shikoku, Kyushu.

4. *Berchemia berchemiaefolia* (Makino) Koidz. *Rhamnella berchemiaefolia* Makino; *Chaydaia berchemiaefolia* (Makino) Koidz.; *Berchemiella berchemiaefolia* (Makino) Nakai.—YOKOGURA-NO-KI. Small tree with glabrous, reddish brown branches and scattered lenticels; leaves membranous, oblong or ovate-oblong, 7-12 cm. long, 3-5 cm. wide, acuminate, acute to rounded and sometimes slightly oblique at base, entire or obsoletely undulate, glabrous on upper side, glaucous, thinly

pubescent near axils of nerves beneath, the lateral nerves 7-9 pairs, the petioles 6-10 mm. long, glabrous; cymes terminal in upper axils, glabrous, few-flowered, short-peduncled, the pedicels 2-4 mm. long; flowers 3-3.5 mm. across; calyx-lobes

deltoid, rather acute; fruit narrowly oblong, 7-8 mm. long. —June. Mountains; Honshu (Rikuchu, Shinano, Echigo Prov. and westw.), Shikoku, Kyushu; rare.—s. Korea and China.

4. SAGERETIA Brongn. KUROIGE ZOKU

Evergreen or deciduous shrubs sometimes scandent, the branchlets often reduced to spines; leaves coriaceous, nearly opposite, small, penninerved, entire or serrate, the stipules small, deciduous; spikes axillary, often in terminal panicles; flowers bisexual, 5-merous, small, whitish; petals inflexed at apex, the disc cup-shaped, 5-lobed; ovary 2- or 3-locular; style short, 2- or 3-lobed; fruit a small, subglobose drupe with 2 or 3 stones.—About 10 species, in e. and s. Asia, and N. America.

1. *Sageretia theezans* (L.) Brongn. *Rhamnus theezans* L.—KUROIGE. Deciduous or semi-evergreen shrub with grayish, ramulose branches, densely short gray-pubescent, the short spurs often reduced to spines; leaves coriaceous, lustrous, broadly ovate, 2-3 cm. long, 1-1.5 cm. wide, obtuse with a mucro at apex, rounded at base, soon glabrous on upper side, with deciduous grayish lanate hairs beneath, appressed-serru-

late, the veinlets rather prominent on both sides, the petioles 2-4 mm. long, short-pubescent; spikes in terminal panicles and on upper part of the branchlets, densely pubescent; flowers sessile, about 3.5 mm. across, in few-flowered fascicles, yellowish; calyx-lobes deltoid, pubescent outside; drupe purplish black, subglobose, about 5 mm. across.—Oct. Shikoku, Kyushu (Fukuejima).—Ryukyus, Formosa, China, and India.

5. RHAMNELLA Miq. NEKO-NO-CHICHI ZOKU

Deciduous trees or shrubs; leaves alternate, serrulate, penninerved, petiolate, the stipules not spinelike, narrow; flowers short-pedicelled, bisexual, 5-merous, greenish, small, in axillary cymes; petals small; stamens 5, perigynous; ovary incompletely 2-locular, semisuperior; style bifid; drupe oblong, black, the stone solitary, 1- or rarely 2-seeded.—Few species, in e. Asia.

1. *Rhamnella franguloides* (Maxim.) Weberb. *R. japonica* Miq.; *Microrhamnus franguloides* Maxim.—NEKO-NO-CHICHI. Deciduous tree with brown branches, the young branchlets, inflorescence and petioles with thinly scattered spreading short hairs; leaves obovate-oblong, sometimes oblong, 6-12 cm. long, 2.5-4 cm. wide, caudate-acuminate, rounded to obtuse at base, serrulate, glabrous or with scat-

tered spreading hairs on midrib beneath, the petioles 3-8 mm. long; cymes axillary, subsessile to short-peduncled, few-flowered, the pedicels 2-4 mm. long; flowers about 3.5 mm. across; calyx-lobes deltoid, with 3 weak nerves; petals small; stamens 5; fruit narrowly oblong, 8-10 mm. long, yellowish at first, black at maturity.—May-June. Mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—s. Korea.

6. RHAMNUS L. KURO-UME-MODOKI ZOKU

Deciduous or evergreen shrubs or trees, sometimes the short spurs spinelike; leaves alternate or nearly opposite, penninerved, serrate or rarely entire, stipulate; flowers bisexual, polygamous, or unisexual, small, yellowish green or whitish, 4- or 5-merous, sometimes apetalous, in axillary fascicles, umbels, or racemes; ovary 2- to 4-locular; style usually simple; fruit a subglobose drupe with 2-4, 1-seeded stones or rarely 1, the stones opening on the inner side.—More than 100 species, chiefly in the N. Hemisphere, a few in S. America and Africa.

1A. Winter-buds with scales; leaves often subopposite; flowers unisexual, the plants dioecious; seeds grooved on back.

2A. Leaves subopposite or at least partly so; stipules small, linear; erect much branched shrubs.

3A. Pairs of lateral nerves few, forming an acute angle with the midrib, prominently incurved at the tip; pedicels not more than 1.5 cm. long; short-spurs often becoming spiny.

4A. Leaves small, 2-8 cm. long, 1-3 cm. wide, glabrous to pubescent.

5A. Leaves broadly to narrowly obovate, 2-8 cm. long.

6A. Branches grayish; leaves glabrous or puberulous. 1. *R. japonica*

6B. Branches purplish brown; leaves puberulent on upper side when young, sparsely pubescent beneath especially on nerves. 2. *R. yoshinoi*

5B. Leaves elliptic to narrowly oblong, or sometimes obovate in smaller ones, 5-10 cm. long. 3. *R. davurica* var. *nipponica*

4B. Leaves larger, 10-20 cm. long, 3-8 cm. wide, membranous, much longer than the petioles, yellowish pubescent on nerves beneath. 4. *R. utilis*

3B. Pairs of lateral nerves 17-23, ascending, parallel, curved at tip; petioles very short; pedicels slender, 2-4 cm. long; branches not spiny. 5. *R. costata*

2B. Leaves always alternate; stipules rather broad; small unarmed shrub with creeping branches. 6. *R. ishidae*

1B. Winter-buds naked, without scales; leaves always alternate; flowers bisexual; seeds without a groove on back. 7. *R. crenata*

1. *Rhamnus japonica* Maxim. *R. japonica* var. *genuina* Maxim.—KURO-UME-MODOKI. Much branched, glabrous, deciduous shrub with short spurs often reduced to spines; leaves broadly to narrowly obovate, rarely orbicular-obovate, 2-8 cm. long, 1-4 cm. wide, rounded to obtuse in smaller ones, abruptly acuminate with an obtuse tip in larger ones,

long-cuneate at base, obtusely appressed-serrulate, glabrous or sparingly short-puberulous on upper side, pale green and glabrous or thinly puberulent on nerves beneath, the lateral nerves 3 or 4 pairs, forming an acute angle with the midrib; flowers yellowish green, about 4 mm. across, fasciculate in axils of lower part of branches, the pedicels 5-15 mm. long; calyx-

lobes elongate-deltoid, acute; drupe globose-obovoid, 6-8 mm. across, glabrous, black, the stones 2 or 3, sometimes 1.—Apr.-May. Hokkaido, Honshu, Shikoku, Kyushu; common.—The leaves are very variable in shape and in pubescence.

2. *Rhamnus yoshinoi* Makino. *R. schneideri* Lévl. & Van't.—AO-UME-MODOKI, KIBINO-KURO-UME-MODOKI. Erect, divaricately branched dioecious shrub with branchlets often reduced to spines, the branches and branchlets purplish brown; leaves alternate or fasciculate on short spurs, obovate or obovate-elliptic, 3-8 cm. long, 1-4 cm. wide, abruptly acuminate, cuneate at base, serrulate, appressed-puberulent on upper side when young, sparingly pubescent beneath especially on nerves, the petioles 5-20 mm. long, usually pubescent; pedicels 1-1.5 cm. long, fasciculate; flowers yellowish green, 5-6 mm. long; calyx-lobes 4, erect, acuminate; stamens 4, about 2/3 as long as the calyx-lobes; fruit obovoid-globose, glabrous, about 7 mm. across, with 2 or 3 stones.—May. Honshu (Chūgoku Distr.), Kyushu.—Korea and Manchuria.

3. *Rhamnus davurica* Pall. var. *nipponica* Makino. *R. nipponica* (Makino) Grubov.—KURO-TSUBARA. Large, glabrous or nearly glabrous, deciduous, dioecious shrub; leaves narrowly oblong or often broadly obovate in the smaller ones, 5-10 cm. long, 2-3 cm. wide, acuminate with an obtuse tip or sometimes rounded at apex, cuneate at base in smaller ones, obtusely serrulate, the lateral nerves 4- or 5-pairs, suberect, forming an acute angle with the midrib, incurved at tip, the petioles 1-2 cm. long; flowers small, few in the lower axils of the branchlets, glabrous, yellowish green, 4-5 mm. across, the pedicels about 1 cm. long; calyx-lobes elongate-deltoid, acute; fruit obovate-globose, 6-8 mm. across, black, usually with 2 stones.—May. Honshu (centr. and n. distr.).—The typical phase with broader leaves occurs in Dahuria, n. China, Manchuria, and Korea.

4. *Rhamnus utilis* Decne. *R. sieboldiana* Makino.—SHIBURUTO-NO-KI, SIEBOLD-NO-KI. Small deciduous tree with glabrous branches, the short-spurs reduced to spines; leaves membranous, obovate-elliptic, 5-20 cm. long, 2.5-7 cm. wide, abruptly acute with an obtuse tip, acute to cuneate at base, obtusely serrulate, sometimes subentire, with scattered yellowish hairs beneath especially on nerves, the petioles 1-2 cm. long; flowers about 3.5 mm. across, the pedicels about 1 cm. long; fruit obovoid-globose.—May. Kyushu (near Nagasaki); rare.—China.

5. *Rhamnus costata* Maxim. KURO-KAMBA. Deciduous unarmed shrub, black when dried, with fulvous glabrous branches; leaves thinly membranous, obovate-oblong to obo-

vate, slightly oblique, 8-15 cm. long, 4-8 cm. wide, abruptly acute to acuminate, broadly short-cuneate or obtuse at base, obtusely serrulate, densely yellowish-brown pubescent beneath especially on nerves, the lateral nerves 17-23 pairs, ascending, rather closely parallel, scarcely to slightly incurved at tip, the petioles 3-6 mm. long; flowers few, in fascicles on the lower part of young branchlets, yellowish green, about 5 mm. across, the pedicels slender, 2-4 cm. long; calyx-lobes deltoid-lanceolate, acute, 2.5-3 mm. long; fruit globose-obovoid, 7-8 mm. across, black, with 2 stones.—May-June. Honshu, Shikoku, Kyushu; rather rare in mountains.—Forma *nambuana* (Honda) Hara. *R. costata* var. *nambuana* Honda.—Nambu-KURO-KAMBA. Glabrescent. Occurs with the typical phase.

6. *Rhamnus ishidae* Miyabe & Kudo. MIYAMA-HAN-MODOKI. Small, deciduous, unarmed, dioecious shrub with creeping grayish brown branches and rather thick, green, thinly and minutely hairy branchlets; leaves elliptic, broadly ovate, or obovate-elliptic, 4-8 cm. long, 3-5 cm. wide, obtuse to rather abruptly acute, rounded to subcordate at base, obtusely serrulate except near the base, glabrate on upper side, sometimes pubescent especially on nerves beneath, the lateral nerves 8-12 pairs, ascending, nearly parallel and incurved at tip, the petioles 5-6 mm. long; pistillate flowers green, solitary in the axils of the branchlets, the pedicels 5-8 mm. long, glabrous; calyx-lobes 5, ovate-deltoid, acuminate, 3-nerved; fruit globose, 7-8 mm. across, red, becoming black at maturity, with 3 stones.—Alpine regions; Hokkaido (Mount Yubari and Mount Apoi); rare.

7. *Rhamnus crenata* Sieb. & Zucc. *Frangula crenata* (Sieb. & Zucc.) Miq.—ISO-NO-KI. Deciduous shrub with glabrous branches sparsely soft-puberulent when young; leaves obovate to oblong, 6-12 cm. long, 2.5-5.5 cm. wide, abruptly acuminate, rounded to obtuse at base, serrulate, pale green with raised veinlets and nerves beneath, the lateral nerves 6-10 pairs, ascending, inwardly curving near the margin, the petioles 8-15 mm. long, sparsely short-pubescent; cymes axillary, pilose, few-flowered, on short peduncles to 7 mm. long or sessile, the pedicels 5-10 mm. long; flowers about 5 mm. across; calyx-lobes narrowly deltoid, acute; fruit globose-obovoid, reddish purple at first, black at maturity, about 6 mm. across, with 3 stones.—June-July. Wet places in mountains and hills; Honshu, Shikoku, Kyushu.—Korea and China.

Var. *yakushimensis* Makino. *R. crenata* var. *acuminatifolia* (Hayata) Hatusima; *R. acuminatifolia* Hayata.—HOSOBABA-ISO-NO-KI. Leaves narrow.—Kyushu.—Formosa.

7. HOVENIA Thunb. KEMPO-NASHI ZOKU

Large deciduous trees without spines; leaves alternate, long-petiolate, 3-nerved from the base, ovate-orbicular, the stipules free, linear-lanceolate, caducous; flowers bisexual, 5-merous, purplish, small, in axillary and terminal cymes, the peduncles becoming fleshy in fruit; petals convolute and enclosing the stamens; disc hairy; style 3-lobed; fruit indehiscent, 3-locular, with a coriaceous exocarp, 3-seeded; seeds flat, lustrous, brown.—Few species in e. Asia.

1A. Fruit glabrous; leaves deep brown when dry, usually glabrous, with obtuse, obliquely triangular teeth; inflorescence glabrous.

1B. Fruit brown-pubescent; leaves dark reddish brown when dry, usually pubescent beneath, with appressed partly obsolete teeth; inflorescence pubescent. 1. *H. dulcis*
2. *H. tomentella*

1. *Hovenia dulcis* Thunb. *H. dulcis* var. *glabra* Makino.—KEMPO-NASHI. Tall, almost glabrous tree with lenticellate branches; leaves rather membranous, broadly ovate, 8-15 cm. long, 6-12 cm. wide, short-acuminate, rounded to shal-

lowly cordate at base, with obliquely triangular obtuse teeth, green and glabrous on upper side, pale green and glabrous to thinly pubescent on nerves beneath, becoming deep brown when dry, 3-nerved from the base, the lateral nerves close to

the margin from near the base; the petioles 2.5–6 cm. long, glabrous; cymes terminal and in the upper axils, glabrous, 3–5 cm. across, many-flowered, the pedicels short, the branches thickened in fruit; flowers pale green, about 7 mm. across; calyx-lobes about 2.5 mm. long, acute; disc sparsely pilose; fruit globose, about 7 mm. across, yellowish brown, glabrous, lustrous.—June–July. Hokkaido (Okushiri Isl.), Honshu, Shikoku, Kyushu.—Korea and China.

2. *Hovenia tomentella* (Makino) Nakai. *H. dulcis* var.

tomentella Makino—KE-KEMPO-NASHI. Resembles the preceding; leaves rather thick, broadly ovate to cordate-ovate, with short, obtuse, partly obsolete teeth, glabrous and becoming dark reddish brown on upper side when dry, pale green and with red-brown short hairs beneath, sometimes only on the nerves; cymes and calyx-lobes densely reddish brown pubescent; fruit densely reddish brown long-pubescent.—June–July. Honshu, Shikoku.

Fam. 130. VITACEAE BUDŌ KA Grape Family

Mostly woody vines with tendrils, rarely herbs or erect woody plants; leaves alternate, simple or palmately compound, stipulate; flowers bisexual or unisexual, actinomorphic, small, in cymes or panicles, usually opposite a leaf; calyx-lobes 4 or 5, rarely 3, 6, or 7, small or indistinct; petals as many as the sepals, valvate in bud; stamens opposite the petals; disc annular or lobed; ovary superior, 2(–6)-locular, the ovules 2 or 1 in each locule; style single, simple, or absent, the stigma capitate, peltate, or lobed; fruit a berry; seeds with endosperm and a small embryo, the cotyledons flat.—About 10 genera, with about 500 species, especially abundant in the Tropics.

- 1A. Petals connate at apex and not expanding, falling as a calyptra at anthesis; inflorescence a panicle; leaves usually simple; bark without lenticles, soon longitudinally fissured, the pith brown. 1. *Vitis*
- 1B. Petals free and expanded at anthesis; inflorescence usually a cyme; bark lenticellate, not fissured, the pith white.
 - 2A. Flowers 5-merous; inflorescence opposite a leaf; leaves simple or rarely compound.
 - 3A. Tendrils twining, without adhesive holdfasts; disc of the flowers cup-shaped, not adnate to the ovary. 2. *Ampelopsis*
 - 3B. Tendrils with adhesive holdfasts; disc adnate to the ovary. 3. *Parthenocissus*
 - 2B. Flowers 4-merous; inflorescence axillary; leaves palmate or digitate. 4. *Cayratia*

I. VITIS L. BUDŌ ZOKU

Deciduous, rarely evergreen, tendril-bearing vines; leaves usually simple and lobed, rarely palmately compound, dentate; flowers bisexual and staminate, 5-merous, in panicles; calyx-lobes small or obscure; petals connate at apex, deciduous as a whole at anthesis; disc of 5 nectary glands; ovary 2-locular, with 2 ovules in each locule; style pyramidal, short; fruit a berry, the seeds 2–4, usually pyriform, abruptly rostrate at base, 2-grooved on the ventral side.—About 60 species, in temperate regions of the N. Hemisphere.

- 1A. Leaves deeply cordate at base; inflorescence relatively large, 10–25 cm. long.
 - 2A. Leaves 10–25 cm. wide; petioles 5–25 cm. long; branches rather thick.
 - 3A. Branches with spreading spiny protuberances. 1. *V. kiusiana*
 - 3B. Branches smooth.
 - 4A. Leaves 8–30 cm. long and as wide, reddish brown lanate beneath. 2. *V. coignetiae*
 - 4B. Leaves 7–15 cm. long and as wide, thinly brownish lanate beneath. 3. *V. amurensis*
 - 2B. Leaves 4–8 cm. wide, densely reddish brown lanate beneath; petioles 3–6 cm. long; branches rather slender. 4. *V. thunbergii*
- 1B. Leaves truncate to shallowly cordate at base with a wide open sinus; inflorescence relatively small, 4–12 cm. long.
 - 5A. Leaves distinctly 3-lobed, densely reddish brown lanate beneath, acute to obtuse, cordate at base. 4. *V. thunbergii*
 - 5B. Leaves undivided or obsoletely 3-lobed, at least the upper ones deltoid, acuminate, truncate to shallowly open-cordate at base.
 - 6A. Leaves rather thick, the teeth undulate and short. 5. *V. saccharifera*
 - 6B. Leaves thin, teeth deltoid. 6. *V. flexuosa*

1. *Vitis kiusiana* Momiyama. KUMAGAWA-BUDŌ. Branches thick, terete, yellowish brown lanate when young, with small black spreading spinelike protuberances; leaves chartaceous, undulate-serrulate, sparsely yellowish brown arachnoid at first and soon glabrous on upper side, densely brown-lanate beneath, the lower oblong-ovate or narrowly ovate, slightly 3-lobed or angled, sometimes 5-angled-ovate, to 17 cm. long, 13 cm. wide, acute to acuminate, open-cordate at base, the petioles 9–13 cm. long, the upper leaves acute to subobtusate, with shorter petioles about 5 cm. long; staminate panicles longer than the leaves, narrow, to 25 cm. long, including the 6 cm. long peduncle, to 7 cm. across, with a tendril on the peduncle.—July. Kyushu (Higo Prov.); rare.

2. *Vitis coignetiae* Pulliat. *V. labrusca* var. *typica* a *grandifolia* Regel; *V. kaempferi* sensu Rehd., non K. Koch; *V. amurensis* var. *coignetiae* (Pulliat) Nakai—YAMA-BUDŌ. Branches terete, smooth, brown-araneous while young; leaves

cordate-orbicular and somewhat 5-angled, 8–30 cm. long and as wide, deeply cordate to slightly open-cordate at base, with depressed-deltoid, mucronate teeth, shallowly 3-lobed, the median lobe depressed-deltoid, acute to subacute, more or less sparingly arachnoid when young, densely reddish brown lanate beneath; inflorescence to 20 cm. long, including the 3–6 cm. long peduncle, about 8 cm. wide, with tendrils; fruit globose, about 8 mm. across, purplish black when mature; seeds about 5 mm. long, broadly obovate, dark brown.—May–June. Thickets in mountains; Hokkaido, Honshu, Shikoku; common.—Korea and Sakhalin.

Var. *glabrescens* Nakai. *V. kaempferi* var. *glabrescens* (Nakai) Nakai; *V. coignetiae* forma *glabrescens* (Nakai) Nakai—TAKESHIMA-YAMA-BUDŌ. Leaves sparsely lanate, becoming green beneath.—Hokkaido.—Korea.

3. *Vitis amurensis* Rupr. var. *shiragae* (Makino) Ohwi. *V. shiragae* Makino—SHIRAGA-BUDŌ. More slender than

No. 2; branches rather thick, smooth, obsoletely angled, pale brown araceous while young; leaves membranous, orbicular-cordate or more or less angled, deeply cordate with a V-shaped sinus at base, 7-15 cm. long and as wide, shallowly deltoid-toothed, thinly arachnoid on upper side while young, dull green and pale lanate beneath, often shallowly 3-lobed, the median lobe slightly larger, deltoid-acuminate to acute, the petioles 5-11 cm. long, at first thinly lanate, later only the spreading bases of the hairs persistent; inflorescence 10-12 cm. long including the short peduncle, 3-5 cm. across, with tendrils.—June. Honshu (Chûgoku Distr.); rare.—Korea, Manchuria, and Amur (species).

4. *Vitis thunbergii* Sieb. & Zucc. *V. ficifolia* var. *thunbergii* (Sieb. & Zucc.) Lavall.; *V. thunbergii* var. *typica* Makino; *V. ficifolia* var. *pentaloba* Nakai; *V. ficifolia* var. *lobata* (Regel) Nakai; *V. labrusca* var. *typica* *B lobata* Regel; *V. kampsferi* K. Koch.—EBIZURU. Branches slender, striate and obsoletely angled, more or less reddish brown arachnoid; leaves membranous, orbicular-cordate, 5-angled, 4-8 cm. long and as wide, rather open-cordate to deeply cordate at base, with 3(-5) lobes, these ovate to broadly so or deltoid, acute to obtuse, densely reddish brown lanate beneath, the teeth short or almost obsolete, short-mucronate; panicles 6-12 cm. long, including the peduncles, 2-4 cm. across, sometimes with tendrils; fruit globose, 5-6 mm. across, black; seeds 3.5 mm. long, dark reddish brown.—June-July. Thickets in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common.—China, Korea, and Formosa.

Var. *sinuata* (Regel) Rehd. *V. labrusca* var. *typica* *sinuata* Regel; *V. ficifolia* var. *sinuata* (Regel) Hara.—KIKUBA-EBIZURU. Leaves deeply lobed, the lobes coarsely sinuate on margin.—More frequent in the western part of our area.

5. *Vitis saccharifera* Makino. *V. flexuosa* var. *japonica* Makino, in syn.—AMAZURU, OTOKO-BUDÔ. Branches slender, obsoletely striate, the nodes often slightly thickened;

leaves cordate, cordate-orbicular, or deltoid-ovate, acute to acuminate, truncate or shallowly open-cordate at base, undulately short-toothed, glabrescent and deep green on upper side, reddish brown arachnoid, especially on nerves while young and with axillary tufts of hairs beneath, the upper leaves longer; panicles with or without tendrils, 4-6 cm. long, including the peduncles, 2-3 cm. across; fruit small, black when mature.—May-June. Honshu (Tôkaidô Distr. and westw.), Shikoku, Kyushu.

Var. *yokogurana* (Makino) Ohwi. *V. yokogurana* Makino—YOKOGURA-BUDÔ. Arachnoid hairs sparse on leaves beneath, persistent at maturity.

6. *Vitis flexuosa* Thunb. *V. flexuosa* forma *typica* Planch.—SANKAKU-ZURU, GYÔJA-NO-MIZU. Branches slender, slightly striate, glabrous; lower leaves depressed-deltoid to cordate-deltoid, slightly shorter to as long as wide, acute to acuminate, the upper leaves elongate-deltoid, rather thin, 4-10 cm. long, 4-8 cm. wide, truncate to shallowly open-cordate at base, green, with short deltoid teeth, glabrous on upper side, the under side with the persistent bases of pale brown arachnoid hairs and with axillary tufts of hairs; inflorescence without tendrils, 4-7 cm. long, including the peduncles, 2-3 cm. across; fruit globose, bluish black, about 7 mm. across; seeds obovate-orbicular, about 5 mm. long.—May-June. Mountains and hills; Honshu, Shikoku, Kyushu; common.—Korea, China, and Amami-Oshima.

Var. *tsukubana* Makino. *V. tsukubana* (Makino) F. Maekawa.—USUGE-SANKAKU-ZURU. Young branches sparingly arachnoid; leaves glabrous above, thinly brown arachnoid beneath.—Honshu (Kantô and Kinki Distr.); rare.

Var. *rufotomentosa* Makino. *V. rufotomentosa* (Makino) Makino; *V. gilvotomentosa* Makino & F. Maekawa.—KESANKAKU-ZURU. Leaves on upper side with only the base of the hairs persistent, arachnoid beneath.—Honshu (Kinki Distr., Wakasa Prov.), Shikoku, Kyushu.

2. AMPELOPSIS Michx. NO-BUDÔ ZOKU

Woody or herbaceous climbing deciduous vines with tendrils; leaves alternate, simple, sometimes compound; cymes peduncled, dichotomously forked, opposite a leaf or terminal; flowers small, bisexual, green, 5-merous or rarely 4-merous; calyx-lobes small; petals small, spreading, free; stamens as many as and shorter than the petals; ovary 2-locular; disc cup-shaped, entire or undulate-toothed, adnate to the ovary; style slender; fruit a 1- to 4-seeded berry.—About 20 species, in e. Asia, centr. Asia, and N. America.

- 1A. Leaves simple, digitately lobed. 1. *A. brevipedunculata*
1B. Leaves ternately pinnate. 2. *A. lecidoides*

1. *Ampelopsis brevipedunculata* (Maxim.) Trautv. *Cissus brevipedunculata* Maxim.; *C. humulifolia* var. *brevipedunculata* (Maxim.) Regel; *A. brevipedunculata* var. *maximowiczii* (Regel) Rehd.; *Vitis heterophylla* Thunb.; *A. heterophylla* (Thunb.) Sieb. & Zucc., non Bl.; *A. regeliana* Carr.; *A. heterophylla* var. *humulifolia* Hook & exl. syn.; *A. citrullifolia* Lebas; *A. brevipedunculata* forma *citrullifolia* (Lebas) Rehd.—NO-BUDÔ. Herbaceous vine, woody at base; branches terete, glabrous or with pale brown multicellular spreading hairs, the nodes slightly thickened and jointed; leaves cordate, 3(-5)-lobed, 4-12 cm. long, 4-10 cm. wide, paler and thinly pilose beneath, with obtuse or acute-mucronate teeth, the median lobes ovate-deltoid, the lateral lobes smaller; inflorescence many-flowered, 3-6 cm. across; flowers about 3 mm. across; petals narrowly ovate-triangular, about

2.5 mm. long, deciduous; disc erect, entire; fruit globose, glabrous, 6-8 mm. across, purplish to blue in maturity; seeds 2, rarely 1 or 3, about 4 mm. long, orbicular with an extended tip, rounded at back.—Thickets in hills; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Korea, China, Manchuria, Ussuri, and s. Kuriles.

2. *Ampelopsis lecidoides* (Maxim.) Planch. *Vitis lecidoides* Maxim.—UDO-KAZURA. Deciduous woody vine with lenticellate, glabrous branches; leaves petiolate, ternately 2- or 3-pinnate, 12-30 cm. long, glabrous or nearly so, the leaflets petiolulate, ovate or oblong, sometimes narrowly oblong, 4-7 cm. long, acuminate, acute at base, with few appressed teeth, the lowest leaflets ternately parted or lobed; the tendrils 2-fid; inflorescence puberulous, large, apparently terminal and pedunculate; flowers short-pedicelled, greenish yellow, about 2

mm. across; disc 5-toothed; fruit globose, red.—July–Aug. Thickets and woods; Honshu (Kii, Yamato, and Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus and Formosa.

Ampelopsis japonica (Thunb.) Makino. *Paullinia japonica* Thunb.; *A. serjaniaefolia* Bunge—KAGAMIGUSA, BYAKU-

REN. Leaves palmate, with ternate-pinnate leaflets on a jointed, winged rachis; flowers pale yellow, in pedunculate cymes.—A climber from China, rarely cultivated for medicinal purposes.

3. PARTHENOCISSUS Planch. TSUTA ZOKU

Deciduous, rarely evergreen vines, the branchlets with white pith, the tendrils ending in a discoid sucker; leaves simple, ternate, or palmately compound, long-petiolate; cymes compound, opposite a leaf or crowded into a terminal panicle; flowers bisexual, rarely polygamous, small; petals 5, rarely 4, spreading; disc indistinct; style short, thick; ovary 2-locular, the ovules 2 in each locule; berry bluish black, 1- to 4-seeded.—About 10 species, in e. Asia, Himalayas, and N. America.

1. *Parthenocissus tricuspidata* (Sieb. & Zucc.) Planch. *Ampelopsis tricuspidata* Sieb. & Zucc.; *Cissus thunbergii* Sieb. & Zucc.; *Vitis inconstans* Miq.; *V. taquetii* Lév.; *Psedera tricuspidata* (Sieb. & Zucc.) Rehd.; *Psedera thunbergii* (Sieb. & Zucc.) Nakai.—TSUTA, NATSUZUTA. Woody vine, glabrous except on nerves of leaves, especially beneath and on upper part of petioles; suckers of tendrils orbicular; leaves polymorphic, usually thick and lustrous, those on the short spurs 3-lobed, cordate at base, with rounded outer edges, the lobes deltoid and acuminate, 5–12 cm. long and as wide, with loose, obtuse and mucronate coarse teeth, leaves on the long shoots smaller

and thinner, broadly ovate, sometimes trifoliate; inflorescence short-pedunculate, usually on a short spur, 3–6 cm. long; fruit purplish black, globose, 5–7 mm. across; seeds 1–3, obovate-rounded, 4–5 mm. long.—June–July. Thickets and woods in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and widely planted in hedges and for covering walls, with several cultivars grown in gardens.—Korea and China.

The North American *Parthenocissus quinquefolia* Planch., AMERIKA-ZUTA, with 5-foliate leaves is sometimes cultivated in our area.

4. CAYRATIA Juss. YABU-KARASHI ZOKU

Woody or herbaceous vines with usually divided tendrils; leaves alternate, ternate or pedately 5- to 9-foliate, the leaflets petioluled; inflorescence axillary, cymose or umbellate; flowers small, 4-merous, bisexual; calyx-lobes indistinct; petals spreading; disc 4-lobed, small, thin, adnate to the ovary; style filiform or linear; berry 2- to 4-seeded, the seeds 1- or 2-grooved on the ventral side.—More than 10 species, in e. and s. Asia.

1A. Branchlets puberulous; inflorescence and petals with short granular hairs; terminal leaflets narrowly ovate or oblong; seeds with broad, transverse ridges on each side on back, the central part of the back with a narrow scarcely impressed longitudinal band.

1. *C. japonica*

1B. Branches and inflorescence glabrous; terminal leaflets broadly lanceolate; seeds with narrow, transverse, much raised ridges on each side on back, the central part with a longitudinal impressed band broader than the sides. 2. *C. corniculata*

1. *Cayratia japonica* (Thunb.) Gagnep. *Vitis japonica* Thunb.; *Cissus japonicus* (Thunb.) Willd.; *Columella japonica* (Thunb.) Merr.—YABU-KARASHI. Herbaceous vine with much-elongate rhizomes; stems much elongate, branched, striate, the young parts furfuraceous, short-puberulent, purplish, flat, the tendrils usually bifid; stipules ovate-deltoid, scarious-margined, ciliate; leaves petiolate, pedately 5-foliate, the terminal leaflets narrowly ovate or oblong, 4–8 cm. long, 2–4.5 cm. wide, short-acuminate, mucronate, acute at base, with shallow undulate, spreadingly mucronate teeth, puberulous on the midrib on both sides, the petiolules 1–3 cm. long, the lateral leaflets smaller; inflorescence with short granular hairs; flowers short-pedicellate, about 5 mm. across; petals 4, green, deflexed, deltoid-ovate, about 3 mm. long, obtuse with an inflexed tip, granular outside; disc yellowish or reddish; fruit globose, black; seeds on the back with broad transverse raised ridges on each side and with a narrow scarcely impressed longitudinal band.—July–Aug. Thickets and hedges in lowlands and hills; very common.—Ryukyus, China, India, and Malaysia.

Var. *dentata* (Makino) Honda. *Cissus japonica* var. *dentata* Makino.—HIIRAGI-YABU-KARASHI. Leaflets incisely dentate.—Kyushu.

2. *Cayratia corniculata* (Benth.) Gagnep. *Vitis corniculata* Benth.; *Cissus corniculata* (Benth.) Planch.; *C. yoshimurae* Makino; *Cayratia yoshimurae* (Makino) Honda.—AKAMI-NO-BUDŌ. Resembles the preceding species; stems slender, glabrous; leaflets thinner, green, the nerves on upper side minutely puberulous, nearly glabrous beneath, with undulate, spreading, mucronate shallow teeth, the terminal leaflets larger, broadly lanceolate, 4–9 cm. long, 1.5–3.5 cm. wide, acuminate, obtuse to acute at base; inflorescence glabrous, peduncled; fruit globose, 7–12 cm. across, purplish red at first, becoming black at maturity; seeds 1–4, broadly obovate, about 7 mm. long, with a narrow transverse raised ridge on each side, the central part with a longitudinal impressed band broader than the sides.—June. Kyushu (s. distr.); rare.—Ryukyus and China.

Fam. 131. ELAEOCARPACEAE HORUTO-NO-KI KA Elaeocarpus Family

Trees with simple, alternate, rarely opposite, stipulate leaves; flowers usually bisexual, actinomorphic, 4- or 5-merous; sepals valvate, free or connate at base; petals free, rarely connate at base, often deeply lacinate, valvate or induplicate, rarely imbricate, not contorted, rarely absent; receptacle sometimes elevated and stipelike; stamens free, the anthers 2-locular, usually opening by

pores, sometimes longitudinally dehiscent; ovary superior, 2- to many-locular, rarely 1-locular, the ovules usually many in each locule, the style simple; fruit a capsule or drupe; seeds often arillate.—About 7 genera, with about 120 species, in tropical and warm-temperate regions, especially in the S. Hemisphere.

1. ELAEOCARPUS L. HORUTO-NO-KI ZOKU

Trees with alternate, rarely opposite, entire or toothed leaves; flowers in axillary racemes, actinomorphic, bisexual or polygamous; sepals usually valvate; petals laciniate or rarely entire, inserted on the base of the thickened receptacle, induplicate; stamens many, rarely 8–12; anthers linear, opening by transverse valves; ovary 2- to 5-locular, the ovules 2 to many in each locule; drupe with one usually bony tuberculate stone; seeds pendulous, one in each locule, the embryo fleshy.—About 60 species, in s. Asia, Malaysia, Australia, the Pacific Isls., and Madagascar.

- 1A. Petioles about half as long as the blade, 2.5–5 cm. long, thickened at apex; leaves narrowly elliptic or ovate-elliptic, rounded to obtuse at base; petals appressed-pubescent on back, deeply 2- to 5-toothed. 1. *E. japonicus*
 1B. Petioles much shorter than the blade, 5–10 mm. long, not thickened at apex; leaves oblanceolate to oblong-lanceolate, acute and slightly decurrent on the petiole; petals glabrous on back, laciniate into filiform lobes. 2. *E. sylvestris* var. *ellipticus*

1. *Elaeocarpus japonicus* Sieb. & Zucc. *E. kobanmochi* Koidz.; *E. dioicus* Turcz.—KOBAN-MOCHI. Evergreen tree with rather thick, terete branches, loosely white-silky while young; leaves long-petiolate, narrowly elliptic or ovate-elliptic, 6–10 cm. long, 3–5 cm. wide, abruptly acuminate with an obtuse tip, rounded to obtuse at base, obtusely appressed-toothed, thinly white-silky on both sides while young, glaucescent and loosely black-spotted beneath; racemes 4–6 cm. long, one-sided, rather many-flowered, the pedicels 4–6 mm. long; flowers about 5 mm. long; sepals and pedicels short white appressed-pubescent; petals cuneate-oblong, as long as the sepals, appressed-pubescent on both sides, deeply and obtusely 2- to 5-toothed; fruit subglobose, about 10 mm. long, grayish green.—May–June. Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyus, Formosa, and China.

2. *Elaeocarpus sylvestris* (Lour.) Poir. var. *ellipticus*

(Thunb.) Hara. *E. decipiens* Hemsl.; *Prunus elliptica* Thunb.; *E. ellipticus* (Thunb.) Makino, non Smith; *E. japonicus* Turcz.; *E. makinoi* Kaneh.; *E. zollingeri* K. Koch.—HORUTO-NO-KI, MOGASHI. Evergreen tree with fulvous appressed-pubescent young branches and inflorescence; leaves short-petiolate, oblanceolate or oblong-lanceolate, 6–12 cm. long, 2–3.5 cm. wide, acute with an obtuse point or subobtuse, acute and slightly decurrent to the petiole, shallowly obtuse-toothed, glabrous; racemes 4–7 cm. long, rather many-flowered, short white appressed-pubescent, the pedicels 3–8 mm. long; petals obovate-cuneate, white, shorter than the appressed-pubescent sepals, deeply laciniate with filiform lobes, puberulous within at base; fruit narrowly ovoid, obtuse, 1.5–1.8 cm. long.—July–Aug. Honshu (Awa and westw.), Shikoku, Kyushu.—Ryukyus and Formosa. The typical phase occurs in China and Indochina.

Fam. 132. TILIACEAE SHINA-NO-KI KA Linden Family

Trees or herbs, often with stellate or fasciculate hairs; leaves alternate, rarely opposite, stipulate; flowers bisexual, actinomorphic; sepals 5, rarely 3 or 4, usually valvate; petals as many as the sepals, contorted, sometimes imbricate, rarely absent; stamens 10 to many, the filaments free or connate at base, the anthers 4-locular; ovary 2- to 10-locular, with 1 to several ovules in each locule; style single, the stigma radiate; fruit a capsule or indehiscent nut or drupe, rarely a berry; seeds with endosperm, the embryo straight.—About 40 genera, with about 400 species, widely distributed in tropical and temperate regions.

1A. Herbs; inflorescence without a subtending leaflike bract.

2A. Fruit globose and indehiscent, or separated into fruitlets, spinulose; receptacle more or less elongate; stamens usually many.

2B. Fruit a 3-lobed, loculicidally dehiscent, elongate capsule, glabrous or stellate-pilose; receptacle not elongate; stamens 10–15. 1. *Triumfetta*

2. *Corchoropsis*

1B. Trees; inflorescence with a subtending leaflike bract adnate to the peduncle. 3. *Tilia*

1. TRIUMFETTA L. RASEN-SŌ ZOKU

Stellate-pilose herbs or shrubs; leaves simple, toothed, 3- to 5-lobed or undivided; flowers yellow, few in dense axillary or fasciculate cymes; sepals 5, free, with a spinose to hornlike protuberance at apex; petals 5, thickened with a gland or depression at base, inserted on the base of the receptacle, sometimes absent; stamens many, free; ovary 2- to 5-locular, with 2 ovules in each locule; style filiform, the stigma 2- to 5-toothed; fruit dry, small, subglobose, spinulose, indehiscent or separating into fruitlets; seeds 1 or rarely 2 in each locule, with endosperm.—About 40 species, in the tropics, abundant in tropical America, Australia, and S. Africa.

1. *Triumfetta japonica* Makino. *T. trichoclada* sensu auct. Japon., non Link; *T. annua* sensu auct. Japon., non L.—RASEN-SŌ. Coarse erect annual, 60–120 cm. high with spreading branches; leaves ovate to elliptic, 5–10 cm. long, 3–10 cm. wide, often obsoletely 3-lobed, the upper ones shorter

and narrowly ovate, acuminate, cordate to rounded at base, deltoid-toothed, loosely hispid on both sides especially on nerves, 3- to 5-nerved, the petioles 0.5–10 cm. long, the stipules reflexed, linear, acuminate; cymes short, supra-axillary, few-flowered; flowers yellow, about 5 mm. across; sepals 5, broadly

linear, slightly pilose, with a hairy protuberance outside just below the apex; petals slightly shorter than the sepals; fruit globose, 6–7 mm. across, densely uncinat-spinulose, smooth

or spreading-pilousulous at base.—Aug.–Oct. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Korea and Ryukyus.

2. CORCHOROPSIS Sieb. & Zucc. KARASU-NO-GOMA ZOKU

Stellate-pilose annuals; leaves petiolate, simple, dentate, 3- or 5-nerved, with short lateral nerves, the stipules linear, deciduous; flowers solitary, axillary, yellow, rather small, the pedicels with 3 filiform bracteoles on upper part; sepals 5, lanceolate, persistent; petals 5, slightly longer than the sepals, obovate; perfect stamens 10–15, free or connate at base, the staminodes 5, linear, longer than the stamens, slightly thickened on upper part; ovary 3-locular, with many ovules in each locule; style simple, subclavate, the stigma truncate and 3-toothed; capsules elongate, terete, loculicidally dehiscent into 3 valves.—Few species, in e. Asia.

1. *Corchoropsis tomentosa* (Thunb.) Makino. *Corchorus tomentosus* Thunb.; *Corchoropsis crenata* Sieb. & Zucc. —KARASU-NO-GOMA. Erect, branched annual with stellate pubescence; leaves ovate, 4–8 cm. long, 2–4.5 cm. wide, sub-acute, rounded to subtruncate at base, obtusely toothed, densely stellate-pubescent on both sides, the petioles 0.5–5 cm. long, stellate-pubescent; peduncles axillary, slender, 1.5–3 cm. long, the bracteoles linear, ternately subverticillate, erect, stellate-pubescent; sepals recurved, linear-lanceolate, 6–8 mm.

long, acuminate, stellate-pilose on the outside; petals obovate, 7–10 mm. long, staminodes linear, slightly thickened on upper part, 7–9 mm. long, granular-tuberculate; capsules 3–4 cm. long, about 3 mm. across, stellate-pilose; seeds ovoid, less than 3 mm. long, with obscure transverse ridges.—Aug.–Sept. Sunny grassy places and waste grounds in lowlands and low mountains; Honshu, Shikoku, Kyushu; rather common.—Korea and China.

3. TILIA L. SHINA-NO-KI ZOKU

Deciduous trees with simple or stellate hairs; leaves alternate, petiolate, usually obliquely cordate at base, toothed; inflorescence cymose, the peduncle adnate to a leaflike axillary or terminal bract; flowers bisexual, rather small, white or yellowish; sepals and petals 5, the latter with or without a petaloid scale at base inside; stamens all perfect, many, free or connate at base, on the receptacle; ovary 5-locular, with 2 ovules in each locule; style simple, the stigma 5-toothed; fruit globose, nutlike, indehiscent, 1- or 2-seeded, the seeds with endosperm.—About 30 species, in temperate regions of the N. Hemisphere.

- 1A. Petioles 8–15 mm. long; leaves obliquely and broadly ovate to oblong-ovate, 5–8 cm. long, 2.5–5 cm. wide; inflorescence furfuraceous or glabrescent. 1. *T. kiusiana*
 1B. Petioles 2–7 cm. long; leaves obliquely 3-angled, broadly ovate to obliquely cordate-orbicular, 5–17 cm. long, 3–15 cm. wide.
 2A. Bract of the inflorescence adnate from base of the peduncle; branchlets and under surface of leaves usually densely pilose.
 3A. Leaves without axillary tufts of hairs on underside.
 4A. Staminodes slightly shorter than the sepals; fruits densely short-pilose; Chinese species planted around temples.

2. *T. miqueliana*

4B. Staminodes much longer than the sepals; fruits villous with both long red-brown hairs and short pubescence; indigenous.

4. *T. rufovillosa*

3B. Leaves with axillary tufts of hairs on under side; staminodes about as long as the sepals; fruits densely yellowish brown-hairy.

3. *T. maximowicziana*

2B. Bract adnate from about the middle part of the peduncle; leaves 5–8 cm. long, glabrous or nearly so except for axillary tufts of hairs beneath; young branches usually glabrous. 5. *T. japonica*

1. *Tilia kiusiana* Makino & Shiras. HERA-NO-KI. Young branchlets puberulous; leaves oblique, broadly ovate, ovate-elliptic, sometimes oblong, 5–8 cm. long, 2.5–5 cm. wide, abruptly caudate-acuminate, broadly and obtusely cuneate on one side at base, truncate to shallowly open-cordate or rounded on other side, serrate, puberulous on both sides, paler and with yellowish brown axillary hairs beneath, the petioles 8–15 mm. long; inflorescence furfuraceous or glabrescent; sepals about 4 mm. long; petals lanceolate, 5–6 mm. long; staminodes linear-oblong, as long as the sepals; fruit subglobose, 4–5 mm. long, densely brownish puberulous, without ribs or ridges.—July. Honshu (Yamato, and w. Chūgoku Distr.), Shikoku, Kyushu.

2. *Tilia miqueliana* Maxim. *T. kinashii* Lév. & Van't.; *T. franchetiana* C. K. Schn.—BODAIJU. Branchlets densely grayish stellate-puberulent; leaves oblique, 3-angled, ovate to cordate-orbicular, 5–10 cm. long, 4–8 cm. wide, narrowly deltoide-acuminate, broadly cuneate to subrounded on one side at base, cordate on the other side, usually acutely serrate, glabrous on upper side, with grayish stellate hairs and without axillary tufts of hairs beneath, the lateral nerves 7–10 pairs, nearly

parallel and straight, the petioles 1.5–7 cm. long, densely stellate-puberulous; sepals about 5 mm. long; petals slightly longer than the sepals, cuneate, rounded, ciliate at tip; staminodes slightly shorter than the sepals; fruit subglobose, 7–8 mm. across, 5-ribbed at base, densely grayish brown puberulous.—Planted around temples.—China.

3. *Tilia maximowicziana* Shiras. *T. miyabei* Jack; *T. maximowicziana* var. *shirasawae* Engl.—ŌBA-BODAIJU. Branches rather thick, densely yellowish brown stellate-puberulous; leaves cordate-orbicular, 10–15 cm. long, 8–12 cm. wide, abruptly acuminate, obliquely cordate, or subtruncate on one side at base, deltoid-toothed, pale yellowish brown stellate-pubescent on both surfaces, densely so and with axillary tufts of hairs beneath, the tertiary nerves rather prominently raised beneath, the petioles 4–7 cm. long, densely pubescent; inflorescence inserted near base of the bract; sepals 7–8 mm. long; petals oblong-cuneate, slightly longer than the sepals; staminodes as long as the sepals, oblanceolate; fruit subglobose, 5-angled, 8–10 mm. long, grayish puberulous.—June–July. Hokkaido, Honshu (centr. distr. and northw.).

Var. *yessoana* (Nakai) Tatew. *T. miyabei* var. *yessoana*

Nakai—Moriwa-BODAIJU. Less pubescent; leaves green beneath.—This may be only a juvenile form.

Tilia × *noziricola* Hisauchi. NOJIRI-BODAIJU. Hybrid of *T. maximowicziana* × *T. japonica*.

4. *Tilia rufovillosa* Hatus. ? *T. mankichiiana* Makino—TSUKUSHI-BODAIJU. Resembles the preceding species; young branches densely grayish pubescent; leaves rather thin, oblique, cordate or ovate-cordate, 10–15 cm. long, 8–12 cm. wide, short-acuminate, acutely serrate, loosely stellate-pubescent only while young, densely grayish pubescent on nerves beneath, without axillary hairs, the lateral nerves 7–9 pairs, the petioles 3–5 cm. long, densely pubescent only while young; inflorescence 5- to 9-flowered, loosely stellate-pilose; sepals 4–5 mm. long, densely stellate-pilose; petals oblong-oblanccolate, about 8 mm. long; staminodes spatulate, about 7 mm. long; fruit subglobose, 6–8 mm. in diameter, obscurely 5-ribbed, with long dense reddish brown simple hairs and short grayish stellate hairs.—July. Honshu (Jakuchisan in Suwo), Kyushu (mountains of n. distr.).

5. *Tilia japonica* (Miq.) Simonk. *T. cordata* var. *japonica* Miq.; *T. ulmifolia* var. *japonica* (Miq.) Sarg. ex Mayr.—SHINA-NO-KI. Branchlets glabrous; leaves oblique, cordate-orbicular, rarely broadly ovate-orbicular, 5–8(–10) cm. long and as wide, abruptly acuminate, obliquely cordate or rounded on one side at the base, rather irregularly and acutely serrate, glabrous on upper side, glabrescent and with pale brown axillary tufts of hairs beneath, the lateral nerves 4–6 pairs, the tertiary nerves very slender, the petioles 3–5 cm. long, rather slender; sepals 3–4 mm. long, densely appressed-puberulent outside, sparsely so inside; petals broadly oblanceolate, about 5 mm. long; stamens as long as the petals; staminodes shorter than the petals; fruit subglobose, about 5 mm. long, densely grayish brown puberulous.—July–Aug. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.

Var. *leiocarpa* Nakai. KENASHI-SHINA-NO-KI. Fruit glabrous.—Shikoku.

Fam. 133. MALVACEAE

Aoi KA Mallow Family

Herbs or woody plants usually with stellate hairs; leaves stipulate, alternate, simple, palmately or rarely pinnately nerved, often palmately lobed; flowers bisexual, actinomorphic; sepals 5, often connate at base, valvate, often with a caliculus; petals 5, contorted, usually connate with the stamens at base; stamens numerous, rarely 5, the filaments adnate into a tube, the anthers 1-locular; ovary superior, 2- to many-locular; styles and stigmas as many as the carpels; ovules 1 to many in each locule; fruit a capsule or composed of separate carpels, very rarely fleshy; seeds with scanty endosperm.—About 80 genera, with about 1,500 species, widely distributed in tropical and temperate regions.

- 1A. Fruit a capsule; flowers large; ovules 3 to many in each locule. 1. *Hibiscus*
 1B. Fruit of few to many separate carpels; flowers usually small.
 2A. Bracteoles adnate to the calyx; carpels 5; style-branches 10; ovules solitary in each locule. 2. *Urena*
 2B. Bracteoles absent or distant from the calyx; carpels 5 to many, as many as the style-branches.
 3A. Ovules and seeds solitary in each locule. 3. *Sida*
 3B. Ovules and seeds few in each locule. 4. *Abutilon*

1. HIBISCUS L. Fuyō Zoku

Herbs, shrubs, or small trees; leaves deciduous or evergreen, alternate, palmately nerved and lobed; flowers usually axillary, solitary, large; calyx campanulate, 5-lobed or -parted, usually caliculate at base; petals 5; staminal tube 5-toothed at apex, the anthers numerous; ovary 5-locular, with 3 to many ovules in each locule; style 5-lobed, the stigma capitate; capsules loculicidally dehiscent, 5-lobed.—About 200 species, chiefly in the Tropics.

- 1A. Flowers yellowish; woody plants; stipules large, narrowly ovate or oblong, obtuse; leaves undivided, densely pubescent beneath; bracteoles forming a partially connate cup-shaped caliculus.
 2A. Leaves 3.5–6 cm. long and as wide, depressed-serrulate, rounded to slightly cordate at base; stipules about 1 cm. long. 1. *H. hamabo*
 2B. Leaves 8–15 cm. long and as wide, obsolete undulate-dentate or subentire, deeply cordate at base; stipules 1.5–3 cm. long. 2. *H. tiliaceus*
 1B. Flowers reddish, yellowish or white; herbs or woody plants; stipules linear, acuminate; leaves lobed; bracteoles nearly free, not connate.
 3A. Herbs with nearly 3-parted and pinnately incised leaves; flowers pale yellow; calyx membranous, thinly pubescent with simple long hairs on nerves. 3. *H. trionum*
 3B. Woody plants with 3- to 5-lobed leaves; flowers reddish or white; calyx herbaceous, densely stellate-pubescent with indistinct nerves.
 4A. Leaves ovate, 3-lobed, subcuneate, sometimes obtuse at base. 4. *H. syriacus*
 4B. Leaves cordate-orbicular, angular, cordate at base. 5. *H. mutabilis*

1. *Hibiscus hamabo* Sieb. & Zucc. *H. tiliaceus* var. *hamabo* (Sieb. & Zucc.) Maxim.—HAMABO. Bushy shrub 1–2 m. high, with yellowish gray stellate pubescence on branchlets, undersides of leaves, outer side of stipules, bracteoles, and calyx; leaves deciduous, rather thick, depressed-orbicular to -obovate, or obsolete 4-angled, 3–6 cm. long, 3–7 cm. wide, abruptly acute, rounded to subcordate at base, obtusely serrulate, 5- or sometimes 7-nerved from the base, thinly stellate-puberulent on upper side, the petioles 8–20 mm. long, the

stipules about 1 cm. long, narrowly ovate-triangular, deciduous; flowers solitary, axillary, pedicellate, about 5 cm. across, pale yellow with a dark red center, the pedicel about 1 cm. long; bracteoles connate to middle, about one-half as long as the calyx, the free portion lanceolate; calyx-lobes deltoid-ovate, acute; petals 4–5 cm. long, obovate, rounded.—July–Aug. Near seashores; Honshu (Sagami Prov. and westw.), Shikoku, Kyushu.—Ryukyus and Korea (Quelpaert Isl.).

2. *Hibiscus tiliaceus* L. *H. tortuosus* Roxb.—YAMASAKI, ÔHAMABÔ. Small tree with rather thick branches, minutely puberulous and punctulate when young; leaves rather thick, cordate-orbicular, 8–15 cm. long, 10–20 cm. wide, abruptly acute, deeply cordate at base, entire or with obsolete undulate teeth, with minute yellowish gray stellate pubescence, 7- to 9-nerved, the petioles 1–10 cm. long, the stipules narrowly ovate-triangular, obtuse, 1.5–3 cm. long; flowers axillary or subterminal on the upper part of the branchlets, pale yellow, with a dark red center, 8–10 cm. across, the pedicels 3–5 cm. long, often with 2 stipulelike bracts on the upper part, the caliculus cup-shaped, with deltoid marginal teeth; calyx-lobes lanceolate, gradually acute, about 15 mm. long; petals broadly obovate, rounded; capsules globose, mucronate, about 1.5 cm. across, yellowish brown long-pilose; seeds many, dark brown, reniform and thick, about 4 mm. across, with scattered raised minute spots.—July–Aug. Near seashores; Kyushu (Yakushima and Tanegashima).—Ryukyus, Formosa, s. China, India, Malaysia, and Australia.

3. *Hibiscus trionum* L. *H. ternatus* Cav.—GINSEIN-KA. Annual herb 30–60 cm. high; stems with scattered coarse spreading hairs and with short hairs; leaves petiolate, membranous, 3-parted nearly to the cuneate base, thinly hirsute, the terminal segment large, 3–10 cm. long, narrowly ovate or broadly lanceolate, obtuse, pinnately lobed and incised; flowers solitary, axillary, pale yellow, 4–5 cm. across, the bracteoles linear; calyx 1.5–2 cm. long, coarsely spreading-hirsute, membranous, with green nerves, the lobes deltoid; capsules globose, enclosed within the calyx, brown-hairy, about 1 cm. across.—Aug.–Sept. Sometimes naturalized in our area; common in warmer regions of the Old World.

4. *Hibiscus syriacus* L. *H. chinensis* DC.—MUKUGE,

HACHISU. Deciduous shrub with grayish branches, stellate-puberulent when young; leaves ovate, rhombic-ovate, or broadly ovate, 3-lobed, 4–10 cm. long, 2.5–5 cm. wide, sub-cuneate at base, 3- to 5-nerved, with scattered simple and stellate hairs, the terminal lobes narrowly deltoid, rather large, acuminate and sometimes with an obtuse tip, the petiole 7–20 mm. long, densely puberulous on upper side; flowers axillary and terminal, 5–6 cm. across, rose-purple, sometimes white (often double in cultivars), the pedicels about 1.5 cm. long, as long as the calyx, the bracteoles linear, nearly as long as the calyx; calyx stellate-puberulent, the lobes deltoid; fruit ovoid-globose, densely stellate-puberulent; seeds reniform, about 4–5 mm. across.—Aug.–Oct. Widely planted for hedges and in gardens, several cultivars are grown.—Introduced from China.

5. *Hibiscus mutabilis* L. FUYÔ. Deciduous shrub densely gray stellate-pubescent on branchlets, under side of leaves, peduncles, and calyx; leaves long-petiolate, 5-angled-orbicular, 10–20 cm. long and as wide, cordate, shallowly 5- or sometimes 3-lobed, with remote and shallow undulate teeth, stellate-pubescent and with minute spots on upper side, the lobes deltoid, acuminate; flowers solitary, pink, 10–13 cm. across, the peduncles to 12 cm. long, usually with an obscure joint above the middle; calyx 5-lobed, nearly to the middle, sometimes glandular-pilose, the lobes narrowly deltoid, the bracteoles longer than the calyx-tube; capsules globose, about 2.5 cm. across, long spreading-pilose, nerved; seeds many, reniform, about 2 mm. across, white-hirsute on the back.—Aug.–Oct. Thickets; Kyushu; often cultivated for the large showy flowers, and sometimes naturalized in warmer regions in our area.—Ryukyus and China.

2. URENA L. BONTEN-KA ZOKU

Coarse herbs or shrubs; leaves angled or palmately lobed, with glands at the base of the midrib beneath; flowers rather small, sessile or short-pedunculate, rose-colored or yellow, the bracteoles forming a 5-lobed connate caliculus, adnate to the calyx-tube; calyx 5-lobed or -toothed; staminal tube truncate or 5-toothed, the anthers sessile or nearly so; ovary 5-locular, the ovules solitary in each locule; style-branches 10, the stigmas capitate; fruitlets indehiscent, glochidiate-hairy, the seeds ascending.—Few species, in Asia, Africa, and tropical America.

1. *Urena lobata* L. var. *tomentosa* (Bl.) Walp. *U. tomentosa* Bl.; *U. lobata* var. *scabriuscula* sensu auct. Japon., non A. Gray—ÔBA-BONTEN-KA, Ô-BONTEN-KA. Shrub, densely grayish stellate-puberulent, the branches elongate; leaves orbicular to broadly ovate and angled, 4–5 cm. long, 4–8 cm. wide, shallowly 3- to 5-lobed or undivided, rounded, cordate or broadly cuneate at base, the lobes deltoid, acute to obtuse, toothed, the petioles 3–10 cm. long; flowers axillary, solitary, on very short pedicels, rose-colored, the caliculus deeply 5-lobed, the lobes lanceolate, longer than the calyx; calyx about 5 mm. long, the lobes broadly lanceolate; fruitlets obovoid, 5–6

mm. long, stellate-hairy and glochidiate-pilose, the hairs about 1.5 mm. long; seeds reniform, about 4 mm. long, grayish brown.—Aug. Thickets and waste grounds; Kyushu (s. distr. incl. Yakushima and Tanegashima). The typical phase, widely distributed in the Tropics, is very variable.

Var. *sinuata* (L.) Gagnep. *U. sinuata* L.—BONTEN-KA. Leaves smaller and less densely puberulous, deeply 5-lobed, the lobes usually ovate, narrowed at the base; bracteoles as long as the calyx; petals glabrous.—Shikoku, Kyushu (s. distr. incl. Yakushima and Tanegashima).—Widely distributed in the Tropics of Asia.

3. SIDA L. KIN-GOJI-KA ZOKU

Herbs or shrubs; leaves simple or lobed; flowers yellow or white, sessile or peduncled, without bracteoles, solitary or in glomerate, racemose, capitate, or spicate inflorescences; calyx 5-toothed or -lobed; staminal tube shorter than the free part of the filaments; ovary 5- to many-locular, the ovules solitary in each locule; style-branches as many as the carpels, filiform or somewhat clavate, the stigmas capitate or truncate; fruitlets separating from the axis, rostrate or erostate, indehiscent or 2-valvate and dehiscent, the seeds pendulous or horizontal.—About 130 species, abundant in America, occurring also in Africa and Asia.

1. *Sida rhombifolia* L. KIN-GOJI-KA. Stellate-puberulent perennial herb with terete branches; leaves narrowly ovate or rhomboid-ovate, rarely oblong, 1.5-5 cm. long, 1-2 cm. wide, obtuse, obtusely toothed, green on upper side, paler and rather densely stellate-pubescent beneath, the petioles 2-6 mm. long, densely puberulent; flowers axillary, yellow, about

1.5 cm. across, the pedicels 1-4 cm. long, jointed above the middle; calyx 5-7 mm. long, infundibuliform, 5-lobed, 10-ribbed, the lobes deltoid and acute; petals obovate; fruitlets 10, stellate-hairy on back, about 3 mm. long, 2-lobed with an awn at apex.—Aug. Kyushu (Yakushima and Tanegashima).—Widely distributed in the Tropics.

4. ABUTILON Gaertn. ICHIBI ZOKU

Herbs and shrubs with stellate-hairs; leaves angled or palmately lobed, sometimes cordate-orbicular; inflorescence axillary or terminal, without bracteoles; calyx often subtubulose, the lobes 5, valvate; petals 5, connate and adnate at base to the staminal tube; filaments free above; carpels 5 to many, the styles as many as the carpels, the ovules 2 to many in each carpel; fruitlets separating from the axis, sometimes awned, seeds 2 or more in each carpel, reniform.—About 100 species, chiefly in the Tropics.

1. *Abutilon theophrasti* Medik. *Sida abutilon* L.; *A. avicennae* Gaertn.—ICHIBI. Velvety annual; stems 50-150 cm. long; leaves cordate-orbicular, 5-12 cm. long and wide, abruptly acuminate, deeply cordate, with obtuse shallow teeth, palmately 7- to 9-nerved; flowers axillary and terminal, short-peduncled, yellow, about 2 cm. across; calyx-lobes longer than

the tube, ovate, mucronate; fruit semiglobose, 15-20 mm. across, the fruitlets about 15 mm. long, dehiscent, membranous, hairy, with 2 ascending awns; seeds obliquely reniform, brown, puberulent, about 3.5 mm. across.—Aug.-Sept. Cultivated and sometimes naturalized.—s. Europe, Asia, America, and Australia.

Fam. 134. STERCULIACEAE AOGIRI KA Sterculia Family

Trees, rarely herbs, often with stellate hairs; leaves alternate, rarely subopposite, simple, or palmately compound, usually stipulate; inflorescence various; flowers bisexual or unisexual, actinomorphic; sepals 3-5, more or less connate, valvate; petals 5 or absent, often adnate to the staminal tube, convolute; stamens often connate into a tube at base, with as many staminodes; ovary, with 2-5 (-12) united carpels; styles usually 4 or 5, distinct or united; ovules usually 2 on inner angle of each locule; fruit dry, rarely a berry, indehiscent or dehiscent; seeds with fleshy endosperm or none.—About 50 genera, with about 750 species, chiefly in the tropics.

- 1A. Trees; flowers unisexual, apetalous; follicles dehiscent early before maturity; styles connate, with a dilated stigma; seeds several in each carpel. 1. *Firmiana*
 1B. Herbs (in ours); flowers bisexual, petaliferous; capsules globose, separating into 5 fruitlets; styles free or connate at base; seeds solitary in each carpel. 2. *Melochia*

1. FIRMIANA Marsili AOGIRI ZOKU

Deciduous trees with alternate palmately lobed leaves; flowers in large terminal panicles, 5-merous, unisexual; sepals yellowish; petals absent; androgynophore well developed; carpels 5, free at base, connate at apex; style solitary; follicles stellately spreading, early dehiscent and leaflike; seeds globose, marginal on the dehiscent carpels.—About 10 species, chiefly in s. Asia, one in Africa.

1. *Firmiana simplex* (L.) W. F. Wight. *Hibiscus simplex* L.; *Sterculia platanifolia* L. f.; *S. tomentosa* Thunb.; *F. platanifolia* (L. f.) Schott & Endl.—AOGIRI. Monoecious tree, the branches green, the branchlets, young leaves on upper side, and petioles brown stellate-hairy while young; leaves large, long-petiolate, palmately 3- to 5-lobed; panicles large, many-flowered, yellowish brown villous; flowers yellowish; sepals 5, reflexed, linear-oblong, about 1.5 cm. long; filaments of

the staminate flowers connate into a tube about 12 mm. long; androgynophore glabrous, about 5 mm. long; carpels early dehiscent after anthesis, stellately spreading, narrowed to a petiolelike base, exposing several marginal seeds.—July. Very common as a street tree, sometimes naturalized in the warmer parts of our area.—Ryukyus, Formosa, China, and Indochina.

2. MELOCHIA L. NOJI-AOI ZOKU

Woody or herbaceous, with simple and stellate hairs; leaves ovate or cordate, serrate; flowers usually small, 5-merous, in axillary or terminal subcapitate inflorescences; calyx 5-lobed or -toothed; petals spatulate or oblong; stamens opposite the petals, connate at base, the staminodes absent or toothlike; ovary sessile or short-stiped, 5-locular, with 2 ovules in each locule; styles 5, free or connate at base; capsules loculicidally dehiscent, 5-valved, the seeds solitary in each locule, obovoid, with scanty endosperm.—About 60 species, chiefly in the Tropics.

1. *Melochia corchorifolia* L. *M. concatenata* L.—NOJI-AOI. Loosely stellate-pilose branched annual 30-60 cm. high; leaves broadly ovate, or in the upper ones narrowly 3-angled ovate, 2.5-6 cm. long, 1.5-5 cm. wide, acute to sub-

obtuse, the larger ones often shallowly and obsoletely 3-fid, irregularly toothed, coarsely hirsute on midrib on upper side and on nerves beneath; flowers in capitate inflorescences in upper axils and terminal, the bracteoles 4, subulate-linear,

ciliate; calyx cup-shaped, shorter than the bracteoles, 5-toothed; petals rose-colored, twice as long as the calyx and nearly as long as the bracteoles, obovate, about 7 mm. long; capsules depressed-globose, about 5 mm. across, coarsely hirsute, the

seeds grayish brown, with black spots, about 2.5 mm. long. —Aug.–Oct. Shikoku, Kyushu.—Widely distributed as a tropical weed.

Fam. 135. ACTINIDIACEAE MATA-TABI KA Actinidia Family

Trees or shrubs, often scandent; leaves alternate, petiolate, simple, often membranous, toothed, without stipules; inflorescence small, in axillary cymes or fascicles; flowers unisexual, bisexual, or polygamous (plants rarely dioecious); sepals 5, imbricate, free; petals 5, imbricate or subcontorted; stamens many, free or adnate to the petals, the anthers versatile; ovary superior, (3–) 5- or many-locular, with many ovules in each locule; styles 5 to many, free or connate at the top; fruit a berry or capsule; seeds many with copious endosperm.—Four genera and about 280 species, in the Tropics, few in temperate regions.

1. ACTINIDIA Lindl. MATA-TABI ZOKU

Deciduous scandent polygamodioecious shrubs; leaves alternate, long-petiolate, simple, toothed or rarely entire; flowers solitary or in axillary cymes, white, rarely reddish; sepals 5, imbricate; petals 5 or rarely 4, contorted; stamens many, the anthers versatile; ovary superior, many-locular; styles many, linear, radiate; fruit a many-seeded berry; seeds small, with endosperm.—About 25 species, in e. and s. Asia, and India.

- 1A. Leaves thick, green and lustrous; anthers dark-purple; fruit ellipsoidal.
- 2A. Leaves green beneath; inflorescence more or less brown pubescent.
- 3A. Inflorescence and sepals densely rusty-brown villous; ovary villous. 1. *A. rufo*
- 3B. Inflorescence pale brown pubescent; sepals ciliate; ovary glabrous. 2. *A. arguta*
- 2B. Leaves glaucescent beneath; inflorescence and sepals nearly glabrous. 3. *A. hypoleuca*
- 1B. Leaves membranous, vivid green, scarcely lustrous, those near the inflorescence white on upper half on upper side; anthers pale yellow; fruit narrowed toward apex.
- 4A. Leaves rounded to acute at base; flowers usually 1, rarely 2 or 3, in axils of the middle portion of young branchlets, about 2.5 cm. in diameter; pith solid. 4. *A. polygama*
- 4B. Leaves at least some of them cordate; flowers 3, rarely 1 or 2, in axils of lower portion of young branchlets; pith lamellate. 5. *A. kolomikta*

1. *Actinidia rufo* (Sieb. & Zucc.) Planch. *Trochostigma rufo* Sieb. & Zucc.; *A. callosa* var. *rufo* (Sieb. & Zucc.) Makino; *A. rufo* var. *typica* Dunn; *A. arguta* var. (?) *rufo* (Sieb. & Zucc.) Maxim.; *A. kusiana* Koidz.—SHIMA-SARU-NASHI, NASHI-KAZURA. Branchlets lenticellate, elongate, reddish brown-woolly while young, soon becoming glabrous; leaves elliptic to broadly so, or ovate-elliptic, 6–13 cm. long, 4–8 cm. wide, acuminate or abruptly so, rounded to shallowly cordate at base, loosely serrate with shallow callose-pointed teeth, pale green, glabrous on upper side, rusty-brown pubescent on nerves beneath while young, persisting as axillary tuft of hairs, the petioles 3–6 cm. long; inflorescence on middle part of the branchlets, rusty-brown villous, 1- to 8-flowered, shorter than the petioles; flowers 1–1.5 cm. across; fruit broadly ellipsoidal, 2–3 cm. long, with light brown spots.—May–June. Honshu (Kii Prov., Chūgoku Distr.), Shikoku, Kyushu.—Ryukyus and s. Korea.

2. *Actinidia arguta* (Sieb. & Zucc.) Planch. ex Miq. *Trochostigma arguta* Sieb. & Zucc.; *A. rufo* var. *arguta* (Sieb. & Zucc.) Dunn; *A. callosa* var. *arguta* (Sieb. & Zucc.) Makino —SARU-NASHI. Woody scandent shrub, branchlets nearly glabrous, smooth, the pith lamellate; leaves thin, elliptic or broadly so, sometimes broadly ovate, 6–10 cm. long, 3.5–7 cm. wide, abruptly short-acuminate, rounded to shallowly cordate at base, mucronate-serrulate, glabrous on upper side, rusty-brown pubescent on nerves beneath while young, persisting in the nerve axils, the petioles rather slender, 2–8 cm. long; inflorescence axillary on upper part of branchlets, 1- to 10-flowered, rusty-brown pubescent; flowers 1–1.3 cm. across, white; sepals ciliate, ovate-rounded; ovary glabrous; fruit broadly ellipsoidal, 2–2.5 cm. long.—May–July. Hokkaido, Honshu,

Shikoku, Kyushu.—s. Kuriles, Sakhalin, Ussuri, Manchuria, and Korea.

Var. *platyphylla* (A. Gray) Nakai. *A. platyphylla* A. Gray; *A. japonica* Nakai—KOKUWA. Under side of leaves callose-hairy.

3. *Actinidia hypoleuca* Nakai. URAJIRO-MATA-TABI. Branchlets glabrous, nearly smooth; leaves oblong, 6–10 cm. long, 3–6 cm. wide, abruptly short-acuminate, rounded to abruptly acute at base, mucronate-serrulate, whitish and with rusty-brown axillary tufts of hairs on the nerves beneath, the petioles 2–6 cm. long; inflorescence on upper part of branchlets, 1- to 10-flowered, puberulent; flowers white, 1–1.5 cm. across; sepals broadly ovate, glabrescent; ovary glabrous; fruit 2–3 cm. long, broadly ellipsoidal, with light colored spots.—May–June. Honshu (Awa and westw.), Shikoku, Kyushu.

4. *Actinidia polygama* (Sieb. & Zucc.) Maxim. *Trochostigma polygama* Sieb. & Zucc.; *T. volubilis* (Sieb. & Zucc.; *A. polygama* var. *latifolia* Miq.; *A. volubilis* (Sieb. & Zucc.) Miq.; *A. repanda* Honda, excl. basonym.—MATA-TABI. Branches rather slender, the pith solid, the branchlets brownish pubescent while young, sometimes thinly callose-hairy; leaves thin, broadly ovate to elliptic, sometimes oblong, 6–15 cm. long, 3.5–8 cm. wide, acuminate to abruptly so, rounded to shallowly cordate at base, mucronate-serrulate, usually with scattered callose hairs on upper side and on nerves beneath, with axillary tufts of pale brown hairs beneath, the petioles 3–6 cm. long; leaves near inflorescence white on upper half; inflorescence 1- to 3-flowered, axillary, pale brown-pubescent, shorter than the petioles; flowers white, pendulous, 2–2.5 cm. across; sepals ovate, membranous, white-puberulent near mar-

gin; ovary glabrous; fruit oblong, rostrate, 2-2.5 cm. long. —June-July. Thickets and woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Sakhalin, s. Kuriles, Korea, Manchuria, and Ussuri.

5. *Actinidia kolomikta* (Rupr. & Maxim.) Maxim. *Prunus kolomikta* Rupr. & Maxim.; *Kolomikta mandshurica* Regel; *Trochostigma kolomikta* (Rupr. & Maxim.) Rupr.—MIYAMA-MATA-TABI. Branches slender; pith lamellate; branchlets brownish pubescent while young; leaves thinly membranous, obovate, elliptic or broadly ovate, 7-12 cm. long, 4-8 cm.

wide, mucronate-serrulate, sometimes loosely callose-hairy on upper side, thinly brownish pubescent on both sides, especially on nerves, with axillary tufts of white hairs beneath, the petioles slender, 4-7 cm. long; inflorescence 3-, sometimes 1- or 2-flowered, axillary, loosely pubescent; flowers pendulous, 1-1.5 cm. across; sepals ovate, white-puberulous near margin; ovary glabrous; fruit narrowly oblong, 1.5-2 cm. long, narrowed toward tip.—June-July. Mountains; Hokkaido, Honshu (centr. distr. and northw.).—s. Kuriles, Sakhalin, Amur, and Manchuria.

Fam. 136. THEACEAE Tsubaki Ka Tea Family

Trees and shrubs; leaves alternate, simple, deciduous or evergreen, stipules absent; flowers usually solitary, sometimes in panicles, racemes, or in cymes, usually large, actinomorphic, bisexual, rarely unisexual; bracts usually just beneath the calyx, paired; sepals 5, free or connate at base, imbricate; petals 5, free or connate at base, imbricate or contorted; stamens many, in several series, rarely definite, free or connate; ovary superior, sessile, 3- to 5-locular; styles sometimes connate; ovules 2 or more, rarely 1 in each locule; fruit dehiscent or indehiscent; seeds with scanty endosperm.—About 33 genera, with about 480 species, abundant in the Tropics and subtropics, few in temperate regions.

1A. Fruit a dehiscent capsule; anthers versatile.

2A. Evergreen; capsules with an axis; seeds wingless; ovules pendulous.

3A. Sepals persistent; bracteoles 2; inflorescence apparently axillary; flowers pedicellate. 1. *Thea*

3B. Sepals deciduous; bracteoles many, deciduous; inflorescence apparently terminal or subterminal; flowers sessile. 2. *Camellia*

2B. Deciduous; capsules without an axis; seeds winged; ovules ascending. 3. *Stewartia*

1B. Fruit fleshy or nearly so, usually indehiscent; anthers basifixed.

4A. Flowers bisexual; leaves usually entire (in ours).

5A. Anthers glabrous; ovules pendulous from the top of the ovary. 4. *Ternstroemia*

5B. Anthers bearded; ovules median. 5. *Cleyera*

4B. Flowers unisexual, the plants dioecious; leaves serrate. 6. *Eurya*

1. THEA L. CHA-NO-KI ZOKU

Evergreen shrubs or small trees; leaves coriaceous, serrate; inflorescence apparently axillary, 1- to 3-flowered; flowers bibracteolate, bisexual, pedicellate, deflexed, actinomorphic; sepals 5, persistent; petals 5, imbricate, connate at base; stamens many, glabrous, connate at base into a short tube, the anthers versatile; ovary superior, usually 3-locular; styles 3, connate at base; ovules few in each locule, pendulous; capsules thick, rather ligneous, loculicidally dehiscent, 3-valved; seeds 1 or 2 in each locule, wingless, without endosperm, the embryo straight, the cotyledons thick.—About 10 species, in s. and e. Asia.

1. *Thea sinensis* L. *Camellia sinensis* (L.) O. Kuntze; *T. bohea* L.; *T. viridis* L.; *T. sinensis* var. *bohea* (L.) K. Koch —CHA-NO-KI. Much-branched evergreen shrub, the young branchlets thinly ascending-pilose; leaves lanceolate-oblong or oblong, 4-10(-15) cm. long, 2-3(-5) cm. wide, obtuse or sub-obtuse, acute at base, short-petiolate, serrulate, glabrous on both sides except for a few appressed hairs sometimes on the underside when young; flowers 1-3, in axillary or subterminal cymes, deflexed, 2-2.5 cm. across, white, the pedicels 5-15 mm.

long; capsules depressed-globose, about 2 cm. across, with 3 shallow indistinct grooves.—Oct.-Dec. Widely cultivated in warmer regions and allegedly spontaneous in Kyushu.—China.—Forma *rosea* (Makino) Ohwi. *T. sinensis* var. *rosea* Makino; *Camellia sinensis* forma *rosea* (Makino) Kitam. —BENIBANA-CHA. Flowers rose.—Forma *macrophylla* (Sieb.) Ohwi. *T. sinensis* var. *macrophylla* Sieb. ex Miq.; *T. macrophylla* (Sieb.) Makino.—Tô-CHA. Leaves larger.—Cultivated.

2. CAMELLIA L. Tsubaki Zoku

Evergreen shrubs or trees; leaves coriaceous, short-petiolate, serrate; inflorescence apparently terminal or subterminal; flowers bisexual, solitary, large, white to red, sessile, the perules (bracteoles and sepals) deciduous; petals 5 (-7) (often numerous in cultivars), slightly connate at base; stamens many, the outer filaments connate into a tube, the anthers versatile; ovary 3-locular (in ours), with 4-6 ovules in each locule; styles slender, connate at base to free or nearly so; fruit a woody loculicidally dehiscent capsule, the axis persistent; seeds few, globose or angled, the embryo straight, the cotyledons thick.—About 80-90 species, in e. and s. Asia.

1A. Leaves 6-12 cm. long, 3-7 cm. wide; petioles 7-12 mm. long; petals connate at base; filaments connate into a tube; ovary glabrous.

2A. Petioles glabrous; involucre of perules (bracteoles and sepals) 2-3 cm. long; petals often nearly erect to ascending-spreading, rounded to slightly retuse or emarginate; outer filaments united to form a tube for $\frac{1}{2}$ - $\frac{2}{3}$ their length; filaments white or creamy yellow. 1. *C. japonica*

2B. Petioles thinly pilose while young; involucre of perules 1.5-1.7, rarely 2 cm. long; petals wide-spreading, distinctly retuse to shallowly bifid; outer filaments united for only 2-3 mm. above base; filaments spreading bright yellow. 2. *C. rusticana*

1B. Leaves 3-5(-7) cm. long, 1-3 cm. wide; petioles 2-5 mm. long; petals nearly free, spreading; filaments only slightly connate at base; ovary villous. 3. *C. sasanqua*

1. *Camellia japonica* L. *Thea japonica* (L.) H. Baill.; *C. japonica* var. *spontanea* (Makino) Makino; *T. japonica* var. *spontanea* Makino—YABU-TSUBAKI. Evergreen tree or shrub with glabrous branches; leaves elliptic or oblong, 6–12 cm. long, 3–7 cm. wide, abruptly acuminate, serrulate, glabrous on both surfaces, deep green and lustrous, the petioles 8–15 mm. long; flowers solitary and subterminal, sessile, red, the bracteoles many, small, rounded, white-puberulous on outer side; sepals 5, rather unequal, ovate-orbicular, 1–2 cm. long; petals 5, 3–5 cm. long, often nearly erect to ascending-spreading, rounded to slightly retuse or emarginate, connate and adnate to the stamens at base; stamens numerous, the filaments white or creamy yellow, the outer ones united to form a tube for 1/2–2/3 their length, the anthers yellow; ovary glabrous; style trifid; capsules globose, 4–5 cm. across, with a thick pericarp; seeds large, dark-brown.—Feb.–Apr. Near seashores; Honshu, Shikoku, Kyushu; common.—Korea and Ryukyus.

Var. *hortensis* (Makino) Makino. *T. japonica* var. *hortensis* Makino—TSUBAKI. Includes cultivars with single to double, red, white, or blotched flowers.

Var. *macrocarpa* Masam. YAKUSHIMA-TSUBAKI, RINGO-TSUBAKI. Fruit larger, about 5 cm. across, the pericarp very thick, about 1.5 cm. thick; seeds rather small, darker brown.—Mountains of Kyushu (Yakushima) and Shikoku, extending to Amami-Oshima.

Camellia reticulata Lindl. TÔ-TSUBAKI. Leaves regularly serrulate, strongly veined; flowers large, semi-double, rose-colored; ovary hairy.—Native of China, but sometimes cultivated in our area.

2. *Camellia rusticana* Honda. *C. japonica* subsp. *rusticana* (Honda) Kitam.—YUKI-TSUBAKI, SARUWA-TSUBAKI. Small tree or shrub with ascending or suberect glabrous branches; leaves thick, oblong to elliptic, sometimes obovate-

oblong, 6–12 cm. long, 3.5–6 cm. wide, abruptly to gradually acuminate, acutely ascending-serrulate, glabrous, deep green and lustrous on upper side, green beneath, the petioles 5–8 mm. long; flowers subterminal on the branchlets, solitary, sessile, reddish, the bracteoles rather numerous, externally pilosulous; sepals orbicular, about 1 cm. long; petals 5, wide-spreading, distinctly retuse to shallowly bifid, 2.5–4 cm. long, about 2 cm. wide, shortly connate at base; outer filaments yellow, obliquely spreading, shortly united above base, the anthers deep yellow; styles 3- or 4-fid; fruit globose, about 2.5 cm. in diameter, with rather thick pericarp.—Apr.–June. Thickets and thin woods on mountain slopes; Honshu (Japan Sea side of centr. distr. and northw.).

3. *Camellia sasanqua* Thunb. *Thea sasanqua* (Thunb.) Noisette; *Thea miyagii* Koidz.; *T. sasanqua* var. *thunbergii* Pierre—SAZANKA. Small evergreen tree with slender branches; branchlets terete, ascending- or spreading-pilose; leaves thinly coriaceous, broadly oblanceolate to narrowly obovate or narrowly oblong, 3–7 cm. long, 1–3 cm. wide, acute with an obtuse tip or sometimes emarginate, obtusely serrulate, with ascending short hairs on the midrib on both sides, the lateral nerves and veinlets slender, only slightly raised on both sides, the petioles 2–5 mm. long, slightly pilose on the upper side; flowers subterminal, sessile, white (also pink to rose in cultivars), 4–7 cm. across; sepals depressed-orbicular, about 1 cm. long; petals obovate or oblong, retuse or shallowly bifid, widely spreading; stamens numerous, the filaments slightly connate at base; ovary densely white-pilose; capsules obovoid-globose, loosely long-pilose, 1.5–2 cm. across, with a rather thick pericarp.—Oct.–Dec. Thickets and grassy slopes in mountains; Kyushu. Many cultivars are grown in gardens.—Ryukyus.

3. STEWARTIA L.

NATSU-TSUBAKI ZOKU

Deciduous shrubs or trees; leaves membranous; flowers bisexual, solitary, rather large, sessile or short-pedicellate, axillary, white or reddish, bibracteolate; sepals 5 or 6, rather unequal, connate at base; petals as many as the sepals, imbricate, connate at base; stamens usually adnate to the petals and connate at base, the anthers versatile; ovary 5-locular; styles 5, free or connate; ovules 2 in each locule, anatropous, ascending; capsules ovoid, woody, loculicidally dehiscent; seeds lenticular, entire or narrowly wing-margined, the endosperm scanty. About 8 species, in E. Asia and N. America.

1A. Leaves (4)–6–12 cm. long, appressed-pilose beneath, acute to abruptly short-acuminate; pedicels 1–6 cm. long; bracteoles always shorter than the sepals; flowers 6–7 cm. across; sepals depressed-orbicular; filaments glabrous; ovary and capsules pilose.

1B. Leaves 3–7 (–8) cm. long, glabrous or pilose only on nerves beneath, acuminate to acute; pedicels less than 1 cm. long; bracteoles as long as or longer than the sepals; flowers 1.5–4 cm. across; sepals lanceolate to ovate; filaments white-hairy at base.

2A. Ovary and capsules glabrous; branches grayish or dark brown; flowers 3.5–4 cm. across; sepals 12–17 mm. long. 2. *S. serrata*

2B. Ovary and capsules white-pilose; branches reddish brown; flowers 1.5–2 cm. across; sepals 4–7 mm. long. 3. *S. monadelphica*

1. *Stewartia pseudocamellia* Maxim. *S. grandiflora* Carr.—NATSU-TSUBAKI. Tree with grayish brown branches, the young branches usually with appressed white hairs on lower portion while young; leaves membranous, obovate or elliptic, (4)–6–12 cm. long, 3–5 cm. wide, acute to short-acuminate, acute to subcuneate at base, mucronate-serrate, green, glabrous on upper side, pilose and with axillary tufts of hairs beneath, the lateral nerves 6 or 7 pairs, the petioles 3–15 mm. long; pedicels axillary, 1–6 cm. long, glabrescent, the bracteoles 2, cordate-orbicular, 4–6 mm. long, much shorter than the sepals; flowers 6–7 cm. across; sepals depressed-orbicular, 8–12 mm. long, with dense long white silky hairs, tubercled on margin; petals white, 3–4 cm. long, obovate, irregularly denticulate, densely white-silky on back; filaments glabrous; ovary pilose; capsules 5 (–6)-angled, conical, ovoid,

gradually acuminate, about 1.5 cm. across, white-pilose.—July. Mountains; Honshu, Shikoku, Kyushu.

2. *Stewartia serrata* Maxim. HIKOSAN-HIME-SHARA. Tree with grayish to dark brown branchlets, densely spotted while young, glabrous or thinly long-pilose; leaves rather thick-membranous or chartaceous, ovate-elliptic or elliptic, 3–7 (–8) cm. long, 1.5–3.5 (–4) cm. wide, acuminate, acute at base, mucronate-serrate, glabrous or pilose on midrib on upper side, pale green with axillary tufts of hairs and loosely appressed-pilose on midrib beneath, the lateral nerves and midrib often reddish; flowers in upper axils, white, 3.5–4 cm. across, the pedicels 2–4 mm. long, the bracteoles leaflike; narrowly ovate, usually longer than the sepals; sepals broadly lanceolate, 12–17 mm. long, serrate; petals obovate, 2.5–3 cm. long, obtusely serrulate, white-silky on back; ovary glabrous; capsules ob-

ovoid, 5-angled, glabrous, about 1.5 cm. across, terminated by a portion of the persistent style; seeds planoconvex, brown, obovate, about 8 mm. long, narrowly wing-margined.—Honshu (Tōkaidō and s. Kinki Distr.), Shikoku, Kyushu.—*Forma epitricha* (Nakai) Ohwi. *S. epitricha* Nakai—Ichibusashara. Leaves sparingly callose-pilose on upper side.—Kyushu (Mount Ichibusu in Higo).—*Forma sericea* (Nakai) Hara. *S. serrata* var. *sericea* Nakai—Tōgoku-Hime-shara. Leaves pilose, especially on midrib beneath.—Honshu (Tōkaidō Distr.).

3. *Stewartia monadelphica* Sieb. & Zucc. HIME-SHARA. Shrub with slender, reddish brown branches, the branchlets glabrous or sparsely ascending-pilose; leaves chartaceous, ovate-elliptic or elliptic to oblong, 4-8 cm. long, 2-3 cm. wide, acuminate, acute at base, short mucronate-toothed, pilose on both sides or only on midrib on upper side, with axillary tufts of hairs beneath, the petioles slender, 2-12 mm. long, often reddish; flowers axillary, white, 1.5-2 cm. across, the pedicels 5-10 mm. long, the bracteoles longer than the sepals; sepals broadly lanceolate to ovate, 4-7 mm. long, entire, ciliate; petals obovate, 12-15 mm. long, obtusely toothed, white-silky on back; ovary white-pilose; capsules 5-angled, ovoid-pyramidal, narrowed above to a beak about 1 cm. across, white-pilose; seeds planoconvex, dark brown, smooth, obovate, about 5 mm. long, narrowly winged.—July-Aug. Mountains; Honshu (Kantō and s. Kinki Distr.), Shikoku, Kyushu.—Korea (Quelpaert Isl.).

4. TERNSTROEMIA Mutis MOKKOKU ZOKU

Evergreen trees or shrubs; leaves coriaceous, entire or with undulate obtuse teeth; flowers bisexual (sometimes functionally unisexual, in ours), solitary or fasciculate, axillary, deflexed, bibracteolate; sepals 5, imbricate, persistent; petals 5, imbricate, connate at base, deciduous; stamens numerous, adnate to the base of the petals, the anthers glabrous, basifixed; ovary 2- or 3-locular; styles connate or nearly absent, the stigma 2- or 3-lobed or nearly entire; ovules 2, rarely 3-6 in each locule, pendulous; fruit fleshy, indehiscent or ultimately dehiscent; seeds rather large, the endosperm fleshy, sometimes absent, the embryo incurved.—About 100 species, in the Tropics of Asia and America, few in Africa.

1. *Ternstroemia gymnanthera* (Wight & Arn.) Sprague. *Cleyera gymnanthera* Wight & Arn.; *C. japonica* Thunb., pro parte; *Taonabo japonica* (Thunb.) Szysz.—MOKKOKU. Glabrous evergreen tree with rather thick, rusty-gray branches; leaves alternate, often closely approximate near the top of branchlets, narrowly cuneate-obovate, 4-7 cm. long, 1.5-2.5 cm. wide, rounded to very obtuse, cuneate to acuminate at base, entire, slightly recurved on margin, deep green and the midrib impressed on upper side, slightly paler and the midrib raised beneath, the lateral nerves and veinlets obscure, the petioles reddish, 5-10 mm. long; flowers axillary, deflexed,

white, the pedicels simple, 1-2 cm. long, curved downward; sepals 5, orbicular, 3.5-4 mm. long, longer than the ovate acute bracteoles, irregularly denticulate; petals obovate-cuneate, about 8 mm. long; stamens many, the anthers longer than the filaments; fruit globose, about 10-12 mm. across, later dehiscent; seeds red.—July. Near seashores; Honshu (Tōkaidō and westw.), Shikoku, Kyushu.—s. Korea, Ryukyus, Formosa, China, India, and Borneo.—*Forma subserrata* (Makino) Ohwi. *T. japonica* var. *subserrata* Makino—HIME-MOKKOKU. Leaves obtusely serrate on upper margin.

5. CLEYERA Thunb. SAKAKI ZOKU

Evergreen trees or shrubs; leaves alternate, coriaceous, petiolate, entire; flowers bisexual, solitary or fasciculate, usually axillary, relatively small, actinomorphic, pedicellate, the bracteoles minute or absent; sepals 5, imbricate; petals 5, imbricate, free or connate at base; stamens many, inserted on the base of the petals, the anthers bearded, basifixed, erect; ovary 2- or 3-locular; styles often elongate, shortly 2- or 3-fid; ovules centrally attached; fruit indehiscent, more or less fleshy, the endosperm fleshy.—Few species, in e. and s. Asia, also Central and S. America.

1. *Cleyera japonica* Thunb., pro parte, emend. Sieb. & Zucc. *C. ochracea* DC.; *Eurya ochracea* (DC.) Szysz.; *Tristylum ochraceum* (DC.) Merr.; *Sakakia ochracea* (DC.) Nakai—SAKAKI. Evergreen glabrous tree with green branches; leaves alternate, coriaceous, narrowly oblong or ovate-oblong, 7-10 cm. long, 2-4 cm. wide, acute with an obtuse tip, acute at base, entire, deep green and lustrous on upper side, paler and the midrib raised beneath, the lateral nerves rather obscure, the petioles 5-10 mm. long; flowers 1-3,

axillary, white, becoming yellowish with age, the pedicels 1-1.5 cm. long, the bracteoles minute, ovate-orbicular, caducous; sepals ovate-orbicular, about 3 mm. long, ciliate; petals rather thick, narrowly oblong, 8-10 mm. long; anthers ovate, cuspidate, white, much shorter than the filaments; fruit globose, black, indehiscent.—(June)-July. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Korea, Ryukyus, Formosa, and China.

6. EURYA Thunb. HI-SAKAKI ZOKU

Evergreen dioecious shrubs, usually with serrate leaves; flowers small, unisexual, sessile or short-pedicellate, solitary or in axillary fascicles, the bracteoles persistent; sepals 5, imbricate; petals 5, imbricate, connate at base; stamens rather many, rarely 5, adnate to the base of petals, glabrous, the anthers basifixed; styles 3, sometimes 2 or up to 5, nearly free to connate; ovules many in the center of each locule; fruit a berry, the seeds with fleshy endosperm.—About 100 species, chiefly in s. and e. Asia, a few in Central America.

1A. Branchlets glabrous or thinly ascending-pilose; leaves elliptic to oblong-lanceolate, acute with an obtuse tip or very obtuse at apex.

1. *E. japonica*

1B. Branchlets densely pilose; leaves narrowly obovate, rounded, often emarginate at apex. 2. *E. emarginata*

1. *Eurya japonica* Thunb. *E. japonica* var. *uniflora* Bl.; *E. japonica* var. *hortensis* Bl.; *E. japonica* var. *montana* Bl.; *E. japonica* var. *pusilla* Bl.; *E. japonica* var. *multiflora* Miq.—HI-SAKAKI. Evergreen shrub or small tree with glabrous or thinly ascending-pilose branches; leaves coriaceous, elliptic to oblong-lanceolate, 3–8 cm. long, 1–3 cm. wide, acute with an obtuse tip, acute at base, with erect obtuse teeth, glabrous, deep green and lustrous, pale green or yellowish green beneath, the midrib impressed on upper side, raised beneath, the petioles short; flowers 5–6 mm. across, glabrous, greenish yellow, short-pedicellate; berry globose, purplish black, 4–5 mm. across; seeds about 1.5 mm. long.—Mar.–Apr. Thickets and thin woods in low mountains; Honshu, Shikoku, Kyushu; very common and variable.—Ryukyus, Formosa, s. Korea, China, India, and Malaysia.

Var. *australis* Hatus. *E. pubicalyx* Ohwi. KE-HI-SAKAKI. Branchlets, back of sepals, and pedicels pilose.—Honshu (Tōkaidō Distr.), Kyushu (Yakushima).

Var. *yakushimensis* Makino. *E. yakushimensis* (Makino) Makino.—HIME-HI-SAKAKI. Leaves elliptic-lanceolate to broadly lanceolate, 1–3 cm. long, 7–12 mm. wide.—Kyushu (Yakushima).

2. *Eurya emarginata* (Thunb.) Makino. *Ilex emarginata* Thunb.—HAMA-HI-SAKAKI. Densely branched shrub; branchlets densely yellowish brown ascending-pilose; leaves thick-coriaceous, narrowly obovate, 2–3.5 cm. long, 1–1.2 cm. wide, rounded to very obtuse, often emarginate, cuneate at base, glabrous, slightly recurved on margin, obtusely undulate-toothed, deep green and with impressed nerves on upper side, pale green and usually the midrib raised beneath, the petioles very short, sometimes obsolete; flowers axillary, the pedicels 1–3 in a group, 2–3 mm. long; sepals 5, depressed-rounded, 1.5–2 mm. long, glabrous, with a hyaline margin; petals pale yellow-green; berry globose, about 5 mm. across, purple-black, glabrous.—Dec.–Apr. Near seashores; Honshu (Mikawa Prov. westw.), Shikoku, Kyushu.—Amami-oshima.

Fam. 137. GUTTIFERAE

OTOGIRI-SŌ KA Garcinia Family

Trees, shrubs, or herbs, sometimes dioecious, with pellucid or black dots; leaves opposite or verticillate, rarely alternate, simple, the stipules absent; flowers bisexual, polygamous or unisexual, solitary or in cymes, actinomorphic; sepals 4 or 5, imbricate; petals 4 or 5, imbricate or contorted; stamens usually many, rarely few, connate in fascicles; ovary superior, 3- to 5-locular or 1-locular; styles as many as the carpels, free or connate; ovules usually many, on parietal placentas; fruit a capsule or drupe, sometimes berrylike; seeds without endosperm.—More than 45 genera, with about 650 species, chiefly in the Tropics, a few genera in temperate regions.

- 1A. Stamens 9, in fascicles of 3's, the filaments connate from the base to the middle; glands 3, entire, between the fascicles of stamens; styles free; flowers rose-colored. 1. *Triadenum*
 1B. Stamens usually many, in fascicles of 3's or 5's, the filaments connate at base; glands absent; styles free or connate to the top; flowers yellow. 2. *Hypericum*

1. TRIADENUM Raf. MIZU-OTOGIRI ZOKU

Erect glabrous perennials; leaves opposite, sessile or subsessile and clasping, entire, with pellucid dots; racemes short, few-flowered, terminal and axillary, the bracteoles 2, small, subtending the flowers; sepals subequal, with pellucid striations; petals 5, actinomorphic, imbricate or contorted, rose-colored; stamens 9, in fascicles of 3's, the filaments connate from the base to the middle, each fascicle alternate with the glands; glands 3, entire, between the fascicles of stamens; anthers with a pellucid gland at apex; ovary apparently 3-locular, with pellucid striations, the placentas much raised; ovules many, anatropous, horizontal; styles 3, free; capsules dehiscent, 3-valved; seeds small, short-cylindric, with raised reticulations.—Two species, one in e. Asia, the other in N. America.

1. *Triadenum japonicum* (Bl.) Makino. *Elodea japonica* Bl.; *E. crassifolia* Bl.; *Hypericum virginicum* auct. Japon., non L.; *E. virginica* var. *asiatica* Maxim.; *H. crassifolium* (Bl.) Nakai.—MIZU-OTOGIRI. Rather soft, glabrous perennial with slender elongate rhizomes; stems erect, rarely branched, terete, 30–70 cm. long; leaves spreading, narrowly oblong or oblong-lanceolate, 4–8 cm. long, 1–2.5 cm. wide, obtuse or rounded at apex, rounded and sessile at base; in-

florescence short-pedunculate, much shorter than the leaves, 1- to 3-flowered, the pedicels very short; flowers about 1 cm. across, rose-colored; sepals oblong, 3–4 mm. long; petals narrowly obovate, 6–7 mm. long; capsules ovoid, 8–10 mm. long, acute, with pellucid striations.—Aug.–Sept. Wet places; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, Ussuri, and Amur.

2. HYPERICUM L. OTOGIRI-SŌ ZOKU

Herbs or rarely shrubs, leaves opposite, usually sessile, membranous, entire, usually with pellucid and black dots; flowers yellow, solitary or in panicles or cymes; sepals usually 5, as many as the petals; stamens usually many, in fascicles of 3's or 5's, the filaments usually connate at base, sometimes free; ovary 1-locular, with 3–5 parietal placentas, sometimes incompletely 3- to 5-locular; styles free or connate; ovules many, rarely few or 2 in each carpel; capsules septicidally dehiscent; seeds wingless.—About 300 species, in temperate and subtropical regions of the N. Hemisphere, few in the S. Hemisphere.

- 1A. Fascicles of stamens in 5's; flowers 4–6 cm. across. 1. *H. ascyron*
 1B. Fascicles of stamens in 3's; flowers 5–25 mm. across.
 2A. Stems 4-ridged; leaves small, 3–10 mm. long; mostly small annuals with flowers 5–8 mm. across; stamens few, the anthers without a gland at tip; capsules without glands.
 3A. Stems 20–50 cm. long, erect; leaves ovate to broadly so, ascending except the lower ones; upper leaves lanceolate to linear, often bractlike; sepals somewhat truncate at apex. 2. *H. japonicum*

- 3B. Stems 5–20 cm. long, erect or decumbent, slender; leaves elliptic or broadly ovate, spreading; upper leaves ovate, leaflike; sepals obtuse. 3. *H. laxum*
- 2B. Stems terete or with 2 striations; leaves usually large, 1.5–5 cm. long; perennial herbs with flowers 8–25 mm. across; stamens many, the anthers with a black dot at tip. 4. *H. sampsonii*
- 4A. Leaves connate at base, perfoliate; capsules with raised, rounded, pellucid glands, without striations. 4. *H. sampsonii*
- 4B. Leaves not connate at base; capsules densely pellucid-striate. 4. *H. sampsonii*
- 5A. Flowers rather small, about 1 cm. across; petals as long as to slightly longer than the often unequal sepals. 5. *H. pseudopetiolatum*
- 6A. Styles shorter than the ovary, if longer the sepals also longer, 5–6 mm. long. 5. *H. pseudopetiolatum*
- 7A. Sepals 3–5.5 mm. long; petals 4–6 mm. long. 5. *H. pseudopetiolatum*
- 7B. Sepals 5–8 mm. long; petals 7–10 mm. long. 6. *H. oliganthum*
- 6B. Styles longer than to as long as the ovary; sepals 3–4.5 mm. long; petals 4–7 mm. long. 7. *H. kinashianum*
- 5B. Flowers rather large, (12–)15–25 mm. across; petals at least twice as long as the sepals. 7. *H. kinashianum*
- 8A. Leaves linear to linear-oblong or oblanceolate, usually 3–5 mm. wide. 8. *H. hakonense*
- 9A. Stems 10–30 cm. long, sparsely leafy; ovary with linear glands. 8. *H. hakonense*
- 10A. Styles 2–3 mm. long. 8. *H. hakonense*
- 10B. Styles 3.5–5 mm. long. 9. *H. sikokumontanum*
- 9B. Stems 30–80 cm. long, very leafy with fascicles of leaves in the axils; ovary with linear and elliptic glands. 9. *H. sikokumontanum*
10. *H. perforatum* var. *angustifolium*
- 8B. Leaves elliptic, ovate to narrowly oblong, sometimes lanceolate, usually more than 5 mm. wide. 10. *H. perforatum* var. *angustifolium*
- 11A. Stems with 2 longitudinal raised striations. 11. *H. yezoense*
- 12A. Bracts leaflike. 11. *H. yezoense*
- 12B. Bracts linear. 12. *H. tosaense*
- 11B. Stems terete. 12. *H. tosaense*
- 13A. Styles 3.5–4 mm. long; flowers 15–20 mm. across; hills and mountains. 13. *H. erectum*
- 13B. Styles 4.5–6 mm. long; flowers 15–25 mm. across; northern districts and alpine regions. 14. *H. kamtschaticum*

1. **Hypericum ascyron** L. *Roscyra japonica* Bl.—Tomoe-sô. Glabrous perennial; stems erect, branched, 4-angled, 50–80 cm. long; leaves lanceolate, 5–10 cm. long, 1–2 cm. wide, acute, sessile and slightly clasping, or abruptly narrowed and sometimes subsagittate at base, entire, pellucid-dotted, penninerved; flowers few, terminal, yellow to reddish, 4–6 cm. across; sepals ovate, about 1 cm. long, obtuse to acute, many-nerved; petals broadly falcate-ovate, 2.5–3.5 cm. long, without black dots; anthers without black dots; styles including the stigmas 6–8 mm. long, connate on lower half, the stigma punctate; capsules ovoid, 12–18 mm. long; seeds minutely reticulate, slightly more than 1 mm. long, with a raised line on one side.—July–Aug. Grassy places in mountains; Hokkaido, Honshu.—c. Siberia, Korea, China, and N. America.

Var. **longistylum** Maxim. *H. sagittifolium* Koidz.—Kôrai-tomoe-sô. Styles about 1 cm. long, 5-lobed on upper one-third.—Mountains of Kyushu.—Altai, Dahuria, Manchuria, Mongolia, and Korea.

2. **Hypericum japonicum** Thunb. *H. mutilum* sensu auct. Japon., non L.; *Sarothra japonica* (Thunb.) Y. Kimura —HIME-OTOGIRI. Glabrous annual or perennial; stems 20–50 cm. long, branched in upper part, 4-angled; leaves ascending to somewhat spreading, ovate to broadly so, 5–12 (–15) mm. long, 3–8 mm. wide, subobtusely, semiclasping at base, with minute pellucid dots, those of the inflorescence narrow and bractlike; flowers 6–8 mm. across, the pedicels usually longer than the flowers; sepals 3–5 mm. long, broadly lanceolate; petals shorter than the sepals, few-nerved, without dots; styles 0.5–1 mm. long; stigmas capitate; capsules ovoid, shorter than the sepals, without glands; seeds oblong, about 0.3 mm. long, with minute reticulations.—June–Aug. Wet places in lowlands; Honshu (Kinki Distr. and westv.), Shikoku, Kyushu.—Ryukyus, Formosa, s. Korea, China, India, and Australia.

3. **Hypericum laxum** (Bl.) Koidz. *H. yabei* Lévl. & Van't. *H. dominii* Lévl.; *H. thunbergii* Fr. & Sav.; *H. japonicum* forma *yabei* (Lévl. & Van't.) Makino; *Sarothra laxa* (Bl.) Y. Kimura; *Brathys laxa* Bl.—KOKE-OTOGIRI. Delicate annual or perennial; stems 5–20 (–35) cm. long, much branched in upper part, 4-angled; leaves elliptic or ovate, 5–10 mm. long,

3–8 mm. wide, rounded at apex, rounded to shallowly cordate at base, sessile, semiclasping, spreading, the uppermost ones narrowly ovate, leaflike; flowers in cymes, 5–7 mm. across; sepals oblong, 3–4 mm. long, obtuse; petals 2.5–3 mm. long, 3-nerved, without dots; stamens 8–10; styles about 0.5 mm. long; capsules ovoid, 3 mm. long; seeds about 0.3 mm. long.—June–Sept. Wet places in lowlands; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.—Korea and Ryukyus.

4. **Hypericum sampsonii** Hance. *H. electrocarpum* Maxim.—TSUKI-NUKI-OTOGIRI. Glabrous, erect perennial; stems terete, often branched in upper part, 50–80 cm. long; leaves membranous, narrowly ovate-oblong, 5–8 cm. long, 15–35 mm. wide, broadest at the base, obtuse, the leaf pairs connate at base, spreading, with pellucid and black dots; flowers few, terminal, 7–8 mm. across, yellow, the bracts linear, 1–2.5 mm. long; sepals oblong, 3–6 mm. long, obtuse; petals slightly longer than the sepals, broadly obovate, 5–6.5 mm. long; stamens many, slightly shorter than the petals, with a black dot at apex of the anther; styles about 1.5 mm. long, the stigmas capitate; capsules ovoid, about 6 mm. long, with raised pellucid linear glands; seeds about 1 mm. long, with few longitudinal striations and minute cross-lines.—July. Honshu, Shikoku, Kyushu; rare.—From Formosa and China to India.

5. **Hypericum pseudopetiolatum** Keller. *H. kiusianum* Koidz.; *H. muraiianum* Makino; *H. kosiense* Koidz.; *H. pentholodes* Koidz.—SAWA-OTOGIRI. Loosely tufted perennial; stems 10–40 cm. long, terete, slender, often branched, usually ascending from base; leaves thin, rather soft, narrowly oblong to oblanceolate, 2–4 cm. long, 6–12 mm. wide, obtuse, narrowed to a petiolelike base, with pellucid and/or black dots, the upper leaves smaller; flowers about 10 mm. across; sepals narrowly oblong, 3.5–5.5 mm. long, obtuse, slightly unequal, often with raised black dots; petals 4–6 mm. long; styles 1–2 mm. long; capsules ovoid-ellipsoid or ovoid, 5–6 mm. long; seeds about 0.8 mm. long, minutely reticulate.—July–Aug. Wet places in mountains; Hokkaido (sw. part), Honshu, Shikoku, Kyushu; rather common.

6. *Hypericum oliganthum* Fr. & Sav. *H. erectum* var. *obtusifolium* Bl.; *H. obtusifolium* (Bl.) Makino; *H. makinoi* Lévl.; *H. conjunctum* Y. Kimura—AZE-OTOGIRI. Glabrous perennial; stems terete, slender, somewhat tufted, often branched, ascending to creeping at base; leaves thin, narrowly oblong to ovate-oblong, 1.5–3.5 cm. long, 8–15 mm. wide, obtuse at both ends, with pellucid and/or black dots, sometimes black-dotted only on margin; inflorescence loosely few-flowered, the bracts small, leaflike; flowers 10–12 mm. across; sepals narrowly oblong, 5–8 mm. long, obtuse; petals 7–10 mm. long; styles 1–2 mm. long; capsules ovoid, 6–7 mm. long; seeds about 0.8 mm. long, minutely reticulate.—Wet places in lowlands; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; rather common.—s. Korea.

7. *Hypericum kinashianum* Koidz. *H. umbrosum* Y. Kimura; *H. conjunctum* var. *longistylum* Y. Kimura—MIYAKO-OTOGIRI. Glabrous perennial; stems erect, terete, often branched above, 20–60 cm. high; leaves rather thin, broadly linear, lanceolate, or linear-oblong, 2–5 cm. long, 3–8 mm. wide, obtuse or subobtusate at both ends, black-dotted, the bracts linear, 2–4 mm. long; flowers 8–12 mm. across; sepals linear-oblong, 3–4.5 mm. long, obtuse; black-dotted and striated; petals 4–7 mm. long, longer than the sepals; styles 2–3 mm. long; capsules ovoid, 5–6 mm. long; seeds minutely reticulate, about 0.8 mm. long.—Aug. Mountains; Honshu, Shikoku, Kyushu.

8. *Hypericum hakonense* Fr. & Sav. KO-OTOGIRI. Slender glabrous perennial; stems tufted, 15–30 cm. long, terete, ascending from base, often branched; leaves thin, linear-oblong or narrowly oblanceolate, 15–25 mm. long, 2–5 mm. wide, obtuse, narrowed to a petiolelike base, usually only with pellucid dots; inflorescence loosely about 10-flowered; flowers about 15 mm. across, the bracts linear to broadly so; sepals lanceolate or linear-oblong, about 3.5 mm. long, rather unequal, acute to obtuse; petals 7–8 mm. long; styles 2–3 mm. long; capsules ovoid-conical, 5–6 mm. long; seeds about 0.8 mm. long, minutely reticulate.—Aug.–Sept. Mountains; Honshu (centr. and Kantō Distr.).

9. *Hypericum sikokumontanum* Makino. TAKANE-OTOGIRI. Loosely tufted, glabrous perennial, rather wide-spreading at the decumbent base; stems 10–25 cm. long, terete, sometimes branched; leaves linear-oblong, about 15 mm. long, 2–4 mm. wide, obtuse or subobtusate, obtuse to acute and semiclasping at base, sometimes with pellucid dots and with scattered black dots on the often slightly recurved margin; flowers few, 18–20 mm. across; sepals lanceolate, 5–7 mm. long, obtuse; petals 10–12 mm. long; styles slender, 3.5–5 mm. long; capsules about 6 mm. long; seeds about 0.8 mm. long, minutely reticulate.—July–Aug. High mountains; Shikoku.

Var. *hyugamontanum* (Y. Kimura) Ohwi. *H. hyugamontanum* Y. Kimura—KUMOI-OTOGIRI. Flowers slightly smaller; petals 8–10 mm. long; sepals 3–5 mm. long, often with protruding black dots on margin.—High mountains; Kyushu.

10. *Hypericum perforatum* L. var. *angustifolium* DC. *H. foliosissimum* Koidz.—KOGOME-OTOGIRI. Glabrous erect perennial; stems 30–80 cm. long, obsoletely striate, much-branched, often with short, leafy shoots in the leaf axils; leaves linear to linear-oblong, 1–2.5 cm. long, 1.5–3 mm. wide, obtuse at both ends, pellucid-dotted, often recurved on margin; flowers few, 15–18 mm. across; sepals lanceolate, 3.5–4.5 mm. long, acute; petals 10–12 mm. long; ovary with linear and elliptic glands; styles 4–5 mm. long, the stigma punctate.

—June–July. Naturalized; Honshu (near Tokyo and in Shima Prov.).—Europe.

11. *Hypericum yezoense* Maxim. *H. procumbens* Keller; *H. mororanense* Keller; *H. oliganthemum* Keller; *H. porphyrandrum* Lévl. & Van't.—EZO-OTOGIRI. Glabrous perennial; stems somewhat tufted, usually 10–30 cm. long, erect, simple or branched, with 2 raised lines; leaves oblong to ovate-oblong, 8–25 mm. long, 3–8 mm. wide, obtuse, semiclasping at base, densely pellucid-dotted, the margin slightly recurved and black-dotted; flowers few, 15–20 mm. across, the bracts leaflike, ovate or oblong-ovate; sepals lanceolate, 4–6 mm. long, acute; petals 8–11 mm. long; styles 4–6 mm. long; capsules broadly ovoid, 5–8 mm. long; seeds about 1 mm. long.—July–Aug. Hokkaido, Honshu (northern distr.); rather rare.—s. Kuriles and Sakhalin.

Var. *moseanum* Makino. SEI-TAKA-OTOGIRI-SŌ. Stems 25–65 cm. long, solitary or few together; sepals abruptly acuminate.—Honshu (centr. distr.).

12. *Hypericum tosaense* Makino. TOSA-OTOGIRI. Glabrous perennial; stems erect, 25–50 cm. long, with 2 raised lines; leaves narrowly oblong, obovate or ovate-oblong, 5–20 mm. long, 2–8 mm. wide, obtuse at both ends, densely pellucid-dotted, the margins slightly recurved and black-dotted; flowers few, 15–18 mm. across, the bracts small, linear or linear-lanceolate; sepals ovate, 2.5–3 mm. long, acute; petals about 1 cm. long; styles 3.5–4.5 mm. long, the stigma punctate; capsules ovoid-conical, about 7 mm. long; seeds about 1 mm. long, minutely reticulate.—Aug.–Sept. Shikoku.

13. *Hypericum erectum* Thunb. *H. erectum* var. *wichurae* Keller and var. *debile* Keller; *H. otaruense* Keller; *H. dielsii* Lévl. & Van't.; *H. erectum* subsp. *vaniotii* Lévl.; *H. matsumurae* Lévl.; *H. amabile* Koidz.; *H. takeuchianum* Koidz.—OTOGIRI-SŌ. Glabrous perennial; stems solitary or few together, 20–60 cm. long, simple or slightly branched, terete; leaves broadly lanceolate to narrowly ovate, sometimes ovate-elliptic, 2–6 cm. long, 7–30 mm. wide, obtuse or subacute, rounded and semiclasping at base, black-dotted; inflorescence subpanicleately few- to rather many-flowered, the bracts leaflike, small; flowers 15–20 mm. across; sepals narrowly oblong, acute to subobtusate; petals 8–10 mm. long; style 3.5–4 mm. long; capsules 5–11 mm. long; seeds minutely reticulate, about 1 mm. long.—July–Aug. Grassy places and thin woods in hills and mountains; Hokkaido, Honshu, Shikoku, Kyushu; variable and very common.

14. *Hypericum kamtschaticum* Ledeb. *H. mutiloides* Keller; *H. paradoxum* Keller; *H. paramushirense* Kudo—IWA-OTOGIRI. Glabrous perennial; stems tufted, 10–30 cm. long, erect or ascending from base, usually simple, terete; leaves elliptic, oblong, or ovate-oblong, 2–5 cm. long, 1–3 cm. wide, obtuse to rounded at both ends, semiclasping at base, with black or rarely with pellucid dots, sometimes without dots, margins usually black-dotted, the bracts leaflike, ovate; flowers 15–25 mm. across; sepals oblong or lanceolate, obtuse or subacute, 6–8 mm. long; petals 8–15 mm. long; styles 4.5–6 mm. long; capsules 6–12 mm. long; seeds minutely reticulate, about 1 mm. long.—July–Aug. Alpine regions; Hokkaido, Honshu (n. and centr. distr.).—Kamchatka and Kuriles.

Var. *senanense* (Maxim.) Y. Kimura. *H. senanense* Maxim.—SHINANO-OTOGIRI. Leaves black-dotted only on margin, with pellucid dots on the surface; flowers 15–18 mm. rarely to 20 mm. across.—July–Aug. Alpine regions; Honshu (centr. and n. distr.).

Fam. 138. **ELATINACEAE** MIZO-HAKOBE KA Waterwort Family

Herbs or subshrubs; leaves simple, opposite or verticillate, stipulate; flowers small, bisexual, actinomorphic, axillary, solitary or in cymes; sepals 3-5, free, imbricate; petals 3-5, persistent, imbricate; stamens as many or twice as many as the petals, free; ovary superior, 3- to 5-locular, the placenta axile; styles 3-5, free; ovules many; capsules septicidally dehiscent; seeds without endosperm.—Two genera, with about forty species, in tropical and temperate regions.

1. **ELATINE** L. MIZO-HAKOBE ZOKU

Delicate herbs growing in muddy places or aquatic, glabrous; leaves opposite or verticillate, small; flowers minute, usually axillary, solitary, 3- or 4-, sometimes 5- or 2-merous; sepals membranous, without ribs, obtuse, connate at base; petals obtuse; ovary globose; capsules globose, membranous, the septa winglike; seeds narrow, often curved, minutely reticulate.—About 20 species, in temperate and tropical regions.

1. *Elatine triandra* Schk. *E. orientalis* Makino; *E. triandra* var. *orientalis* (Makino) Makino—MIZO-HAKOBE. Small soft annual; stems terete, decumbent, branched, 3-10 cm. long; leaves broadly lanceolate to narrowly ovate, 3-10 mm. long, 2-3 mm. wide, obtuse, narrowed to a short petiole-like base, lateral nerves delicate, in 2 or 3 pairs; flowers solitary, nearly sessile, about 1 mm. across, rose-colored; sepals 3, ovate, very obtuse, connate at base, 1 of them often smaller

than the others; petals 3, elliptic, very obtuse, slightly longer than the sepals; stamens 3; styles 3, free, short, erect; capsules membranous, depressed-globose, about 2 mm. across; seeds many, oblong-cylindric, about 0.5 mm. long, slightly curved, rounded at both ends, with minute hexagonal reticulations. —June-Aug. Wet places and paddy fields in lowlands; Honshu, Shikoku, Kyushu.—The N. Hemisphere and S. America.

Fam. 139. **VIOLACEAE** SUMIRE KA Violet Family

Herbs, rarely shrubs; leaves alternate, rarely opposite, simple, the stipules small or leaflike; flowers solitary or in panicles, zygomorphic or actinomorphic, bisexual, rarely polygamous, sometimes cleistogamous; sepals 5, persistent, imbricate, often produced at base as an appendage; petals 5, imbricate or contorted, usually unequal, the lower ones often largest and spurred; stamens 5, the anthers erect, introrse, the lower 2 often spurred; ovary superior, sessile, 1-locular, with 3 (or 2, 4, or 5) parietal placentae; style connate or rarely divided; ovules usually many, anatropous; fruit an abruptly dehiscent capsule or berry; seeds often appendaged, the endosperm fleshy.—About 16 genera, with about 800 species, in temperate and tropical regions.

1. **VIOLA** L. SUMIRE ZOKU

Herbs or rarely shrubs; stipules persistent, often leaflike; leaves basal or alternate; peduncles axillary, usually solitary; flowers zygomorphic, some of them often cleistogamous; sepals nearly equal; petals spreading, the lower one spurred at base; styles solitary, simple, variously dilated or curved; stigma terminal or placed in front; capsules abruptly dehiscent, 3-valvate; seeds ovoid or ovoid-globose, the testa crustaceous, usually lustrous.—More than 400 species, chiefly in temperate regions, mostly in the N. Hemisphere, few in the S. Hemisphere.

1A. Flowers violet, purple or white, never yellow.

2A. Plants stemless.

3A. Leaves compound or deeply incised. 1. *V. dissecta*

3B. Leaves simple, serrate.

4A. Capsules and ovaries pilose; leaves rounded-cordate to reniform.

5A. Sepals obtuse; spur saccate and short; rhizomes thick, densely noded; leaves green on upper surface, the petioles and peduncles with spreading white hairs. 2. *V. collina*

6A. Stolons absent or very short; leaves ovate-cordate, subacute with an obtuse tip. 3. *V. hondoensis*

6B. Stolons well developed; leaves cordate-obicular, usually rounded at the tip. 21. *V. variegata* var. *nipponica*

5B. Sepals subacute; spur long; rhizomes slender and short; leaves white-variegated on upper surface, the petioles and peduncles short-pubescent. 40. *V. mirabilis* var. *subglabra*

4B. Capsules and ovaries glabrous, or if puberulous, the leaves much longer than wide.

7A. Rhizomes thick, densely noded; stolons absent.

8A. Rhizomes thick and short, erect; bracts 8-13 mm. long; flowers white; capsules ellipsoidal. 4. *V. keiskei*

8B. Rhizomes thick and rather long-creeping; bracts 3-8 mm. long.

9A. Leaves depressed-cordate or orbicular-cordate, short-obtuse; spur 5-7 mm. long; capsules produced exclusively from the cleistogamous flowers. 40. *V. mirabilis* var. *subglabra*

9B. Leaves narrowly deltoid-ovate or deltoid-cordate, acute to acuminate; flowers before the leaves, the spur saccate, 2.5-5 mm. long.

10A. Petioles usually persistent on rhizomes over winter; flowers rather small, 8-13 mm. long. 5. *V. yamazawa*

10B. Petioles usually not persistent on rhizomes over winter; flowers larger, 15-20 mm. long.

11A. Stipules pale green, 5-10 mm. long; adult leaves cordate; flowers pale rose-purple. 6. *V. rossi*

11B. Stipules dark brown, 10-18 mm. long; flowers pale purple.

12A. Adult leaves cordate-rounded. 7. *V. vaginata*

12B. Adult leaves broadly deltoid-lanceolate to ovate. 8. *V. bissetii*

7B. Rhizomes slender or almost absent, sometimes rather thick and short; stolons often present.

- 13A. Leaves truncate to shallowly cordate at base; petioles rather broad, often winged.
- 14A. Petioles distinctly winged on upper portion.
- 15A. Spur 3–4 mm. long, terete; plants of wet places, with white roots; petioles usually longer than the blades; flowers white with purple striations. 9. *V. patrinii*
- 15B. Spur 5–7 mm. long; plants of grassy fields, with orange-brown roots; petioles as long as to shorter than the blades; flowers dark-purple, or rarely white with purple striations. 10. *V. mandshurica*
- 14B. Petioles very narrowly winged or wingless.
- 16A. Flowers rose-purple.
- 17A. Flowers deep rose-purple; petals 10–13 mm. long; leaves rather thick, 1–3 cm. long, 0.8–2.5 cm. wide. 13. *V. phalacrocarpa*
- 17B. Flowers pale rose-purple; petals 15–20 mm. long; leaves thin, 3–6 cm. long, 2–4 cm. wide. 16. *V. hirtipes*
- 16B. Flowers purple.
- 18A. Leaves rather thin, ovate to broadly so; roots slender; flowers pale purple to violet. 14. *V. japonica*
- 18B. Leaves rather thick, lanceolate, deltoid-lanceolate to -ovate; roots rather thick.
- 19A. Flowers purple; petals 10–14 mm. long, the lateral ones glabrous; leaves 3–6(–8) cm. long. 11. *V. yedoensis*
- 19B. Flowers deep purple, small; petals 8–10 mm. long, the lateral ones bearded inside; leaves 1.5–4 cm. long. 12. *V. minor*
- 13B. Leaves deeply cordate at base; petioles slender and wingless.
- 20A. Spur saccate, very short; flowers white with purple striations on the lip; petals often of different lengths.
- 21A. Rhizomes slender, long-creeping, distinctly noded.
- 22A. Leaves orbicular-reniform, rounded and sometimes with an abrupt short tip; rhizomes with persistent petiole bases of preceding year. 17. *V. blandaeformis*
- 22B. Leaves broadly ovate-orbicular to ovate, short-acuminate; rhizomes without persistent petiole bases of preceding year. 22. *V. shikokiana*
- 21B. Rhizomes short.
- 23A. Leaves ovate-elliptic to ovate; sepals recurved toward tip; plant often white-pubescent. . . . 20. *V. maximowicziana*
- 23B. Leaves ovate, deltoid, or broadly deltoid-lanceolate; sepals erect; plant glabrous or puberulous.
- 24A. Leaves ovate to ovate-cordate, depressed-toothed. 18. *V. pumilio*
- 24B. Leaves deltoid-cordate to narrowly ovate, usually broadly deltoid-ovate, the teeth slightly dilated at tip. 19. *V. boissieuana*
- 20B. Spur elongate, cylindric; flowers purple to white; petals nearly all equal in length.
- 25A. Leaves at flowering time ovate or reniform-cordate, nearly as long as wide.
- 26A. Leaves broadly ovate-elliptic to cordate-orbicular, obtuse to rounded. 21. *V. variegata* var. *nipponica*
- 26B. Leaves broadly ovate to rounded-cordate, acute.
- 27A. Flowers pale purple; leaves rather thick, broadly ovate, purplish beneath, the teeth short, undulate, with a notch at each end. 24. *V. tokubuchiana*
- 27B. Flowers pale violet to whitish; leaves thin, ovate to ovate-cordate, sometimes purplish beneath, the outer margin of teeth flat on lower half, semirounded on upper half.
- 28A. Leaves ovate; flowers white with purple striations. 15. *V. yezoensis*
- 28B. Leaves ovate-cordate; flowers pale violet. 23. *V. selkirkii*
- 25B. Leaves at flowering time broadly lanceolate to ovate, usually distinctly longer than wide.
- 29A. Leaves deltoid-ovate to narrowly so, usually sparingly pilose, especially those of summer, the teeth undulate, semirounded on upper half; flowers rose-purple. 25. *V. takédana*
- 29B. Leaves narrowly deltoid-ovate to broadly lanceolate, glabrous or sparsely short-hairy on upper surface, the teeth flat, indistinctly notched at both ends.
- 30A. Flowers deep rose-purple; leaves narrowly deltoid-ovate. 26. *V. violacea*
- 30B. Flowers rose-purple; leaves broadly deltoid-lanceolate. 27. *V. makinoi*
- 2B. Plants with distinct aerial stems or leafy stolons.
- 31A. Radical leaves absent at anthesis; stems erect.
- 32A. Leaves much longer than wide; stipules toothed.
- 33A. Leaves deltoid-lanceolate, broadest at the truncate base. 28. *V. raddeana*
- 33B. Leaves broadly lanceolate, broadest below the middle, cuneate at base. 29. *V. shibaudieri*
- 32B. Leaves ovate to ovate-cordate; stipules pinnately incised. 30. *V. acuminata*
- 31B. Radical leaves present at anthesis; stems usually ascending or decumbent at base.
- 34A. Leaves ovate, broadly cuneate to subtruncate at base, broadly decurrent on the petiole; stoloniferous; coarsely pilose or glabrescent. 31. *V. diffusa* var. *glabella*
- 34B. Leaves cordate, reniform-cordate, or ovate-cordate.
- 35A. Capsules subglobose, pilose. 3. *V. honoensis*
- 35B. Capsules ellipsoidal or oblong, glabrous.
- 36A. Stipules pinnately lobed to distinctly incised; leaves brown-spotted when dry.
- 37A. Flowers usually cauline only; spur rather thick and slightly flattened.
- 38A. Stipules divided for less than half their length; flowers pale violet, the lateral petals bearded inside. 33. *V. sacchalensis*
- 38B. Stipules divided for more than half their length; petals glabrous.
- 39A. Plants to 40 cm. high, in woods or in wet places; rhizomes herbaceous, creeping; flowers pale violet. 34. *V. kusanoana*
- 39B. Plants 5–10 cm. high, in dunes along seacoast; rhizomes woody, erect to ascending; flowers deep violet. 35. *V. senamiensis*
- 37B. Flowers radical and cauline; spur rather slender and long.

- 40A. Spur 10–15 mm. long, as long as or longer than the lip. 32. *V. rostrata* var. *japonica*
 40B. Spur 4–5 mm. long, straight, much shorter than the lip.
 41A. Flowers pale violet, not fragrant; peduncles usually glabrous.
 42A. Rhizomes woody, elongate; leaves orbicular-cordate to deltoid-cordate, thick, lustrous above, with raised veinlets above when dry. 36. *V. fauriana*
 42B. Rhizomes soft and very short, whitish; leaves herbaceous.
 43A. Leaves cordate to reniform. 37. *V. grypoceras*
 43B. Leaves cordate to reniform in the radical, ovate to narrowly deltoid-ovate in the upper cauline.
 39. *V. ovato-oblonga*
 41B. Flowers purple, with a white center, fragrant; peduncles usually puberulous. 38. *V. obtusa*
 36B. Stipules entire or with few indistinct teeth; leaves green when dry.
 44A. Leaves 4–7 cm. long; stems suberect; rhizomes creeping, thick, densely noded; flowers violet, 15–20 mm. across.
 45A. Chasmogamic flowers always radical and usually sterile; fertile cleistogamous flowers cauline.
 40. *V. mirabilis* var. *subglabra*
 45B. Chasmogamic and cleistogamic flowers cauline. 41. *V. langsdorffii*
 44B. Leaves smaller, 2–3.5 cm. wide; stems decumbent or creeping; rhizomes very short or absent; flowers white with purple striations on the lip, 6–8 mm. across. 42. *V. verecunda*
- 1B. Flowers yellow.
 46A. Petals glabrous; leaves reniform or reniform-cordate, leaf-blades 1–2 cm. long.
 47A. Leaves thin, soft, usually sparingly pilose at least in part; wet or moist places in high mountains. 43. *V. biflora*
 47B. Leaves thick, firm, usually quite glabrous; gravelly places in alpine regions. 44. *V. crassa*
 46B. Lateral petals bearded inside; leaves ovate-cordate to depressed-cordate, leaf-blades 2.5–8 cm. long.
 48A. Leaves reniform, 2–3 cm. long, rounded to broadly retuse, incised-toothed; styles glabrous. 45. *V. allariaefolia*
 48B. Leaves cordate or ovate, 3–8 cm. long, with a more or less extended apex; styles bearded on each side at apex.
 49A. Rhizomes creeping, often elongate; appendage of sepals semirounded.
 50A. Stems terete, glabrous; stem-leaves cordate to narrowly ovate, acuminate. 46. *V. brevistipulata*
 50B. Stems 4-angular, densely puberulous; stem-leaves thicker in texture, cordate with an obtuse or acute apex. 47. *V. yubariana*
 49B. Rhizomes short, usually erect; appendage of sepals ovate. 48. *V. orientalis*

1. *Viola dissecta* Ledeb. var. *sieboldiana* (Maxim.) Nakai. *V. pinnata* L. var. *sieboldiana* Maxim.; *V. sieboldiana* (Maxim.) Makino; *V. chaerophylloides* var. *sieboldiana* (Maxim.) Makino; *V. albidia* var. *chaerophylloides* forma *sieboldiana* (Maxim.) F. Maekawa; *V. chaerophylloides* sensu Ohwi, pro parte, non W. Becker.—HIGO-SUMIRE. Rhizomes short; leaf-blades green, 1.5–2.5 cm. long and as wide (vernal), to 3 cm. long, 3–4 cm. wide (summer), palmately 5-nate, the lobes linear with few incisions, pinnately parted or divided, glabrous or short-pilose on upper surface and on margin, rarely also on nerves beneath, the petioles 4–12 cm. long, 2 or 3 times as long as the blades, the stipules broadly linear, adnate to the petiole; peduncles 5–12 cm. long; flowers slightly fragrant, white with purple striations; sepals lanceolate, 5–8 mm. long, subobtusate, the appendage ovate, or 4-angled and bifid, acutely few-toothed; petals 10–12 mm. long, the lateral ones slightly bearded inside at base, the spur short-cylindric, 4–5 mm. long; capsules ellipsoidal, glabrous, 6–10 mm. long.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu; rather common.

Var. *chaerophylloides* (Regel) Makino forma *eizanensis* (Makino) E. Itô. *V. dissecta* var. *eizanensis* Makino; *V. chaerophylloides* var. *eizanensis* (Makino) Ohwi.—EIZAN-SUMIRE. Vernal leaves pedately dissected, the summer leaves ternate, the segments broadly lanceolate, to 10 cm. long, 4 cm. wide, incised, flowers purplish.—Honshu, Shikoku, Kyushu.—Forma *simplicifolia* (Makino) Ohwi. *V. chaerophylloides* forma *simplicifolia* Makino; *V. eizanensis* var. *simplicifolia* (Makino) Makino; *V. eizanensis* forma *simplicifolia* (Makino) F. Maekawa.—HITOTSUBE-EZO-SUMIRE. Leaves simple. Sometimes confused with the dissected-leaved phase.—Forma *chaerophylloides*. *V. pinnata* L. var. *chaerophylloides* Regel; *V. chaerophylloides* (Regel) W. Becker; *V. sieboldiana* var. *chaerophylloides* (Regel) Nakai; *V. albidia* Palib. var. *chaerophylloides* (Regel) F. Maekawa.—NANZAN-SUMIRE. Rather small; leaves finely dissected.—Honshu, Shikoku,

Kyushu.—Korea, Manchuria. The typical phase occurs in e. Siberia.

2. *Viola collina* Bess. *V. hirta* var. *collina* (Bess.) Regel; *V. teshioensis* Miyabe & Tatew.—MARUBA-KE-SUMIRE. Densely spreading-pilose on leaves, petioles and peduncles; rhizomes thick, creeping, densely noded; stolons nearly absent; leaf-blades ovate-cordate or subcordate, 2–3.5 cm. long, 2–3 cm. wide (vernal), to 6 cm. long and as wide in summer, subacute with an obtuse tip, short-toothed, the petioles at anthesis 3–10 cm. long, at fruiting time to 20 cm. long, sometimes slightly wing-margined; peduncles 4–6 cm. long, much shorter than the petioles in fruit, loosely pilose; flowers pale purple; sepals narrowly oblong or narrowly ovate, 5–6 mm. long, obtuse, ciliolate, appendages semirounded, short; petals 10–12 mm. long, the lateral ones sparingly bearded, the spur 3–4 mm. long, ellipsoidal; capsules subglobose, 6–8 mm. long, densely pubescent.—Apr.–May. Dry woods in mountains; Hokkaido, Honshu (n. & c. distr.).—Korea, Sakhalin, Manchuria, Siberia, e. Europe, and Caucasus.

3. *Viola hondoensis* W. Becker & H. Boiss. *V. nipponica* Maxim., nom. prov.; *V. hirta* var. *nipponica* (Maxim.) Fr. & Sav.—AOI-SUMIRE. Conspicuously spreading white-pubescent; rhizomes thick, short; stolons slender, bearing flowers; leaf-blades cordate-orbicular, 1–3 cm. long, 1.5–4 cm. wide, to 6 cm. long, 8 cm. wide in fruit, rounded or nearly so at the tip, deeply cordate, undulately toothed, the petioles at anthesis 2–8 cm. long, at fruiting time to 25 cm. long; peduncles 4–7 cm. long, from the leaf rosettes and stolons, usually pilose; flowers pale violet or nearly white; sepals narrowly oblong, 5–7 mm. long, obtuse, ciliolate, the appendage deltoid or trapezoid, acute to obtuse; petals 10–13 mm. long, the lateral ones slightly bearded inside, the lip purple-striate, the spur oblong, short, 3–4.5 mm. long; capsules chiefly from the cleistogamous flowers, globose, densely white-pubescent, 5–6 mm. long.—Mar.–Apr. Moist woods; Hokkaido, Honshu, Shikoku, Kyushu.

4. *Viola keiskei* Miq. *V. keiskei* var. *typica* Makino; *V. okuboi* var. *glabra* Makino; *V. keiskei* var. *glabra* (Makino) W. Becker.—MARUBA-SUMIRE. Glabrous or glabrescent; rhizomes short, rather thick, erect, densely noded; leaf-blades cordate, sometimes ovate-cordate, 2–3 cm. long, 2–4 cm. wide at anthesis, usually rounded or very obtuse, undulately toothed, 5–6 cm. long and as wide at fruiting time, the petioles 2–10 cm. long at anthesis, to 20 cm. long at fruiting time; peduncles glabrous, 5–10 cm. long; flowers white; sepals narrowly oblong, 6–8 mm. long, obtuse to subobtusely, the appendage 4-angled, with few teeth; petals 10–14 mm. long, the lateral ones glabrous or only slightly bearded, the lip purple-striate, the spur 6–7 mm. long; capsules ovoid-ellipsoid, 7–8 mm. long, the valves glabrous, with an obtuse keel.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu; rather common.—Korea.—Forma *okuboi* (Makino) F. Mackawa. *V. keiskei* var. *okuboi* Makino; *V. okuboi* (Makino) Makino; *V. keiskei* var. *typica* W. Becker.—KE-MARUBA-SUMIRE. Plant pilose. Occurs with the typical phase and equally as common.

5. *Viola yazawana* Makino. HIME-SUMIRE-SAISHIN. Sparingly short-pilose on leaves and sometimes on upper part of petioles; rhizomes rather thick, long-creeping, firm, densely noded, with a few persistent petiole bases of previous year; leaves few, appearing after anthesis, blades broadly ovate-cordate, 3–4 cm. long and as wide, acuminate, sometimes with an obtuse tip, deeply cordate at base, with scattered undulate teeth, the petioles slender, 8–12 cm. long, the stipules adnate at base to the petiole, the free portion lanceolate, 3–4 mm. long; peduncles 7–8 cm. long; flowers white; sepals narrowly ovate to broadly lanceolate, 5–8 mm. long, acute, the appendage semirounded, entire; petals 8–13 mm. long, sometimes to 15 mm. long, glabrous, the lip purple-striate, the spur saccate, 2.5–3 mm. long and as wide; capsules 7–8 mm. long, glabrous, purple-spotted.—June. Mountains; Honshu (w. Kantō and e. centr. distr.); rare.

6. *Viola rossii* Hemsl. *V. matsumurae* Makino.—AKE-BONO-SUMIRE. Sparingly pilose on leaves especially on nerves beneath, rarely glabrescent; rhizomes rather thick, creeping, densely noded; leaves appearing after anthesis, rather thick, blades 4–7 cm. long, 4–8 cm. wide, abruptly acuminate with an obtuse tip, cordate, undulately toothed, the petioles 10–25 cm. long; stipules free, thinly membranous, lanceolate, 7–10 mm. long, pale green; peduncles 10–15 cm. long; flowers pale rose-purple; sepals oblong, 7–8 mm. long, obtuse, the appendage obtusely 4-angled, usually entire; petals 15–20 mm. long, rounded to retuse at apex, the lateral ones glabrous or only slightly bearded, the spur thick and short, saccate, 3–4 mm. long; capsules glabrous, indistinctly brown-spotted, 1–1.5 cm. long.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu.—Korea, China, and Manchuria.

7. *Viola vaginata* Maxim. *V. franchetii* H. Boiss.—SUMIRE-SAISHIN. Sparingly white-pilose on leaves beneath and rarely on upper part of petioles; rhizomes creeping, thick, densely noded; leaves appearing after anthesis, rather thick, blades 5–14 cm. long and as wide, abruptly acuminate, cordate, undulately toothed, glabrous on upper side, the petioles usually shorter than the peduncles at anthesis, 15–25 cm. long at fruiting time; stipules brown, scarious, free, 12–18 mm. long, lanceolate; peduncles few, 10–15 cm. long; flowers relatively large, pale purple; sepals broadly lanceolate, obtuse, 6–8 mm. long, the appendage ovate or 4-angled, toothed; petals 15–20 mm. long, rounded to emarginate, glabrous, the lip purple-

striate, the spur globose, saccate, 4–5 mm. long; capsules 12–15 mm. long, usually from cleistogamous flowers.—Apr.–June. Mountains; Hokkaido, Honshu (Japan Sea side, as far west as Kinki Distr.). A phase with white flowers is known.

8. *Viola bissetii* Maxim. *V. vaginata* var. *angustifolia* Yatabe.—NAGABA-NO-SUMIRE-SAISHIN. Glabrous or slightly pilose on underside of leaves especially near base; rhizomes rather thick, creeping, densely noded; leaves appearing after anthesis, few, rather thick, blades narrowly deltoid-ovate to broadly deltoid-lanceolate, 5–10 cm. long, 3–5 cm. long, to 8 cm. wide, gradually acuminate to acute, deeply cordate, the petioles at first shorter than the peduncles, to 7–15 cm. long at fruiting time; stipules brownish, free, deltoid-lanceolate, (5–)8–12 mm. long; peduncles 5–12 cm. long; flowers relatively large, pale purple; sepals broadly lanceolate, 6–8 mm. long, obtuse, the appendage 4-angled ovate, toothed; petals 15–18 mm. long, glabrous, the lip purple-striate toward base, the spur globose, saccate, 4–5 mm. long.—Apr. Mountains; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Forma *albiflora* Nakai has white flowers.

9. *Viola patrinii* DC. *V. primulifolia* L. pro parte.—SHIROBANA-SUMIRE. Glabrous or sometimes spreading-pilose on nerves of leaves and lower part of petioles; rhizomes short, with white, divided roots; leaves suberect, blades deltoid-lanceolate or broadly oblong-lanceolate, 2.5–7 cm. long, 1–2 cm. wide, obtuse to subacute, truncate at base, sparsely or obsoletely toothed, the petioles conspicuously winged in upper part, especially in those developed after anthesis, 4–10 cm. long, longer than the blades; peduncles 7–15 cm. long; flowers white, with purplish striations; sepals lanceolate, 4–7 mm. long, acute, the appendage semirounded, sometimes with few obtuse teeth; petals 10–13 mm. long, the lateral ones slightly bearded inside, the lip purple-striate, the spur terete, 3–4 mm. long, ellipsoidal; capsules about 8 mm. long.—Apr.–May. Wet places in lowlands; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, Kuriles, Sakhalin, and Siberia.

10. *Viola mandshurica* W. Becker. *V. patrinii* var. *chinensis* sensu auct. Japon., non Ging.; *V. patrinii* var. *macrantha* Maxim.—SUMIRE. Glabrous, sometimes pilose; rhizomes short, with orange-brown divided roots; leaf-blades rather thick, deltoid-lanceolate to broadly oblong-lanceolate, 3–8 cm. long, 1–2.5 cm. wide, obtuse, truncate to broadly cuneate at base, the summer leaves often narrowly ovate-deltoid, sometimes shallowly cordate, the teeth undulate, the upper leaves remote and indistinct, the petioles 3–15 cm. long, as long as to shorter than the blades, winged in upper part; peduncles 5–20 cm. long; flowers deep purple, rarely white with purple striations; sepals lanceolate, 5–8 mm. long, acute, the appendage semirounded, usually entire; petals 12–17 mm. long, the lateral ones bearded inside, rarely glabrous, the spur short-cylindric, 5–7 mm. long.—Apr.–May. Grassy places and fields in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common.—s. Kuriles, Korea, Manchuria, China, and Formosa.

Var. *boninensis* (Nakai) Mizushima. *V. boninensis* Nakai.—ATSUBA-SUMIRE. Maritime phase with thicker lustrous leaves, often elongate-deltoid in spring.—Near seashores.

11. *Viola yedoensis* Makino. *V. philippica* subsp. *munda* W. Becker, pro parte.—NOJI-SUMIRE. Rather conspicuously short spreading-pilose; rhizomes short; leaf-blades rather thick, broadly deltoid-lanceolate, 3–6 cm. long, 1–2 cm. wide at anthesis, sometimes to 8 cm. long, and 3 cm. wide in

fruit, subobtusate, truncate to broadly cuneate, or slightly cordate at base, with scattered obtuse undulate teeth, the petioles usually shorter than the blades, 2-5 cm. long or sometimes to 15 cm. long, slightly winged in upper part; peduncles as long as or slightly shorter than the leaves; flowers purple; sepals broadly lanceolate, 5-7 mm. long, acute or subobtusate, glabrous, the appendage rounded, entire to obtusely toothed; petals 10-14 mm. long, glabrous, the spur slender, cylindric, 5-7 mm. long.—Apr. Grassy fields in lowlands; Honshu, Shikoku, Kyushu.—Korea, Manchuria, and China.

12. *Viola minor* (Makino) Makino. *V. patrinii* var. *minor* Makino.—HIME-SUMIRE. Usually glabrous, rarely puberulous; rhizomes short; leaf-blades deep green and slightly lustrous on upper side, broadly deltoid-lanceolate at anthesis, somewhat narrowly deltoid in fruit, 1.5-4 cm. long, 1-1.5 cm. wide, obtuse to subacute, truncate to slightly cordate at base, undulately toothed or sometimes entire toward the tip, the petioles 2-4 cm. long at anthesis, to 8 cm. long at fruiting time, wingless or slightly winged in upper part; peduncles 4-10 cm. long, usually longer than the leaves; flowers deep-purple, relatively small; sepals broadly lanceolate, acute, 3-4 mm. long, the appendage semirounded; petals 8-10 mm. long, the lateral ones bearded inside, the spur slender, 3-4 mm. long.—Apr. Lowlands; Honshu, Shikoku, Kyushu.

13. *Viola phalacrocarpa* Maxim. *V. prionantha* var. *latifolia* Miq. pro parte; *V. conili* Fr. & Sav.; *V. pseudopriantha* W. Becker; *V. nipponica* Makino; *V. phalacrocarpoides* Makino; *V. reinii* W. Becker; *V. ishidoyana* Nakai.—AKANE-SUMIRE, OKA-SUMIRE. Glabrous to densely short-pubescent; rhizomes short, somewhat tufted; leaf-blades ovate to narrowly so, 1-3 cm. long, 0.8-2.5 cm. wide at anthesis, to 8 cm. long in fruit, obtuse to subacute, shallowly cordate to truncate-rounded at base, obtusely undulate-toothed, the petioles 3-10 cm. long at anthesis, to 20 cm. long at fruiting time, narrowly winged in upper part; peduncles 5-10 cm. long; flowers deep rose-purple; sepals broadly lanceolate, 5-7 mm. long, acute, the appendage deltoid, acute, or 4-angled, with acute teeth; petals 10-13 mm. long, the lateral ones bearded inside, the spur slender, 6-8 mm. long.—Apr. Lowlands; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

14. *Viola japonica* Langsd. *V. prionantha* var. *latifolia* Miq. pro parte; *V. oedemansii* W. Becker; *V. lactiflora* sensu auct. Japon., non Nakai; *V. metajaponica* Nakai.—KO-SUMIRE. Mostly glabrous or sparingly pilose on upper leaves and petioles; rhizomes short; blades of vernal leaves ovate to broadly so or narrowly deltoid-ovate, 2-5 cm. long, 1.5-3.5 cm. wide, obtuse or subobtusate, cordate to slightly so at base, obtusely toothed, the summer leaves often elongate-deltoid, to 8 cm. long, the petioles 2-8 cm. long, narrowly winged in upper part; peduncles 6-12 cm. long, usually glabrous; flowers purple; sepals broadly lanceolate, acute, 5-7 mm. long, the appendage elliptic, often obtusely toothed; petals 1-1.5 cm. long, rounded at apex, the lateral ones bearded inside or glabrous, the spur cylindric, 6-8 mm. long.—(Mar.)—Apr.—Lowlands; Honshu, Shikoku, Kyushu; common.—s. Korea and Ryukyu.

15. *Viola yezoensis* Maxim. *V. pycnophylla* Fr. & Sav.; *V. yatabei* Makino; *V. biacuta* W. Becker.—HIKAGE-SUMIRE. Spreading whitish pilose on leaves and peduncles; rhizomes slender, short, the roots slender, often with adventitious buds;

leaf-blades thin, sometimes obscurely white-variegated along the nerves, ovate, 3-6 cm. long, 2.5-4 cm. wide in anthesis, to 10 cm. long and 8 cm. wide at fruiting time, subobtusate, cordate at base, obtusely toothed, the petioles 5-10 cm. long at anthesis, to 20 cm. long at fruiting time, narrowly winged in upper portion; peduncles 7-12 cm. long; flowers white, with purple striations, relatively large; sepals broadly lanceolate, 8-10 mm. long, subacute, ciliate, the appendage ovate to broadly lanceolate, somewhat elongate, acute, entire or with few lobes; petals 15-20 mm. long, the lateral ones bearded inside, the lip purple-striate, the spur 7-8 mm. long, cylindric.—Apr.—May. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu.

16. *Viola hirtipes* S. Moore. *V. miyabei* Makino; *V. hirtipes* var. *typica* and var. *miyabei* (Makino) Nakai.—SAKURA-SUMIRE. Rather long-spreading soft white-pubescent, rarely subglabrous; rhizomes short; leaf blades ovate to narrowly so, rarely deltoid-ovate, 3-6 cm. long, 2-4 cm. wide, obtuse or subobtusate, cordate at base, undulately obtuse-toothed, the petioles 5-15 cm. long, slightly winged near the apex; peduncles 7-12 cm. long; flowers pale rose-purple; sepals lanceolate, 7-8 mm. long, subacute, the appendage semirounded, entire, glabrous; petals 15-20 mm. long, retuse to rounded at apex, the lateral ones bearded inside, the spur cylindric, 7-8 mm. long.—May. Mountains; Hokkaido, Honshu, Shikoku, Kyushu.—Korea, Manchuria, and Ussuri.—Forma *rhodovena* (Nakai) Hiyma ex F. Maekawa. *V. hirtipes* var. *rhodovena* Nakai.—CHISHIO-SUMIRE. Leaves with nerves on upper side purple-brown.

17. *Viola blandaeformis* Nakai. *V. blanda* var. *violascens* Nakai; *V. blanda* sensu auct. Japon., pro parte, non Willd.—USUBA-SUMIRE. Glabrous, slender; rhizomes rather thick, short, creeping, densely noded, with persistent petiole bases of preceding year; stolons present; leaf-blades membranous, orbicular-reniform, 1-2 cm. long, 1.5-3 cm. wide, rounded and sometimes with an abrupt short tip, deeply cordate, obsolete toothed, the petioles 2-5 cm. long; peduncles 4-6 cm. long; flowers white; sepals broadly lanceolate, 3-4 mm. long, acute, the appendage semirounded, entire; petals 8-10 mm. long, glabrous, the lip with purple striations, the spur about 2 mm. long, saccate.—July. Wet places in coniferous forests; Hokkaido, Honshu (centr. distr. and westw.).—Kuriles and Kamchatka.

Var. *pilosa* Hara. *V. blanda* sensu auct. Japon., non Willd.; *V. hultenii* W. Becker.—KE-USUBA-SUMIRE. Leaves short-pilose.—Hokkaido, Honshu (centr. distr. and northw.).

18. *Viola pumilio* W. Becker. FUMOTO-SUMIRE. Small, glabrous or sparingly puberulous on upper side of leaves; rhizomes very short; leaf-blades ovate to ovate-cordate, 1-2(-2.5) cm. long, 1-1.8 cm. wide, obtuse, cordate at base, often white-variegated on upper side, often purplish beneath, depressed-toothed, the petioles 2-5 cm. long; peduncles 4-7 cm. long; flowers white, small; sepals broadly lanceolate, 3-4 mm. long, acute, the appendage semirounded, entire; petals 7-8(-10) mm. long, the lateral ones usually bearded inside, the lip short, narrow, the spur about 2.5 mm. long, saccate; capsules 5-7 mm. long, pale green.—Apr.—May. Sunny hills; Honshu, Shikoku, Kyushu.

Viola sieboldii Maxim., with glabrous petals, possibly is a form of *V. pumilio*.

19. *Viola bioisueana* Makino. *V. pseudoselkirkii* Nakai.—HIME-MIYAMA-SUMIRE. Very slender, glabrous or

with short hairs on upper side of leaves; rhizomes short; leaf-blades thin, deltoid-cordate to narrowly ovate, usually broadly deltoid-ovate, 0.8–2 cm. long, 1–2 cm. wide, acute to obtuse, deeply cordate with an obtuse sinus, often white-variegated above, the teeth few, slightly dilated on upper part of outer margin, the petioles 2–7 cm. long; peduncles 5–10 cm. long; flowers white, small; sepals lanceolate, acute, 3–4.5 mm. long, the appendage entire, obtuse; petals 7–10 mm. long, the lateral ones usually bearded inside, the lip rather short, purple-striate, the spur 2–3 mm. long, saccate, rounded.—May. Woods; Honshu (w. Kantô Distr. and westw.), Shikoku, Kyushu.

Var. *iwagawae* (Makino) Ohwi. *V. iwagawae* Makino —YAKUSHIMA-SUMIRE. Plants smaller; leaves nearly deltoid, 5–10 mm. long and as wide, truncate-cordate at base; capsules 3–5 mm. long.—Kyushu (Yakushima).

20. *Viola maximowicziana* Makino. *V. selkirkii* var. *major* Yatabe —KO-MIYAMA-SUMIRE. Often white-pubescent; rhizomes short, the roots often with adventitious buds; leaf-blades spreading, ovate-elliptic to ovate, 2–3.5 cm. long, 1.5–3 cm. wide, acute or subacute, cordate at base, undulately toothed, often white-variegated on upper side, sometimes purplish beneath, the petioles 2–5 cm. long, 1 or 2 times as long as the blades, the stipules lanceolate; peduncles 5–10 cm. long, the bracts 3–6 mm. long, usually on upper part; flowers white; sepals broadly lanceolate, about 3 mm. long, acute, usually pilose, recurved toward tip, the appendage short, entire; petals rather narrow, 8–10 mm. long, the lateral ones glabrous to slightly bearded inside, the lip short, purple-striate, the spur somewhat globose, 2–3 mm. long.—May. Woods; Honshu (Kantô Distr. and westw.), Shikoku, Kyushu.

21. *Viola variegata* Fisch. var. *nipponica* Makino. *V. umemurae* Makino —GENJI-SUMIRE, IYO-SUMIRE. Short-pubescent especially on leaves, peduncles, sepals, and capsules; rhizomes slender, short; leaf-blades rather thick-membranous, broadly ovate-elliptic to cordate-orbicular, 2.5–5 cm. long and as wide, obtuse to rounded, cordate at base, often white-variegated on upper surface, purplish beneath, obtusely toothed, the petioles 2–5 cm. long at anthesis, to 15 cm. long at fruiting time; peduncles 6–10 cm. long, shorter than the leaves in fruit, the bracts linear, 3–10 mm. long, near the middle on the peduncle; sepals lanceolate, subacute, 3–7 mm. long, the appendage semirounded or somewhat squarrose, entire, rounded to retuse at the tip; petals pale purple, 8–11 mm. long, the lateral ones bearded inside, the spur cylindrical, 7–8 mm. long; capsules puberulent, 4–5 mm. long.—Apr. Honshu (Kantô and centr. distr., Mimasaka Prov.), Shikoku (Iyo); rare.—The typical phase occurs in Korea, Manchuria, and Siberia.

22. *Viola shikokiana* Makino. *V. epipsila* Ledeb. var. *acuminata* Nakai —SHIKOKU-SUMIRE. Rhizomes slender, creeping, remotely nodded; leaf-blades few, membranous, ovate-orbicular to broadly ovate, 2–4 cm. long and as wide, short-acuminate, cordate at base, obtusely undulate-toothed, sparingly short-pilose on upper side and on nerves beneath, the petioles 4–15 cm. long; peduncles 5–10 cm. long, longer than the leaves in anthesis; flowers white, 5–6 mm. long, somewhat precocious; sepals lanceolate or narrowly so, subobtusely, the appendage short, deltoid or squarrose; petals narrowly oblong, 8–15 mm. long, the lateral ones glabrous or slightly bearded, the lip slightly shorter than the other petals, purple-striate, the spur saccate, globose, 2–3 mm. long; capsules glabrous.—

Apr.–May. Mountains; Honshu (w. Kantô and Tōkaidō Distr.), Shikoku, Kyushu.

23. *Viola selkirkii* Pursh. *V. kamtschatica* Ging.; *V. selkirkii* var. *glabra* Miq. —MIYAMA-SUMIRE. Plant slender, usually loosely pilose on leaves and peduncles; rhizomes short, slender; leaf-blades ovate-cordate, 2–3 cm. long and as wide at anthesis, to 5 cm. long and as wide at fruiting time, abruptly acute or short-acuminate, deeply cordate, undulately toothed, the petioles 3–10 cm. long, 1.5–3 times as long as the blades; peduncles 5–8 cm. long, about as long as the leaves; flowers pale violet; sepals lanceolate, subacuminate, 5–7 mm. long, the appendage ovate-deltoid, subacute or with few subacute small teeth at apex, sometimes glabrous; petals 12–15 mm. long, glabrous, the spur short-cylindric, 6–8 mm. long.—May. Mountains; Hokkaido, Honshu (centr. distr. and northw.).—Widely distributed in the cooler temperate regions of the N. Hemisphere.

24. *Viola tokubuchiana* Makino. *V. nikkoensis* Nakai —FUJI-SUMIRE. Sparingly short pilose on leaf-blades, sometimes on the peduncles and petioles; rhizomes often elongate; leaf-blades broadly ovate, 1.5–2 cm. long, 1–1.5 cm. wide, subacute, cordate, white-variegated, often purplish beneath, the summer leaves to 4 cm. long and as wide, with short undulate teeth notched at each end, the petioles 2–8 cm. long, 1 to 2 times as long as the blades; stipules linear; peduncles 5–8 cm. long, the bracts linear, 3–8 mm. long; flowers pale purple; sepals lanceolate, acute, 4–5 mm. long, the appendage short; petals 8–12 mm. long, the lateral ones bearded inside, the spur 4–6 mm. long, cylindric; capsules glabrous, 6–7 mm. long.—Apr. Honshu (Kantô and centr. distr.).

25. *Viola takedana* Makino. *V. scabrida* Nakai; *V. tokubuchiana* var. *takedana* (Makino) F. Maekawa —HINA-SUMIRE. Glabrous or sparsely short-pilose on leaf-blades on upper side and on nerves beneath, especially in summer leaves; rhizomes short; leaf-blades rather thick, deltoid-ovate to narrowly so, sometimes broadly ovate, 3–6 cm. long, 2–4.5 cm. wide, acuminate to gradually acute with a minute obtuse tip, deeply cordate, undulately toothed, nerves on upper side often white, the petioles 3–10 cm. long, 1.5 to 2 times as long as the blades; stipules broadly linear; peduncles 5–8 cm. long, the bracts filiform-linear, 5–7 mm. long; flowers rose-purple; sepals broadly lanceolate, acute, 6–7 mm. long, the appendage ovate, subobtusely, often few-toothed; petals 12–15 mm. long, the lateral ones glabrous or slightly bearded inside, the spur short-cylindric, 6–7 mm. long; capsules 6–8 mm. long.—Apr.–May. Woods in mountains; Honshu.

26. *Viola violacea* Makino. SHIHAI-SUMIRE. Usually glabrous or rarely short-pubescent on upper side of leaves; rhizomes short; leaf-blades deltoid-ovate to narrowly so, sometimes ovate, 2–4 cm. long, 1–2 cm. wide at anthesis, to 5 cm. long, 3 cm. wide at fruiting time, nerves on upper side white, purplish beneath, obtusely short-toothed, the petioles 2–10 cm. long, 1 to 2 times as long as the blades; peduncles 5–8 cm. long; flowers deep rose-purple; sepals broadly lanceolate, 3–4 mm. long, subacute, the appendage rounded, usually entire; petals 8–12 mm. long, glabrous, the spur rather slender, cylindric, 5–6 mm. long, curved slightly upward; capsules 6–7 mm. long.—Apr. Honshu (centr. distr. and westw.), Shikoku, Kyushu.—Korea.

27. *Viola makinoi* H. Boiss. *V. obtusosagitta* Koidz.;

V. violacea var. *makinoid* (H. Boiss.) Hiyama—MAKINO-SUMIRE. Usually glabrous; rhizomes short; leaf-blades broadly deltoid-lanceolate, 2–4 cm. long, 1–1.5 cm. wide at anthesis, to 5 cm. long and 3 cm. wide at fruiting time, acuminate with an obtuse tip, sinuately cordate at base, sometimes obsoletely white-variegated on upper side, with scattered, obscure teeth, the petioles 4–10 cm. long, 1.5 to 3 times as long as the blades; peduncles 4–10 cm. long; flowers rose-purple; sepals broadly lanceolate, 3–4 mm. long, acute, the appendage short, rounded, entire; petals 8–10 mm. long, glabrous, the spur short-cylindric, 6–8 mm. long; capsules usually from short-peduncled cleistogamic flowers.—Apr.–May. Mountains; Honshu, Shikoku, Kyushu.

28. *Viola raddeana* Regel. *V. raddeana* var. *japonica* Makino; *V. deltoidea* Yatabe—TACHI-SUMIRE. Glabrous or sometimes sparsely pilose and short pilose on nerves of leaves beneath and on bracts; rhizomes short; stems 30–50 cm. long, erect, tufted; cauline leaves deltoid-lanceolate, 4–8 cm. long, 1–2(–3) cm. wide, gradually narrowed to a subobtusate tip, broadest at the truncate to very slightly cordate base, obscurely obtuse-toothed; stipules rather large, green, linear-lanceolate to lanceolate, 3–6 cm. long, acutely few-toothed, the petioles 2–5 cm. long, winged in upper part; peduncles 5–10 cm. long, axillary on upper part of stem; flowers pale-purple; sepals lanceolate, 5–6 mm. long, very acute at the tip, the appendage short, entire; petals 8–10 mm. long, the lateral ones slightly bearded inside, the lip purple-striate, shorter than the other petals, the spur semiglobose, 1.5–2 mm. long.—May. Wet places in lowlands; Hokkaido, Honshu (Kantō Distr.), Kyushu.—Korea, Manchuria, and Amur.

29. *Viola thibaudieri* Fr. & Sav. TADE-SUMIRE. Glabrous; rhizomes short; stems tufted, 25–35 cm. long, green; lowermost leaves reduced, the principal ones broadly lanceolate, 7–10 cm. long, 15–25 mm. wide, gradually acuminate, broadest below the middle, cuneately narrowed in lower third, with scattered obtuse teeth and the margins papillose, subsessile or short-petioled; stipules brown, linear-lanceolate, 1.5–2 cm. long, long-acuminate with few linear teeth, the lower ones strongly connate along the dorsal margins; peduncles 5–6 cm. long, slender; sepals narrowly lanceolate, 5–6 mm. long, acuminate, the appendage short, obtuse or retuse; petals 12–13 mm. long, rather narrow, the lateral ones slightly white-bearded inside at base, the lip short, purple-striate, the spur ellipsoidal, short, about 3 mm. long; capsules usually on short-peduncled cleistogamic flowers.—May. Mountains; Honshu (Shinano Prov.); very rare.—Korea.

30. *Viola acuminata* Ledeb. *V. micrantha* Turcz., non Presl; *V. laciniosa* A. Gray—EZO-NO-TACHI-TSUBO-SUMIRE. Plant whitish puberulent; rhizomes short; stems erect, tufted, 20–40 cm. long; lower leaves reduced, the cauline cordate or ovate-cordate, 2.5–4 cm. long, 3–5 cm. wide, the uppermost ones sometimes ovate-deltoid to cordate, longer than broad, abruptly acuminate with an obtuse tip, with short depressed teeth, the petioles or some of them longer than the blades, those uppermost shorter than the blades, wingless; stipules oblong, pinnately incised, 15–25 mm. long; peduncles 5–10 cm. long, with a pair of linear bracts on upper half; flowers pale violet; sepals narrowly lanceolate, 7–10 mm. long, acuminate, often short white-pubescent, the appendage semirounded to retuse; petals 8–13 mm. long, the lateral ones white-bearded inside at base, the spur saccate and globose, 3–4 mm. long.

—May–June. Hokkaido, Honshu.—Korea, China, Manchuria, s. Kuriles, Sakhalin, and e. Siberia.—Forma *glaber-rima* (Hara, pro var.) Ohwi. (?) *V. micrantha* subsp. *shiko-kuensis* W. Becker; (?) *V. acuminata* forma *shiko-kuensis* (W. Becker) F. Maekawa—KENASHI-EZO-NO-TACHI-TSUBO-SUMIRE. Glabrous except the lateral petals.—Honshu and reported from Shikoku.

31. *Viola diffusa* Ging. var. *glabella* H. Boiss. *V. kiusiana* Makino—TSUKUSHI-SUMIRE, HAI-SUMIRE. Coarsely white-pilose or glabrescent; rhizomes short, leafy; stoloniferous; leaf-blades spreading, ovate, 2–5 cm. long, 1.5–3 cm. wide, obtuse, broadly cuneate to subtruncate at base, broadly decurrent on the petiole, obtusely toothed, the petioles 1 or 2 times as long as the blades, winged; stipules narrowly lanceolate, with linear teeth; peduncles radical, from the stolons, 3–10 cm. long; flowers white, slightly purple-tinged, small; sepals narrowly ovate or broadly lanceolate, 3–4 mm. long, gradually acute, the appendage rounded, short; petals 6–8 mm. long, glabrous, the lip purple-striate, much shorter than the other petals, the spur semiglobose, very short, only slightly exerted between the sepals; capsules not exerted from the sepals.—Apr. Kyushu (Satsuma, Higo, and Hizen Prov.).—The typical phase occurs in China and Formosa.

32. *Viola rostrata* Muhl. var. *japonica* (W. Becker & H. Boiss.) Ohwi. *V. rostrata* subsp. *japonica* W. Becker & H. Boiss.; *V. rostrata* sensu auct. Japon., non Muhl.—NAGASHI-SUMIRE. Glabrous; rhizomes short; stems 2–4 cm. long at anthesis; leaves radical and cauline, the radical ones rather thick, orbicular-cordate, 2–4 cm. long and as wide, abruptly acute with an obtuse tip, obtusely short-toothed, the midrib raised above; upper leaves usually ovate-deltoid, acuminate with an obtuse tip, shallowly cordate, short-petioled or subsessile, the petioles 2–5 cm. long; stipules red-brown, narrowly ovate-oblong, about 1 cm. long, deeply laciniate-lobed; upper stipules linear-lanceolate, few-toothed; peduncles near base or radical, longer than the radical leaves; flowers pale violet; sepals broadly lanceolate, 5–6 mm. long, acute, the appendage semirounded, entire; petals 12–14 mm. long, glabrous, the spur cylindric, ascending, 10–15 mm. long; capsules from short-peduncled cleistogamic flowers on upper part of stems.—Apr.–May. Shaded places in low mountains; Honshu (Japan Sea side of northern distr. as far west as Inaba Prov.).—The typical phase occurs in N. America.

33. *Viola sachalinensis* H. Boiss. *V. komarovii* W. Becker; *V. mutsuensis* W. Becker; *V. sylvestriiformis* W. Becker; *V. canina* var. *kamschatica* Ging.—AINU-TACHI-TSUBO-SUMIRE. Rhizomes rather short; stems few, ascending, 2–5 cm. long at anthesis, 10–25 cm. long at fruiting time; radical leaf-blades cordate-orbicular or reniform-cordate, 2–3 cm. long and as wide at anthesis, 3–4 cm. long and as wide at fruiting time, subacute or obtuse, vivid green, flat, soft, obscurely undulate-toothed, the petioles 2 to 3 times as long as the blades; cauline leaves few, short-petiolate; stipules pinnately lobed; peduncles axillary to the stem-leaves; flowers pale violet; sepals narrowly lanceolate, 4–6 mm. long, acuminate, the appendage semirounded, entire; petals 10–15 mm. long, the lateral ones bearded inside, the spur narrowly oblong, 4–6 mm. long; capsules from short-peduncled cleistogamic flowers on upper part of stems.—May–June. Hokkaido, Honshu (n. distr.).—s. Kuriles, Sakhalin, Kamchatka, n. Korea, Manchuria, and Siberia.

34. *Viola kusanoana* Makino. *Ö-TACHI-TSUBO-SUMIRE*. Usually glabrous; rhizomes densely noded, short-creeping; stems erect, ascending at base, 5–10 cm. long at anthesis, to 40 cm. long at fruiting time; radical leaf-blades cordate-ovate or depressed, 3–5 cm. long and as wide at anthesis, to 6 cm. long and as wide at fruiting time, densely brown-spotted, subsuccinate to obtuse, vivid green, membranous, cordate at base, obtusely undulate-toothed, the petioles 1.5 to 2.5 times as long as the leaves; cauline leaves short-petioled; stipules deeply lacinate-lobed; peduncles axillary to the stem-leaves; flowers pale violet, rather large; sepals lanceolate, 5–8 mm. long, acute, the appendage semirounded, obtusely toothed or entire; petals glabrous, 15–18 mm. long, the spur short-cylindric, 6–8 mm. long; capsules chiefly from short-peduncled cleistogamic flowers on upper part of stems.—Apr.–May. Wet grassy places sometimes in thin woods; Hokkaido, Honshu, Kyushu.—Forma *pubescens* (Nakai) Mizushima. *V. kusanoana* var. *pubescens* Nakai—*KE-Ö-TACHI-TSUBO-SUMIRE*. Plant short-pubescent. Occurs with the species, but especially abundant in northern districts.

35. *Viola senamiensis* Nakai. *V. grayi* Fr. & Sav., pro parte, nom., excl. syn.; *V. grayi* var. *glabra* W. Becker; *V. grypceras* var. *grayi* (Fr. & Sav.) Nakai—Iso-SUMIRE, SENAMI-SUMIRE. Usually glabrous; rhizomes thick, elongate, often branched, rather ligneous, ascending or erect; stems tufted, 5–10 cm. long; radical leaves thick, depressed-orbicular, 1–3 cm. long, 1.5–3.5 cm. wide, very obtuse, cordate, obtusely toothed, rather long-petioled; stipules deeply pinnately lobed; peduncles usually cauline; flowers deep-violet; sepals lanceolate to broadly so, 6–7 mm. long, acute, the appendage semirounded, subentire; petals 13–15 mm. long, glabrous, the spur rather short, white, about 5 mm. long; capsules glabrous.—May. Sand-dunes near seashores; Hokkaido, Honshu (Japan Sea side as far south as Echigo Prov., also Rikuchu and Mutsu Prov.).

36. *Viola fauriana* W. Becker. *TERIHA-TACHI-TSUBO-SUMIRE*. Glabrous; rhizomes densely noded; stems ascending, few-leaved, very short at anthesis, to 20 cm. long at fruiting time; radical leaf-blades orbicular-cordate to somewhat orbicular-deltoid, 2–3 cm. long and as wide, rounded to obtuse, shallowly cordate or subtruncate at base, or sometimes deltoid-cordate to broadly deltoid-ovate, to 4 cm. long, 3.5 cm. wide, obtusely toothed, nerves and veinlets slender, raised on upper side when dry, the petioles 2 to 2.5 times as long as the blades; stipules deeply linear-lobed; cauline leaves rather few, short-petioled; peduncles radical and cauline, with a pair of bracts on upper half; flowers pale violet; sepals broadly lanceolate, 3.5–5 mm. long, subsuccinate, the appendage semirounded, entire; petals 8–12 mm. long, glabrous, the spur 4–5 mm. long.—May. Woods; Honshu (Japan Sea side from Mutsu to Echigo).

37. *Viola grypceras* A. Gray. *V. canina* var. *japonica* Ging; *V. sylvestris* var. *japonica* (Ging.) Makino; *V. sylvestris* var. *grypceras* (A. Gray) Maxim.; *V. reichenbachiana* sensu Fr. & Sav., non Jord.; *V. longipedunculata* Fr. & Sav.; *V. pruniflora* Nakai—*TACHI-TSUBO-SUMIRE*. Usually glabrous; rhizomes short, densely noded; stems few, ascending or decumbent, short at anthesis, 10–30 cm. long at fruiting time; radical leaf-blades cordate to depressed-cordate, 1.5–2.5 cm. long, 2–3 cm. wide, obtuse to very obtuse, cordate, shallowly toothed, the petioles 3–7 cm. long, 2 to 4 times as long as the blades; cauline leaves simulating the radical; stipules deeply

lacinate-lobed; peduncles 6–10 cm. long, radical and cauline, with a pair of linear-bracts on upper half; flowers pale violet, inodorous; sepals lanceolate, 5–7 mm. long, acute, the appendage semirounded, with a rounded entire tip; petals 12–15 mm. long, glabrous, the spur short-cylindric, 6–8 mm. long.—Apr.–May. Thin woods in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and very variable.—Forma *pubescens* (Nakai) Mizushima. *V. grypceras* var. *pubescens* Nakai—*KE-TACHI-TSUBO-SUMIRE*. Plant short-pubescent.—Common especially in northern areas.

Var. *rhizomata* (Nakai) Ohwi. *V. rhizomata* Nakai—*TSURU-TACHI-TSUBO-SUMIRE*. Stems decumbent, overwintering, new buds appearing from the apex; leaves smaller, depressedly deltoid-orbicular, subtruncate at base.—High mountains on Japan Sea side of Honshu (from Tajima to Echigo).

Var. *exilis* (Miq.) Nakai. *V. sylvestris* var. *exilis* Miq.; *V. coreana* H. Boiss.—*KO-TACHI-TSUBO-SUMIRE*. Smaller plant with decumbent stems and depressedly deltoid leaves truncate at base.—Honshu (western distr.), Shikoku and Kyushu.

Var. *imberbis* (A. Gray) Ohwi. *V. sylvestris* var. *imberbis* A. Gray; *V. krugiana* W. Becker—Iso-TACHI-TSUBO-SUMIRE. Stems tufted; leaves thicker, rather lustrous.—Maritime form near seashores; Honshu, Shikoku, Kyushu.

Var. *hichitoana* (Nakai) F. Maekawa. *V. hichitoana* Nakai; *V. kusanoana* var. *hichitoana* (Nakai) Ohwi—*SHICHI-TSUBO-SUMIRE*. Plant larger with larger leaves.—Izu-shichitō Islands.

38. *Viola obtusa* (Makino) Makino. *V. ovato-oblonga* var. *obtusa* Makino—*NIJO-TACHI-TSUBO-SUMIRE*. Usually papillose-puberulous throughout; stems ascending or erect, usually very short at anthesis, 10–30 cm. long at fruiting time; radical leaf-blades cordate or deltoid-cordate, 1–2 cm. long and as wide at anthesis, to 3 cm. long and as wide at fruiting time, obtuse to rather rounded at apex, cordate, obtusely short-toothed, the petioles 1 to 3 times as long as the blades; cauline leaves at fruiting time narrowly ovate-deltoid, 2.5–4 cm. long, 1.5–2.5 cm. wide, shallowly cordate; stipules pinnately linear-lacinate; peduncles radical and cauline; flowers rose-purple with a white center, fragrant; sepals lanceolate, 6–8 mm. long, acute, the appendage semirounded, obtusely toothed; petals 12–15 mm. long, glabrous, the spur 6–7 mm. long; capsules glabrous, usually from short-peduncled cleistogamic flowers on upper part of stems.—Apr.–May. Thickets and sunny slopes; Honshu, Kyushu.—Forma *nuda* (Ohwi) F. Maekawa. *V. obtusa* var. *nuda* Ohwi—*KENASHI-NIJO-TACHI-TSUBO-SUMIRE*. Glabrous.—Grows with the typical phase.

39. *Viola ovato-oblonga* (Miq.) Makino. *V. sylvestris* forma *ovato-oblonga* Miq.—*NAGABA-TACHI-TSUBO-SUMIRE*. Glabrous; rhizomes short, densely noded; stems ascending or erect, 20–40 cm. long in fruit; radical leaf-blades cordate-orbicular to cordate, 2–2.5 cm. long, 2–3 cm. wide, very obtuse to subrounded at apex, cordate, undulate-toothed, the petioles 1.5–4 times as long as the blades; stipules pinnately lacinate-lobed; lower cauline leaves narrowly ovate-deltoid, subsuccinate to obtuse, shallowly cordate, the upper ones short-petioled, lanceolate to narrowly deltoid-ovate, acuminate with an obtuse tip, shallowly cordate, obsoletely toothed; stipules narrowly lanceolate, pinnately incised; peduncles radical and cauline; flowers pale violet; sepals lanceolate, 5–7 mm. long, acute, the appendage rounded, short, entire; petals 12–15 mm. long,

glabrous, the spur 7-8 mm. long, short-cylindric; capsules chiefly from short-peduncled cleistogamic flowers on upper part of stems.—Apr.-May. Sunny slopes and thickets in hills and low mountains; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Forma *pubescens* (Nakai) F. Maekawa. *V. ovato-oblonga* var. *pubescens* Nakai—KE-NAGABA-TACHI-TSUBO-SUMIRE. Plant pubescent.—Grows with the typical phase.—s. Korea.

40. *Viola mirabilis* L. var. *subglabra* Ledeb. *V. brachysepala* Maxim.; *V. mirabilis* var. *glaberrima* W. Becker —IBUKI-SUMIRE. Rhizomes creeping, rather short; stems erect, 15-30 cm. long, with 2 subsessile cauline leaves at the top and sometimes with a third long-petiolate one; leaf-blades membranous, depressed-cordate or orbicular-cordate, 2-3-(4-5) cm. long, 2.5-4-(6) cm. wide, very shortly obtuse, cordate, with flat obtuse teeth, the petioles 7-15 cm. long; stipules thinly membranous, broadly lanceolate, acute to obtuse, glabrous or loosely glandular-ciliate, the cauline 5-8 mm. long, acute, usually short-ciliate, nearly free; peduncles radical; flowers pale violet, chasmogamic, rather large, usually sterile; sepals narrowly ovate or broadly lanceolate, 6-8 mm. long, subacute, the appendage depressed-rounded, short, entire; petals 13-15 mm. long, the lateral ones bearded inside at base, the spur 5-7 mm. long, oblong; capsules 8-10 mm. long, from short-peduncled cleistogamic flowers, terminal on the stems.—Apr. Honshu.—c. Siberia, Korea, Manchuria. The typical phase occurs in Europe, Caucasus, and Siberia.

41. *Viola langsdorffii* Fisch. *V. kamtschadalarum* W. Becker & Hult.; *V. langsdorffii* var. *caulescens* Ging.; *V. mirabilis*, β *langsdorffii*, γ *canescens*, δ *hispidula*, and var. *kusnetzovii* a *glabra* Regel; *V. langsdorffii* subsp. *sachalinensis* W. Becker; *V. kurelensis* Nakai; *V. sapporoensis* Franch.—OBA-TACHI-TSUBO-SUMIRE. Glabrous or slightly pilose on leaves beneath; rhizomes creeping; stems erect, 20-30-(40) cm. long, 3- to 4-leaved; leaf-blades cordate or orbicular-cordate, 3-7 cm. long, 4-8 cm. wide, slightly extended and obtuse, cordate, undulate-toothed, the petioles 7-15 cm. long; stipules broadly lanceolate, acuminate, slightly connate at base, nearly entire, the cauline membranous, greenish, semi-ovate, 1-2 cm. long, acute, entire or with few fine teeth; peduncles from upper part of stems; flowers pale violet, rather large; sepals broadly lanceolate, 7-8 mm. long, acute, the appendage short, sometimes with few obsolete teeth; petals 15-20 mm. long, the lateral ones bearded inside at base, the spur short, saccate, 3-4 mm. long; capsules glabrous, 12-15 mm. long.—May-July. Wet grassy places; Hokkaido, Honshu (Oze in Kotsuke).—Sakhalin, Kuriles, and Kamchatka.

42. *Viola verecunda* A. Gray. *V. alata* subsp. *verecunda* (A. Gray) W. Becker; *V. japonica* Fr. & Sav., non Langsd., incl. var. *typica* Fr. & Sav., var. *subaequiloba* Fr. & Sav., var. *decumbens* Fr. & Sav., and var. *pusilla* Fr. & Sav.—TSUBO-SUMIRE. Glabrous; rhizomes short; stems ascending or decumbent, 5-20-(30) cm. long; radical leaf-blades reniform-cordate or deltoid-reniform, 1.5-2.5 cm. long, 2-3.5 cm. wide, obtuse or deltoid-rounded, deeply open-cordate, obtusely undulate-toothed, the petioles 2 to 4 times as long as the blades; cauline leaves depressed-cordate, deltoid-cordate or deeply open-cordate, subacute to obtuse, the upper cauline leaves short; stipules membranous, green, lanceolate or linear-oblong, 7-20 mm. long, entire or with few obsolete teeth; peduncles cauline; flowers white; sepals broadly lanceolate, 4-5 mm. long, subacute, the appendage short, rounded, entire; petals 8-10 mm.

long, the lateral ones slightly bearded inside at base, the lip shorter than the other petals, purple-striate, the spur short, saccate, 2-3 mm. long.—Apr.-May. Wet grassy places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; very common and variable.—Korea, China, Manchuria, Sakhalin, s. Kuriles, Ussuri, Amur, and Formosa.

Var. *fibrillosa* (W. Becker) Ohwi. *V. fibrillosa* W. Becker —MIYAMA-TSUBO-SUMIRE. Small alpine phase with short stems, smaller leaves and stipules.—High mountains in Honshu (Japan Sea side).

Var. *yakusimana* (Nakai) Ohwi. *V. yakusimana* Nakai —KOKE-SUMIRE. An extremely dwarf phase with leaves 3-7 mm. wide and petals 4-5 mm. long.—High mountains; Kyushu (Yakushima).

Var. *semilunaris* Maxim. *V. semilunaris* (Maxim.) W. Becker —AGI-SUMIRE. Leaves depressed, broadly cordate with an open sinus at base.—Occurs with the typical phase.

Var. *excisa* (Hance) Maxim. *V. excisa* Hance —HIME-AGI-SUMIRE. Resembles var. *semilunaris* but smaller and with long-creeping stems.

43. *Viola biflora* L. KIBANA-NO-KOMA-NO-TSUME. Rhizomes short, creeping, closely noded; stems ascending, 5-20 cm. long, loosely 3- or 4-leaved; leaf-blades reniform-cordate, 1-2 cm. long, 1.5-3.5 cm. wide, rounded at apex, cordate, undulate-toothed, sparingly pilose on upper side and on nerves beneath, the petioles 2-10 cm. long, 2-6 times as long as the blades; upper cauline leaves short-petioled; stipules green, narrowly ovate or broadly lanceolate, 3-5 mm. long, subobtusely to subacute, entire, loosely ciliate; peduncles cauline, 2-5 cm. long, with a pair of minute bracts; flowers yellow; sepals lanceolate, subobtusely, 3-5 mm. long, the appendage short, rounded, entire; petals 7-10 mm. long, glabrous, the lip with dark brown striations, the spur short, semirounded, 1.5-2 mm. long.—June-July. Wet places in high mountains; Hokkaido, Honshu (centr. distr. and northw.), Shikoku, Kyushu (Yakushima).—Cooler regions of the N. Hemisphere.

44. *Viola crassa* Makino. *V. biflora* var. *crassifolia* Makino —TAKANE-SUMIRE. Glabrous or nearly so, deep-green, suffused with red-brown; rhizomes short, creeping, densely noded; stems 5-12 cm. long, 3- or 4-leaved; leaf-blades thick, lustrous, reniform-cordate or sometimes depressed-cordate, 1-2 cm. long, 2-4.5 cm. wide, rounded at apex, undulate-toothed, the petioles 3 to 4 times as long as the blades; stipules ovate, 3-4 mm. long, subobtusely; peduncles cauline, 3-5 cm. long, with a pair of small bracts on upper half; flowers deep yellow; sepals narrowly oblong or broadly lanceolate, 4-5 mm. long, obtuse, the appendage semirounded, entire; petals 10-12 mm. long, glabrous, the lip with dark-brown striations, the spur short, semiglobose, about 1 mm. long, slightly protruding between the sepals.—July-Aug. Gravelly places in alpine regions; Hokkaido, Honshu (centr. and n. distr.); rare.—Kuriles and Kamchatka.

45. *Viola alliariaefolia* Nakai. *V. glabella* var. *renifolia* Koidz.; *V. brevistipulata* var. *renifolia* (Koidz.) F. Maekawa —JIN'YO-KI-SUMIRE. Loosely soft-pubescent on nerves of leaves beneath and on margins; stems erect, 10-20 cm. long, 3- or 4-leaved; radical leaf-blades solitary or none, reniform, 2-3 cm. long, 3-6 cm. wide, rounded to broadly retuse, cordate, obtusely toothed or irregularly incised-toothed, the petioles 2 to 4 times as long as the blades, the cauline leaves simulating the basal, the upper ones usually smaller and approximate, on very short petioles; stipules ovate, 2-3 mm.

long, acute with obsolete glandular teeth or subentire; peduncles 2-5 cm. long, axillary in the upper stem leaves, with short bracts; flowers yellow; sepals lanceolate, 4-5 mm. long, obtuse, the appendage short, entire; petals 10-12 mm. long, the lateral ones slightly bearded inside at base, the spur short, about 2 mm. long; styles glabrous.—July. Alpine regions; Hokkaido.

46. *Viola brevistipulata* (Fr. & Sav.) W. Becker. *V. pubescens* var. *brevistipulata* Fr. & Sav.; *V. glabella* sensu auct. Japon., non Nutt.; *V. kishidae* Nakai; *V. flaviflora* Nakai; *V. brevistipulata* var. *acuminata* Nakai; *V. brevistipulata* var. *minor* Nakai; *V. lasiostipes* Nakai—ŌBA-KI-SUMIRE. Glabrous or slightly pubescent with rather thick, creeping rhizomes; stems erect, 15-30 cm. long, naked at base, 3- or 4-leaved on upper part; radical leaves 1 or 2, or absent, blades 5-8(-10) cm. long and as wide, abruptly acute, sometimes with an obtuse tip, cordate, obtusely undulate-toothed, the petioles 2 or 3 times as long as the blades; cauline leaves unequally petioled; stipules broadly ovate, 4-7 mm. long, acute, entire, ascending-spreading; peduncles 1-3, 3-7 cm. long, axillary in the stem-leaves, with a pair of minute bracts; flowers yellow; sepals narrowly lanceolate, 6-8 mm. long, gradually narrowed to an obtuse tip, the appendage very short, semirounded, entire; petals 12-15 mm. long, obovate, the lateral ones bearded inside, the spur very short, slightly protruding between the sepals.—June-July. High mountains; Hokkaido, Honshu (Mount Daisen in Hōki Prov., n. Kinki, and centr. distr. northw.); rather common.

Var. *lacinata* W. Becker. *V. lacinata* (W. Becker) Koidz. —FUGIRE-SUMIRE. Leaves lacinately cut.—High mountains; Hokkaido.

Var. *hidakana* (Nakai) S. Watanabe. *V. hidakana* Nakai —EZO-KI-SUMIRE. Leaves thicker, rather firm, lustrous on both sides, often purplish beneath.—July. Alpine; Hokkaido.

47. *Viola yubariana* Nakai. *V. glabella* var. *crassifolia* Koidz.—SHISOBA-KI-SUMIRE. Short-pilose on stems and petioles; stems 4-5 cm. long; radical leaves thick, orbicular, 2.5-4 cm. wide, abruptly acuminate with an obtuse tip, cordate with closed or overlapping edges, undulate-toothed, purplish beneath; cauline leaves 3-4, sessile except the lowest; stipules orbicular or broadly ovate, nearly entire; peduncles axillary to the stem-leaves, 1-2(-3.5) cm. long, with a pair of small bracts; sepals 4-5 mm. long, lanceolate or broadly so, acute or obtuse, the appendage semirounded; petals about 10 mm. long, yellow, with reddish nerves, the spur very short; capsules 6-7 mm. long.—Hokkaido (alpine zone of Mount Yubari); rare.

48. *Viola orientalis* (Maxim.) W. Becker. *V. uniflora* var. *orientalis* Maxim.; *V. xanthopetala* Nakai; *V. uniflora* sensu auct. Japon., non L.; *V. uniflora* var. *glabricapsula* Makino—KI-SUMIRE. Puberulous or nearly glabrous except the leaves; rhizomes usually erect, with rather numerous, horizontally spreading, thick roots; stems erect, 10-15 cm. long, 3(-4)-leaved, naked at base; radical leaf-blades cordate, 2.5-4 cm. long and as wide, acute, sometimes with an obtuse tip, undulate-toothed, the petioles tinged red-brown, 3-5 times as long as the leaves; cauline leaves 3, broadly ovate to cordate, sometimes rounded at base, the lower ones short-petioled, usually rather distant, the upper ones nearly opposite, subsessile; stipules broadly ovate, 2-3 mm. long, acute, subentire; peduncles 2-4 cm. long, with a pair of small bracts; flowers yellow; sepals lanceolate, 6-8 mm. long, gradually narrowed to an obtuse tip, the appendage ovate, entire, short; petals 12-15 mm. long, the lateral ones sometimes bearded inside, the spur very short.—Apr.-May. Mountains; Honshu (Sugra, Bingo), Kyushu (n. distr.).—Korea, Manchuria, and Ussuri.

Fam. 140. FLACOURTIACEAE IGIRI KA Flacourtia Family

Trees or shrubs; leaves simple, alternate; stipules caducous; flowers usually bisexual but often unisexual (the plants monoecious or dioecious); sepals imbricate or valvate, sometimes free, often similar to the petals; petals large, small, or absent, sometimes with a scale inside, imbricate; stamens numerous, rarely few, free; ovary superior, 1-locular, the placenta parietal; ovules 2 or more; styles or stigmas as many as the placenta; fruit usually a berry or drupe, indehiscent; endosperm fleshy.—About 70 genera, with about 500 species, chiefly in the Tropics.

1A. Leaves coriaceous, 4-8 cm. long, acute at base, penninerved, the petioles 2-5 mm. long, glandless; inflorescence axillary. . . 1. *Xylosma*
1B. Leaves herbaceous, 10-20 cm. long, cordate, palmately nerved, the petioles elongate, with glands at top; inflorescence terminal. . . 2. *Idesia*

1. XYLOSMA G. Forst. KUSUDO-IGE ZOKU

Dioecious or polygamous trees or shrubs usually with axillary spines; leaves coriaceous, toothed, short-petioled; stipules absent; flowers small, in axillary panicles, with small bracts; sepals 4-5(-7), slightly connate at base, imbricate, usually ciliate; petals absent; stamens many; disc glandlike or annular and surrounding the stamens; ovary 1-locular, free, the placenta 2-3(-6); styles short, alternate with the placenta, the stigmas slightly thickened and lobed; fruit a berry; seeds usually few, rather flat, usually obovate.—About 60 species, in the Tropics.

1. *Xylosma japonicum* (Walp.) A. Gray. *Apactis japonica* Thunb.; *Hisingera racemosa* Sieb. & Zucc., non Presl; *Flacourtia japonica* Walp.; *H. japonica* Sieb. & Zucc.; *X. racemosa* (Sieb. & Zucc.) Miq.; *Myroxylon japonicum* (Thunb.) Makino; *X. congestum* Merr.; *X. apactis* Koidz.—KUSUDO-IGE. Evergreen dioecious shrub with spinelike

short spurs in young individuals; branches red-brown, short-pubescent when young; leaves ovate to oblong-ovate, 4-8 cm. long, 3-4(-5) cm. wide, acuminate sometimes with an obtuse tip, acute at base, rounded when young, toothed, glabrous, the petioles 2-5 mm. long; flowers in very short axillary racemes, yellowish white, about 2.5 mm. across, short-pedi-

celled; sepals nearly round, short-pubescent on outer side; stamens much longer than the sepals; berry globose, black, about 5 mm. across; style very short, the stigma thickened; seeds 2-3, ovoid, about 4 mm. in diameter, rounded on back,

brown with black striations.—Sept. Near seashores; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu.—Ryukyu, Formosa, and China.

2. IDESIA Maxim. IGIRI ZOKU

Deciduous dioecious tree; branches thick, gray-brown, glabrous; leaves large, ovate-cordate or deltoid-cordate, 10-20 cm. long, 8-20 cm. wide, acuminate, shallowly cordate or truncately rounded at base, sparsely toothed, palmately 5- to 7-nerved, green, glaucous and white-hairy beneath chiefly on the midrib near base, the petioles reddish, about as long as the blades, with two sessile oblong glands at the top, young leaves with 1 or 2 additional pairs of petiolar glands; inflorescence panicle, large, 20-30 cm. long, terminal and axillary, often somewhat subracemose, yellowish puberulent; flowers yellowish, the pedicels 1-1.5 cm. long, the staminate 13-16 mm. across, the pistillate about 8 mm. across; sepals often with obscure teeth, nearly as long as the stamens; petals absent; stamens numerous, on a small disc, the filaments hairy; staminodia of pistillate flowers small; ovary glabrous, globose; placentae 5 (3-6), parietal; ovules many; styles about 2 mm. long, deciduous, the stigmas clavate-globose; berry 8-10 mm. across, orange-red, with numerous small seeds.—One species in e. Asia.

1. *Idesia polycarpa* Maxim. *Polycarpa maximowiczii* Linden ex Carr.; *Cathaya polycarpa* (Maxim.) Ohwi—IGIRI. Branches thick, gray-brown, glabrous; leaves long-petiolate, ovate-cordate or deltoid-cordate, 10-20 cm. long, 8-20 cm. wide, acuminate, shallowly cordate or truncately rounded at base, rather loosely toothed, green on upper side, glaucous and white-hairy chiefly on the midrib at base of leaf beneath, petioles reddish, about as long as the leaves, with 2 oblong sessile glands at apex, often with 1 to 2 more pairs of

accessory glands in young individuals; inflorescence pendulous, 20-30 cm. long, yellowish puberulent, the pedicels 1-1.5 cm. long; staminate flowers 13-16 mm. across, the sepals often with obscure teeth, nearly as long as the stamens; pistillate flowers about 8 mm. across; ovary glabrous, globose; styles about 2 mm. long, deciduous, the stigma clavate-globose; fruit globose, 8-10 mm. across, orange-red.—Apr. Hills and mountains; Honshu, Shikoku, Kyushu; often planted.—Ryukyu, Formosa, China, and Korea.

Fam. 141. STACHYURACEAE KIBUSHI KA Stachyurus Family

Deciduous or evergreen trees or shrubs; leaves alternate, simple, toothed, petioled; stipules small, caducous; flowers bisexual or sometimes unisexual, actinomorphic, subsessile, in axillary pendulous racemes; sepals and petals 4, imbricate; stamens 8, free; ovary superior, incompletely 4-locular by the intrusion of the parietal placentae; styles short, the stigma 4-lobed; ovules many; fruit a berry with a coriaceous pericarp; seeds many, soft arillate, with endosperm, the embryo straight.—One genus with few species, in e. Asia and the Himalayas.

1. STACHYURUS Sieb. & Zucc. KIBUSHI ZOKU

1. *Stachyurus praecox* Sieb. & Zucc. KIBUSHI. Large deciduous shrub; branches brown to red-brown, glabrous, lustrous; leaves membranous to herbaceous, elliptic-ovate, oblong, or narrowly ovate, 7-12 cm. long, 3-6 cm. wide, long-acuminate, rounded at base, toothed, glabrous or thinly pubescent especially on nerves beneath, the petioles 1-2.5(-3) cm. long; racemes precocious, rather densely many-flowered, subsessile, 4-10 cm. long, pendulous, glabrous, the bracts deltoid, small, about 2 mm. long; flowers subsessile, about 7 mm. long, campanulate, pale yellow to greenish yellow; petals about twice as long as the sepals, cuneate-obovate; fruit el-

lipsoidal to nearly globose, yellowish at maturity, 8-12 mm. long.—Mar.-Apr. Thickets and thin woods in mountains; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.

Var. *matsuzakii* (Nakai) Makino. *S. lanceifolius* Koidz.; *S. matsuzakii* Nakai; *S. ovalifolius* Nakai—NAMBAN-KIBUSHI, ENOSHIMA-KIBUSHI, HACHIJO-KIBUSHI. Maritime form with thicker branches, larger and longer leaves 10-15 cm. long, and larger fruit 10-15 mm. long.—Thickets and thin woods near seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyu.

Fam. 142. THYMELAEACEAE JINCHŌGE KA Mezereum Family

Plants woody, rarely herbaceous; leaves opposite or alternate, simple, usually small; stipules absent; flowers usually actinomorphic, usually in terminal heads, spikes, or racemes, bisexual or unisexual (plants then mostly dioecious); calyx tubular, sometimes corollalike, the lobes 4 or 5, imbricate; petals absent or represented by 4-12 scales, inserted on the tube or throat of calyx; stamens 2 to many, usually as many as the calyx-lobes and opposite them or twice as many, the disc scalelike, annular or cup-shaped, sometimes absent; ovary superior, 1- to 2-locular; style lateral in 1-locular ovaries, the stigma capitate; ovules solitary in each locule, pendulous, anatropous; fruit indehiscent; seeds with or without endosperm, the embryo straight.—About 40 genera, with about 450 species, widely distributed in both hemispheres.

1A. Inflorescence in terminal or axillary heads or in very short racemes, usually bracteate; disc absent or annular, sometimes lobed on one side; leaves usually alternate.

2A. Style short or absent, the stigma capitate. 1. *Daphne*

2B. Style cylindric, the stigma elongate, linear; inflorescence nodding. 2. *Edgeworthia*

- 1B. Inflorescence in terminal racemes or spikes, sometimes in panicles, bractless; disc of one or more scales; leaves usually opposite, sometimes alternate. 3. *Wikstroemia*

1. DAPHNE L. JINCHÖGE ZOKU

Evergreen or deciduous shrubs; inflorescence capitate or short-racemose, sometimes paniculate; flowers bisexual or unisexual (plants sometimes dioecious); calyx-lobes 4, the tube cylindric, often dilated at base, without an appendage in the throat; stamens 8, inserted on the calyx-tube, the filaments very short, the anthers oblong, the connective indistinct; disc absent or annular, sometimes lobed on one side; ovary 1-locular, sessile or nearly so; style often absent, the stigma capitate; berry globose or oblong, sometimes surrounded by the persistent calyx-tube, sometimes naked; testa crustaceous, the endosperm scanty or absent; cotyledons fleshy.—About 50 species, in Europe and Asia.

- 1A. Leaves coriaceous, lustrous, evergreen, deep green; branchlets dark purple-brown; flowers white. 1. *D. kiusiana*
 2A. Calyx-tube short-pilose externally; inflorescence terminal on last year's branchlets. 2. *D. miyabeana*
 2B. Calyx-tube glabrous externally; inflorescence on current year's branchlets. 2. *D. miyabeana*
 1B. Leaves membranous, appearing in autumn, deciduous in summer, green or glaucous; branchlets gray-brown; flowers yellowish.
 3A. Leaves oblanceolate, 1–2 cm. wide, rather acute to obtuse; flowers greenish yellow. 3. *D. pseudomezereum*
 3B. Leaves narrowly cuneate-obovate, 2–3 cm. wide, rounded to retuse with a minute mucro at apex; flowers yellow. 4. *D. kamschatkica* var. *jezoensis*

1. *Daphne kiusiana* Miq. *D. odora* var. *kiusiana* (Miq.) Keissler; *D. cannabina* sensu auct. Japon., non Wall.—KOSHŌ-NO-KI. Evergreen dioecious shrub, glabrous except the inflorescence; leaves alternate, rather softly coriaceous, lustrous, oblanceolate, 7–14 cm. long, 1.2–3.5 cm. wide, acute to acuminate with an obtuse tip, gradually narrowed to the base, entire, short-petiolate; flowers white, in dense terminal heads on last year's branchlets, the pedicels very short, finely white-puberulous; calyx tube 7–8 mm. long, short-pilose externally, the lobes spreading, about half as long as the tube; stamens 8, in 2 series, the anthers of the upper series half-exserted from the throat; berry red, ellipsoid-globose, about 8 mm. long; seeds ellipsoidal, about 6 mm. long.—Apr. Honshu (s. Kantō Distr. and westw.), Shikoku, Kyushu.—Ryukyus. Closely related to *D. odora*.

Daphne odora Thunb. *D. japonica* Thunb.—JINCHÖGE. Chinese shrub commonly cultivated in our area, slightly larger than *D. kiusiana* in all respects; flowers larger, white or rose-purple outside, glabrous; plants cultivated in this country are staminate.

2. *Daphne miyabeana* Makino. KARASU-SHIKIMI. Small evergreen shrub often puberulous on young branchlets; leaves thinly coriaceous, oblanceolate, 5–10 cm. long, 1–2.5 cm. wide, acute to acuminate with an obtuse or subacute tip, dark green above, entire, glabrous, usually lustrous, gradually narrowed to a short petiole; heads terminal on current year's branchlets, puberulous; flowers white, on very short pedicels; calyx-tube 5–6 mm. long, glabrous externally, the lobes spreading, ovate, 3-nerved; stamens 8, in 2 series, the anthers of upper series semi-exserted from the throat; ovary glabrous; berry ellipsoidal, about 8 mm. across, vermilion.—Rocks

in high mountains; Hokkaido, Honshu (centr. distr. and northw.); rare.

3. *Daphne pseudomezereum* A. Gray. ONI-SHIBARI, NATSU-BÔZU. Glabrous, dioecious shrub with thick gray-brown branches; leaves oblanceolate, 5–10 cm. long, 8–20 mm. wide, obtuse, acute, or rounded at apex, slightly glaucous, gradually narrowed to a short petiole; inflorescence a few-flowered, sessile, axillary head, nearly terminal on the branchlets; flowers yellowish green, the pedicels very short; calyx-lobes narrowly ovate, about half as long as the tube, the tube 6–8 mm. long; stamens 8, in 2 series, the anthers of upper series semi-exserted from the throat; berry red, ellipsoidal, about 8 mm. long, usually 2-seeded.—Mar.–Apr. Mountains; Honshu, Shikoku, Kyushu.

4. *Daphne kamschatkica* Maxim. var. *jezoensis* (Maxim.) Ohwi. *D. jezoensis* Maxim.—NANIWAZU. Glabrous, dioecious shrub with thick, terete, pale yellow-brown branchlets; leaves rather thick, cuneate-obovate to narrowly ovate, 4–8 cm. long, 2–3 cm. wide, rounded to obtuse, sometimes retuse with a minute mucro at apex, cuneately narrowed to a short petiole, vivid green or slightly glaucous on upper side, glaucous beneath; inflorescence axillary, sessile, usually more than 10-flowered, glabrous; flowers yellow, on very short pedicels, the staminate slightly larger; calyx-lobes ovate, those of the upper series 4–5 mm. long, slightly shorter than the tube, the calyx-tube 5–8 mm. long, glabrous, greenish, with 8 obtuse longitudinal ridges; stamens 8, in 2 series, the anthers bright yellow, semi-exserted from the throat, the pollen orange-yellow; ovary glabrous.—Apr.–May. Hokkaido, Honshu (Japan Sea side as far west as Noto Prov.).—The typical phase occurs in Sakhalin, Kuriles, Ussuri, and Kamchatka.

2. EDGEWORTHIA Meisn. MITSUMATA ZOKU

Deciduous shrubs with membranous, alternate, entire leaves; inflorescence a dense axillary head on branches of the preceding year; flowers bracteate, bisexual; calyx-lobes 4, the tube cylindric, white-pubescent externally, without appendage in throat; stamens 8, in 2 series on the calyx-tube, the filaments very short, the anthers oblong; disc annular, very short, slightly lobed; ovary sessile, 1-locular, hairy; stigma elongate, linear, papillose; fruit surrounded by the persistent calyx-tube, scarcely fleshy.—Two species, one in India, another in e. Asia.

1. *Edgeworthia papyrifera* Sieb. & Zucc. *E. chrysantha* sensu auct. Japon., non Lindl.; *E. tomentosa* Nakai, excl. syn.—MITSUMATA. Ternately branched shrub with rather

thick yellow-brown branches appressed-pubescent while young; leaves membranous, lanceolate to broadly so, 8–15 cm. long, 2–4 cm. wide, acute to acuminate, acuminate at base, ap-

pressed-pubescent especially on underside, whitish beneath, the petioles 5–8 mm. long, appressed-pubescent; inflorescence densely white-villous, many-flowered, globose, capitate, on nodding peduncles, subtended by few narrowly ovate caducous bracts while young; calyx-lobes elliptic, yellow inside, about 5

mm. long, the tube sessile, 12–14 mm. long; anthers of the upper stamens slightly exserted from the throat.—Mar.–Apr. Introduced from China, now much cultivated in our area for making paper.

3. WIKSTROEMIA Endl. GAMPI ZOKU

Shrubs or rarely trees; leaves evergreen or deciduous, opposite or alternate; inflorescence terminal, spicate, racemose, or capitate, sometimes in compound terminal panicles, bractless, bisexual; calyx-lobes 4, spreading, the tube elongate, without appendages on the throat; stamens 8, in 2 series on the calyx-tube, the upper 4 often slightly exserted from the throat, the filaments very short, the anthers oblong, the connective indistinct; disc with 4 or 2, very rarely with single scales; ovary sessile or nearly so, 1-locular, usually pubescent; style very short, the stigma large, globose; fruit a berry or rather dry, the endosperm scanty or absent; cotyledons fleshy.—About 50 species, in E. Asia, Malaysia, and the Pacific Islands.

- 1A. Inflorescence mostly capitate; disc-scales fleshy, somewhat globose-thickened at apex; leaves terminal at tip of branches.
- 2A. Leaves somewhat coriaceous, 2–4 cm. long, 1.2–2.2 cm. wide; ovary and fruit short-stiped. 1. *W. kudoi*
- 2B. Leaves thin, about 15 cm. long, 6 cm. wide; ovary and fruit long-stiped. 2. *W. capitellata*
- 1B. Inflorescence usually a raceme; disc-scales thin; leaves scattered on the branches.
- 3A. Glabrous shrubs with opposite leaves.
- 4A. Inflorescence 2- to 4-flowered, without an axis; flowers white. 3. *W. albiflora*
- 4B. Inflorescence about 10-flowered, with an elongate axis; flowers yellow. 4. *W. trichotoma*
- 3B. More or less pubescent shrubs, with alternate leaves.
- 5A. Inflorescence in simple solitary heads on branchlets; leaves ovate, silky on both sides. 5. *W. sikokiana*
- 5B. Inflorescence in terminal, usually branched racemes; leaves glabrous to slightly pubescent.
- 6A. Leaves oblong, glabrous or sparsely pubescent. 6. *W. ganpi*
- 6B. Leaves ovate, more or less appressed-pubescent. 7. *W. pauciflora*

1. *Wikstroemia kudoi* Makino. *Diplomorpha kudoi* (Makino) Masam.; *Daphnimorpha kudoi* (Makino) Nakai —SHAKUNAN-GAMPI. Branched shrub to 1.5 m. high, with thick, terete, densely leaf-scarred branches; leaves rather coriaceous, alternate, sessile, becoming dense toward the top of branchlets, obovate, 2–4 cm. long, 1.5–2.2 cm. wide, cuneate toward base, obtuse to subacute, glabrous, paler beneath, entire, sessile; heads few, 2- or 3-flowered, terminal, 2–3 cm. long, glabrous; flowers nearly sessile; calyx-lobes 4, ovate-lanceolate, about 5 mm. long, the tube about 8 mm. long, glabrous; upper 4 stamens inserted at the middle on the tube; disc-scales linear, erect; ovary appressed-pilose; fruit about 5 mm. long, enclosed in the calyx-tube, very short stipitate.—June. High mountains; Kyushu (Mount Miyanouradake in Yakushima); rare.

2. *Wikstroemia capitellata* Hara. *Diplomorpha capitellata* Hara; *Daphnimorpha capitellata* (Hara) Nakai —TSUCHIBI-NOKI. Deciduous shrub to 2 m. high; branches thick, with numerous large leaf-scars; leaves thin, alternate, dense at the top of branches, obovate to lanceolate-obovate, to 15 cm. long and 6 cm. wide, rounded to obtuse, cuneately narrowed at base, entire, glabrous, whitish beneath, the petioles 2–5 mm. long; inflorescence capitate, terminal, glabrous, 5–10 mm. long, sometimes with a few branches; flowers 1 to many, subsessile; calyx 10–14 mm. long, glabrous, the tube on back slightly inflated below the middle, the lobes about 4 mm. long; stamens inserted at the middle of the tube; fruit ovoid, about 5 mm. long, acute, long-stiped.—Wet woods in mountains; Kyushu (Hyuga Prov.); very rare.

3. *Wikstroemia albiflora* Yatabe. *W. gynopoda* Maxim.; *Diplomorpha albiflora* (Yatabe) Nakai —MIYAMA-GAMPI. Glabrous shrub with slender, red-brown branches and branchlets; leaves membranous, opposite, ovate or elliptic, 1.5–3 cm. long, 1–2 cm. wide, acute to obtuse at both ends, entire, whitish beneath, the petioles 1–2 mm. long; peduncles terminal or subterminal, 0.8 mm. long, slender, simple; in-

florescence more or less capitate, 2- to 4-flowered; flowers white, on short pedicels 1–2 mm. long; calyx-lobes elliptic, 2.5–3 mm. long, the tube about 10 mm. long; stamens of the upper series on the throat, the lower 4 median; fruit narrowly ovoid, 4–5 mm. long, distinctly stiped, with few long white hairs or glabrate.—May. Mountains; Honshu (Mount Odaigahara in Yamato), Shikoku, Kyushu; rare.

4. *Wikstroemia trichotoma* (Thunb.) Makino. *Queria trichotoma* Thunb.; *Passerina japonica* Sieb. & Zucc.; *W. japonica* (Sieb. & Zucc.) Miq.; *W. ellipsocharpa* Maxim.; *Diplomorpha ellipsocharpa* (Maxim.) Nakai; *D. trichotoma* (Thunb.) Nakai —KI-GAMPI. Glabrous much-branched shrub with slender reddish branchlets; leaves membranous, ovate or oblong ovate, 2.5–4.5 cm. long, 1–3 cm. wide, subacute, usually rounded at base, entire, whitish beneath, the petioles short, about 2 mm. long; racemes few- to about 10-flowered, on an axis 2–15 mm. long, the pedicels very short; peduncles slender, 1–2 cm. long, often branched, terminal and in upper axils; calyx yellow, the tube 6–7 mm. long, the lobes elliptic, about 2 mm. long; anthers of the 4 upper stamens slightly exserted from the throat, the lower ones on upper part of the tube; fruit ovoid, about 5 mm. long, short-stiped, glabrous.—Aug.–Sept. Grassy slopes and thickets in hills; Honshu (Kinki Distr. and westw.), Shikoku, Kyushu; rather common.—Korea.

5. *Wikstroemia sikokiana* Fr. & Sav. *Diplomorpha sikokiana* (Fr. & Sav.) Nakai —GAMPI. Silky pubescent shrub; leaves membranous, more or less alternate, ovate, 3–5 cm. long, 1.5–2.5 cm. wide, densely silky on both sides, especially so beneath, the petioles 2–3 mm. long; inflorescence capitate, few-flowered, terminal, the peduncles terminal, simple, 5–10 mm. long; calyx yellow, white-silky, subsessile, the tube 8–10 mm. long, the lobes ovate, about 3 mm. long; anthers of upper stamens half-exserted from the throat, the lower series above the middle of the tube; ovary white-pubescent; fruit ovoid-fusiform, about 6 mm. long, sparsely white-

hairy, short-stiped.—May–June. Honshu (Tōkaidō Distr. and westw.), Shikoku, Kyushu.

6. *Wikstroemia ganpi* (Sieb. & Zucc.) Maxim. *Passerina ganpi* Sieb. & Zucc.; *W. canescens* var. *ganpi* (Sieb. & Zucc.) Miq.; *Diplomorpha ganpi* (Sieb. & Zucc.) Nakai—KO-GAMPI. Shrub with white-appressed pubescence on branchlets, inflorescence, and petioles; leaves membranous, oblong or rarely ovate-oblong, 2–4 cm. long, 8–20 mm. wide, obtuse to subacute, sparsely pubescent or nearly glabrous, with rather conspicuous raised nerves beneath, the petioles 1–2 mm. long; inflorescence a raceme, densely few-flowered, very short, terminal on the branchlets and in upper axils, the peduncles short; calyx lobes narrowly ovate, about 2.5 mm. long, the tube white-pubescent, pale rose, 7–8 mm. long; anthers of upper stamens on the throat, the lower series on upper half of the tube; fruit ovoid-fusiform, about 4 mm. long, loosely white-pilose.—Aug. Honshu (Kantō Distr. and westw.), Shikoku, Kyushu.

7. *Wikstroemia pauciflora* Fr. & Sav. *W. ganpi* var. *pauciflora* (Fr. & Sav.) Maxim.; *Diplomorpha pauciflora* (Fr. & Sav.) Nakai; *W. franchetii* Koidz.—SAKURA-GAMPI, MIYAMA-KO-GAMPI. Shrub with loosely pubescent branches and

leaves, the branchlets much branched; leaves membranous, nearly alternate, ovate, 2–3 cm. long, 1–2 cm. wide, acute, subacute to rounded at base, slightly paler on underside, appressed-pubescent especially beneath, slenderly nerved, the petioles about 2 mm. long; inflorescence very short, few-flowered, terminal and axillary in the upper axils, peduncled, often slightly branched, rather densely white-pubescent; calyx-lobes oblong, 1.5 mm. long, the tube about 6 mm. long, appressed-pubescent; anthers of the upper 4 stamens two-thirds exerted from the throat, the lower 4 on the upper part of the tube; fruit narrowly ovoid, about 3 mm. long, loosely appressed-pilose, stipitate.—July–Aug. Honshu (Idzu, Sagami, and Suruga Prov.).

Var. *yakusimensis* Makino. *W. yakusimensis* (Makino) Nakai; *Diplomorpha yakusimensis* (Makino) Masam.—SHIMA-SAKURA-GAMPI. Plant slightly larger; leaves 3–7 cm. long, 1.5–3 cm. wide, often acuminate; inflorescence more branched; flowers more numerous; anthers of lower stamens nearer the throat.—Aug. Kyushu (Bungo, Hyuga, and Osumi Prov. in Yakushima.).

Fam. 143. ELAEAGNACEAE GUMI KA Oleaster Family

Woody plants with scalelike or stellate hairs; leaves alternate, rarely opposite, entire; flowers bisexual or unisexual (plants dioecious or polygamodioecious), solitary, fasciculate, or in racemes; calyx tubular, constricted above the ovary, the lobes 2 to 4, valvate, rarely depressed and truncate; stamens on the calyx-tube, 4, and alternate with calyx-lobes, or 8, the filaments free, the anthers 2-locular; staminodes absent; ovary sessile, 1-locular; style terminal, linear, the stigma on one side; ovules solitary, basal, erect, anatropous; fruit enclosed in the thickened fleshy or juicy calyx-tube, berrylike or drupaceous; seeds erect, the endosperm scanty or absent, the embryo straight.—Three genera, with about 50 species, in N. America, e. Asia, Europe, and Malaysia.

1. ELAEAGNUS L. GUMI ZOKU

Deciduous or evergreen trees or shrubs often with spines (reduced branches); leaves alternate, short-petioled; flowers axillary, solitary or in fascicles, without common peduncles, bisexual or the plants polygamous; calyx-lobes 4, the tube (receptacle) cylindrical or campanulate, somewhat constricted near the base, the lower part adnate to the ovary; stamens 4, inserted on the tube, the filaments very short; fruit drupelike, the stones ellipsoidal, longitudinally sulcate.—About 45 species, s. Europe, abundant in e. Asia and N. America.

- 1A. Evergreen trees or shrubs with coriaceous leaves, flowering in autumn, fruiting in spring.
- 2A. Petioles 1–2.5 cm. long; leaves orbicular-ovate to broadly elliptic-ovate, 4–6 cm. wide, abruptly acuminate, densely white-scaly beneath. 1. *E. macrophylla*
- 2B. Petioles 7–12 mm. long; leaves oblong or ovate-elliptic, less than 3.5 cm. wide.
- 3A. Leaves oblong to ovate-elliptic, often caudate, brown-scaly beneath. 2. *E. glabra*
- 3B. Leaves oblong to narrowly so, acute to obtuse, prominently undulate on margin, with white and brown scales beneath; branchlets often spinelike. 3. *E. pungens*
- 1B. Deciduous shrubs or small trees with membranous leaves, flowering in spring, fruiting in autumn.
- 4A. Underside of leaves scaly, without stellate hairs.
- 5A. Branchlets white-scaly; flowers 1–7 in axils, the pedicels 3–12 mm. long; calyx-lobes small, one-half to two-thirds as long as the tube, the tube gradually narrowed to the ovary. 4. *E. umbellata*
- 5B. Branchlets brown-scaly; flowers 1–3 in axils, the pedicels 1–5 cm. long; calyx-lobes broadly ovate, the tube constricted above the ovary.
- 6A. Leaves abruptly acuminate with an obtuse tip, acute to rounded at base; flowering late May to July. 5. *E. montana*
- 6B. Leaves, especially at flowering time, obtuse to acute at both ends; flowering April to early May. 6. *E. multiflora*
- 4B. Underside of leaves with scales and stellate hairs; young branches with few stellate hairs.
- 7A. Flowers usually solitary in axils, the pedicels elongate and nodding, 1.5–5 cm. long in fruit.
- 8A. Branchlets and petioles with red-brown scales; leaves oblong, obovate, oblanceolate, sometimes ovate-elliptic; fruit obovoid, with a narrow stipelike base. 7. *E. murakamiana*
- 8B. Branchlets and petioles with pale red-brown or fulvous scales; leaves lanceolate to ovate or obvate-elliptic, often caudate; fruit ellipsoidal to oblong.
- 9A. Calyx-tube about 7 mm. long; fruit broadly ellipsoidal, 6–7 mm. long. 8. *E. matsunoana*
- 9B. Calyx-tube about 4–5 mm. long; fruit oblong-fusiform, about 12 mm. long. 9. *E. takeshiata*
- 7B. Flowers 1–3 in axils, the pedicels straight, about 1 cm. long in fruit. 10. *E. yoshinoi*

1. *Elaeagnus macrophylla* Thunb. *E. macrophylla* var. *typica* C. K. Schn.—MARUBA-GUMI. Slightly scandent evergreen shrub with white and pale brown scales while young; leaves coriaceous, orbicular-ovate to broadly elliptic-ovate, sometimes orbicular, 5–7 cm. long, 4–6 cm. wide, acute to abruptly acuminate with an obtuse tip or rounded at both ends, loosely white-scaly on upper surface while young, densely white-scaly beneath, the petioles 1–2.5 cm. long; flowers few in axils, the pedicels 5–8 (–10) mm. long, densely white-scaly, sometimes also with reddish brown scales; calyx campanulate, the tube abruptly narrowed at base, 4–5 mm. long, the lobes broadly ovate, slightly shorter than the tube; fruit oblong, white-scaly, 1.5–2 cm. long.—Oct.–Nov. Thickets near seashores; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu. —S. Korea and Ryukyus. Hybrids are:

Elaeagnus × *maritima* Koidz. *E. hisauchii* Makino; *E. liukiuensis* Rehd.—AKABA-GUMI, ŌBA-TSURU-GUMI. Hybrid of *E. glabra* × *E. macrophylla*.

Elaeagnus × *submacrophylla* Serv. *E. nikaii* Nakai—ŌNAWASHIRO-GUMI. Hybrid allegedly of *E. macrophylla* × *E. pungens*.

2. *Elaeagnus glabra* Thunb. TSURU-GUMI. Scandent evergreen shrub with spreading, rather slender, red-brown scaly branches; leaves rather coriaceous, oblong to ovate-elliptic, 4–8 cm. long, 2.5–3.5 cm. wide, often caudate with an obtuse tip, rounded to acute at base, often stellate-scaly on upper surface while young, becoming glabrate, densely red-brown scaly beneath, the petioles 7–10 mm. long; flowers few, axillary, fasciculate, the pedicels red-brown scaly, 4–7 mm. long; calyx-tube narrow, 4–5 mm. long, about twice as long as the lobes; fruit oblong, 12–18 mm. long, red-brown scaly.—Oct.–Nov. Thickets in hills; Honshu (Kantō Distr. and westw.), Shikoku, Kyushu; common.

Elaeagnus × *reflexa* Morren & Decne. *E. glabropungens* Maxim. ex Nakai; *E. hypargentea* Hatusima—MARUBA-TSURU-GUMI, URAGIN-TSURU-GUMI. Hybrid of *E. glabra* × *E. pungens*.

3. *Elaeagnus pungens* Thunb. NAWASHIRO-GUMI. Evergreen shrub; branchlets densely brown-scaly, frequently reduced to spines; leaves coriaceous, oblong to narrowly so, 5–8 cm. long, 2.5–3.5 cm. wide, obtuse to acute with an obtuse tip, rounded at base, obsoletely toothed with prominently undulate margins, glabrous and lustrous on upper side, densely whitish and usually also brown-scaly beneath; petioles 10–12 (–15) mm. long, brown-scaly; flowers few, fasciculate in axils, the pedicels 5–8 mm. long, brown-scaly; calyx-tube 6–7 mm. long, rather thick, abruptly narrowed at base, the lobes ovate-rounded, about half as long as the tube; fruit oblong, about 1.5 cm. long, brown-scaly.—Oct.–Nov. Thickets in lowlands especially near the sea; Honshu (centr. distr. and westw.), Shikoku, Kyushu; common.

4. *Elaeagnus umbellata* Thunb. *E. crispa* Thunb.; *E. umbellata* var. *typica* C. K. Schn.—AKI-GUMI. Deciduous shrub with densely white-scaly branchlets becoming grayish with age; leaves membranous, oblong-lanceolate, sometimes narrowly oblong or broadly oblanceolate, 4–8 cm. long, 1–2 (–2.5) cm. wide, subobtusate to acute with an obtuse tip, acute to gradually so at base, thinly white-scaly on upper surface while young, densely and persistently so beneath, the petioles 5–10 mm. long, white-scaly; flowers 1–7, fasciculate in axils, densely white-scaly, the pedicels 3–6 (–8) mm. long at anthesis to 12 mm. long in fruit; calyx-tube slender, gradually narrowed at

base, 5–7 mm. long, the lobes narrowly ovate, about one-half to two-thirds as long as the tube, acute to acuminate; fruit subglobose to broadly ellipsoidal, 6–8 mm. long.—May. Thickets and thin woods in lowlands and hills; Hokkaido (w. distr.), Honshu, Shikoku, Kyushu. Common and variable.

Var. *coreana* (Lév.) Lév. *E. coreana* Lév.; *E. umbellata* var. *borealis* Ohwi—KARA-AKI-GUMI, MICHINO-KU-AKI-GUMI. Leaves sparsely stellate-pilose on upper side.—Honshu (n. distr.).—Korea.

Var. *rotundifolia* Makino. *E. fragrans* Nakai—MARUBA-AKI-GUMI. Branchlets thicker; leaves obovate to ovate, to 5 cm. wide.—Abundant near seashores; Honshu, Shikoku, Kyushu.

5. *Elaeagnus montana* Makino. MAME-GUMI. Deciduous shrub with densely brown-scaly young branchlets; leaves chartaceous to somewhat membranous, elliptic, ovate to oblong, 3–8.5 cm. long, 1.5–4 cm. wide, rather abruptly acuminate with an obtuse tip (especially at flowering time), acute to rounded at base, loosely white-scaly or glabrous on upper side, densely white- and red-brown scaly beneath, the petioles 5–8 mm. long; flowers 1–3, usually solitary, axillary, the pedicels about 1 cm. long at anthesis, 1–3 cm. long in fruit, thickened in upper part, whitish scaly; calyx-tube abruptly constricted above the ovary, the lobes large, broadly ovate, 3–4 mm. long, acute or abruptly so; fruit ovoid-ellipsoid, about 1 cm. long.—May–July. Mountains; Honshu, Shikoku, Kyushu.

Var. *ovata* (Maxim.) Araki. *E. longipes* var. *ovata* Maxim.; *E. tsukubana* Makino; *E. nikoensis* Nakai; *E. multiflora* var. *tsukubana* (Makino) Ohwi—TSUKUBA-GUMI, NIKKŌ-NATSU-GUMI. Branchlets red-brown scaly; leaves green, with fulvous stellate hairs on upper surface while young, densely white-scaly and loosely brown stellate-hairy beneath; calyx-tube red-brown scaly.—Honshu (Iwaki to Shinano Prov.).

6. *Elaeagnus multiflora* Thunb. *E. longipes* A. Gray; *E. multiflora* var. *crispa* (Maxim.) Serv.; *E. longipes* var. *crispa* Maxim., excl. syn.—NATSU-GUMI. Deciduous shrub or small tree with red-brown scales on young branchlets; leaves elliptic, ovate to obovate-oblong, 3–10 cm. long, 2–5 cm. wide, obtuse to acute at both ends (especially at flowering time), loosely stellate-pilose while young, densely white- and brown-scaly beneath; flowers 1 or 2, usually solitary, axillary, densely white- and sparsely brown-scaly; corolla-tube constricted at base, nearly as long to 1.5 times as long as the broadly ovate abruptly acute lobes; fruit oblong, about 1.5 cm. long, on a slender pendulous pedicel 1.5–5 cm. long.—Apr.–May. Thickets and thin woods in lowlands and mountains; Hokkaido, Honshu, Shikoku, Kyushu; common and variable; often cultivated.

Var. *hortensis* (Maxim.) Serv. *E. edulis* Carr.; *E. longipes* var. *hortensis* Maxim.—TŌ-GUMI. Leaves elliptic, loosely stellate-pilose on upper side while young; fruit larger.—Occurs with the typical phase.

Var. *angustifolia* (Nakai) Makino & Nemoto. *E. longipes* var. *angustifolia* Nakai—HOSŌBA-NATSU-GUMI. Leaves narrow, loosely white-scaly on upper side.

Var. *jucundicoeca* (Koidz.) Ohwi. *E. jucundicoeca* Koidz.; *E. isensis* Makino—SAI-GUMI, ISUZU-GUMI. Leaves narrow, with white-stellate scalelike hairs on upper side while young; pedicels 4–5 cm. long.—Honshu (Kinki Distr.).

7. *Elaeagnus murakamiana* Makino. ARIMA-GUMI. Deciduous shrub, the branchlets densely red-brown scaly and

loosely stellate-pilose while young; leaves membranous, oblong, obovate, oblanceolate or sometimes ovate-elliptic, 4–8 cm. long, 1–4 cm. wide, obtuse to abruptly acuminate with an obtuse tip, with stellate hairs on upper side while young, densely white-scaly and with fulvous-stellate hairs especially on nerves near base beneath, the petioles 3–5 mm. long; flowers 1 to 3 in axils, the pedicels 2.5–3 cm. long in fruit, with white and brown scales and pale stellate pubescence; calyx-tube 6–8 mm. long, abruptly constricted above the ovary, with white-stellate hairs, the lobes broadly ovate, 3–4 mm. long; fruit brown-scaly, obovoid, 7–8 mm. long, abruptly narrowed to a stipelike base.—Apr.–May. Honshu (Tōkai and Kinki Distr.), Shikoku.

8. *Elaeagnus matsunoana* Makino. HAKONE-GUMI. Deciduous shrub; branchlets gray-brown, densely fulvous-scaly, with fulvous-stellate hairs while young; leaves membranous, broadly lanceolate to narrowly ovate, 4–8 cm. long, 1.5–3.5 cm. wide, caudate-acuminate to acute with an obtuse tip, obtuse, rounded to subacute at base, stellate-pilose on upper side, densely white-scaly and loosely stellate-pilose beneath, the petioles 3–5 mm. long; flowers solitary, with pale yellow scales and stellate hairs; calyx-tube rather broad, abruptly constricted above the ovary, about 7 mm. long, the lobes rounded-ovate, 4–5 mm. long, acute; fruit broadly ellipsoidal, small, 6–7 mm. long, the pedicels 2.5–4 cm. long, thinly stellate-pilose at first, later only with scales.—May. Honshu (Mushashi, Kai and to Suruga Prov.); rare.

9. *Elaeagnus takeshitae* Makino. KATSURAGI-GUMI. Much-branched, deciduous shrub with slender branches, the branchlets gray-brown, with dense red-brown stellate scales; leaves membranous, ovate-elliptic to ovate-oblong, 4–6 cm. long, 1.5–2.5 cm. wide, caudate-acuminate, rather obtuse at the tip, obtuse to acute at base, conspicuously stellate-hairy on both sides, loosely brown-scaly beneath, the petioles 2–4 mm. long, brown-scaly and stellate-pilose; flowers solitary; calyx-tube slender, 4–5 mm. long, constricted above the ovary, the lobes ovate, acute, slightly shorter than the tube; fruit oblong-fusiform, about 12 mm. long, the pedicels 2.5–4 cm. long, at first fulvous-pilose and -scaly, later only scaly.—May. Honshu (Kawachi, Izumi, and Kii Prov.); rare.

10. *Elaeagnus yoshinoi* Makino. NATSU-ASADORI. Large deciduous shrub; branches dark brown, the young branchlets densely stellate-pilose; leaves membranous, obovate-elliptic, oblong, to ovate-elliptic, 5–12 cm. long, 3–6 cm. wide, acute to short-acuminate with an obtuse tip, rounded to obtuse or broadly cuneate at base, with brown scales while young, later densely stellate-hairy on both surfaces, especially so beneath, the petioles 5–8 mm. long, with fulvous-stellate hairs; flowers 1 to 3, fasciculate in axils; calyx-tube slender, 8–10 mm. long, slightly narrowed at base, white stellate-pilose, the lobes broadly ovate, acute, about half as long as the tube; fruit obovoid-oblong, about 1 cm. long, the pedicels erect, straight, about 1 cm. long, densely fulvous-stellate hairy.—May. Honshu (Chūgoku Distr.).

Fam. 144. LYTHRACEAE

MISO-HAGI KA

Loosestrife Family

Herbs or woody plants; leaves opposite or verticillate, rarely alternate, stipules absent or very small; flowers usually actinomorphic, bisexual, solitary or panicle; calyx tubular, the lobes valvate, often with an appendage between the lobes; petals on the throat of calyx-tube, usually wrinkled in bud, sometimes absent; stamens 4 or 8, sometimes fewer, inserted on the tube; anthers 2-locular; ovary superior, perfectly or imperfectly 2- to 6-locular, rarely 1-locular; style simple, solitary; ovules many, the placentation typically axile; capsules longitudinally to transversely or sometimes irregularly dehiscent; seeds many, without endosperm, the embryo straight.—About 22 genera, with about 500 species, chiefly in the Tropics.

- 1A. Trees or shrubs; placentae continuous on the style; stamens many, with long filaments; capsules loculicidally dehiscent; seeds winged. 1. *Lagerstroemia*
 1B. Herbs; placentae interrupted, not continuous on the style; stamens 2–12; capsules septicidally or irregularly dehiscent; seeds unwinged.
 2A. Capsules not horizontally striate. 2. *Ammannia*
 3A. Capsules irregularly dehiscent. 3. *Lythrum*
 3B. Capsules septicidally dehiscent. 4. *Rotala*
 2B. Capsules transversely striate, septicidally dehiscent.

I. LAGERSTROEMIA L.

SARU-SUBERI ZOKU

Evergreen or deciduous trees or shrubs; leaves opposite, simple; stipules small, caducous; racemes terminal or axillary, often compound and paniculate, the bracts and bracteoles caducous, the pedicels jointed; flowers 5- to 8-merous; calyx nearly hemispherical or obconical, sometimes ridged or winged, the appendage absent or short; petals often clawed; stamens many, inserted on the calyx-tube, the longer ones opposite the lobes; ovary 3- to 6-locular; ovules many; style slender; capsules ellipsoidal, woody, loculicidally dehiscent, 3- to 6-valved; seeds winged.—About 30 species, in se. Asia, Malaysia, and Australia.

- 1A. Branches and inflorescence puberulous; leaves 3.5–8 cm. long, with 3–5 pairs of lateral nerves, the petioles 2–3 mm. long. 1. *L. subcostata*
 1B. Branches and inflorescence glabrous; leaves 8–10 cm. long, with 8–13 pairs of lateral nerves, the petioles 8–10 mm. long. . . . 2. *L. fauriei*

1. *Lagerstroemia subcostata* Koehne. *L. subcostata* var. *hirtella* Koehne.—SHIMA-SARU-SUBERI. Deciduous, much-branched tree, branches gray-brown, terete, 4-striate when young, spreading-puberulent; leaves ovate, elliptic, or obovate, 3.5–8 cm. long, 2–3 cm. wide, acute to short-acuminate, sub-acute at base, glabrous on upper side, with 3–5 pairs of lateral nerves, white spreading-pubescent at least on the axils of nerves

beneath, the petioles 2–3 mm. long; panicles terminal, 5–10 cm. across, obtuse, densely many-flowered, puberulent, the pedicels 5–8 mm. long, jointed at base, the subtending bracts small; calyx-tube hemispherical-obconical, about 3 mm. long, glabrescent, 10- to 12-ribbed, the lobes 5–6, ovate, acute; limb of the petals white, ovate, wrinkled, 5–6 mm. long, slightly longer than the linear claw; capsules ellipsoidal, 8–10 mm. long;

seeds obliquely oblong, inclusive of the wing, about 6 mm. long.—July–Aug. Kyushu (Yakushima and Tanegashima).—Ryukyus and Formosa.

Lagerstroemia indica L. SARU-SUBERI. Branchlets 4-winged; leaves obtuse to rounded at apex; flowers large; calyx-tube inconspicuously nerved. Introduced from China. Much planted as an ornamental in gardens.

Lagerstroemia × **amabilis** Makino. KO-SARU-SUBERI. Hybrid of *L. indica* × *L. subcostata*. Sometimes cultivated.

2. **Lagerstroemia fauriei** Koehne. YAKUSHIMA-SARU-SUBERI. Deciduous tree with glabrous somewhat terete branches; leaves coriaceous, oblong, sometimes ovate, 8–10 cm.

2. AMMANNIA L. HIME-MISO-HAGI ZOKU

Annual herbs growing in wet places or aquatic; stems and branches often 4-angled; leaves opposite, sessile, 1-nerved; inflorescence cymose, sessile or pedunculate, the bracteoles small, membranous, hyaline or white; flowers small, 4(–6)-merous; calyx-tube campanulate or urceolate, often becoming globose or obovoid in fruit; stamens 2–8, inserted on the tube; ovary incompletely 2- to 4-locular or 1-locular; capsules globose or ellipsoidal, often slightly exserted from the calyx-tube, thinly membranous, irregularly dehiscent; seeds numerous, minute.—About 20 species, mostly in the Tropics, also warm-temperate N. America and e. Asia.

1A. Flowers petaliferous; leaves more or less auricled at base.

- 2A. Capsules exserted from the calyx, 2–2.5 mm. across 1. *A. multiflora*
 2B. Capsules not exserted from the calyx, 3.5–4 mm. across 2. *A. coccinea*
 1B. Flowers apetalous; leaves narrowed at the base; capsules 1–1.5 mm. across, exserted from the calyx 3. *A. baccifera*

1. **Ammannia multiflora** Roxb. *A. parviflora* DC.; *A. multiflora* var. *parviflora* (DC.) Koehne; *A. japonica* Miq.—HIME-MISO-HAGI. Annual, 20–30 cm. high; stems erect, 4-angled, short-branched; leaves spreading, broadly linear to lanceolate-oblong, 2.5–5 cm. long, 3–12 mm. wide, or 7–20 mm. long, 1–4 mm. wide in those of the branches, acute to sub-obtuse, slightly narrowed and rounded at the clasping and auriculate base; flowers few, in dense sessile axillary cymes, the pedicels about as long as the flowers; flowers about 1.5 mm. across; calyx obconical, obsoletely 4-angled, the lobes deltoid; petals minute, whitish; stamens 4; capsules globose, 2–2.5 mm. across, red-brown, lustrous, half-exserted from the calyx; styles distinct, slightly less than 1 mm. long, the stigmas rather thickened; seeds minute, brown.—Sept.–Nov. Wet places in lowlands, especially in paddy fields; Honshu, Shikoku, Kyushu.—Tropics and subtropics of Africa, Asia, and Australia.

2. **Ammannia coccinea** Rotb. HOSOMA-HIME-MISO-HAGI. Glaucous glabrous annual; stems simple or branched at base, quadrangular, 30–50 cm. long; leaves broadly linear to lanceolate, 3–5 cm. long, 3–6 mm. wide, acute, auriculate and sessile

at base, entire; flowers few, in dense axillary fascicles, the pedicels less than 1 mm. long; calyx about 2.5 mm. long, short-tubulose at anthesis, hemispherical, 3–4 mm. long in fruit, whitish with green nerves, teeth short, green; petals minute, purplish, obovate; stamens slightly exserted; capsules globose, not exserted from the calyx, 3.5–4 mm. across; styles about 1.5 mm. long.—Kyushu (Hizen Prov.); introduced.—N. and S. America, Philippines, Micronesia, and Ryukyus.

3. **Ammannia baccifera** L. *A. indica* Lam.; *A. discolor* Nakai.—SHIMA-MISO-HAGI, NAGATO-MISO-HAGI. Erect glabrous much-branched annual; stems 10–50 cm. long, 4-angled; leaves membranous, oblanceolate to linear, 5–50 mm. long, 1–10 mm. wide, narrowed at both ends, entire; flowers few, in dense axillary fascicles, the pedicels 0.2–1.5 mm. long, glabrous; calyx 1–2 mm. long, the lobes 0.5–0.7 mm. long; petals absent; stamens 4, the anthers subglobose; styles 0.3–0.5 mm. long; capsules globose, 1–1.5 mm. across, slightly exserted from the calyx.—Paddy fields; Honshu (Nagato Prov.); introduced.—Africa, se. Asia, Europe, and Australia.

3. LYTHRUM L. MISO-HAGI ZOKU

Annuals, perennials, or rarely half-shrubs; leaves opposite, verticillate, or rarely alternate, entire; inflorescence cymose, often in compound spikes or umbels, or flowers solitary in axils, actinomorphic or slightly zygomorphic, 4- to 6-merous, dimorphic or trimorphic; calyx-tube tubular or rarely campanulate, appendage distinct, rarely obscure; petals prominent or absent; stamens 4–12, the ventral ones inserted higher than the dorsal; ovary sessile or nearly so; style distinct, rarely short; capsules septicidally dehiscent, 2-valved, the valves sometimes 2-fid; seeds 8 to many, small.—About 25 species, in the Tropics and temperate regions.

- 1A. Plant scabrous with papillose hairs; leaves rounded or subcordate at base, semiclasping; appendage of calyx-lobes 1.5–2 mm. long, erect. 1. *L. salicaria*
 1B. Plant glabrescent; leaves acute to broadly cuneate at base, sessile but not clasping; appendage of calyx-lobes 0.5–0.7 mm. long, spreading. 2. *L. anceps*

1. **Lythrum salicaria** L. *L. salicaria* var. *intermedium* Koehne; *L. salicaria* var. *vulgare* DC.—EZO-MISO-HAGI. Rhizomatous perennial, usually scabrous on stems, leaves be-

neath, and calyx; stems erect, slightly branched, 4-sterile, 50–100 cm. long; leaves opposite, lanceolate to broadly so, 4–6 cm. long, 8–15 mm. wide, subobtusely or acute, rounded or sub-

cordate and semiclasping at base; spikes erect, terminal, 20–35 cm. long, the bracts ascending, broadly lanceolate to deltoid-ovate, 5–12 mm. long; flowers rose-purple, 1–3 in axils, cymose; peduncles and pedicels very short; calyx-tube 5–8 mm. long, 12-ribbed, with 6 deltoid teeth, the appendage spinelike, erect, 1.5–2 mm. long; petals cuneate-oblong, 7–8 mm. long.—Aug. Wet places in lowlands and hills; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Europe, N. Africa, Afghanistan, n. India, China, and e. Asia.

2. *Lythrum anceps* (Koehne) Makino. *L. virgatum* sensu Miq. non L.; *L. salicaria* var. *anceps* Koehne; *L. salicaria* subsp. *anceps* (Koehne) Hara.—MISO-HAGI. Resembling the preceding but more slender and nearly glabrous; leaves usually acute, acute to broadly cuneate at base, sessile or subsessile, not clasping; floral bracts usually spreading, broadly lanceolate to ovate-oblong; appendages of calyx-tube short, 0.5–0.7 mm. long, spreading.—Wet places in lowlands and hills; Honshu, Shikoku, Kyushu.—Korea.

4. *ROOTAL* L. KIKASHIGUSA ZOKU

Glabrous annuals or perennials; leaves opposite or verticillate, sessile; flowers small, 3- to 6-merous, usually sessile, solitary in axils or in terminal spikes or panicles, 2-bracteolate at base; calyx nearly globose, campanulate, or urceolate, 3- to 6-lobed, often with a spinelike appendage between the lobes, with annular nectary glands at base; petals persistent, deciduous, or absent; stamens 1–6, opposite the calyx-lobes; ovary incompletely 2- to 4-locular; ovules few to many; style absent or conspicuous; capsules septicidally dehiscent, cartilaginous, the pericarp with minute transverse striae; seeds minute.—About 40 species, in the Tropics and warm temperate regions.

- 1A. Leaves verticillate, shortly truncate or minutely bimucronate at apex.
 - 2A. Flowers apetalous; stamens 2 or 3; leaves 3- or 4-verticillate. 1. *R. mexicana*
 - 2B. Flowers petaliferous; stamens 4; leaves 5- to 12-verticillate. 2. *R. hippuris*
- 1B. Leaves opposite, obtuse, rounded, or subacute at apex.
 - 3A. Flowers or fascicles of flowers axillary, white to reddish.
 - 4A. Leaves broadly linear to broadly lanceolate-oblong, 6–25 mm. long, obtuse or subacute. 3. *R. leptopetala* var. *littorea*
 - 4B. Leaves obovate-oblong, 5–10 mm. long, rounded at apex.
 - 5A. Leaves with translucent cartilaginous margins; styles 0.5–0.7 mm. long, slender, distinct, with a capitate stigma; stamens 4. 4. *R. indica*
 - 5B. Leaves without translucent cartilaginous margins; styles shorter, with a capitate stigma; stamens 2. 5. *R. elatinomorpha*
 - 3B. Flowers in a terminal spike, red-purple. 6. *R. rotundifolia*

1. *Rotala mexicana* Cham. & Schltdl. *R. apetal* F. Muell.; *Hypobrichia spruceana* Benth.; *R. mexicana* var. *typica* Koehne, and var. *spruceana* (Benth.) Koehne.—MIZU-MATSUBA. Glabrous reddish annual 3–10 cm. high, usually creeping and branching at base, erect in upper part, rather soft; leaves 3- to 4(–5)-verticillate, narrowly lanceolate to broadly linear, 6–10 mm. long, 1.5–2 mm. wide, truncate and often bimucronate, narrowed to a sessile base; flowers solitary in axils, sessile, about 0.8 mm. long, reddish, usually 5-merous, the bracteoles thinly membranous, linear, as long as the calyx; calyx semiglobose in fruit, the lobes deltoid; stamens 2 or 3; capsules globose, about twice as long as the calyx; style absent.—Aug.–Oct. Paddy fields and wet places in lowlands; Honshu, Shikoku, Kyushu; common.—The Tropics and warm-temperate regions of the world.

2. *Rotala hippuris* Makino. MIZU-SUGINA. Usually glabrous perennial with slender creeping rhizomes; stems erect, terete, branched at base; leaves 5- to 12-verticillate, the submerged ones filiform, 2–3 cm. long, 2-lobulate at apex, the aerial ones linear, 5–10 mm. long, 0.7–1 mm. wide, obtusely truncate to obscurely bimucronate at apex, scarcely narrowed at base; flowers solitary in axils, sessile, the bracteoles linear, shorter than the calyx-tube; calyx-tube about 0.7 mm. long, globose in fruit, the lobes 4, deltoid, short; petals obovate, about twice as long as the calyx-lobes, retuse; stamens 4; capsules globose, about 1.5 mm. across; styles short and slender, the stigmas capitate.—Sept.–Oct. Wet places in lowlands; Honshu (Owari and Ise Prov.); very rare.

3. *Rotala leptopetala* (Bl.) Koehne var. *littorea* (Miq.) Koehne. *Ammannia littorea* Miq.—MIZU-KIKASHIGUSA. Erect, branched annual often ascending from base; stems terete, 10–30 cm. long; leaves broadly linear to broadly lanceolate-oblong, 6–25 mm. long, 2–5 mm. wide, obtuse to subacute,

obtuse to subrounded at the sessile base; leaves on upper branches much smaller and narrower; flowers solitary in axils, sessile, often reddish, about 0.7 mm. long; calyx-tube cup-shaped in fruit, the lobes usually 4, very small, acuminate; petals oblanceolate, as long as the calyx-tube, persistent; capsules globose, about 2 mm. across, reddish, much exserted from the calyx-tube.—Aug.–Nov. Paddy fields and wet places in lowlands; Honshu, Shikoku, Kyushu; common.—The typical phase occurs in e. Asia to Malaysia, and s. Asia to Afghanistan.

4. *Rotala indica* (Willd.) Koehne. *Peplis indica* Willd.; *Ammannia peploides* Spreng.; *Ameletia uliginosa* Miq.—KIKASHIGUSA. Glabrous annual; stems creeping and branched at base, ascending to erect and short-branched in upper part; leaves opposite, flat, obovate-oblong or obovate, sometimes nearly oblong, 5–10 mm. long, 3–5 mm. wide, rounded at apex, narrowed to the sessile base, with translucent cartilaginous margins; leaves of short upper branches smaller; flowers solitary in axils, sessile, the bracteoles linear, as long as the calyx; calyx tubular-campanulate, about 1.5 mm. long, the lobes 4, narrowly deltoid, acuminate, spine-tipped; petals small; stamens 4; capsules ellipsoidal, not exserted, included within the calyx; styles slender, 0.5–0.7 mm. long, the stigmas capitate.—Aug.–Oct. Paddy fields and wet places in lowlands; Hokkaido (sw. distr.), Honshu, Shikoku, Kyushu; common.—e. Asia, Malaysia, and India.

5. *Rotala elatinomorpha* Makino. HIME-KIKASHIGUSA. Glabrous annual; stems creeping, the branches erect 4–7 cm. long, loosely leafy; leaves thin, opposite, obovate-oblong, 3–10 mm. long, 1.5–4 mm. wide, rounded at apex, narrowed to the sessile base, without translucent cartilaginous margins; flowers sessile, solitary in axils, about 1.5 mm. long, the bracteoles linear, acuminate, as long as the calyx-tube; calyx-tube short-cylindric, 4-angled, without appendages, the lobes 4, narrowly

Pittosporum tobira (Thunb.) Ait. (Pittosporaceae). Cape Ashizuri, Tosa Prov., s. Shikoku. (Photo J. Ohwi.)

Rhus javanica A. (Anacardiaceae). Narashino near Tokyo, Honshu. (Photo J. Ohwi.)

Kandelia candel (L.) Druce (Rhizophoraceae). Kumano, Tanegashima Island, Kyushu. (Photo S. Ochiyama.)

Angelica ursina (Rupr.) Maxim. (Umbelliferae). Rubeshibe, Kitami Prov., Hokkaido. (Photo M. Tatewaki.)

Helwingia japonica (Thunb.) F. G. Dietr. (Cornaceae), Fuji-Yamomaka, Honshu. (Photo Lindquist and Nitzelius.)

Rhododendron japonicum (A. Gray) Sur. (Ericaceae), Red flowered phase; Mount Hakkoda, Honshu. (Photo J. L. Creech.)

deltoid, acuminate, about one-third as long as the calyx-tube; petals less than half as long as the calyx-lobes, obovate-oblong, obtuse; stamens 2; styles very short, with a capitate stigma; capsules globose or ellipsoidal, about 1 mm. across.—Sept.-Oct. Wet places in lowlands; Honshu (Shimōsa and westw.), Shikoku; rare.

6. *Rotala rotundifolia* (Roxb.) Koehne. *Ammannia rotundifolia* Roxb.—HOZAKI-KIKASHIGUSA. Glabrous perennial; rhizomes slender, creeping; stems simple or sparsely branched, 10-20 cm. long, erect, with ascending base, loosely leafy, purplish red; leaves membranous, opposite, elliptic to

obovate-elliptic, sometimes nearly orbicular, 5-8 mm. long, 3.5-6 mm. wide, rounded at apex, narrowed to the sessile base; inflorescence erect, 3-6 cm. long, small-leafy; flowers many in a terminal spike, red-purple, about 2.5 mm. across, the bracteoles lanceolate, slightly longer than the calyx-tube; calyx-tube obconical, about 1 mm. long, the lobes 4, deltoid, acute, slightly shorter than the tube; petals 4, obovate, 1.5 mm. long, red-purple; stamens not exerted from calyx-lobes; capsules dehiscent, 4- or rarely 3-valved; styles short, the stigma capitate.—May. Kyushu (Chikuzen, Chikugo, Higo Prov.).—Ryukyus, Formosa, China, and India.

Fam. 145. RHIZOPHORACEAE

HIRUGI KA

Mangrove Family

Trees or shrubs of tidal marshes; branches inflated and jointed at the nodes; leaves usually coriaceous and simple, opposite, stipulate, rarely alternate and exstipulate; inflorescence axillary; flowers bisexual; calyx-tube free or adnate to the ovary, the lobes 3-14, persistent, valvate; petals small, sometimes laciniate, convolute or involute; stamens inserted on the disc, as many as the petals or more, often in pairs, opposite the petals; anthers 4- or many-locular; ovary usually inferior, 2- to 6-locular, rarely 1-locular; ovules inserted on inner angle near top of the locule in pairs or rarely more; styles free or connate; fruit usually indehiscent, 1-seeded; seeds sometimes with endosperm, often germinating on the plant and with a well-developed much-elongating hypocotyl; cotyledons cylindric or connate.—About 17 genera, with about 60 species, the chief component of tropical mangrove forests.

1. KANDELIA Wight & Arn.

ME-HIRUGI ZOKU

Evergreen small tree with terete branches; leaves thick-coriaceous, opposite, simple, petiolate, elliptic, obtuse, entire, the stipules intrapetiolar, caducous; inflorescence a dichotomous cyme, the peduncles axillary; flowers few, white, rather large; calyx with a cuplike caliculus, the tube short, adnate to the ovary at base, lobes 5-6, linear-lanceolate, coriaceous, valvate; petals 5-6, on a fleshy disc, bifid, the lobes filiform-laciniate; stamens many, the filaments capillary; ovary semi-inferior, 1-locular, conical; style filiform, the stigma 3-lobed; ovules 6, in pairs on a central axis; fruit ovoid, coriaceous; seeds 1, pendulous; germinating on the plant, with the hypocotyl much-elongating before dropping to the ground.—A single species, in se. Asia.

1. *Kandelia candel* (L.) Druce. *Rhizophora candel* L.; *K. rheedii* Wight & Arn.—ME-HIRUGI, RYUKYŪ-KŌGAI. Plant glabrous, the branchlets rather thick, with slightly inflated nodes; leaves thick, deep green, lustrous, oblong to obovate-oblong, sometimes elliptic, 5-10 cm. long, 3-5 cm. wide, rounded and with a mucro at apex, acute at base, the petioles 9-10 mm. long, narrowly winged; inflorescence shorter than the leaves, short-peduncled, about 10-flowered, the bracteoles

about 3 mm. long, sepallike; calyx-tube short, the lobes linear-oblong, reflexed, about 16 mm. long; petals narrow, laciniate, about 1 cm. long; fruit ovoid, about 3 cm. long, surrounded by the persistent reflexed calyx-lobes.—Aug. Muddy places near the mouth of rivers; Kyushu (s. distr. including Yakushima and Tanegashima).—India, Malaysia, s. China, Formosa, and Ryukyus.

Fam. 146. ALANGIACEAE

URI-NO-KI KA

Alangium Family

Shrubs or trees; leaves simple, alternate, exstipulate; flowers white or pale yellow, actinomorphic, bisexual, in axillary cymes, pedicels jointed; calyx small, truncate, or the limb 4- to 10-toothed; petals 4-10, valvate, usually linear, revolute, sometimes connate at base; stamens as many as the petals and alternate with them, or 2 to 4 times as many as the petals, pubescent inside, the anthers 2-locular, linear, longitudinally dehiscent; ovary inferior, 1- or 2-locular; style simple, clavate, or 2- or 3-fid; ovules solitary, pendulous; drupe 1-seeded, crowned by the calyx-teeth and a disc; seeds with endosperm.—A single genus with about 20 species, in e. Asia, Malaysia, Australia, and Africa.

1. ALANGIUM Lam.

URI-NO-KI ZOKU

Characters of the family.

- 1A. Leaves cordate-orbicular, 4-angled, palmately 3- to 5(-7)-lobed, usually short-pubescent especially beneath; petals 6, 3-3.5 cm. long; stamens about 3 cm. long, the anthers about $\frac{1}{2}$ their length, the connective glabrous. 1. *A. platanifolium*
 1B. Leaves obliquely obovate to oblong, sometimes ovate, entire, obliquely truncate at base, nearly glabrous except for axillary tufts beneath; petals 7, about 2 cm. long; stamens about 18 mm. long, the anthers about $\frac{1}{3}$ their length, the connective densely appressed yellowish pubescent on inner side at base. 2. *A. premnifolium*

1. *Alangium platanifolium* (Sieb. & Zucc.) Harms var. *platanifolium*. *Marlea platanifolia* Sieb. & Zucc.; *A. platanifolium* (Sieb. & Zucc.) Harms; *A. platanifolium* var. *genuinum* Wanger.; *M. platanifolia* var. *typica* Makino—MOMIJI-URI-

NO-KI. Leaves deeply 3- to 5(-7)-cleft, the lobes ovate to narrowly so, caudately long-acuminate.—Honshu (western distr.), Shikoku, Kyushu; rare.—Korea.

Var. *trilobum* (Miq.) Ohwi. *Marlea macrophylla* Sieb. &

Zucc.; *M. platanifolia* var. *triloba* Miq.; *M. platanifolia* var. *macrophylla* (Sieb. & Zucc.) Makino; *A. platanifolium* var. *macrophyllum* (Sieb. & Zucc.) Wanger.; *M. macrophylla* var. *trilobata* Nakai.—URL-NO-KI. Large shrub; branches usually short-pilose when young, gray-brown; leaves thinly membranous, cordate-obicular, 7–20 cm. long and as wide, 4-angled, slightly cordate at base, usually slightly short-pilose and green above, paler and usually prominently short-pubescent beneath, shallowly 3- to 5(-7)-lobed, the lobes deltoid, caudately long-acuminate, the petioles 3–10 cm. long, short-pubescent; inflorescence loosely few-flowered; limb of calyx about 1 mm. long, minutely toothed; petals white, revolute at anthesis, linear, 3–3.5 cm. long, about 2.5 mm. wide; stamens 12, the filaments short-pilose on back at base, the anthers glabrous; drupe ellipsoidal, 7–8 mm. long, blue, glabrous.—June. Woods in mountains; Hokkaido, Honshu, Shikoku, Kyushu; rather common.—Korea and Manchuria.

2. *Alangium premnifolium* Ohwi. *Marlea premnifolia* (Ohwi) Honda; *A. begoniaefolium* sensu auct. Japon., non Roxb.; *A. chinense* var. *nipponicum* Masam.—SHIMA-URL-NO-KI. Leaves obliquely obovate to oblong, sometimes ovate, 10–15 cm. long, 5–10 cm. wide, abruptly obtuse, obliquely truncate at base, entire, with axillary tufts of hairs beneath, the petioles 2–4 cm. long; inflorescence short, 2- to 5-flowered; calyx glabrous, the limb minutely toothed; petals 7, broadly linear, about 2 cm. long, pale yellow-pubescent inside; stamens about 18 mm. long, the anthers about 1/3 as long, the connective densely appressed yellowish pubescent on inner side at base; style as long as the stamens, glabrous; stigma 2-fid; drupe ellipsoidal, 8–12 mm. long.—Kyushu (Sata in Oosumi, Yakushima, and Tanegashima).—Ryukyus.

Fam. 147. MYRTACEAE FUTO-MOMO KA Myrtle Family

Trees or shrubs; leaves simple, usually entire, opposite, rarely alternate, glandular-dotted, stipules usually absent; flowers usually actinomorphic, bisexual, or polygamous by abortion; calyx-tube more or less adnate to the ovary, the lobes 3 or more, imbricate, valvate, or irregularly lobed; petals 4 or 5, rarely absent, on the margin of the disc; stamens numerous, on the margin of the disc, incurved in bud, sometimes erect, the filaments often connate at base; ovary inferior, 1- to many-locular; ovules many, on axile, rarely on parietal placentae; fruit loculicidally dehiscent or indehiscent; seeds nearly destitute of endosperm; embryo straight or coiled.—About 70 genera, with about 3,000 species, mostly tropical.

1. SYZYGIUM Gaertn. ADEKU ZOKU

Trees or shrubs; leaves coriaceous, sometimes membranous, opposite, penninerved; inflorescence a terminal or sometimes axillary cyme, usually ternately branched; flowers 4- sometimes 5-merous, rather small; calyx obconical, obovoid, or clavate, not much longer than the ovary, the margin of the limb truncate, undulate, or short-lobed; petals usually not spreading, calyptrately deciduous at anthesis, or absent; stamens numerous, prominently incurved in bud; anther-locules parallel, longitudinally dehiscent; ovary usually 2-locular; ovules many in each locule; style simple, filiform; fruit a few-seeded berry; testa loosely adnate to the pericarp; cotyledons 2.—Many species in the Tropics of the Old World.

1. *Syzygium buxifolium* Hook. & Arn. *Eugenia microphylla* Abel; *S. microphyllum* (Abel) Masam., non Gamble; *E. tinensis* Hemsl.—ADEKU. Evergreen, glabrous, much-branched small tree; branches 4-angled, slender, dark brown; leaves rather thick, elliptic, broadly ovate or broadly obovate, 2–4 cm. long, 1–2.5 cm. wide, rounded to very obtuse, abruptly acute at base, the midrib impressed on upper side, raised beneath, the nerves pinnate, parallel, ascending; petioles 2–4 mm. long; flowers rather numerous, about 3 mm. across, bracteolate

at base; calyx narrowly campanulate, about 3 mm. long, the teeth very depressed and short; corolla deciduous at anthesis; fruit globose, black, about 7 mm. across.—Kyushu (s. distr.).—Ryukyus, Formosa, s. China, Indochina, and Bonins.

Jambosa jambos (L.) Millsp. *Eugenia jambos* L.—FUTO-MOMO. Branches thick; leaves lanceolate 10–20 cm. long; flowers about 4 cm. across.—Naturalized in Kyushu (Yakushima and Tanegashima).—India; much cultivated in tropical countries.

Fam. 148. MELASTOMATACEAE NO-BOTAN KA Melastoma Family

Herbs or woody plants, rarely scandent; leaves simple, opposite or verticillate, 3- to 9-nerved from the base or rarely penninerved; stipules absent; flowers bisexual, usually showy, actinomorphic; calyx short-tubular, adnate to the ovary or sometimes connected by the septa, or free, the lobes imbricate or valvate in bud; petals imbricate, free; stamens as many or twice as many as the petals, the filaments free, incurved in bud, the anthers 2-locular, basifixed, usually with 1 or 2 pores, the connective often produced as an appendage at base; ovary 2- to many-locular; style simple; ovules many, on axile, basal, or parietal placentae; fruit a capsule or berry; seeds usually small, endosperm absent.—About 150 genera, with about 4,000 species, chiefly in the Tropics and subtropics.

- 1A. Flowers small, 7–17 mm. across, in axillary fascicles or terminal panicles; calyx-lobes persistent; seeds straight.
 - 2A. Flowers in axillary fascicles; stamens 4, homomorphic, the connective without an appendage. 1. *Blastus*
 - 2B. Flowers in terminal cymes or panicles; stamens 8, dimorphic, the larger ones with a bifid appendage on the connective in front at base. 2. *Bredia*
- 1B. Flowers larger, 3–8 cm. across, in terminal heads or cymes; calyx-lobes deciduous; seeds curved.
 - 3A. Anthers homomorphic, the connective scarcely extended at base, without an appendage; fruit a dry, regularly dehiscent capsule; herbs (in ours). 3. *Osbeckia*
 - 3B. Anthers dimorphic, the larger ones with 2 tubercles or spurs in front at base; fruit a drupe, indehiscent or irregularly dehiscent; shrubs. 4. *Melastoma*

1. **BLASTUS** Lour. MIYAMA-HASHI-KAMBOKU ZOKU

Glabrous or short-pilose shrubs with slender, terete branches; leaves membranous, opposite, oblong, long-acuminate, 3- to 5-nerved, petiolate; flowers small, fasciculate in axils, short-pedicelled; calyx-tube short-pubescent, ellipsoidal, the limb truncate with 4 minute teeth on margin; petals 4, ovate, convolute; stamens 4, homomorphic, the filaments filiform, the anthers linear-lanceolate, the locules distinct and divergent at base, the connective without an appendage; ovary with 4 septa and joined with the calyx-tube, 4-locular, short-pilose at apex; capsules obovoid-globose, with 4 obscure grooves, enclosed in the calyx-tube; seeds falcate. —Few species, in se. Asia, and India.

1. **Blastus cochinchinensis** Lour. *Anplectrum parviflorum* Benth.; *B. parviflorus* (Benth.) Triana —MIYAMA-HASHI-KAMBOKU. Shrub, with yellow, sessile, mealy glands throughout; branches slender; leaves membranous, oblong or oblong-lanceolate, 8-15 cm. long, 2.5-5 cm. wide, long-caudate, acute at base, entire, often purplish beneath, the 5 nerves slender, raised beneath, the outermost pair very slender not reaching the apex, the veinlets transversely parallel, very slender, the

petioles slender, 2-4 cm. long, grooved above; flowers white, 1-6 in axillary fascicles, 7-8 mm. across, the pedicels 3-5 mm. long; calyx-tube tubular-campanulate, 2-3 mm. long; petals 4, deltoid-ovate, about 3 mm. long, deflexed, short-clawed at base; anthers about 4 mm. long, the locules with a callose base; capsules urceolate-globose, about 3 mm. long. —July-Aug. Dense woods in evergreen forests; Kyushu (Yakushima); rare. —Ryukyus, Formosa, s. China, Indochina, and e. India.

2. **BREDIA** Bl. HASHI-KAMBOKU ZOKU

Glabrous or puberulous shrubs; leaves petioled, ovate to oblong, often oblique, acute, serrulate, 5-nerved; flowers in terminal cymes or panicles, pedicelled, rather small, rose-purple; calyx pilose, the tube obconical and obtusely 4-angled, the limb short, the lobes 4, persistent, deltoid, mucronate below the apex; petals 4, obovate; stamens 8, dimorphic, the anthers narrowly lanceolate, incurved, the larger with a bifid appendage on the connective in front at base, the smaller with a globose appendage of connective in front at base, with a short protuberance on back; ovary 4-locular, adnate to the calyx-tube, with 8 septa and with a membranous crown at apex; style ascending, the stigma punctate; capsules semiglobose with a depressed apex surrounded by a crown, enclosed in the obconical calyx-tube; seeds obovoid, small. —Few species, in se. Asia.

1. **Bredia hirsuta** Bl. HASHI-KAMBOKU. Shrub with spreading callose hairs and short puberulence; branches terete; leaves ovate to narrowly so, or ovate-oblong, 4-10 cm. long, 2-5 cm. wide, more or less unequal, sometimes slightly oblique, acute to rather acuminate, slightly cordate at base, callose-denticulate, 5- to 7-nerved, green on upper side, whitish beneath, the petioles 1-7 cm. long; inflorescence 8-12 cm. long, ascending, rather many-flowered, puberulous, the pedicels 5-12 mm. long, with 2 minute bracteoles at base; flowers rose with

a purple hue, about 1.5 cm. across; calyx-tube about 4 mm. long, narrowed to the pedicel, the lobes small, deltoid-lanceolate, about 1 mm. long, obtuse, spreading; petals obovate-rhombic, about 8 mm. long, mucronate; anthers 8, the larger ones 4-5 mm. long, rose, the smaller ones about 2.5 mm. long; capsules obconical, about 7 mm. long, the crown nearly entire. —July-Oct. Kyushu (Kagoshima and Yakushima). —Ryukyus.

3. **OSBECKIA** L. HIME-NO-BOTAN ZOKU

Herbs or shrubs, strigose, the branches usually 4-angled; leaves rather firm, 3- to 7-nerved; flowers terminal, solitary or in heads or panicles, rose or rose-purple, usually bracteate at base; calyx with pinnate scales or stellately fascicled hairs, the tube urceolate or ovoid, the lobes 4-5, linear or lanceolate, deciduous; petals 4-5, obovate, deciduous; stamens 8 or 10, homomorphic, the anthers often beaked, the connective inflated but not appendaged at base, with 2 tubercles in front, rarely with a short spur at base on back; ovary 4- to 5-locular, more or less adnate to calyx-tube at base, the apical portion free, with a tuft of hairs; capsules enclosed in the calyx-tube, 4- to 5-valved; seeds small, curved. —About 50 species, India, Malaysia, e. Asia, and Australia.

1. **Osbeckia chinensis** L. *O. japonica* Naud. —HIME-NO-BOTAN. Perennial 30-50 cm. high; stems erect, firm, rather slender, 4-angled, strigose on the angles, sparsely branched; leaves broadly lanceolate, 3-6 cm. long, 8-15 mm. wide, acute, subrounded at base, spreading, strigose-hairy, entire, 5-nerved, the petioles 1-2 mm. long; flowers few, sessile, in terminal heads, the bracts ovate, obtuse, ciliate, slightly shorter than the calyx-tube; calyx-tube urceolate, glabrous, 5-6 mm. long, the lobes 4, membranous, ovate-oblong, subobtusely

as long as the tube, with a short callose tubercle terminated by a tuft of long straight hairs between the lobes; petals broadly obovate, 12-15 mm. long, ciliate near tip; anthers about 4 mm. long, short-beaked, the connective slightly thickened at base; capsules enclosed in the calyx-tube, subglobose, 4-valved; seeds minutely tubercled. —Aug.-Oct. Grassy places in lowlands; Honshu (Kii Prov.), Shikoku, Kyushu. —Ryukyus, Formosa, China, and Malaysia.

4. **MELASTOMA** L. NO-BOTAN ZOKU

Strigose shrubs; leaves coriaceous, opposite, elliptic to lanceolate, entire, 3- to 7-nerved, petioled; flowers terminal, large, solitary, fasciculate, or in panicles, rose-purple, rarely white, with 2 bracts at base; calyx-tube ovoid or urceolate, the lobes 4-7, usually 5, ovate or lanceolate, deciduous, often with a tooth between the lobes; petals 4-7, usually 5; stamens 8-14, usually 10, dimorphic, the anthers slender and slightly incurved, the larger ones usually violet-purple, the connective much extended at base,

bifid or emarginate, the smaller ones yellow, the connective not extended, with 2 tubercles in front; ovary ovoid, free or with 5(4-7) septa, hairy at the mucronate apex; fruit a coriaceous or fleshy, indehiscent or irregularly dehiscent berry.—About 80 species, tropical Asia, Pacific Islands, and Australia.

1. *Melastoma candidum* D. Don. *M. macrocarpum* D. Don; *M. septemnerium* Lour., non Jacq.; *M. nobotan* Bl.; *M. candidum* var. *nobotan* (Bl.) Makino—No-BOTAN. Shrub, the branches rather thick, obscurely 4-angled, densely appressed-strigose and with flattened whitish scalelike hairs; leaves somewhat coriaceous, oblong to ovate-elliptic, 5-12 cm. long, 2.5-6 cm. wide, acute, obtuse to rounded at base, entire, appressed-strigose on both sides, 5- to 7-nerved, the veinlets slender, parallel, the petioles 1-2 cm. long; flowers 3-7, terminal, 6-8 cm. across, rose-purple, the bracts lanceolate to nar-

rowly ovate, caducous, slightly shorter than the calyx-tube; calyx-tube urceolate-campanulate, 8-10 mm. long, the lobes 5, narrowly deltoid, acuminate, as long as the tube; anthers dimorphic, the larger ones about 1 cm. long, with the elongate portion of connective as long as the anther and shallowly bifid at the tip, the smaller ones 8-9 mm. long, the connective without an elongate portion; berry coriaceous, the upper half free, exerted, with flattened hairs.—July-Aug. Reported to occur in Kyushu (Yakushima); rare.—Ryukyus, Formosa, China, and Indochina.

Fam. 149. ONAGRACEAE

AKABANA KA

Evening Primrose Family

Herbs, or rarely shrubs, sometimes aquatic; leaves simple, opposite or alternate; stipules deciduous or absent; flowers bisexual, actinomorphic, usually solitary in axils or in spikes; calyx adnate to the ovary, the lobes 4 or 5, sometimes 2, valvate; petals as many as the calyx-lobes, convolute or imbricate, rarely absent; stamens as many or twice as many as the calyx-lobes; anthers 2-locular, longitudinally dehiscent; ovary inferior or half-inferior, 2- to 6-locular, rarely the locules incomplete; ovules 1 to many, on axile placentae; style simple; fruit a capsule or nutlike; seeds 1 to many, endosperm absent, embryo straight.—About 37 genera, with about 600 species, in both hemispheres, especially abundant in the New World.

- 1A. Ovary half-inferior, 1-locular, 1-seeded; fruit relatively large, with 2-4 spines, indehiscent; aquatic herbs with rhomboidal coarsely toothed leaves. 1. *Trapa*
 1B. Ovary inferior, usually 2- to 6-locular, with 1 to many small seeds.
 2A. Flowers dimerous; fruit indehiscent, obovoid, uncinately-pilose, 1- or 2-locular, each locule 1-seeded. 2. *Circaea*
 2B. Flowers tetramerous; fruit a many-seeded capsule.
 3A. Capsules loculicidally dehiscent; seeds comose; petals usually rose, white, or red-purple. 3. *Epilobium*
 3B. Capsules septically dehiscent or irregularly ruptured; seeds not comose; petals yellow or absent. 4. *Ludwigia*

1. TRAPA L. HISHI ZOKU

Aquatic herbs; leaves floating, rhombic, coarsely toothed, the petioles often spongy and partially inflated; flowers axillary, solitary, short-pedicelled; calyx-tube short, subtending the ovary, the limb 4-lobed, the lobes persistent, becoming at least partly spine-like; petals 4, inserted on the disc, superior to the ovary; stamens 4; ovary half-inferior, 1-locular, adnate at base to the calyx-tube, the free portion conical, terminated by the persistent style, the stigma capitate; ovules solitary, pendulous; fruit bony, indehiscent, obconical, with 2-4 large spines, 1-seeded; seeds rather large, testa membranous, cotyledons unequal.—Few species, in tropical and temperate regions of the Old World.

- 1A. Plant prominently pubescent on petioles, pedicels, calyx, and underside of leaves; leaves 3-8 cm. wide; fruit 3-4 cm. long, inclusive of the usually spreading spines. 1. *T. japonica*
 1B. Plant glabrous except leaves beneath; leaves 1-2 cm. wide; fruit 2-3 cm. across, inclusive of the usually ascending spines; plant smaller than the preceding. 2. *T. incisa*

1. *Trapa japonica* Flerov. *T. bispinosa* sensu auct. Japon., non Roxb.; *T. natans* var. *bispinosa* Makino, excl. syn.; *T. bispinosa* var. *iwasakii* Nakano, and var. *inunai* Nakano—HISHI. Annual; stems slender, much elongate, with filiform pinnately divided roots at each node; leaves rosulate, ovate-rhombic or broadly rhombic, 2.5-5 cm. long, 3-8 cm. wide, obtuse to subacute, broadly cuneate or subtruncate at base, entire on lower half, irregularly coarse-toothed on upper margin, glabrous and lustrous on upper side, prominently pubescent beneath especially on nerves, the petioles 10-20 cm. long, pubescent, the inflated portion lanceolate, 1-5 cm. long; pedicels short, pubescent, 2-4 cm. long, deflexed in fruit; flowers white to pale rose, about 1 cm. across; calyx soft-pubescent, the dorsal and ventral calyx-lobes deciduous; fruit bony, rather flat, obtriangular, 3-4 cm. long inclusive of the spines, with a hornlike projection at the center and with a solitary spine at each end, the spines retrorsely scabrous toward tip.—July-Oct. Lakes and ponds; Hokkaido, Honshu, Shikoku, Kyushu; common.—Korea, Manchuria, and China.

Var. *rubeola* (Makino) Ohwi. *T. natans* var. *rubeola* Makino—MEBISHI. Petioles reddish; fruit 4-spined.—Honshu.

2. *Trapa incisa* Sieb. & Zucc. *T. bispinosa* var. *incisa* (Sieb. & Zucc.) Fr. & Sav.; *T. natans* var. *incisa* (Sieb. & Zucc.) Makino—HIMEBISHI. Resembling the preceding species but smaller; stems very slender; leaves deltoid-rhombic or depressed-rhombic, 1-2 cm. long and as wide, acute or subacute, broadly cuneate and entire on lower half, with few, prominent deltoid teeth on upper margin, glabrous on upper side, glabrous or loosely pubescent on nerves near base beneath, the petioles 1-8 cm. long, slender, usually glabrous except at apex; flowers white or pale rose, 6-8 mm. across; fruit slightly flattened, obtriangular, 2-3 cm. long inclusive of the spines, with a hornlike projection at the center, with an ascending or obliquely spreading spine at each end, dorsal and ventral calyx-lobes becoming spinose and descending in fruit.—July-Oct. Lakes and ponds; Honshu, Shikoku, Kyushu.

2. CIRCAEA L. MIZU-TAMA-SÔ ZOKU

Perennial herbs, glabrous or short-pubescent; leaves membranous, petioled, opposite, ovate, toothed or subentire; flowers numerous, in terminal or axillary racemes, small, white or rose, the bracts absent or small; calyx-tube ovoid, adnate to and constricted above the ovary, the lobes 2; petals 2, obcordate or obovate, inserted on the margin of the ovary-disc; stamens 2, alternate with the petals; ovary 1- or 2-locular; style filiform, the stigma capitate; ovules usually solitary and ascending on the inner side of each locule, rarely paired and collateral; fruit obovoid, indehiscent, uncinately-pilose, with 1 seed in each locule.—About 10 species in the temperate to northern parts of the N. Hemisphere.

- 1A. Fruit 2-locular, often sulcate, 2-seeded, obovoid-clavate to globose; petals much shorter than the calyx-lobes; plants 20–60 cm. high, glabrous to pubescent.
